<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance less than 10,000 ohms?

Yes

REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No

GO to B3.

B3: CHECK THE SECONDARY AIR INJECTION RELAY TO AIR PUMP SUPPLY CIRCUIT FOR SHORT CIRCUIT TO POWER

1 Measure the resistance between:

<table>
<thead>
<tr>
<th>Secondary air injection relay base</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 03</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>
Is the resistance less than 10,000 ohms?
Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
GO to B4.

**B4: CHECK THE SECONDARY AIR INJECTION PUMP SIGNAL CIRCUIT FOR SHORT CIRCUIT TO GROUND**

<table>
<thead>
<tr>
<th>Measure the resistance between:</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Secondary air injection relay base</td>
<td>Battery</td>
</tr>
<tr>
<td>Pin 02 Negative terminal</td>
<td></td>
</tr>
</tbody>
</table>

Is the resistance less than 10,000 ohms?
Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
GO to B5.

**B5: CHECK THE SECONDARY AIR INJECTION PUMP SIGNAL CIRCUIT FOR SHORT CIRCUIT TO POWER**

| Measure the resistance between: |
|---------------------------------|---|
| Secondary air injection relay base | Battery |
| Pin 02 Positive terminal |  |

Is the resistance less than 10,000 ohms?
Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
GO to B6.

**B6: CHECK THE SECONDARY AIR INJECTION RELAY TO AIR PUMP SUPPLY CIRCUIT FOR HIGH RESISTANCE**

| Measure the resistance between: |
|---------------------------------|---|
| Secondary air injection relay base | Secondary air injection pump connector FH310, harness side |
| Pin 03 Pin 02 |  |

Is the resistance greater than 5 ohms?
Yes
REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
GO to B7.

**B7: CHECK THE SECONDARY AIR INJECTION PUMP GROUND CIRCUIT FOR HIGH RESISTANCE**

| Measure the resistance between: |
|---------------------------------|---|
| Secondary air injection pump connector FH310, harness side | Battery |
| Pin 01 Negative terminal |  |

Is the resistance greater than 5 ohms?
Yes
REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
GO to B8.

**B8: CHECK THE SECONDARY AIR INJECTION PUMP SIGNAL CIRCUIT FOR HIGH RESISTANCE**

1 Disconnect the ECM electrical connector, FH300.
2 Measure the resistance between:

| Measure the resistance between: |
|---------------------------------|---|
| Secondary air injection relay base | ECM connector FH300, harness side |
| Pin 02 Pin 52 |  |

Is the resistance greater than 5 ohms?
Yes
REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
INSTALL a new secondary air injection pump relay. CLEAR the DTC and test the system for normal operation.

**PINPOINT TEST C: (N/A FEDERAL SPECIFICATION ONLY) CHECK THE SECONDARY AIR INJECTION MAP SENSOR CIRCUITS**

<table>
<thead>
<tr>
<th>Test Conditions</th>
<th>Details/Results/Actions</th>
</tr>
</thead>
</table>

**C1: CHECK THE SECONDARY AIR INJECTION MAP SENSOR SUPPLY CIRCUIT FOR SHORT CIRCUIT TO GROUND**

1 Key off.
2 Disconnect the secondary air injection MAP sensor electrical connector, FH312.
3 Measure the resistance between:

| Measure the resistance between: |
|---------------------------------|---|
| Secondary air injection MAP sensor connector FH312, harness side | Battery |
| Pin 01 Negative terminal |  |

Is the resistance less than 10,000 ohms?
Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
GO to C2.

**C2: CHECK THE SECONDARY AIR INJECTION MAP SENSOR SUPPLY CIRCUIT FOR SHORT CIRCUIT TO POWER**

1 Measure the resistance between:

| Measure the resistance between: |
|---------------------------------|---|
| Secondary air injection MAP sensor connector FH312, harness side | Battery |
| Pin 01 Positive terminal |  |

Is the resistance less than 10,000 ohms?
Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
GO to C3.

**C3: CHECK THE SECONDARY AIR INJECTION MAP SENSOR SIGNAL CIRCUIT FOR SHORT CIRCUIT TO GROUND**
Measure the resistance between:

<table>
<thead>
<tr>
<th>Secondary air injection MAP sensor connector FH312, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance less than 10,000 ohms?

Yes

REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No
GO to C4.

C4: CHECK THE SECONDARY AIR INJECTION MAP SENSOR SIGNAL CIRCUIT FOR SHORT CIRCUIT TO POWER

Measure the resistance between:

<table>
<thead>
<tr>
<th>Secondary air injection MAP sensor connector FH312, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance less than 10,000 ohms?

Yes

REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No
GO to C5.

C5: CHECK THE SECONDARY AIR INJECTION MAP SENSOR SUPPLY CIRCUIT FOR HIGH RESISTANCE

1 Disconnect the ECM electrical connector, FH300.

2 Measure the resistance between:

<table>
<thead>
<tr>
<th>Secondary air injection MAP sensor connector FH312, harness side</th>
<th>ECM connector FH300, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 01</td>
<td>Pin 19</td>
</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?

Yes

REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No
GO to C6.

C6: CHECK THE SECONDARY AIR INJECTION MAP SENSOR SIGNAL CIRCUIT FOR HIGH RESISTANCE

Measure the resistance between:

<table>
<thead>
<tr>
<th>Secondary air injection MAP sensor connector FH312, harness side</th>
<th>ECM connector FH300, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Pin 13</td>
</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?

Yes

REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No
GO to C7.

C7: CHECK THE SECONDARY AIR INJECTION MAP SENSOR GROUND CIRCUIT FOR HIGH RESISTANCE

Measure the resistance between:

<table>
<thead>
<tr>
<th>Secondary air injection MAP sensor connector FH312, harness side</th>
<th>ECM connector FH300, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 03</td>
<td>Pin 07</td>
</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?

Yes

REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No
INSTALL a new secondary air injection MAP sensor. CLEAR the DTC and test the system for normal operation.

PINPOINT TEST D : CHECK THE SECONDARY AIR INJECTION CONTROL VALVE CIRCUITS

TEST CONDITIONS

D1: CHECK THE SECONDARY AIR INJECTION CONTROL VALVE SUPPLY VOLTAGE

1 Key off.
2 Disconnect the secondary air injection control valve electrical connector, PI302.
3 Key on, engine off.
4 Measure the voltage between:

<table>
<thead>
<tr>
<th>Secondary air injection control valve connector PI302, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 01</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the voltage less than 10 volts?

Yes

REPAIR the supply circuit between the secondary air injection control valve and battery. This circuit includes fuse 2 of the front power distribution. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No
GO to D2.

D2: CHECK THE SECONDARY AIR INJECTION CONTROL VALVE CONTROL CIRCUIT FOR SHORT CIRCUIT TO GROUND

Measure the resistance between:

<table>
<thead>
<tr>
<th>Secondary air injection control valve connector PI302, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance less than 10,000 ohms?

Yes

REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No
GO to D3.

D3: CHECK THE SECONDARY AIR INJECTION CONTROL VALVE CONTROL CIRCUIT FOR SHORT CIRCUIT TO POWER

Measure the resistance between:

<table>
<thead>
<tr>
<th>Secondary air injection control valve connector PI302, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>
Is the resistance less than 10,000 ohms?

Yes
   REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No
   GO to D4.

D4: CHECK THE SECONDARY AIR INJECTION CONTROL VALVE CONTROL CIRCUIT FOR HIGH RESISTANCE

1. Disconnect the ECM electrical connector, FH300.

2. Measure the resistance between:

   Secondary air injection control valve connector PI302, harness side  ECM connector FH300, harness side

   Pin 02  Pin 55

Is the resistance greater than 5 ohms?

Yes
   REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No
   INSTALL a new secondary air injection control valve.
   CLEAR the DTC and test the system for normal operation.
Inspection and verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

<table>
<thead>
<tr>
<th>Mechanical</th>
<th>Electrical</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Engine breather hoses</td>
<td>• Fuses</td>
</tr>
<tr>
<td>• Cyclone separator</td>
<td>• Wiring harness</td>
</tr>
<tr>
<td>• Exhaust gas recirculation (EGR) pipes (check for cracks)</td>
<td>• Loose or corroded electrical connectors</td>
</tr>
<tr>
<td>• EGR valve</td>
<td>• Sensor(s)</td>
</tr>
<tr>
<td></td>
<td>• Stepper motor(s)</td>
</tr>

<td></td>
<td>• Secondary air injection pump</td>
</tr>
<tr>
<td></td>
<td>• Secondary air injection control valve</td>
</tr>
<tr>
<td></td>
<td>• Engine control module (ECM)</td>
</tr>
</tbody>
</table>

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. If the cause is not visibly evident use the Jaguar approved diagnostic system or a scan tool to retrieve the fault codes before proceeding to the diagnostic trouble code (DTC) Index.

Symptom Chart

DTC index

• NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

• NOTE: For a full list of DTCs. REFER to: Electronic Engine Controls - VIN Range: N52048->N80180 (303-14A Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Diagnosis and Testing).

or

REFER to: Electronic Engine Controls - VIN Range: N52048->N80180 (303-14B Electronic Engine Controls - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Diagnosis and Testing).
### Pinpoint tests

**CAUTION:** When probing connectors to take measurements in the course of the pinpoint tests, use the adaptor kit, part number 3548-1358-00.

- **NOTE:** When performing electrical voltage or resistance tests, always use a digital multimeter (DMM) accurate to 3 decimal places, and with an up-to-date calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.
- **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

### PINPOINT TEST A : CHECK THE EGR STEPPER SUPPLY AND CONTROL CIRCUITS

**NOTE:** Check for DTCs indicating an air filter solenoid, purge valve or mass air flow meter fault before carrying out EGR stepper supply voltage pinpoint tests.

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>

<td>Pin 05</td>
<td></td>
</tr>
</tbody>
</table>
Is either voltage less than 10 volts?

Yes

REPAIR the relevant EGR stepper supply voltage circuit. This circuit includes the front power distribution box (fuse 37) and the EMS control relay. For additional information, refer to the wiring diagrams. CLEAR the DTCs and test the system for normal operation.

No

GO to A2.

A2: CHECK THE EGR STEPPER CONTROL CIRCUITS FOR SHORT CIRCUIT TO GROUND

1. Key off.
2. Measure the resistance between:

<table>
<thead>
<tr>
<th>EGR stepper connector PI15, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 04</td>
<td>Negative terminal</td>
</tr>
<tr>
<td>Pin 01</td>
<td>Positive terminal</td>
</tr>
<tr>
<td>Pin 06</td>
<td>Pin 53</td>
</tr>
<tr>
<td>Pin 03</td>
<td>Pin 52</td>
</tr>
</tbody>
</table>

Is any of the resistances less than 10,000 ohms?

Yes

REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs and test the system for normal operation.

No

GO to A3.

A3: CHECK THE EGR STEPPER CONTROL CIRCUITS FOR SHORT CIRCUIT TO POWER

1. Measure the resistance between:

<table>
<thead>
<tr>
<th>EGR stepper connector PI15, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 04</td>
<td>Negative terminal</td>
</tr>
<tr>
<td>Pin 01</td>
<td>Pin 53</td>
</tr>
<tr>
<td>Pin 06</td>
<td>Pin 52</td>
</tr>
<tr>
<td>Pin 03</td>
<td>Pin 51</td>
</tr>
</tbody>
</table>

Are any of the resistances less than 10,000 ohms?

Yes

REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs and test the system for normal operation.

No

GO to A4.

A4: CHECK THE EGR STEPPER CONTROL CIRCUITS FOR HIGH RESISTANCE

1. Key off.
2. Disconnect the ECM electrical connector, PI300.
3. Measure the resistance between:

<table>
<thead>
<tr>
<th>EGR stepper connector PI15, harness side</th>
<th>ECM connector PI300, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 04</td>
<td>Pin 53</td>
</tr>
<tr>
<td>Pin 01</td>
<td>Pin 52</td>
</tr>
<tr>
<td>Pin 06</td>
<td>Pin 51</td>
</tr>
<tr>
<td>Pin 03</td>
<td>Pin 50</td>
</tr>
</tbody>
</table>

Are any of the resistances less than 10,000 ohms?

Yes

REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No

CHECK for DTCs. Refer to the DTC index.

PINPOINT TEST B : CHECK THE SECONDARY AIR INJECTION PUMP CIRCUITS

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
</table>

B1: CHECK THE SECONDARY AIR INJECTION PUMP RELAY SUPPLY VOLTAGES

1. Key off.
2. Remove the secondary air injection pump relay.
3. Measure the voltage between:

<table>
<thead>
<tr>
<th>Secondary air injection relay base</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 01</td>
<td>Negative terminal</td>
</tr>
<tr>
<td>Pin 05</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is either voltage less than 10 volts?

Yes

REPAIR the circuit between the secondary air injection relay base and battery. This circuit includes fuse 31 of the front power distribution box. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No

GO to B2.

B2: CHECK THE SECONDARY AIR INJECTION RELAY TO AIR PUMP SUPPLY CIRCUIT FOR SHORT CIRCUIT TO GROUND

1. Disconnect the secondary air injection pump electrical connector, FH310.
2. Measure the resistance between:

<table>
<thead>
<tr>
<th>Secondary air injection relay base</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 03</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance less than 10,000 ohms?

Yes

REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No

GO to B3.

B3: CHECK THE SECONDARY AIR INJECTION RELAY TO AIR PUMP SUPPLY CIRCUIT FOR SHORT CIRCUIT TO POWER

1. Measure the resistance between:

<table>
<thead>
<tr>
<th>Secondary air injection relay base</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 03</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>
Is the resistance less than 10,000 ohms?
Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
GO to B4.

**B4: CHECK THE SECONDARY AIR INJECTION PUMP SIGNAL CIRCUIT FOR SHORT CIRCUIT TO GROUND**

1 Measure the resistance between:

<table>
<thead>
<tr>
<th>Secondary air injection relay base</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance less than 10,000 ohms?
Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
GO to B5.

**B5: CHECK THE SECONDARY AIR INJECTION PUMP SIGNAL CIRCUIT FOR SHORT CIRCUIT TO POWER**

1 Measure the resistance between:

<table>
<thead>
<tr>
<th>Secondary air injection relay base</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance less than 10,000 ohms?
Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
GO to B6.

**B6: CHECK THE SECONDARY AIR INJECTION RELAY TO AIR PUMP SUPPLY CIRCUIT FOR HIGH RESISTANCE**

1 Measure the resistance between:

<table>
<thead>
<tr>
<th>Secondary air injection relay base</th>
<th>Secondary air injection pump connector FH310, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 03</td>
<td>Pin 02</td>
</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?
Yes
REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
GO to B7.

**B7: CHECK THE SECONDARY AIR INJECTION PUMP GROUND CIRCUIT FOR HIGH RESISTANCE**

1 Measure the resistance between:

<table>
<thead>
<tr>
<th>Secondary air injection pump connector FH310, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 01</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?
Yes
REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
GO to B8.

**B8: CHECK THE SECONDARY AIR INJECTION PUMP SIGNAL CIRCUIT FOR HIGH RESISTANCE**

1 Disconnect the ECM electrical connector, FH300.
2 Measure the resistance between:

<table>
<thead>
<tr>
<th>Secondary air injection relay base</th>
<th>ECM connector FH300, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Pin 52</td>
</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?
Yes
REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
INSTALL a new secondary air injection pump relay. CLEAR the DTC and test the system for normal operation.

**PINPOINT TEST C: (N/A FEDERAL SPECIFICATION ONLY) CHECK THE SECONDARY AIR INJECTION MAP SENSOR CIRCUITS**

<table>

Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
GO to C2.

**C2: CHECK THE SECONDARY AIR INJECTION MAP SENSOR SUPPLY CIRCUIT FOR SHORT CIRCUIT TO POWER**

1 Measure the resistance between:

<table>
<thead>
<tr>
<th>Secondary air injection MAP sensor connector FH312, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 01</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance less than 10,000 ohms?
Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
GO to C3.

**C3: CHECK THE SECONDARY AIR INJECTION MAP SENSOR SIGNAL CIRCUIT FOR SHORT CIRCUIT TO GROUND**
Measure the resistance between:

Secondary air injection MAP sensor connector FH312, harness side

Battery

Pin 02

Is the resistance less than 10,000 ohms?

Yes

REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No

GO to C4.

C4: CHECK THE SECONDARY AIR INJECTION MAP SENSOR SIGNAL CIRCUIT FOR SHORT CIRCUIT TO POWER

Measure the resistance between:

Secondary air injection MAP sensor connector FH312, harness side

Battery

Pin 02

Is the resistance less than 10,000 ohms?

Yes

REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No

GO to C5.

C5: CHECK THE SECONDARY AIR INJECTION MAP SENSOR SUPPLY CIRCUIT FOR HIGH RESISTANCE

Disconnect the ECM electrical connector, FH300.

Measure the resistance between:

Secondary air injection MAP sensor connector FH312, harness side

ECM connector FH300, harness side

Pin 01

Pin 19

Is the resistance greater than 5 ohms?

Yes

REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No

GO to C6.

C6: CHECK THE SECONDARY AIR INJECTION MAP SENSOR SIGNAL CIRCUIT FOR HIGH RESISTANCE

Measure the resistance between:

Secondary air injection MAP sensor connector FH312, harness side

ECM connector FH300, harness side

Pin 02

Pin 13

Is the resistance greater than 5 ohms?

Yes

REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No

GO to C7.

C7: CHECK THE SECONDARY AIR INJECTION MAP SENSOR GROUND CIRCUIT FOR HIGH RESISTANCE

Measure the resistance between:

Secondary air injection MAP sensor connector FH312, harness side

ECM connector FH300, harness side

Pin 03

Pin 07

Is the resistance greater than 5 ohms?

Yes

REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No

INSTALL a new secondary air injection MAP sensor. CLEAR the DTC and test the system for normal operation.

PINPOINT TEST D : CHECK THE SECONDARY AIR INJECTION CONTROL VALVE CIRCUITS

D1: CHECK THE SECONDARY AIR INJECTION CONTROL VALVE SUPPLY VOLTAGE

Key off.

Disconnect the secondary air injection control valve electrical connector, PI302.

Key on, engine off.

Measure the voltage between:

Secondary air injection control valve connector PI302, harness side

Battery

Pin 01

Is the voltage less than 10 volts?

Yes

REPAIR the supply circuit between the secondary air injection control valve and battery. This circuit includes fuse 2 of the front power distribution. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No

GO to D2.

D2: CHECK THE SECONDARY AIR INJECTION CONTROL VALVE CONTROL CIRCUIT FOR SHORT CIRCUIT TO GROUND

Measure the resistance between:

Secondary air injection control valve connector PI302, harness side

Battery

Pin 02

Is the resistance less than 10,000 ohms?

Yes

REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No

GO to D3.

D3: CHECK THE SECONDARY AIR INJECTION CONTROL VALVE CONTROL CIRCUIT FOR SHORT CIRCUIT TO POWER

Measure the resistance between:

Secondary air injection control valve connector PI302, harness side

Battery

Pin 02

Is the resistance less than 10,000 ohms?

Yes

REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No

GO to D4.
Is the resistance less than 10,000 ohms?

Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No
GO to D4.

**D4: CHECK THE SECONDARY AIR INJECTION CONTROL VALVE CONTROL CIRCUIT FOR HIGH RESISTANCE**

<table>

</tbody>
</table>

Is the resistance greater than 5 ohms?

Yes
REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No
INSTALL a new secondary air injection control valve.
CLEAR the DTC and test the system for normal operation.
Removal

Left-hand drive vehicles with Supercharger

1. Remove the cabin air filter.
   For additional information, refer to: Cabin Air Filter (412-01 Air Distribution and Filtering, Removal and Installation).

2. Remove the cabin air filter housing retaining nut.

3. Remove the cabin air filter housing.

4. Remove the engine compartment panel.

Vehicles with supercharger

5. Remove the throttle body. For additional information, refer to: (303-04 Fuel Charging and Controls - 3.5L/4.2L)

   Throttle Body - Vehicles With: Supercharger, VIN Range: G00442->G45703 (Removal and Installation),
   Throttle Body - Vehicles With: Supercharger, VIN Range: G45704->G99999 (Removal and Installation).
6. Disconnect the exhaust gas recirculation (EGR) valve electrical connector.

7. **NOTE:** Cap the exposed ports.
   Disconnect the coolant hoses.

8. Remove the exhaust manifold to EGR valve tube retaining nuts.

9. Remove the EGR valve and the exhaust manifold to EGR valve tube.
   - Remove the retaining bolts.
   - Remove and discard the exhaust manifold to EGR valve tube gasket.
   - Remove and discard the EGR valve to air intake elbow gasket.

10. Remove the EGR valve.
    - Remove and discard the EGR valve to exhaust manifold to EGR valve tube gasket.
11. NOTE: Cap the exposed ports.
Disconnect the EGR valve coolant hoses.

1. Disconnect the EGR valve electrical connector.
2. Disconnect the EGR valve coolant hoses.

12. Remove the retaining bolts.

13. Remove the EGR valve.
   - Remove and discard the EGR valve to exhaust manifold to EGR valve tube gasket.
   - Remove and discard the EGR valve to intake manifold gasket.

**Installation**

Vehicles with supercharger

1. Install the EGR valve.
   - Install a new EGR valve to exhaust manifold to EGR valve tube gasket.
   - Tighten to 21 Nm.
2. Install the EGR valve and the exhaust manifold to EGR valve tube.
   - Install a new exhaust manifold to EGR valve tube gasket.
   - Install a new EGR valve to air intake elbow gasket.
   - Tighten to 10 Nm.

3. Tighten to 21 Nm.

4. NOTE: Un-cap the exposed ports.

   Connect the coolant hoses.

5. Connect the EGR valve electrical connector.

6. Install the throttle body. For additional information, refer to: (303-04 Fuel Charging and Controls - 3.5L/4.2L)

   Throttle Body - Vehicles With: Supercharger, VIN Range: G00442->G45703 (Removal and Installation),
   Throttle Body - Vehicles With: Supercharger, VIN Range: G45704->G99999 (Removal and Installation).

Vehicles without supercharger
7. Install the EGR valve.
   - Install a new EGR valve to exhaust manifold to EGR valve tube gasket.
   - Install a new EGR valve to intake manifold gasket.
   - Tighten to 10 Nm.

8. Tighten to 21 Nm.

9. NOTE: Un-cap the exposed ports.
   Connect the EGR valve electrical connector.
   1. Connect the EGR valve coolant hoses.
   2. Connect the EGR valve electrical connector.

Left-hand drive vehicles with Supercharger

10. Install the engine compartment panel.
11. Install the cabin air filter housing.

12. Install the cabin air filter housing retaining nut.

13. Install the cabin air filter.
   For additional information, refer to: Cabin Air Filter (412-01 Air Distribution and Filtering, Removal and Installation).

All vehicles

14. Check and top up the coolant expansion tank.

15. NOTE: For NAS vehicles only.
   If required, carry out a long drive cycle.
   For additional information, refer to: Powertrain Control Module (PCM) Long Drive Cycle Self-Test (303-14A Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, General Procedures).
Engine Emission Control - V8 4.2L Petrol/V8 S/C 4.2L Petrol/2.5L NA V6 - AJV6/3.0L NA V6 - AJ27 - Exhaust Manifold to Exhaust Gas Recirculation (EGR) Valve Tube

Removal

Vehicles with supercharger

1. Remove the exhaust gas recirculation (EGR) valve. For additional information, refer to: Exhaust Manifold to Exhaust Gas Recirculation (EGR) Valve Tube (303-08A Engine Emission Control - V8 4.2L Petrol/V8 S/C 4.2L Petrol/2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation).

Vehicles without supercharger

2. Remove the exhaust manifold to exhaust gas recirculation (EGR) valve tube.
   - Remove and discard the gasket.

Installation

Vehicles with supercharger

1. Install the EGR valve. For additional information, refer to: Exhaust Gas Recirculation (EGR) Valve (303-08A Engine Emission Control - V8 4.2L Petrol/V8 S/C 4.2L Petrol/2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation).

Vehicles without supercharger

2. Install the exhaust manifold to exhaust gas recirculation (EGR) valve tube.
   - Install a new gasket.
   - Tighten to 21 Nm.

3. Install the intake manifold. For additional information, refer to: (303-01B)
   Intake Manifold - VIN Range: G00442->G45170 (In-vehicle Repair), Intake Manifold - VIN Range: G45171->G99999 (In-vehicle Repair).
1. **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

   Raise and support the vehicle.

2. Drain the cooling system. For additional information, refer to: Cooling System Draining, Filling and Bleeding (303-03A Engine Cooling - V8 4.2L Petrol/V8 S/C 4.2L Petrol/2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, General Procedures).

3. Remove the air cleaner. For additional information, refer to: Air Cleaner (303-12A Intake Air Distribution and Filtering - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation).

4. Release the coolant pipes.
   - Release the 2 clips.

5. Disconnect the secondary air injection (AIR) control valve to exhaust manifold right-hand tube.
6. Disconnect the AIR switching valve electrical connector.

7. Disconnect the AIR switching valve vacuum hoses.

8. Detach the AIR wiring harness.

9. Disconnect the AIR control valve vacuum hose.

10. NOTE: Note the position of the timing marks on the AIR control valve and the AIR supply hose.

   Disconnect the AIR supply hose.
11. Remove the AIR control valve and bracket assembly.

**Installation**

1. To install, reverse the removal procedure.
   - Tighten to 8 Nm.

2. Tighten to 35 Nm.

3. **NOTE:** For NAS vehicles only.
   If required, carry out a short drive cycle.
   For additional information, refer to: Powertrain Control Module (PCM)
   Short Drive Cycle Self-Test (303-14A Electronic Engine Controls - 2.5L NA
   V6 - AJV6/3.0L NA V6 - AJ27, General Procedures).
Removal

1. Disconnect the battery ground cable. For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

2. Remove the air cleaner. For additional information, refer to: Air Cleaner (303-12B Intake Air Distribution and Filtering - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Removal and Installation).

3. Disconnect the secondary air injection (AIR) control valve vacuum hose.

4. Disconnect the AIR control valve to exhaust manifold tube.

5. Reposition the AIR control valve downwards.
   - Remove the AIR control valve retaining bolts.

6. Remove the air deflector. For additional information, refer to: Air Deflector (501-02 Front End Body Panels, Removal and Installation).
7. Remove the AIR control valve.
   - Disconnect the AIR control valve supply hose.

**Installation**

1. To install, reverse the removal procedure.
   1. Tighten to 25 Nm.

2. Tighten to 35 Nm.

3. **NOTE:** For NAS vehicles only.
   If required, carry out a short drive cycle.
   For additional information, refer to: Powertrain Control Module (PCM) Short Drive Cycle Self-Test (303-14A Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, General Procedures).
Engine Emission Control - V8 4.2L Petrol/V8 S/C 4.2L Petrol/2.5L NA V6 - AJV6/3.0L NA V6 - AJ27 - Secondary Air Injection (AIR) Control Valve

4.2L, Vehicles With: Supercharger

Removal

1. Disconnect the battery ground cable.
   For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

2. Remove the radiator grille opening panel.
   For additional information, refer to: Radiator Grille Opening Panel (501-02 Front End Body Panels, Removal and Installation).

3. Remove the air cleaner outlet pipe.
   For additional information, refer to: Air Cleaner Outlet Pipe (303-12B Intake Air Distribution and Filtering - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Removal and Installation).

4. Remove the air cleaner intake duct.

5. Disconnect the secondary air injection (AIR) control valve to exhaust manifold tube.

6. Disconnect the AIR control valve vacuum hose.
7. Release the hose from the cooling fan motor and shroud.

8. Disconnect the AIR control valve air supply hose.
   1. Release the hose from the cooling fan motor and shroud.
   2. Disconnect the AIR control valve air supply hose.

9. Remove the AIR control valve.

**Installation**

1. Install the AIR control valve.
   - Tighten to 25 Nm.
2. Connect the AIR control valve air supply hose.
   1. Connect the AIR control valve air supply hose.
   2. Secure the hose to the cooling fan motor and shroud.

3. Secure the hose to the cooling fan motor and shroud.

4. Connect the AIR control valve vacuum hose.

5. Connect the AIR control valve to exhaust manifold tube.
   - Tighten to 35 Nm.

6. Install the air cleaner intake duct.
7. Install the air cleaner outlet pipe.  
   For additional information, refer to: Air Cleaner Outlet Pipe (303-12B Intake Air Distribution and Filtering - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Removal and Installation).

8. Install the radiator grille opening panel.  
   For additional information, refer to: Radiator Grille Opening Panel (501-02 Front End Body Panels, Removal and Installation).

9. Connect the battery ground cable.  
   For additional information, refer to: Battery Connect (414-01 Battery, Mounting and Cables, General Procedures).

10. NOTE: For NAS vehicles only.  
     If required, carry out a short drive cycle.  
     For additional information, refer to: Powertrain Control Module (PCM) Short Drive Cycle Self-Test (303-14A Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, General Procedures).
Removal

1. **NOTE:** Note the position of the timing mark on the secondary air injection (AIR) control valve to exhaust manifold left-hand tube. The timing mark indicates the correct end of the AIR control valve to exhaust manifold left-hand tube that should be connected to the AIR control valve to exhaust manifold right-hand tube.

   Disconnect the secondary air injection (AIR) control valve to exhaust manifold left-hand tube.

2. Remove the air deflector.
   For additional information, refer to: Air Deflector (501-02 Front End Body Panels, Removal and Installation).

3. Remove the AIR control valve to exhaust manifold left-hand tube from the left-hand exhaust manifold.

Installation

1. To install, reverse the removal procedure.
   - Tighten to 35 Nm.

2. **NOTE:** Make sure that the timing mark on the AIR control valve to exhaust manifold left-hand tube is correctly aligned.

   Tighten to 35 Nm.
Removal

1. Disconnect the battery ground cable. For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

2. Disconnect the secondary air injection (AIR) control valve to exhaust manifold right-hand tube from the right-hand exhaust manifold.

3. Disconnect the AIR control valve to exhaust manifold left-hand tube.

4. Disconnect the AIR control valve to exhaust manifold right-hand tube.

5. Remove the air deflector. For additional information, refer to: Air Deflector (501-02 Front End Body Panels, Removal and Installation).

6. Remove the AIR control valve to exhaust manifold right-hand tube.

Installation
1. To install, reverse the removal procedure.
   - Tighten to 8 Nm.

2. Tighten to 35 Nm.

3. Tighten to 35 Nm.

4. Tighten to 35 Nm.
Engine Emission Control - V8 4.2L Petrol/V8 S/C 4.2L Petrol/2.5L NA V6 - AJV6/3.0L NA V6 - AJ27 - Secondary Air Injection (AIR) Control Valve to Exhaust Manifold Tube 4.2L, Vehicles Without: Supercharger

Removal

Right-hand drive vehicles

1. Center the steering wheel.
   - Lock in position, remove the ignition key.

All vehicles

2. Remove the right-hand exhaust manifold heat shield upper retaining bolts.

3. Remove the cooling fan motor and shroud.
   For additional information, refer to: [Cooling Fan Motor and Shroud](303-03A Engine Cooling - V8 4.2L Petrol/V8 S/C 4.2L Petrol/2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation).

4. Remove the air deflector.
   For additional information, refer to: [Air Deflector](501-02 Front End Body Panels, Removal and Installation).

5. Disconnect the secondary air injection (AIR) control valve to exhaust manifold tube.

Right-hand drive vehicles

6. Remove the steering gear coupling upper pinch bolt
7. Remove the steering gear coupling.
   - Remove the steering gear coupling lower pinch bolt.

8. Remove the right-hand heated oxygen sensor (HO2S).
   For additional information, refer to: Heated Oxygen Sensor (HO2S) (303-14B Electronic Engine Controls - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Removal and Installation).

9. Remove the right-hand exhaust manifold heat shield.

10. Disconnect the AIR control valve to exhaust manifold tube.

11. Lower the vehicle.

12. Disconnect the coolant hose.
13. NOTE: Vehicles with supercharger shown, vehicles without supercharger similar.

Disconnect the AIR control valve to exhaust manifold tube.

14. NOTE: Vehicles with supercharger shown, vehicles without supercharger similar.

Remove the AIR control valve to exhaust manifold tube.

**Installation**

All vehicles

1. To install, reverse the removal procedure.
   - Tighten to 35 Nm.

2. Tighten to 35 Nm.
3. Tighten to 3 Nm.

Tube4.2L, Vehicles With: Supercharger

Removal

1. Disconnect the battery ground cable.
   For additional information, refer to: Battery Disconnect and Connect
   (414-01 Battery, Mounting and Cables, General Procedures).

2. Remove the engine cover.

3. Remove the radiator grille opening panel.
   For additional information, refer to: Radiator Grille Opening Panel
   (501-02 Front End Body Panels, Removal and Installation).

4. Remove the air cleaner outlet pipe.
   1. Disconnect the positive crankcase ventilation (PCV) hose.
   2. Remove the air cleaner outlet pipe.

5. Remove the air cleaner intake duct.

6. CAUTION: If power steering fluid comes into contact with the
   paintwork, the affected area must be immediately washed down with cold
   water.
   Detach the power steering fluid reservoir.
7. Remove the air deflector.  
   For additional information, refer to: Air Deflector (501-02 Front End Body Panels, Removal and Installation).

8. Remove the radiator splash shield.  
   For additional information, refer to: Radiator Splash Shield (501-02 Front End Body Panels, Removal and Installation).

9. Drain the cooling system.  
   For additional information, refer to: Cooling System Draining, Filling and Bleeding (303-03C Engine Cooling - 2.7L V6 - TdV6, General Procedures).

10. Disconnect the secondary air injection (AIR) control valve to exhaust manifold tube from the left-hand exhaust manifold.

11. Remove the right-hand exhaust manifold heat shield.

12. Lower the ramp.

13. Remove the right-hand exhaust manifold heat shield upper retaining bolts.

14. Remove the coolant expansion tank.  
   For additional information, refer to: Coolant Expansion Tank (303-03C Engine Cooling - 2.7L V6 - TdV6, Removal and Installation).

15. Disconnect the AIR control valve to exhaust manifold tube from the right-hand exhaust manifold.
16. NOTE: Install suitable blanking plugs to the open orifices.
   Disconnect the coolant hose.
   1. Release the coolant hose from the cooling fan motor and shroud.
   2. Disconnect the coolant hose.

17. Disconnect the AIR control valve to exhaust manifold tube.

18. Disconnect the AIR control valve vacuum hose.

19. Release the hose from the cooling fan motor and shroud.
20. Disconnect the AIR control valve air supply hose.
   1. Release the hose from the cooling fan motor and shroud.
   2. Disconnect the AIR control valve air supply hose.

21. Remove the AIR control valve.

22. Remove the AIR control valve retaining bracket.

23. NOTE: Remove and discard the O-ring seal.

   • NOTE: Install suitable blanking plugs to the open orifices.

   Release the thermostat housing.
24. NOTE: Install suitable blanking plugs to the open orifices. Disconnect the coolant hoses.

25. Remove the AIR control valve to exhaust manifold tube.

**Installation**

1. Install the AIR control valve to exhaust manifold tube.

2. NOTE: Remove and discard the blanking plugs. Connect the coolant hoses.
3. NOTE: Install a new O-ring seal.
   - NOTE: Remove and discard the blanking plugs.
   Secure the thermostat housing.
   - Tighten to 9 Nm.

4. Install the AIR control valve retaining bracket.
   - Tighten to 8 Nm.

5. Install the AIR control valve.
   - Tighten to 35 Nm.

6. Connect the AIR control valve air supply hose.
   1. Connect the AIR control valve air supply hose.
   2. Secure the hose to the cooling fan motor and shroud.
7. Secure the hose to the cooling fan motor and shroud.

8. Connect the AIR control valve vacuum hose.

9. Connect the AIR control valve to exhaust manifold tube.
   - Tighten to 35 Nm.

10. **NOTE:** Remove and discard the blanking plugs.

    Connect the coolant hose.
    1. Connect the coolant hose.
    2. Secure the coolant hose to the cooling fan motor and shroud.
11. Connect the AIR control valve to exhaust manifold tube to the right-hand exhaust manifold.
   • Tighten to 35 Nm.

12. Install the coolant expansion tank. For additional information, refer to: Coolant Expansion Tank (303-03C Engine Cooling - 2.7L V6 - TdV6, Removal and Installation).

13. Install the right-hand exhaust manifold heat shield upper retaining bolts.
   • Tighten to 3 Nm.

14. Raise the ramp.

15. Install the right-hand exhaust manifold heat shield.
   • Tighten to 3 Nm.

16. Connect the AIR control valve to exhaust manifold tube to the left-hand exhaust manifold.
   • Tighten to 3 Nm.

17. Install the radiator splash shield. For additional information, refer to: Radiator Splash Shield (501-02 Front End Body Panels, Removal and Installation).

18. Install the air deflector. For additional information, refer to: Air Deflector (501-02 Front End Body Panels, Removal and Installation).

19. Lower the ramp.
20. Secure the power steering fluid reservoir.

21. Install the air cleaner intake duct.

22. Install the air cleaner outlet pipe.
   1. Install the air cleaner outlet pipe.
   2. Connect the PCV hose.

23. Install the radiator grille opening panel.
    For additional information, refer to: Radiator Grille Opening Panel
    (501-02 Front End Body Panels, Removal and Installation).

24. Fill the cooling system.
    For additional information, refer to: Cooling System Draining, Filling and
    Bleeding (303-03C Engine Cooling - 2.7L V6 - TdV6, General
    Procedures).

25. Install the engine cover.

26. Connect the battery ground cable.
    For additional information, refer to: Battery Connect (414-01 Battery,
    Mounting and Cables, General Procedures).
Engine Emission Control - V8 4.2L Petrol/V8 S/C 4.2L Petrol/2.5L NA V6 - AJV6/3.0L NA V6 - AJ27 - Secondary Air Injection (AIR) Pump

Removal

1. Remove the radiator splash shield. For additional information, refer to: Radiator Splash Shield (501-02 Front End Body Panels, Removal and Installation).

2. Disconnect the secondary air injection (AIR) pump electrical connector.

3. Disconnect the AIR pump hose.

4. Remove the AIR pump retaining bolt.

5. Remove the AIR pump.

Installation
1. To install, reverse the removal procedure.
   - Tighten to 9 Nm.

2. Tighten to 9 Nm.

3. NOTE: For NAS vehicles only.
   If required, carry out a short drive cycle.
   For additional information, refer to: Powertrain Control Module (PCM) Short Drive Cycle Self-Test (303-14A Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, General Procedures).

Crankcase Ventilation

The crankcase ventilation system on the 2.7L Diesel ensures that all gases emitted from the crankcase during engine running are separated from any oil particles.

</tbody>
</table>

Crankcase ventilation is by a cyclone separator. The oil separator is constructed from a plastic composite material. The oil separator is located between the 'V' at the back of the engine block by means of three seals. The oil separator contains a diaphragm and spring which opens under intake vacuum.

The ventilation system’s first chamber is a horizontal void cavity fed by eight points. Once primary separation is complete, the partially cleaned vapor is sucked through a cyclone where the process further reduces the oil content. Prior to the vapor entering the air supply at the compressor, a diaphragm pressure balance valve operates to minimize the crankcase pressure variations caused by engine air demand and service condition.

Due to the shape and design of the cyclone unit, the oil and vapor are separated more effectively. Vapor is directed into the inlet system and the heavier oil drains back into the engine.

Exhaust Emission Control

The exhaust of a diesel engine contains the following pollutants:

- Carbon Monoxide (CO)
- Hydrocarbons (HC)
Particulates
- Oxides of Nitrogen (NOx)

These pollutants are primarily produced as a result of incomplete combustion of the fuel.
The particulates in the exhaust gases consist of pure carbon and various compounds such as metal oxide and sulphur.

Exhaust Gas Re-Circulation

<table>

<td>Gasket</td>
</tr>
</tbody>
</table>

The exhaust gas re-circulation (EGR) system is fitted to the engine in order to reduce the amount of nitrogen oxide (NOx). This is done by reducing the temperature of the combustion process by introducing some waste exhaust gases into the inlet manifold. The effect of this is that there is a depletion of oxygen which reduces the temperature of the combustion process and in turn reduces the amount of NOx produced.

The engine control module (ECM) will determine the amount of EGR operation depending on the engine rpm, intake air temperature, coolant temperature and fuel flow rate. The amount of exhaust gas being recirculated is measured by a combination of position sensing of the valves and a mass air flow (MAF) sensor.

The EGR valves are operated through their full range at each engine start-up. This is to clear any carbon deposits that may have built up whilst the engine was running.

The EGR system is continually monitored for faults. Depending on how the system fails, the ECM will dictate whether the malfunction indication light (MIL) is on or off. In the event of a failure of the EGR system, the ECM will use substitute values and the EGR function will become inoperative.

The EGR cooler is connected to the vehicle cooling system via hoses and is there to cool the exhaust gases being recirculated.

The EGR valve and cooler are supplied as separate components. The EGR valve itself should not be disassembled.
**Engine Emission Control - 2.7L V6 - TdV6 - Engine Emission Control**

**Principle of operation**

**Exhaust gas recirculation (EGR)**

The EGR system recycles exhaust gases back through the combustion process to reduce NOx emissions. By introducing this gas into the air intake, oxygen content and combustion temperatures are reduced, which reduces the NOx emissions.

High EGR flow is necessary during cruising and mid-range acceleration, when combustion temperatures are typically very high, while lower EGR flow is needed during low speed and light load conditions.

No EGR flow should occur during conditions when it could adversely affect engine operating efficiency or vehicle driveability, such as engine warm-up, idle, etc.

The EGR function of the 2.7 L engine is managed by the engine control module (ECM), which controls the operation of stepper motors, allowing precise control of the EGR valve actuators.

**Positive crankcase ventilation**

The crankcase ventilation system uses the depression created in the air intake to draw vapors from the crankcase through the engine where they are burnt with the fuel/air charge.

By doing this, any build-up of pressure inside the crankcase is avoided, reducing blow-by and potential oil leakage problems, while still reducing emissions into the atmosphere.

The 2.7 L engine crankcase ventilation is through a cyclone separator mounted in the engine ‘V’.

The separator consists of a diaphragm and spring inside the casing which respond to crankcase pressure variations and separate the oil from the vapor, allowing the oil back into the engine while the vapor is directed to the intake system.

**Inspection and verification**

1. **Verify the customer concern.**

2. **Visually inspect for obvious signs of mechanical or electrical damage.**

**Visual inspection chart**

</tbody>
</table>

**CAUTION:** When probing connectors to take measurements in the course of the pinpoint tests, use the adaptor kit, part number 3540-1358-00. Failure to follow this instruction may result in damage to the vehicle.

- **NOTE:** When performing voltage or resistance tests, always use a digital multimeter (DMM) accurate to 3 decimal places, and with an up-to-date calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.

- **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

- **NOTE:** If diagnostic trouble codes (DTCs) are recorded and the symptom is not present when performing the pinpoint tests, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

- **NOTE:** For a full list of DTCs, REFER to: Electronic Engine Controls (303-14C Electronic Engine Controls - 2.7L V6 - TdV6, Diagnosis and Testing).

**Diagnostic Trouble Code (DTC) index**

</table>
### Inspection and Verification

This pinpoint test is intended to diagnose the following:

- Short circuit to GROUND in the EGR throttle actuator (ETA) circuit
- Short circuit to POWER in the EGR throttle actuator (ETA) circuit
- Open circuit in the EGR throttle actuator (ETA) circuit
- EGR throttle actuator (ETA) circuit
- ECM

</table>
Measure the resistance between:
EGR throttle sensor - signal - Pin 02
EGR throttle sensor - ground - Pin 01

Is the resistance greater than 100 Kohms?
Yes
   GO to A8.
No
   REPAIR the short circuit. For additional information, refer to the wiring diagrams.

A8: CHECK WHETHER THE SHORT CIRCUIT TO GROUND IS IN THE ETA HARNESS OR ECU

Measure the resistance between:
EGR throttle sensor - signal - Pin 02
Negative post

Is the resistance greater than 100 Kohms?
Yes
   Suspect:- ECM
No
   REPAIR the short circuit. For additional information, refer to the wiring diagrams.

A9: CHECK WHETHER THE SHORT CIRCUIT TO POWER IS IN THE ETA HARNESS OR ECU

Key off.
1
ECM connector disconnected.
2
Key on, engine off.
3
Measure the resistance between:
EGR throttle sensor - signal - Pin 02
Positive post

Is the resistance greater than 100 Kohms?
Yes
   Suspect:- ECM
No
   REPAIR the short circuit. For additional information, refer to the wiring diagrams.

A10: CHECK WHETHER THE SHORT CIRCUIT IS IN THE ETA HARNESS OR CONTROL UNIT

Key off.
1
ECM connector disconnected.
2
Key on, engine off.
3
Measure the resistance between:
EGR throttle sensor - signal - Pin 02
EGR throttle sensor - supply - Pin 06
Positive post

Is the resistance greater than 100 Kohms?
Yes
   Suspect:- ECM
No
   REPAIR the short circuit. For additional information, refer to the wiring diagrams.

A11: CHECK THE 5 VOLT SUPPLY LINE FOR SHORT CIRCUIT TO GROUND

Measure the resistance between:
EGR throttle sensor - supply - Pin 06
Negative post

Is the resistance greater than 100 Kohms?
Yes
   GO to A12.
No
   GO to A17.

A12: CHECK THE 5 VOLT SUPPLY LINE FOR SHORT CIRCUIT TO POWER

Measure the resistance between:
EGR throttle sensor - supply - Pin 06
Positive post

Is the resistance greater than 100 Kohms?
Yes
   GO to A13.
No
   GO to A19.

A13: CHECK THE ETA 5 VOLT SUPPLY LINE FOR OPEN CIRCUIT

Key off.
1
ECM connector disconnected.
2
Key on, engine off.
3
Measure the resistance between:
EGR throttle sensor - supply - Pin 06
EGR throttle sensor - supply - Pin B-F1

Is the resistance less than 10 ohms?
Yes
   Suspect :- ECM connector+ ECM
No
   REPAIR the open circuit. For additional information, refer to the wiring diagrams.

A14: CHECK THE ETA SENSOR RETURN LINE FOR SHORT CIRCUIT TO POWER

Measure the resistance between:
EGR throttle sensor - ground - Pin 01
Positive post

Is the resistance greater than 100 Kohms?
Yes
   GO to A15.
No
   GO to A20.

A15: CHECK WHETHER THE 5 VOLT SUPPLY AND SIGNAL RETURN LINES ARE SHORTED TOGETHER

Key off.
1
ECM connector disconnected.
2
Key on, engine off.
3
Measure the resistance between:
EGR throttle sensor - supply - Pin 06
EGR throttle sensor - ground - Pin 01

Is the resistance greater than 100 Kohms?
Yes
   GO to A16.
No
   REPAIR the short circuit. For additional information, refer to the wiring diagrams.

- **No**: REPAIR the short circuit. For additional information, refer to the wiring diagrams.

---

**Inspection and Verification**

- This pinpoint test is intended to diagnose the following:
  - Short circuit to GROUND in the EGR throttle valve (ETV) circuit
  - Short circuit to POWER in the EGR throttle valve (ETV) circuit
  - Open circuit in the EGR throttle valve (ETV) circuit
  - EGR throttle valve (ETV)
  - ECM

- EGR throttle actuator (ETA) connector

---

</table>
C4: CHECK THE ETA SIGNAL LINE FOR SHORT CIRCUIT TO GROUND
1 Measure the resistance between:
EGR throttle sensor - signal - Pin 02 Negative post

Is the resistance greater than 100 Kohms?
Yes Go to C5.
No Go to C8.

C5: CHECK THE ETA SIGNAL LINE FOR SHORT CIRCUIT TO POWER
1 Measure the resistance between:
EGR throttle sensor - signal - Pin 02 Positive post

Is the resistance greater than 100 Kohms?
Yes Go to C6.
No Go to C10.

C6: CHECK THE ETA SIGNAL LINE FOR SHORT CIRCUIT TO SENSOR POWER
1 Measure the resistance between:
EGR throttle sensor - signal - Pin 02 EGR throttle sensor - supply - Pin 06
EGR throttle sensor - signal - Pin 02 EGR throttle sensor - ground - Pin 01

Are the resistances greater than 100 Kohms?
Yes Go to C7.
No Go to C11.

C7: CHECK THE ETA SIGNAL LINE FOR OPEN CIRCUIT
1 Key off.
2 ECM connector disconnected.
3 Measure the resistance between:
EGR throttle sensor - signal - Pin 02 EGR throttle sensor - signal - Pin B-E1

Is the resistance less than 10 ohms?
Yes Go to C22.
No REPAIR the open circuit. For additional information, refer to the wiring diagrams.

C8: CHECK THE ETA CIRCUIT(S) FOR SIGNAL AND RETURN LINES SHORTED TOGETHER
1 Key off.
2 ECM connector disconnected.
3 Key on, engine off.
4 Measure the resistance between:
EGR throttle sensor - signal - Pin 02 EGR throttle sensor - ground - Pin 01

Is the resistance greater than 100 Kohms?
Yes Go to C9.
No REPAIR the short circuit. For additional information, refer to the wiring diagrams.

C9: CHECK WHETHER THE SHORT CIRCUIT TO GROUND IS IN THE ETA HARNESS OR ECU
1 Measure the resistance between:
EGR throttle sensor - signal - Pin 02 Negative post

Is the resistance greater than 100 Kohms?
Yes Suspect:- ECM
No REPAIR the short circuit. For additional information, refer to the wiring diagrams.

C10: CHECK WHETHER THE SHORT CIRCUIT TO POWER IS IN THE ETA HARNESS OR ECU
1 Key off.
2 ECM connector disconnected.
3 Key on, engine off.
4 Measure the resistance between:
EGR throttle sensor - signal - Pin 02 Positive post

Is the resistance greater than 100 Kohms?
Yes Suspect:- ECM
No REPAIR the short circuit. For additional information, refer to the wiring diagrams.

C11: CHECK WHETHER THE SHORT CIRCUIT IS IN THE ETA HARNESS OR CONTROL UNIT
1 Key off.
2 ECM connector disconnected.
3 Key on, engine off.
4 Measure the resistance between:
EGR throttle sensor - signal - Pin 02 EGR throttle sensor - supply - Pin 06
EGR throttle sensor - signal - Pin 02 EGR throttle sensor - ground - Pin 01

Are the resistances greater than 100 Kohms?
Yes Suspect:- ECM
No REPAIR the short circuit. For additional information, refer to the wiring diagrams.

C12: CHECK THE 5 VOLT SUPPLY LINE FOR SHORT CIRCUIT TO GROUND
1 Measure the resistance between:
EGR throttle sensor - supply - Pin 06 Negative post
Is the resistance greater than 100 Kohms?
Yes
GO to C13.
No
GO to C18.

C13: CHECK THE 5 VOLT SUPPLY LINE FOR SHORT CIRCUIT TO POWER

1. Measure the resistance between:
   EGR throttle sensor - supply - Pin 06 Positive post
   EGR throttle sensor - supply - Pin B-F1

Is the resistance greater than 100 Kohms?
Yes
GO to C14.
No
GO to C20.

C14: CHECK THE ETA 5 VOLT SUPPLY LINE FOR OPEN CIRCUIT

1. Key off.
2. ECM connector disconnected.
3. Measure the resistance between:
   EGR throttle sensor - supply - Pin 06
   EGR throttle sensor - supply - Pin B-F1

Is the resistance less than 10 ohms?
Yes
Suspect: ECM or ECM connector
No
REPAIR the open circuit. For additional information, refer to the wiring diagrams.

C15: CHECK THE ETA SENSOR RETURN LINE FOR SHORT CIRCUIT TO POWER

1. Measure the resistance between:
   EGR throttle sensor - ground - Positive post
   Pin 01

Is the resistance greater than 100 Kohms?
Yes
GO to C16.
No
GO to C21.

C16: CHECK WHETHER THE 5 VOLT SUPPLY AND SIGNAL RETURN LINES ARE SHORTED TOGETHER

1. Key off.
2. ECM connector disconnected.
3. Measure the resistance between:
   EGR throttle sensor - supply - Pin 06
   EGR throttle sensor - ground - Pin 01

Is the resistance greater than 100 Kohms?
Yes
GO to C17.
No
REPAIR the short circuit. For additional information, refer to the wiring diagrams.

C17: CHECK THE ETA SENSOR RETURN LINE FOR OPEN CIRCUIT

1. Measure the resistance between:
   EGR throttle sensor - ground - Pin 01
   EGR throttle sensor - ground - Pin B-F2

Is the resistance less than 10 ohms?
Yes
Suspect: ECM or ECM connector
No
REPAIR the open circuit. For additional information, refer to the wiring diagrams.

C18: CHECK WHETHER THE 5 VOLT SUPPLY AND SIGNAL RETURN LINES ARE SHORTED TOGETHER

1. Key off.
2. ECM connector disconnected.
3. Key on, engine off.
4. Measure the resistance between:
   EGR throttle sensor - supply - Pin 06
   EGR throttle sensor - ground - Pin 01

Is the resistance greater than 100 Kohms?
Yes
GO to C19.
No
REPAIR the short circuit. For additional information, refer to the wiring diagrams.

C19: CHECK WHETHER THE SHORT CIRCUIT TO GROUND IS IN THE ETA HARNESS OR ECU

1. Measure the resistance between:
   EGR throttle sensor - supply - Pin 06 Negative post

Is the resistance greater than 100 Kohms?
Yes
Suspect: ECM
No
REPAIR the short circuit. For additional information, refer to the wiring diagrams.

C20: CHECK WHETHER THE SHORT CIRCUIT TO POWER IS IN THE ETA HARNESS OR ECU

1. Key off.
2. ECM connector disconnected.
3. Key on, engine off.
4. Measure the resistance between:
   EGR throttle sensor - ground - Pin 01 Positive post

Is the resistance greater than 100 Kohms?
Yes
Suspect: ECM
No
REPAIR the short circuit. For additional information, refer to the wiring diagrams.

C21: CHECK WHETHER THE SHORT CIRCUIT TO POWER IS IN THE ETA HARNESS OR ECU

1. Key off.
2. ECM connector disconnected.
3. Key on, engine off.
Measure the resistance between:
**EGR throttle sensor - ground - Pin 01 Positive post**

Removal

1. Remove the exhaust gas recirculation (EGR) valve outlet tube. For additional information, refer to: Exhaust Gas Recirculation (EGR) Valve Outlet Tube (303-08B Engine Emission Control - 2.7L Diesel, Removal and Installation).

2. Remove the fuel injector soundproofing.

3. Drain the cooling system. For additional information, refer to: Cooling System Draining, Filling and Bleeding (303-03C Engine Cooling - 2.7L Diesel, General Procedures).

4. Remove the air cleaner. For additional information, refer to: Air Cleaner (303-12C Intake Air Distribution and Filtering - 2.7L Diesel, Removal and Installation).

5. Remove the power steering reservoir. For additional information, refer to: Power Steering Fluid Reservoir (211-02 Power Steering, Removal and Installation).

6. Remove the left-hand engine compartment cover.

7. Detach the fuel filter from the mounting bracket.
   1. Press the retaining tang.
   2. Detach the fuel filter from the mounting bracket.

8. Remove the fuel filter retaining bracket.
9. Disconnect the EGR valve electrical connector.

10. Disconnect the EGR valve coolant outlet hose.

11. Detach the EGR valve cooler outlet tube.
   - Disconnect the outlet hose.
   - Detach the EGR valve cooler outlet tube retaining clip.

12. Detach the EGR valve cooler outlet tube from the EGR mounting bracket.

13. Remove the left-hand catalytic converter.
    For additional information, refer to: Catalytic Converter - 2.7L Diesel (309-00 Exhaust System, Removal and Installation).
14. Detach the EGR valve coolant outlet tube.
   - Reposition the tube.

15. Lower the vehicle.
16. Disconnect the EGR valve coolant inlet hose.

17. Detach the EGR valve inlet tube.
   - Discard the gasket.

18. Remove the EGR valve inlet tube.
   - Detach and discard the retaining clip.

19. Remove the EGR valve.
Installation

1. Loosely install the EGR valve.

2. Install the EGR valve inlet tube.
   - Install a new retaining clip.
   - Do not fully close the retaining clip at this stage.

3. Raise the vehicle.
4. Install the EGR valve inlet tube retaining bolts.
   - Install a new gasket
   - Do not fully tighten the retaining bolts at this stage.

5. Lower the vehicle.
6. Fully close the EGR valve inlet tube retaining clip.
7. Tighten to 10 Nm.

8. Tighten to 10 Nm.

9. Connect the EGR valve coolant inlet hose.

10. Raise the vehicle.

11. Attach the EGR valve coolant outlet tube.

12. Install the left-hand catalytic converter.
   For additional information, refer to: Catalytic Converter - 2.7L Diesel
   (309-00 Exhaust System, Removal and Installation).

13. Lower the vehicle.
14. Attach the EGR valve cooler outlet tube to the EGR mounting bracket.

15. Attach the EGR valve cooler outlet tube.
   - Connect the outlet hose.
   - Attach the EGR valve cooler outlet tube retaining clip.

16. Connect the EGR valve coolant outlet hose.

17. Connect the EGR valve electrical connector.

18. Install the fuel injector soundproofing.
19. Tighten to 27 Nm.
20. Attach the fuel filter.

21. Install the left-hand engine compartment cover.

22. Install the power steering reservoir.
   For additional information, refer to: Power Steering Fluid Reservoir
   (211-02 Power Steering, Removal and Installation).

23. Fill and bleed the cooling system.
   For additional information, refer to: Cooling System Draining, Filling and
   Bleeding (303-03C Engine Cooling - 2.7L Diesel, General Procedures).

24. Install the air cleaner.
   For additional information, refer to: Air Cleaner (303-12C Intake Air
   Distribution and Filtering - 2.7L Diesel, Removal and Installation).

25. Install the fuel injector soundproofing.

26. Install the exhaust gas recirculation (EGR) valve outlet tube.
   For additional information, refer to: Exhaust Gas Recirculation (EGR)
   Valve Outlet Tube (303-08B Engine Emission Control - 2.7L Diesel,
   Removal and Installation).
Removal

1. Remove the oil filler cap.

2. Remove the engine cover.

3. NOTE: Right-hand shown, left-hand similar.
   Detach the exhaust gas recirculation (EGR) valve outlet tube.

4. NOTE: Right-hand shown, left-hand similar.
   Detach the EGR valve outlet tube.
5. NOTE: Right-hand shown, left-hand similar.
Remove the EGR valve outlet tube.
- Discard the gasket.

Installation

1. NOTE: Right-hand shown, left-hand similar.
Loosely install the EGR valve outlet tube.
- Install a new retaining clip.
- Do not fully close the retaining clip at this stage.

2. NOTE: Right-hand shown, left-hand similar.
Install the EGR valve outlet tube retaining bolts.
- Install a new gasket
- Do not fully tighten the retaining bolts at this stage.

3. NOTE: Right-hand shown, left-hand similar.
Attach the EGR valve outlet tube.
- Do not fully tighten the retaining bolt at this stage.
4. **NOTE**: Right-hand shown, left-hand similar.
   Fully close the EGR valve outlet tube retaining clip.

5. **NOTE**: Right-hand shown, left-hand similar.
   Tighten to 10 Nm.

6. **NOTE**: Right-hand shown, left-hand similar.
   Tighten to 5 Nm.

7. Install the engine cover.

8. Install the oil filler cap.
Removal

1. Remove the exhaust gas recirculation (EGR) valve outlet tube. For additional information, refer to: Exhaust Gas Recirculation (EGR) Valve Outlet Tube (303-08B Engine Emission Control - 2.7L V6 - TdV6, Removal and Installation).

2. Remove the injector soundproofing.

3. Drain the cooling system. For additional information, refer to: Cooling System Draining, Filling and Bleeding (303-03C Engine Cooling - 2.7L V6 - TdV6, General Procedures).

4. Disconnect the EGR valve electrical connector.

5. Disconnect the EGR valve coolant outlet hose.

6. Disconnect the EGR valve coolant inlet hose.

7. NOTE: Catalytic converter shown removed for clarity.
   
   Detach the EGR valve inlet tube retaining bolts.
   
   • Discard the gasket.
8. Remove the EGR valve inlet tube.
   - Detach and discard the retaining clip.

9. Remove the EGR valve.

**Installation**

1. Loosely install the EGR valve.

2. Install the EGR valve inlet tube.
   - Install a new retaining clip.
   - Do not fully close the retaining clip at this stage.
3. NOTE: Catalytic converter shown removed for clarity.
Install the EGR valve inlet tube retaining bolts.
  - Install a new gasket
  - Do not fully tighten the retaining bolts at this stage.

4. Fully close the EGR valve inlet tube retaining clip.

5. NOTE: Catalytic converter shown removed for clarity.
Tighten to 10 Nm.

6. Tighten to 10 Nm.

7. Connect the EGR valve coolant inlet hose.
8. Connect the EGR valve coolant outlet hose.

9. Connect the EGR valve electrical connector.

10. Install the fuel injector soundproofing.

11. Install the EGR valve outlet tube.
    For additional information, refer to: Exhaust Gas Recirculation (EGR) Valve Outlet Tube (303-08B Engine Emission Control - 2.7L V6 - TdV6, Removal and Installation).

12. Fill and bleed the cooling system.
    For additional information, refer to: Cooling System Draining, Filling and Bleeding (303-03C Engine Cooling - 2.7L V6 - TdV6, General Procedures).

Overview

There are changes to the engine management system (EMS) for 2006 MY, the most obvious of which will be the change to 7-digit diagnostic trouble codes (DTCs) from the familiar 5-digit, plus the addition of secondary air injection and changes to evaporative emissions and exhaust gas recirculation to comply with stage four emissions requirements.

For more information on these systems, REFER to: Engine Emission Control - VIN Range: N52048->N99999 (303-08A Engine Emission Control - V8 4.2L Petrol/V8 S/C 4.2L Petrol/2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Description and Operation) / Evaporative Emissions - VIN Range: N52048->N99999 (303-13 Evaporative Emissions, Description and Operation).

Inspection and Verification

1. Verify the customer concern.  
2. Visually inspect for obvious signs of damage.

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. If the cause is not visually evident use the Jaguar approved diagnostic system or a scan tool to retrieve the fault codes before proceeding to the DTC Index.

### Symptom chart

<table>
<thead>
<tr>
<th>Symptom</th>
<th>Possible cause</th>
<th>Action</th>
</tr>
</thead>
</table>
| Vehicle does not start/hard starting/poor performance | Restricted/blocked air intake  
Restricted/blocked air cleaner element | Clear the restriction, REFER to: Air Cleaner (303-12A Intake Air Distribution and Filtering - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation). Replace the air cleaner element as necessary, REFER to: Air Cleaner Element (303-12A Intake Air Distribution and Filtering - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation). |

Excessive intake noise |  
Intake pipe disconnected/damaged after the air cleaner  
Air cleaner assembly incorrectly assembled/damaged | Check the intake system and hoses for correct installation/damage, REFER to: Air Cleaner (303-12A Intake Air Distribution and Filtering - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation). |

### DTC index

• NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

Removal

1. Remove the air cleaner outlet pipe. For additional information, refer to Air Cleaner Outlet Pipe in this section.

2. Disconnect the mass air flow (MAF) sensor electrical connector.

3. Remove the radiator grill opening panel. For additional information, refer to Section 501-02 Front End Body Panels.

4. Remove the air cleaner.
   1. Remove the air cleaner retaining bolt.
   2. Disconnect the extra air flap actuator electrical connector.
   3. Remove the air cleaner.

Installation

1. NOTE: When installing the air cleaner, make sure the locating pegs fit securely in the grommets located in the inner wing.

   To install, reverse the removal procedure.
   - Tighten to 8Nm.
Intake Air Distribution and Filtering - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27 - Air Cleaner Element
Removal and Installation

Removal
1. Remove the air cleaner outlet pipe. For additional information, refer to Air Cleaner Outlet Pipe in this section.
2. Disconnect the mass air flow sensor (MAF) electrical connector.
3. Remove the air cleaner cover.
   1. Release the retaining clips.
   2. Remove the air cleaner cover.
4. Remove the air cleaner element.

Installation
1. To install, reverse the removal procedure.
Removal

1. Disconnect the engine breather hose.

2. Remove the air cleaner outlet pipe.
   1. Loosen the retaining clips.
   2. Remove the air cleaner outlet pipe.

Installation

1. To install, reverse the removal procedure.
Removal

1. Detach the air cleaner outlet pipe.
   - Loosen the retaining clips.

2. Remove the air cleaner outlet pipe.
   - Disconnect the engine breather hose.

Installation

1. To install, reverse the removal procedure.

Intake air distribution and filtering for vehicles with supercharger

Air is supplied to the supercharger via the air cleaner, air cleaner outlet pipe, throttle body intake pipe, throttle body and throttle body elbow. The supercharger delivers pressurized air to two separate charge air cooler units, each unit being mounted on the cylinder bank it supplies. Pressurized cooled air is fed from the charge air coolers directly into each inlet port. The air cleaner outlet pipe differs from the normally aspirated by having tuned resonators to reduce inlet noise levels. An intake air temperature sensor is fitted at the outlet of the bank 1 charge air cooler. The sensor provides an input to the engine control module (ECM). For additional information, refer to Section 303-14A Electronic Engine Controls / 303-14B Electronic Engine Controls / 303-14C Electronic Engine Controls. The intake elbow directs the metered airflow from the throttle body outlet (underside of the throttle body) into the intake of the supercharger. The supercharger by-pass valve assembly is part of the intake elbow. The butterfly valve inside the assembly is opened by a diaphragm actuator operated by vacuum feed from the elbow. At closed or partially open throttle positions, the butterfly valve opens, allowing the airflow from the two charge air cooler inlets to be directed back to the supercharger inlet. This action inhibits the supercharging effect and reduces engine torque. Progressive opening of the throttle causes the by-pass valve to gradually close.

Supercharger

The supercharger is attached to the three mounting bosses between the two cylinder heads. The supercharger has a filled for life internal lubrication system. The supercharger is positively aligned with the drive belt by a doweled mounting bracket.

Charge Air Cooler

Each cylinder bank is fitted with a charge air cooler which supplies pressurized air to the four cylinders. The inlet ports to the two charge air coolers are connected to the supercharger via the supercharger outlet pipe consisting of adjustable metal ducts with bonded rubber seals. The charge air coolers are water cooled via a radiator and water pump. For additional information, refer to Section 303-03A Engine Cooling / 303-03B Supercharger Cooling / 303-03C Engine Cooling.
Inspection and Verification

1. Verify the customer concern by operating the system.
2. Visually inspect for obvious signs of mechanical damage.
3. Verify the customer concern.
4. Visually inspect for obvious signs of mechanical damage.

5. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

6. If the cause is not visually evident, verify the symptom and refer to the Jaguar Approved Diagnostic System.
Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of damage.

**NOTE:** If any warning lights and/or messages were displayed when the fault occurred, refer to the driver information table for Diagnostic Trouble Codes (DTCs) associated with the display, then to the DTC index table for possible sources and actions. Some warnings will appear to clear when the ignition is cycled. This is often because the warning has flagged as a result of one of the vehicle's on-board diagnostic routines having run to detect the fault. If the same routine is not run when the ignition is switched ON, the warning will not reflag until the routine does run. See the DTC summaries for drive cycle routines.

Pinpoint tests

**CAUTION:** When probing connectors to take measurements in the course of the pinpoint tests, use the adaptor kit, part number 3548-1358-00. Failure to follow this instruction may result in damage to the vehicle.

- **NOTE:** When performing electrical voltage or resistance tests, always use a digital multimeter (DMM) accurate to 3 decimal places, and with an up-to-date calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.
- **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

### PINPOINT TEST A : CHECK THE SUPERCHARGER AIR INTAKE ELBOW

**TEST CONDITIONS** | **DETAILS/RESULTS/ACTIONS**
--- | ---
A1: CHECK THE AIR INTAKE ELBOW VACUUM LINE | 1. Check the vacuum connection to the supercharger air intake elbow at both ends.
2. Check the vacuum line to the supercharger air intake elbow along its length.

| Is the vacuum line connected and in good condition? | Yes | GO to A2. |
| | No | Reconnect or replace the vacuum line as necessary. Test the system for normal operation. |

A2: CHECK THE OPERATION OF THE AIR INTAKE ELBOW ACTUATOR LINKAGE

| Does the actuator linkage operate? | Yes | GO to A3. | |
| | No | Install a new supercharger air intake elbow. Test the system for normal operation. | |

A3: CHECK THE OPERATION OF THE AIR INTAKE ELBOW BUTTERFLY

| Does the butterfly operate? | Yes | Check for another cause of the malfunction. |
| | No | Install a new supercharger air intake elbow. Test the system for normal operation. |
Overview

There are changes to the engine management system (EMS) for 2006 MY, the most obvious of which will be the change to 7-digit diagnostic trouble codes (DTCs) from the familiar 5-digit, plus the addition of secondary air injection and changes to evaporative emissions and exhaust gas recirculation to comply with stage four emissions requirements.

For more information on these systems, refer to: Engine Emission Control - VIN Range: N52048->N99999 (303-08A Engine Emission Control - V8 4.2L Petrol/V8 S/C 4.2L Petrol/2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Description and Operation) / Evaporative Emissions - VIN Range: N52048->N99999 (303-13 Evaporative Emissions, Description and Operation).

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of damage.

**PINPOINT TEST A: CHECK THE SUPERCHARGER AIR INTAKE ELBOW**

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>A1: CHECK THE AIR INTAKE ELBOW VACUUM LINE</strong></td>
<td></td>
</tr>
</tbody>
</table>
| 1 | Check the vacuum connection to the supercharger air intake elbow at both ends.  
2 | Check the vacuum line to the supercharger air intake elbow along its length.  
Is the vacuum line connected and in good condition?  |
| Yes | GO to A2.  
No | CONNECT or replace the vacuum line as necessary. Test the system for normal operation.  |
| **A2: CHECK THE OPERATION OF THE AIR INTAKE ELBOW ACTUATOR LINKAGE** | |
| 1 | Disconnect the vacuum line from the actuator diaphragm.  
2 | Connect a suitable hand vacuum pump to the actuator diaphragm.  
3 | Apply a vacuum to the actuator diaphragm.  
4 | Observe the actuator linkage operation.  |
| Does the actuator linkage operate?  |
| Yes | GO to A3.  
No | INSTALL a new supercharger air intake elbow. Test the system for normal operation.  |
| **A3: CHECK THE OPERATION OF THE AIR INTAKE ELBOW BUTTERFLY** | |
| 1 | Remove the air cleaner outlet pipe,  
REFER to: [Air Cleaner Outlet Pipe](303-12B Intake Air Distribution and Filtering - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Removal and Installation).  |
| 2 | Remove the supercharger outlet pipe,  
REFER to: [Supercharger Outlet Pipe](303-12B Intake Air Distribution and Filtering - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Removal and Installation).  |
| 3 | Apply a vacuum to the actuator diaphragm.  
4 | Observe the butterfly operation.  |
| Does the butterfly operate?  |
| Yes | Check for another cause of the malfunction.  
No | INSTALL a new supercharger air intake elbow. Test the system for normal operation.  |
Removal

1. Remove the air cleaner outlet pipe. For additional information, refer to Air Cleaner Outlet Pipe in this section.
2. Disconnect the mass air flow (MAF) sensor electrical connector.
3. Remove the radiator grill opening panel. For additional information, refer to Section 501-02 Front End Body Panels.
4. Remove the air cleaner.
   1. Remove the air cleaner retaining bolt.
   2. Disconnect the extra air flap actuator electrical connector.
   3. Remove the air cleaner.

Installation

1. NOTE: When installing the air cleaner, make sure the locating pegs fit securely in the grommets located in the inner wing.
   To install, reverse the removal procedure.
   • Tighten to 8Nm.
**Removal**

1. Remove the air cleaner outlet pipe. For additional information, refer to [Air Cleaner Outlet Pipe](#) in this section.
2. Disconnect the mass air flow sensor (MAF) electrical connector.
3. Remove the air cleaner cover.
   1. Release the retaining clips.
   2. Remove the air cleaner cover.
4. Remove the air cleaner element.

**Installation**

1. To install, reverse the removal procedure.
Removal

1. Remove the engine cover.

2. Install the oil filler cap.

3. Disconnect the engine breather hose.

4. Remove the air cleaner outlet pipe.

Installation

1. To install, reverse the removal procedure.
Intake Air Distribution and Filtering - V8 4.2L Petrol/V8 S/C 4.2L Petrol - Charge Air Cooler
Removal and Installation

Removal

1. Remove the supercharger. For additional information, refer to: **Supercharger - VIN Range: M45255->N52047** (303-12B Intake Air Distribution and Filtering - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Removal and Installation).

2. **CAUTION:** Make sure no foreign matter enters the cylinder head ports.
   Remove the charge air cooler.
   - Remove and discard the charge air cooler gasket.

Installation

1. Install the charge air cooler.
   - Install a new charge air cooler gasket.
   - Tighten to 13 Nm.

2. Install the supercharger. For additional information, refer to: **Supercharger - VIN Range: M45255->N52047** (303-12B Intake Air Distribution and Filtering - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Removal and Installation).
Removal

1. Disconnect the battery ground cable. For additional information, refer to: *Battery Disconnect and Connect* (414-01 Battery, Mounting and Cables, General Procedures).

2. Carry out the supercharging cooling system draining procedure. For additional information, refer to: *Supercharger Cooling System Draining, Filling and Bleeding* (303-03B Supercharger Cooling, General Procedures).

3. Detach the supercharger belt.
   - Use a 1/2 inch square drive bar to rotate the supercharger belt tensioner.
   - Detach the supercharger belt.

5. Detach the hoses.
   - Reposition the hose retaining clip.

6. Detach the supercharger outlet pipe coolant hose.
   - Cap the coolant ports.
7. **CAUTION:** Make sure no foreign matter enters the supercharger.

   Remove the supercharger outlet pipe

8. Remove and discard the supercharger outlet pipe gasket.
9. Remove and discard the supercharger outlet pipe retaining bolt seals.
10. Remove and discard the supercharger outlet pipe to charge air coolers ducts.

11. Disconnect the thermostat housing hoses

12. Disconnect the coolant temperature sensor electrical connector.
13. Reposition the thermostat housing hose retaining clip.

14. Disconnect the hose.

15. Disconnect the hose.

16. Disconnect the hose.

17. Disconnect the hose.
18. Remove the thermostat housing retaining bolts.

19. Remove the thermostat housing.
   - Remove and discard thermostat housing O-ring seals.

20. Disconnect the charge air cooler coolant pipes.

21. Disconnect the intake air temperature (IAT) sensor electrical connector.

22. Remove the throttle body.
    For additional information, refer to: Throttle Body - Vehicles With: Supercharger, VIN Range: M45255-\>N52047 (303-04B Fuel Charging and Controls - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Removal and Installation).
23. Disconnect the exhaust gas recirculation (EGR) valve electrical connector.

24. NOTE: Cap the exposed ports.
    Disconnect the coolant hoses.

25. Remove the exhaust manifold to EGR valve tube retaining nuts.

26. Remove the EGR valve and the exhaust manifold to EGR valve tube.
    • Remove the retaining bolts.
    • Remove and discard the exhaust manifold to EGR valve tube gasket.
    • Remove and discard the EGR valve to air intake elbow gasket.

27. Disconnect the air intake elbow pipes.
28. **NOTE:** Make sure correct location of the ground strap is noted. Remove the air intake elbow retaining bracket lower retaining bolts.

29. Detach the air intake elbow.
   - Remove and discard the gasket.
   - Remove and discard the retaining bolt seals.

30. Remove the air intake elbow.
   - Disconnect the manifold absolute pressure (MAP) sensor

31. Remove the supercharger.

**Installation**
1. Install the supercharger.
   - Tighten to 24 Nm.

2. Connect the manifold absolute pressure (MAP) sensor.

3. Install the air intake elbow.
   - Install a new gasket.
   - Install new retaining bolt seals.
   - Tighten to 24 Nm.

4. NOTE: Make sure ground strap is correctly installed to the location noted.
   Install the air intake elbow retaining bracket lower retaining bolts.
   - Tighten to 20 Nm.

5. Connect the air intake elbow pipes.
6. Install the EGR valve and the exhaust manifold to EGR valve tube.
   - Install a new exhaust manifold to EGR valve tube gasket.
   - Install a new EGR valve to air intake elbow gasket.
   - Tighten to 10 Nm.

7. Tighten to 21 Nm.

8. NOTE: Un-cap the exposed ports.
   Connect the coolant hoses.

9. Connect the exhaust gas recirculation (EGR) valve electrical connector.

10. Connect the IAT sensor electrical connector.
11. Connect the charge air cooler coolant pipes.

12. Install new O-ring seals to the thermostat housing.
13. Install thermostat housing.
14. Tighten to 10 Nm.

15. Tighten to 10 Nm.

16. Connect the hose.
17. Connect the hose.

18. Connect the hose.

19. Connect the hose.

20. Reposition the thermostat housing hose retaining clip.

21. Connect the coolant temperature sensor electrical connector.
22. Connect the thermostat housing hoses

23. Install new supercharger outlet pipe to charge air coolers ducts.
   • Tighten to 8 Nm.

24. Install a new supercharger outlet pipe gasket.
25. Install new seals to the supercharger outlet pipe retaining bolts

26. **CAUTION:** Make sure no foreign matter enters the supercharger.
    Install the supercharger outlet pipe

27. **NOTE:** Un-cap the coolant ports.
    Attach the supercharger outlet pipe coolant hose.
28. Attach the hoses.
   - Reposition the hose retaining clip.

29. Install the throttle body.
   For additional information, refer to: Throttle Body - Vehicles With: Supercharger, VIN Range: M45255->N52047 (303-04B Fuel Charging and Controls - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Removal and Installation).

30. Attach the supercharger belt.
   - Use a 1/2 inch square drive bar to rotate the supercharger belt tensioner.
   - Attach the supercharger belt.

31. Connect the battery ground cable.
   For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

32. Carry out the supercharging cooling system filling and bleeding procedure.
   For additional information, refer to: Supercharger Cooling System Draining, Filling and Bleeding (303-03B Supercharger Cooling, General Procedures).
Removal

1. Disconnect the battery ground cable. For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

2. Carry out the cooling system draining procedure. For additional information, refer to: Cooling System Draining, Filling and Bleeding (303-03A Engine Cooling - V8 4.2L Petrol/V8 S/C 4.2L Petrol/2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, General Procedures).

3. Remove the coolant expansion tank. For additional information, refer to: Coolant Expansion Tank (303-03A Engine Cooling - V8 4.2L Petrol/V8 S/C 4.2L Petrol/2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation).

4. Remove the air cleaner outlet pipe. For additional information, refer to: Air Cleaner Outlet Pipe (303-12B Intake Air Distribution and Filtering - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Removal and Installation).

5. Detach the supercharger belt. Use a 1/2 inch square drive bar to rotate the supercharger belt tensioner.

6. Detach the hoses. Reposition the hose retaining clip.

7. Remove the throttle body. For additional information, refer to: Throttle Body - Vehicles With: Supercharger, VIN Range: N52048->N99999 (303-04B Fuel Charging and Controls - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Removal and Installation).

8. Detach the supercharger outlet pipe coolant hose. Cap the coolant ports.
9. **CAUTION:** Make sure no foreign matter enters the supercharger. Remove the supercharger outlet pipe.

10. Remove and discard the supercharger outlet pipe gasket.
11. Remove and discard the supercharger outlet pipe retaining bolt seals.
12. Remove and discard the supercharger outlet pipe to charge air coolers ducts.

13. Disconnect the coolant hose.

14. Disconnect the coolant hose.
15. Disconnect the coolant hose.

16. Disconnect the engine coolant temperature (ECT) sensor electrical connector.

17. Disconnect the coolant hose.

18. Disconnect the coolant hose.
19. Detach the coolant assembly.

20. Remove the coolant assembly.
   - Disconnect the coolant hose.
   - Remove and discard the O-ring seals.

21. Disconnect the charge air cooler coolant hoses.

22. Disconnect the intake air temperature (IAT) sensor electrical connector.
23. Disconnect the exhaust gas recirculation (EGR) valve electrical connector.

24. **NOTE:** Cap the exposed ports.

   Disconnect the coolant hoses.

25. Remove the exhaust manifold to EGR valve tube retaining nuts.

26. Remove the EGR valve and the exhaust manifold to EGR valve tube.
   - Remove the retaining bolts.
   - Remove and discard the exhaust manifold to EGR valve tube gasket.
   - Remove and discard the EGR valve to air intake elbow gasket.

27. Disconnect the air intake elbow pipes.
28. Remove the air intake elbow retaining bracket lower retaining bolts.

29. Detach the air intake elbow.
   - Remove and discard the gasket.
   - Remove and discard the retaining bolt seals.

30. Remove the air intake elbow.
   - Disconnect the manifold absolute pressure (MAP) sensor.

31. Remove the supercharger.

Installation
1. Install the supercharger.
   - Tighten to 21 Nm.

2. Connect the MAP sensor.

3. Install the air intake elbow.
   - Install a new gasket.
   - Install new retaining bolt seals.
   - Tighten to 21 Nm.

4. Install the air intake elbow retaining bracket lower retaining bolts.
   - Tighten to 18 Nm.

5. Connect the air intake elbow pipes.
6. Install the EGR valve and the exhaust manifold to EGR valve tube.
   - Install a new exhaust manifold to EGR valve tube gasket.
   - Install a new EGR valve to air intake elbow gasket.
   - Tighten to 10 Nm.

7. Install the exhaust manifold to EGR valve tube retaining nuts.
   - Tighten to 21 Nm.

8. NOTE: Remove the blanking caps from the coolant ports.
   Connect the coolant hoses.

9. Connect the EGR valve electrical connector.

10. Connect the IAT sensor electrical connector.
11. Connect the charge air cooler coolant hoses.

12. Install the coolant assembly.
   - Install new O-ring seals.
   - Connect the coolant hose.

13. Attach the coolant assembly.
   - Tighten to 10 Nm.

14. Connect the coolant hose.
15. Connect the coolant hose.

16. Connect the ECT sensor electrical connector.

17. Connect the coolant hose.

18. Connect the coolant hose.
19. Connect the coolant hose.

20. Install new supercharger outlet pipe to charge air coolers ducts.
   - Tighten to 8 Nm.

22. Install new seals to the supercharger outlet pipe retaining bolts.

23. **CAUTION:** Make sure no foreign matter enters the supercharger.
   Install the supercharger outlet pipe.
   1. Tighten the supercharger outlet pipe retaining bolts to 10 Nm.
   2. Tighten the charge air cooler ducts retaining bolts to 9 Nm.

24. **NOTE:** Remove the blanking caps.
   Attach the supercharger outlet pipe coolant hose.

25. Install the throttle body.
For additional information, refer to: [Throttle Body - Vehicles With: Supercharger, VIN Range: N52048->N99999](303-04B Fuel Charging and Controls - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Removal and Installation).
26. Attach the hoses.
   - Reposition the hose retaining clip.

27. Attach the supercharger belt.
   - Use a 1/2 inch square drive bar to rotate the supercharger belt tensioner.

28. Install the air cleaner outlet pipe.
    For additional information, refer to: Air Cleaner Outlet Pipe (303-12B Intake Air Distribution and Filtering - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Removal and Installation).

29. Install the coolant expansion tank.
    For additional information, refer to: Coolant Expansion Tank (303-03A Engine Cooling - V8 4.2L Petrol/V8 S/C 4.2L Petrol/2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation).

30. Connect the battery ground cable.
    For additional information, refer to: Battery Connect (414-01 Battery, Mounting and Cables, General Procedures).

31. Carry out the cooling system filling and bleeding procedure.
    For additional information, refer to: Cooling System Draining, Filling and Bleeding (303-03A Engine Cooling - V8 4.2L Petrol/V8 S/C 4.2L Petrol/2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, General Procedures).
Removal

1. Disconnect the battery ground cable.
   For additional information, refer to: Battery Disconnect and Connect
   (414-01 Battery, Mounting and Cables, General Procedures).

2. Remove the cowl vent screen.
   For additional information, refer to: Cowl Panel Grille (501-02 Front End
   Body Panels, Removal and Installation).

3. Remove the air cleaner outlet pipe.
   For additional information, refer to: Air Cleaner Outlet Pipe (303-12B
   Intake Air Distribution and Filtering - V8 4.2L Petrol/V8 S/C 4.2L Petrol,
   Removal and Installation).

4. Remove the throttle body intake pipe.

5. Detach the hoses.
   • Reposition the hose retaining clip.

6. **WARNING: Make sure the cooling system is not pressurized.**
   Detach the supercharger outlet pipe coolant hose.
   • Cap the coolant ports.
7. **CAUTION:** Make sure no foreign matter enters the supercharger.

   Remove the supercharger outlet pipe

8. Remove and discard the supercharger outlet pipe gasket.
9. Remove and discard the supercharger outlet pipe retaining bolt seals.
10. Remove and discard both supercharger outlet pipe to charge air cooler ducts.

**Installation**

1. Install new supercharger outlet pipe to charge air cooler ducts.
   - Tighten to 8 Nm.

2. Install a new supercharger outlet pipe gasket.
3. Install new seals to the supercharger outlet pipe retaining bolts
4. Install the supercharger outlet pipe
   - Tighten to 9 Nm.
5. NOTE: Un-cap the coolant ports. 
Attach the supercharger outlet pipe coolant hose.

6. Attach the hoses. 
   - Reposition the hose retaining clip.

7. Install the throttle body intake pipe. 
   - Tighten to 5 Nm.

8. Install the air cleaner outlet pipe. 
   For additional information, refer to: Air Cleaner Outlet Pipe (303-12B Intake Air Distribution and Filtering - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Removal and Installation).

9. Install the cowl vent screen. 
   For additional information, refer to: Cowl Panel Grille (501-02 Front End Body Panels, Removal and Installation).

10. Connect the battery ground cable. 
    For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

11. Check and top up the coolant expansion tank.

*NOTE: The air cleaner outlet pipe and air cleaner cover are only supplied as an assembly and must not be disassembled.*

The primary functional requirements of the air induction system is to:

- deliver clean filtered air to the engine with minimum pressure loss.
- reduce the engine intake and structure related noises to within legal & vehicle requirements.
- manage the induction of water, sand or snow to prevent adverse effect on vehicle operation.
- minimize air temperature rise over ambient air temperature at the throttle body/turbo in high ambient conditions.
- purge the hot air from the intake system quickly whilst the engine is hot, and after a period of rest. This is to maximize engine drive away performance.

Pinpoint tests

CAUTION: When probing connectors to take measurements in the course of the pinpoint tests, use the adaptor kit, part number 3548-1358-00. Failure to follow this instruction may result in damage to the vehicle.
• NOTE: When performing electrical voltage or resistance tests, always use a digital multimeter (DMM) accurate to 3 decimal places, and with an up-to-date calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.

• NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

**Removal**

1. Remove the radiator grille opening panel. For additional information, refer to: Radiator Grille Opening Panel (501-02 Front End Body Panels, Removal and Installation).

2. Detach the mass air flow (MAF) wiring harness.

3. Disconnect the MAF sensor electrical connectors.

4. Using special tool 303-397, detach the MAF sensor outlet pipes.
   1. Detach the upper MAF sensor outlet pipe.
   2. Detach the lower MAF sensor outlet pipe.
5. Disconnect the port deactivation vacuum hose.

6. Remove the air cleaner retaining scrivet.

7. Remove the air cleaner.
   - Remove the air cleaner retaining bolt.

**Installation**

1. To install, reverse the removal procedure.
   - Tighten to 8 Nm.
Intake Air Distribution and Filtering - 2.7L V6 - TdV6 - Air Cleaner Element
Removal and Installation

Removal

1. Remove the air cleaner. For additional information, refer to: Air Cleaner (303-12C Intake Air Distribution and Filtering - 2.7L V6 - TdV6, Removal and Installation).

2. Remove the air cleaner intake assembly from air cleaner base.

3. Remove the air cleaner cover.

4. Remove the air cleaner element.

Installation

1. To install, reverse the removal procedure.
1. The charge air cooler is removed as part of the radiator assembly and can be serviced separately. For additional information, refer to: Radiator (303-03C Engine Cooling - 2.7L V6 - TdV6, Removal and Installation).

<td>Evaporative emission canister carrier bolts</td>
<td>10</td>
<td>7</td>
<td>-</td>
</tr>
</tbody>
</table>
The evaporative emission fuel vapor management system consists of an evaporative emission canister, evaporative emission canister purge valve and an evaporative emission canister purge valve resonator. A combination of plastic pipes and rubber hoses connect the evaporative emission canister to the fuel tank and the evaporative emission canister purge valve to the intake manifold.
Onboard refuel vapor recovery (ORVR).

The vehicle is fitted with an onboard vapor recovery (ORVR) type fuel tank. During refuelling all vapor is collected in the evaporative emission canister as well as in normal vehicle operations.

Vehicles built up to 01/2004

On Federal (USA) specification vehicles the fuel vapor management system uses a canister vent solenoid and a fuel tank pressure sensor which are used during the engine management system on board diagnostic routines.

When the evaporative emission canister purge valve is closed, the fuel tank is vented into the evaporative emission canister through the fuel tank roll-over valve. The evaporative emission canister absorbs the fuel vapor and prevents the release of hydrocarbons into the atmosphere. When the vapor evaporative emission canister purge valve is opened, the canister is exposed to the intake manifold vacuum and the fuel vapor deposits are drawn into the manifold where they mix with the incoming air/fuel charge.

The evaporative emission fuel vapor management system is controlled by the engine control module (ECM) according to calibrated data tables.
Evaporative Emissions - Evaporative Emissions
VIN Range: N52048->N99999

Description and Operation

The evaporative emission fuel vapor management system consists of an evaporative emission canister and an evaporative emission canister purge valve. A combination of plastic pipes and rubber hoses connect the evaporative emission canister to the fuel tank and the evaporative emission canister purge valve to the intake manifold.

Onboard refuel vapor recovery (ORVR).

Onboard refuel vapor recovery (ORVR) type fuel tank. During refuelling all vapor is collected in the evaporative emission canister as well as in normal vehicle operations.

When the evaporative emission canister purge valve is closed, the fuel tank is vented into the evaporative emission canister through the fuel tank roll-over valve. The evaporative emission canister absorbs the fuel vapor and prevents the release of hydrocarbons into the atmosphere. When the vapor evaporative emission canister purge valve is opened, the canister is exposed to the intake manifold vacuum and the fuel vapor deposits are drawn into the manifold where they mix with the incoming air/fuel charge.
The evaporative emission fuel vapor management system is controlled by the engine control module (ECM) according to calibrated data tables.
Evaporative Emissions - Evaporative Emissions
VIN Range: M45255->N52047

Diagnosis and Testing

Preliminary Inspection

1. Visually inspect for obvious signs of mechanical or electrical damage, blown fuses, etc.
2. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
3. If the concern is not visually evident, verify the symptom and proceed with diagnosis, using the Jaguar approved diagnostic system, where available.
4. Where K-Line equipment is available, it should be used as an aid to diagnosis.

Diagnostic Drive Cycles

Following the setting of a DTC, the appropriate repairs must be carried out, and the normal operation of the system checked. This will be done by performing a series of drive cycles which will enable the vehicle to operate the Evaporative Emissions system as a function check. The following drive cycles cover the use of the Jaguar approved diagnostic system, GDS510 instrument, and a test with no additional equipment, where possible.

Flow check monitor drive cycle conditions (non-Fed)

• NOTE: These conditions must be satisfied before the test is commenced.

This drive cycle should be performed following rectification work on the system.

- Make sure the fuel tank is between one quarter and three quarters full. (adding fuel will increase vapor generation; the diagnostic will not run if the vapor concentration is too great)
- Make sure the ambient air temperature is above -5°C. (23°F)

Flow check monitor drive cycle (non-Fed)

- Drive the vehicle for a minimum of 15 minutes, avoiding severe or excessive fuel movement.
- Avoiding excessive fuel movement, gently bring the vehicle to rest. (coast to a stop)
- Allow the vehicle to idle for two minutes.

Full Evaporative system monitor drive cycle conditions

• NOTE: These conditions must be satisfied before the test is commenced.

- Make sure the fuel filler cap is correctly fitted. (minimum three clicks)
- Clear the DTCs. (perform a code clear, even if no codes are present. This will reset TIDs)
- Make sure the fuel tank is between one quarter and three quarters full. (adding fuel will increase vapor generation; the diagnostic will not run if the vapor concentration is too great)
- Drive the vehicle for a minimum of two minutes, and until fully warm. (temperature gauge just below mid-point)
- Make sure that the purge valve is operating, either by touch, sound, or using datalogger. (purge vapor management valve-duty cycle)
  - If the purge is not active, perform the "Drive cycle for green engine control module (ECM)" in this section.

Full Evaporative system monitor drive cycle

- Drive the vehicle to a suitable road where the test can be carried out, switch off the ignition.
- Leave the ignition switched off for 30 seconds.
- Restart the engine, accelerate briskly to 50 miles per hour (80 Kilometres per hour) making sure that the engine speed reaches at least 3500 RPM for a minimum of five seconds.

40 thou test, using the Jaguar approved diagnostic system

- Avoiding high engine loads, drive the vehicle steadily between 40 and 60 miles per hour. (64 and 97 Kilometres per hour) Using the Jaguar approved diagnostic system, monitor the Evap valve duty cycle (Purge vapor management valve-duty cycle) CCV status (Canister close valve-vapor recovery system) and the FTPS (Fuel tank pressure-vapor recovery system) The Jaguar approved diagnostic system will give an indication when the test is active. Dependant on the level of vapor concentration, it may take up to 30 minutes for the test to initialise. (vapor concentration cannot be measured using the Jaguar approved diagnostic equipment) When the test has initialised, (CCV closed) it will take up to 90 seconds to complete. Avoid excessive fuel movement while the test is active.

20 thou test, using the Jaguar approved diagnostic system

- Continue driving the vehicle steadily between 40 and 60 miles per hour. (64 and 97 Kilometres per hour) avoiding high engine loads for a further 10 minutes.
- Avoiding excessive fuel movement, gently bring the vehicle to rest (coast to a stop)
- Allow the vehicle to idle for 2 minutes.
- Use the Jaguar approved diagnostic system to monitor the Evap valve duty cycle (Purge vapor management valve-duty cycle) CCV status (Canister close valve-vapor recovery system) and the FTPS (Fuel tank pressure-vapor recovery system) The Jaguar approved diagnostic system will give an indication when the test is active. When the test has initialised, (CCV closed) it will take up to 90 seconds to complete.

If the 20 thou test has not run, it is likely that the vapor concentration in the purge system is too great. In this case, carry out the following -

- Drive the vehicle steadily for a further 30 minutes, avoiding excessive fuel movement.
- Avoiding excessive fuel movement, gently bring the vehicle to rest (coast to a stop)
- Allow the vehicle to idle for 2 minutes.
- Use the Jaguar approved diagnostic system to monitor the Evap valve duty cycle (Purge vapor management valve-duty cycle) CCV status (Canister close valve-vapor recovery system) and the FTPS (Fuel tank pressure-vapor recovery system) The Jaguar approved diagnostic system will give an indication when the test is active. When the test has initialised, (CCV closed) it will take up to 90 seconds to complete.
If the 20 thou test fails to run a second time, repeat the entire test.

- Check for DTCs. Rectify as indicated.

### 40 thou test, using GDS510

- Avoiding high engine loads, drive the vehicle steadily between 40 and 60 miles per hour. (64 and 97 Kilometres per hour)
- When the test has initialised, using the GDS510, monitor the Evap valve duty cycle, CCV status, and the FTPS (the GDS510 will give an indication when the test is active)
- When the test has initialised, (CCV closed) it will take up to 90 seconds to complete.
- To make sure that the test has completed, TID 08 in mode 6 must be checked. (if the test has not completed, this TID will display 0. Any other value indicates test completion)
- If the test did not complete, repeat the test.

### 20 thou test, using GDS510

- Continue driving the vehicle steadily between 40 and 60 miles per hour. (64 and 97 Kilometres per hour) avoiding high engine loads for a further 10 minutes.
- Avoiding excessive fuel movement, gently bring the vehicle to rest (coast to a stop)
- Allow the vehicle to idle for 2 minutes.
- When the test has initialised, using the GDS510, monitor the Evap valve duty cycle, CCV status, and the FTPS (the GDS510 will give an indication when the test is active)
- When the test has initialised, (CCV closed) it will take up to 90 seconds to complete.
- To make sure that the test has completed, TID 06 in mode 6 must be checked. (if the test has not completed, this TID will display 0. Any other value indicates test completion)
- If the test did not complete, repeat the test.
- If the 20 thou test has not run, it is likely that the vapor concentration in the purge system is too great. In this case, drive the vehicle steadily for a further 30 minutes, avoiding excessive fuel movement, then repeat the test.
- Check for DTCs. Rectify as indicated.

### 40 thou and 20 thou tests using no additional equipment

The test procedure and conditions are as for the Jaguar approved diagnostic system or GDS510, but no confirmation of the test having run is possible without the use of one of these instruments. The DTC will be set if the fault still exists, but the possibility exists that the conditions for the test to run may not have met, in which case, the DTC may not be set until the owner reproduces the conditions in which the fault originally occurred.

### Drive cycle for "green" ECM

- To enable the ECM to re-learn fuelling adaptions.

**NOTE:** This procedure should be performed whenever the vehicle battery has been disconnected.

Due to component tolerance and wear during the normal running of a vehicle, fuelling and air requirements for an engine will vary over time. The ECM has the ability to adjust for this variation by "learning" the level of compensation that is required. (These compensation values are referred to as adaptions)

If the vehicle battery is disconnected, all adaptions held within the ECM will be lost (ie, set to Zero) The ECM is then referred to as "green". To enable the vehicle to function correctly, the ECM must "relearn" these adaptions.

There are four areas or sites that need to be releart.

- Allow the vehicle to idle until fully warm. (temperature gauge just below mid-point)
- Allow to idle for a further three minutes, minimum.
- Drive the vehicle with the air conditioning OFF on a level road using a constant throttle, or speed control if fitted, for at least one minute in the following gears, at the stated engine speeds for each of the sites below.

The vehicle speed is for guidance only. DO NOT use the vehicle speed as the target to set adaptions.

Bring the vehicle to rest, allow to idle for one minute.

⚠️ **WARNING:** The following tests may involve parts which are hot.
If sufficient adaptions have occurred, the Evap valve should now be operating. This can be verified manually by either touching or listening to the valve. By touching the Evap valve, it should be possible to feel the valve switching. Listening to the Evap valve is best done using a workshop stethoscope, through which it should be possible to hear the valve operating.

</tr>
</tbody>
</table>

#### PINPOINT TEST B: P0442. LEAK DETECTED. 40 THOU.

**TEST CONDITIONS**

<table>
<thead>
<tr>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>1:</td>
</tr>
</tbody>
</table>
B1: CHECK FUEL FILLER CAP FITMENT AND CONDITION OF PIPES AND CONNECTORS.

1. Ensure that the fuel filler cap is correctly installed and tightened. (minimum 3 clicks)
2. Check the condition of all accessible pipes and connectors in the vapor line.

Are all pipes and connectors in good condition?

Yes

No

Suspect concern with fuel tank assembly or carbon canister assembly.

REPAIR as necessary. CLEAR the DTC. Carry out a full Evap system monitor drive cycle, recheck DTCs. For additional information, see "diagnostic drive cycles" above.

PINPOINT TEST C : P0443. EVAP/PURGE VALVE LEAKING.

TEST CONDITIONS

C1: CHECK EVAP/PURGE VALVE INTEGRITY.

1. Disconnect the outlet pipe from the EVAP/purge valve. (From valve to manifold).
2. Apply a vacuum to the valve outlet pipe.

Does the valve hold vacuum?

Yes

Possible intermittent fault. CLEAR the DTC. Carry out a full Evap system monitor drive cycle, recheck DTCs. For additional information,

No

INSTALL a new EVAP/purge valve. CLEAR the DTC. Carry out a full Evap system monitor drive cycle, recheck DTCs. For additional information, see "diagnostic drive cycles" above.

PINPOINT TEST D : P0444. EVAP/PURGE VALVE CIRCUIT OPEN CIRCUIT.

TEST CONDITIONS

D1: CHECK SUPPLY VOLTAGE TO EVAP/PURGE VALVE.

1. Disconnect EVAP/purge valve electrical connector, FH111.
2. Turn the ignition switch to the ON position.
3. Measure the voltage at FH111, pin 1 (GU).

Is the voltage greater than 10 volts?

Yes

GO to D2.

No

REPAIR the circuit between EVAP/purge valve electrical connector, FH111, pin 1 (GU) and the EMS control relay. For additional information, refer to wiring diagrams. CLEAR the DTC. Turn the ignition switch to the ON position. Leave switched on for minimum 30 seconds. Recheck DTCs. For additional information, see "diagnostic drive cycles" above.

D2: CHECK THE EVAP/PURGE VALVE SIGNAL WIRE FOR CONTINUITY.

1. Disconnect the ECM electrical connector, PI01.
2. Measure the resistance between PI01, pin 66 (UY) and FH111, pin 2 (UY).

Is the resistance less than 5 Ohms?

Yes

GO to D3.

No

REPAIR the circuit between PI01, pin 66 (UY) and FH111, pin 2 (UY). CLEAR the DTC. Turn the ignition switch to the ON position. Leave switched on for minimum 30 seconds. Recheck DTCs. For additional information, see "diagnostic drive cycles" above.

D3: CHECK THE EVAP/PURGE VALVE SIGNAL WIRE FOR SHORT TO GROUND

1. Measure the resistance between FH111, pin 2 (UY) and GROUND.

Is the resistance less than 10,000 Ohms?

Yes

REPAIR the short to ground. For additional information, refer to wiring diagrams. CLEAR the DTC. Turn the ignition switch to the ON position. Leave switched on for minimum 30 seconds. Recheck DTCs. For additional information, see "diagnostic drive cycles" above.

No

GO to D4.

D4: CHECK THE EVAP/PURGE VALVE SIGNAL WIRE FOR SHORT TO BATTERY

1. Connect the ECM electrical connector, PI01.
2. Turn the ignition switch to the ON position.
3. Check for a voltage at FH111, pin 2 (UY).

Is the voltage greater than 1 volt?

Yes

REPAIR the short to battery. For additional information, refer to wiring diagrams. CLEAR the DTC. Turn the ignition switch to the ON position. Leave switched on for minimum 30 seconds. Recheck DTCs. For additional information, see "diagnostic drive cycles" above.

No

GO to D5.

D5: CHECK THE EVAP/PURGE VALVE RESISTANCE.

1. Check the resistance between pins 1 and 2 of the EVAP/purge valve.

Is the resistance 30 to 34 Ohms at 68°F (20°C)?

Yes

INSTALL a new ECM. REFER to Section 303-14A Electronic Engine Controls / 303-14B Electronic Engine Controls / 303-14C Electronic Engine Controls. Before replacing a ECM, contact Dealer technical support.

No

INSTALL a new EVAP/purge valve. REFER to Evaporative Emission Canister Purge Valve in this section. CLEAR the DTC. Turn the ignition switch to the ON position. Leave switched on for minimum 30 seconds. Recheck DTCs. For additional information, see "diagnostic drive cycles" above.

PINPOINT TEST E : P0445. EVAP/PURGE VALVE CIRCUIT SHORTED.

TEST CONDITIONS

E1: CHECK EVAP/PURGE VALVE SIGNAL WIRE FOR SHORT TO GROUND.

1. Disconnect EVAP/purge valve electrical connector FH111.
2. Disconnect ECM electrical connector, PI01.
Measure the resistance between FH111, pin 2 (UY) and ground.

Is the resistance less than 10,000 Ohms?

Yes
  REPAIR the short to ground. For additional information, refer to wiring diagrams. CLEAR the DTC. Turn the ignition switch to the ON position. Leave switched on for minimum 30 seconds. Recheck DTCs. For additional information, see "diagnostic drive cycles" above.

No
  NO short found. A short in the EVAP/purge valve supply circuit may result in a blown fuse 36, PDFB. See initial checks. CLEAR the DTC. Turn the ignition switch to the ON position. Leave switched on for minimum 30 seconds. Recheck DTCs. For additional information, see "diagnostic drive cycles" above.

PINPOINT TEST F: P0446. CANISTER CLOSE VALVE STUCK CLOSED.

</tbody>
</table>

**TEST ACTIONS**

- Connect ECM electrical connector, P101.
**J4: CHECK FTPS SIGNAL WIRE FOR SHORT TO BATTERY, UP TO CONNECTOR FP002**

1. Turn the ignition switch to the ON position.
2. Check for a voltage at FP002, pin 3 (RG)

Is the voltage greater than 1 volt?

Yes
   - REPAIR the short to battery. For additional information, refer to wiring diagrams. CLEAR the DTC. Turn the ignition switch to the ON position. Leave switched on for minimum 30 seconds. Recheck DTCs. For additional information, see "diagnostic drive cycles" above.

No
   - GO to J5.

**J5: CHECK FTPS GROUND WIRE FOR SHORT TO BATTERY, UP TO CONNECTOR FP002**

1. Turn the ignition switch to the ON position.
2. Check for a voltage at FP002, pin 2 (BG)

Is the voltage greater than 1 volt?

Yes
   - REPAIR the short to battery. For additional information, refer to wiring diagrams. CLEAR the DTC. Carry out a full Evap system monitor drive cycle, recheck DTCs. For additional information, see "diagnostic drive cycles" above.

No
   - GO to J2.

**J6: CHECK FTPS SUPPLY WIRE FOR SHORT TO BATTERY UP TO CONNECTOR FP002**

1. Connect ECM electrical connector, PI01.
2. Turn the ignition switch to the ON position.
3. Check for a voltage at FP002, pin 6 (OY)
   - This test will not check the integrity of the harness from FP002 to FT1. If the circuit is sound to FP002, the fuel tank must be removed and the harness and sensor continuity checked.

Is the voltage greater than 5 volts?

Yes
   - REPAIR the short to battery. For additional information, refer to wiring diagrams. CLEAR the DTC. Carry out a full Evap system monitor drive cycle, recheck DTCs. For additional information, see "diagnostic drive cycles" above.

No
   - INSTALL a new FTPS, (and/or harness, FP002 to FT1) CLEAR the DTC. Carry out a full Evap system monitor drive cycle, recheck DTCs. For additional information, see "diagnostic drive cycles" above. If the DTC is repeated, INSTALL a new ECM. REFER to Section 303-14A Electronic Engine Controls / 303-14B Electronic Engine Controls / 303-14C Electronic Engine Controls. Before replacing a ECM, contact Dealer technical support.

**PINPOINT TEST K : P0455. GROSS LEAK DETECTED.**

Evaporative Emissions - Evaporative Emissions
VIN Range: N52048->N99999
Diagnosis and Testing

Overview

2006my changes

There are changes to the engine management system (EMS) for 2006 my, the most obvious of which will be the change to 7-digit diagnostic trouble codes (DTCs) from the familiar 5-digit, plus the addition of secondary air injection and changes to Federal evaporative emissions (Europe is unchanged) and all market exhaust gas recirculation to comply with stage four emissions requirements.

The hardware changes to the Federal evaporative emissions system are the deletion of the canister close valve and the fuel tank pressure sensor, which have been replaced with a combined unit incorporating a DMTL (diagnostic monitoring of tank leakage) pump and a COV (change-over valve) into one module.

The software changes will have more effect on the technician, as there is no longer the need to carry out extensive drive cycles to confirm the success of a repair.

DMTL conditions

The DMTL test is performed after the engine has stopped following a 10 minute run, providing that the vehicle fuel tank is between 15 and 85 percent full and that the ambient temperature is above 0°C (32°F) and less than 40°C (104°F).

The DMTL pump is driven to pressurize the fuel tank and the current is measured with the change-over valve in different states. A comparison of the current draw in each state indicates the degree of any leak, and the ECM then sets the appropriate DTC.

Inspection and verification

1. Visually inspect for obvious signs of mechanical or electrical damage.

2. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

Visual inspection chart

<table>
<thead>
<tr>
<th>Mechanical</th>
<th>Electrical</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fuel filler cap and seal</td>
<td>Fuses</td>
</tr>
<tr>
<td>Fuel filler neck</td>

</tr>
<tr>
<td>Carbon canister</td>
<td></td>
</tr>
<tr>
<td>Purge valve</td>
<td></td>
</tr>
<tr>
<td>DMTL pump module</td>
<td></td>
</tr>
</tbody>
</table>

3. If the cause is not visually evident use the Jaguar approved diagnostic system or a scan tool to retrieve the fault codes before proceeding to the DTC Index.

4. NOTE: On all vehicles equipped with Diagnostic Monitor Tank Leakage (DMTL), there is a requirement to blank off the ventilation port (large diameter stub pipe) of the DMTL module, to prevent mis-diagnosis when carrying out a smoke test.

4. Where K-Line, Vacutec or other proprietary smoke test equipment is available, it should be utilised to assist with Evaporative Emissions System leak diagnosis.

Symptom Chart

<table>
<thead>
<tr>
<th>Symptom</th>
<th>Possible Source</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Difficulty in filling</td>
<td>Restriction in the vapor line between the fuel tank and the carbon canister outlet/atmospheric port</td>
<td>Check for restrictions/damage, etc (see visual inspection).</td>
</tr>
<tr>
<td>Fuel smell</td>
<td>System leak</td>
<td>Check for leaks, check the purge valve operation. GO to Pinpoint Test A.</td>
</tr>
<tr>
<td></td>
<td>Purge valve inoperative</td>

</tr>
<tr>
<td>Message center display (refer to the owners handbook)</td>
<td>Fuel filler cap missing/not tightened after refuelling</td>
<td>Check the fuel filler cap and seal (see visual inspection).</td>
</tr>
</tbody>
</table>

DTC index

**NOTE:** Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

</tbody>
</table>

**Pinpoint Tests**

**CAUTION:** When probing connectors to take measurements in the course of the pinpoint tests, use the adaptor kit, part number 3548-1358-00.

- **NOTE:** When performing electrical voltage or resistance tests, always use a digital multimeter (DMM) accurate to 3 decimal places, and with an up-to-date calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.
- **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

### PINPOINT TEST A : EVAPORATIVE SYSTEM INCORRECT PURGE FLOW

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>A1: CHECK FUEL FILLER CAP FITMENT AND CONDITION OF CANISTER, PIPES AND CONNECTORS</strong></td>
<td>Make sure that the fuel filler cap is correctly installed and tightened. Check the condition of the carbon canister. Check the condition of all accessible pipes and connectors in the vapor line. Are the canister and all pipes and connectors in good condition? Yes: GO to A2. No: REPAIR as necessary, CLEAR the DTC, test the system for normal operation.</td>
</tr>
<tr>
<td><strong>A2: CHECK THAT THE PURGE VALVE IS OPERATING</strong></td>
<td>Disconnect the vapor pipe from the inlet port of the evaporative purge valve. Run the engine for 2 minutes, making sure that the engine reaches normal operating temperature. Check that the evaporative purge valve is operating, by touch or by sound (using a stethoscope, it will be possible to hear the valve operating). Is the valve operating? Yes: CHECK for related DTCs. Refer to the index above. No: CHECK the purge valve circuits. GO to Pinpoint Test C.</td>
</tr>
</tbody>
</table>

### PINPOINT TEST B : CHANGE-OVER VALVE (COV) CONTROL CIRCUIT

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>B1: CHECK THE COV CONTROL CIRCUIT FOR SHORT CIRCUIT TO GROUND</strong></td>
<td></td>
</tr>
</tbody>
</table>
**Key off.**

1. Disconnect the DMTL electrical connector, CA401.
2. Measure the resistance between:
   | DMTL connector CA401, harness side | Battery |
   | Pin 03 | Negative terminal |

   Is the resistance less than 10,000 ohms?
   - **Yes**
     REPAIR the short circuit. For additional information, refer to the wiring diagrams. Clear the DTC, test the system for normal operation.
   - **No**
     GO to B2.

**B2: CHECK THE COV CONTROL CIRCUIT FOR SHORT CIRCUIT TO POWER**

1. Measure the resistance between:
   | DMTL connector CA401, harness side | Battery |
   | Pin 03 | Positive terminal |

   Is the resistance less than 10,000 ohms?
   - **Yes**
     REPAIR the short circuit. For additional information, refer to the wiring diagrams. Clear the DTC, test the system for normal operation.
   - **No**
     GO to B3.

**B3: CHECK THE COV CONTROL CIRCUIT FOR HIGH RESISTANCE**

1. Disconnect the ECM electrical connector, FH300.
2. Measure the resistance between:
   | DMTL connector CA401, harness side | ECM connector FH300, harness side |
   | Pin 03 | Pin 48 |

   Is the resistance greater than 5 ohms?
   - **Yes**
     REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. Clear the DTC, test the system for normal operation.
   - **No**
     INSTALL a new DMTL assembly. If the DTC is repeated, refer to the warranty policy and procedures manual if an ECM is suspect.

**PINPOINT TEST C : PURGE VALVE CONTROL CIRCUIT**

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>C1: CHECK THE POWER SUPPLY TO THE PURGE VALVE</strong></td>
<td></td>
</tr>
</tbody>
</table>
1. Disconnect the purge valve connector, PI304.
2. Key on, engine off.
3. Measure the voltage between:
   | Purge valve connector PI304, harness side | Battery |
   | Pin 01 | Negative terminal |

   Is the voltage less than 10 volts?
   - **Yes**
     REPAIR the circuit between the purge valve and battery. This circuit includes harness splices and fuse 37 of the front power distribution box. For additional information, refer to the wiring diagrams. Clear the DTC, test the system for normal operation.
   - **No**
     GO to C2.

| **C2: CHECK THE PURGE VALVE CONTROL CIRCUIT FOR SHORT CIRCUIT TO GROUND** |
1. Key off.
2. Measure the resistance between:
   | Purge valve connector PI304, harness side | Battery |
   | Pin 02 | Negative terminal |

   Is the resistance less than 10,000 ohms?
   - **Yes**
     REPAIR the short circuit. For additional information, refer to the wiring diagrams. Clear the DTC, test the system for normal operation.
   - **No**
     GO to C3.

| **C3: CHECK THE PURGE VALVE CONTROL CIRCUIT FOR SHORT CIRCUIT TO POWER** |
1. Measure the resistance between:
   | Purge valve connector PI304, harness side | Battery |
   | Pin 02 | Positive terminal |

   Is the resistance less than 10,000 ohms?
   - **Yes**
     REPAIR the short circuit. For additional information, refer to the wiring diagrams. Clear the DTC, test the system for normal operation.
   - **No**
     GO to C4.

| **C4: CHECK THE PURGE VALVE CONTROL CIRCUIT FOR HIGH RESISTANCE** |
1. Disconnect the ECM electrical connector, PI300.
2. Measure the resistance between:
   | Purge valve connector PI304, harness side | ECM connector PI300, harness side |
   | Pin 02 | Pin 92 |

   Is the resistance greater than 5 ohms?
   - **Yes**
     REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. Clear the DTC, test the system for normal operation.
   - **No**

Removal and Installation

Special Tool(s)

<table>
<thead>
<tr>
<th>Powertrain assembly jack</th>
</tr>
</thead>
<tbody>
<tr>
<td>HTJ1200-2</td>
</tr>
</tbody>
</table>

Removal

All vehicles

1. Raise and support the vehicle.
   For additional information, refer to: Lifting (100-02 Jacking and Lifting, Description and Operation).

2. Remove the support bracket.

3. NOTE: Right-hand shown, Left-hand similar.
   Detach the rear muffler and tailpipe exhaust hanger insulator.

4. **CAUTION:** Using a suitable transmission jack, support the intermediate muffler.
   Detach the front muffler exhaust hanger insulators.
5. NOTE: Left-hand shown, right-hand similar.
Loosen both catalytic converter retaining clamps.

6. Remove the front muffler and tail pipes.

7. CAUTION: Under no circumstances must the flexible coupling (or its fixings) be loosened or removed from the driveshaft.

   Detach the driveshaft from the rear drive axle flange.
   - Mark the position of the driveshaft in relation to the rear drive axle flange.
   - Mark the position of the balance nut in relation to the rear drive axle flange (if fitted).
   - Mark the position of each nut and bolt in relation to the rear drive axle flexible joint.

8. Remove both rear wheels and tires.
   For additional information, refer to: Wheel and Tire (204-04 Wheels and Tires, Removal and Installation).

Vehicles without Brembo brakes
9. NOTE: Left-hand shown, right-hand similar.
   Detach the brake caliper.
   
   1. Remove and discard the brake caliper retaining bolts.
   • Detach the brake caliper.

10. CAUTION: The brake caliper must be supported at all times.
    • NOTE: Left-hand shown, right-hand similar.
    Using a suitable tie strap, secure the caliper to one side.

Vehicles with Brembo brakes

11. CAUTION: The brake caliper must be supported at all times.
    • NOTE: Left-hand shown, right-hand similar.
    Detach the brake caliper and secure to one side.
    • Remove and discard the brake caliper retaining bolts.
    • Using a suitable tie strap, secure the caliper to one side.

All vehicles

12. NOTE: Left-hand shown, right-hand similar.
    Detach the wiring harness.

13. Remove the left-hand shock absorber and spring assembly.
    For additional information, refer to: Shock Absorber and Spring Assembly
    (204-02 Rear Suspension, Removal and Installation).
14. Detach the right-hand shock absorber.

15. **NOTE:** Left-hand shown, right-hand similar.
Remove the rear subframe reinforcement plate retaining bolts.

16. Install the special tool to support the rear subframe.

17. **NOTE:** Left-hand shown, right-hand similar.
Remove the rear subframe rear retaining bolt.

18. **NOTE:** Left-hand shown, right-hand similar.
Remove the rear subframe front retaining bolt.
19. **CAUTION:** Make sure the rear subframe does not come into contact with the fuel tank filler pipe.

Lower the rear subframe to a suitable height.

Vehicles built up to 01/2004

20. **NOTE:** Rear subframe shown removed for clarity.

Detach the wiring harness from the evaporative emission canister.

21. Disconnect the emission hose.

22. Detach the evaporative emission canister.

Vehicles built 02/2004 onwards
23. NOTE: Rear subframe shown removed for clarity.
Disconnect the emission hose.

24. Detach the evaporative emission canister.

25. Remove the evaporative emission canister.

**Installation**

All vehicles

1. Install the evaporative emission canister.

Vehicles built up to 01/2004
2. To install, reverse the removal procedure.
   1. Tighten to 10 Nm.

Vehicles built 02/2004 onwards

3. To install, reverse the removal procedure.
   1. Tighten to 10 Nm.

All vehicles

4. NOTE: Left-hand shown, right-hand similar.
   Loosely install the rear subframe front bolt.

5. Loosely install the rear subframe reinforcement plate bolts
6. Tighten to 125 Nm.

7. **NOTE:** Left-hand shown, right-hand similar.
   Install the rear subframe rear retaining bolt.
   - Tighten to 125 Nm.

8. Remove the special tool.

9. **NOTE:** Left-hand shown, right-hand similar.
   Install the rear subframe reinforcement plate retaining bolts.
   - Tighten to 47 Nm.

10. Attach the right-hand shock absorber.
    1. Tighten to 133 Nm.

11. Install the left-hand shock absorber and spring assembly.
For additional information, refer to: Shock Absorber and Spring Assembly (204-02 Rear Suspension, Removal and Installation).

12. NOTE: Left-hand shown, right-hand similar.
Attach the wiring harness.

13. CAUTION: The brake caliper must be supported at all times.
- NOTE: Left-hand shown, right-hand similar.
Attach the brake caliper.
  - Remove the tie strap.
  - Install new brake caliper retaining bolts.
  - Tighten to 70 Nm.

Vehicles with Brembo brakes

14. CAUTION: The brake caliper must be supported at all times.
- NOTE: Left-hand shown, right-hand similar.
Remove the tie strap.

Vehicles without Brembo brakes

15. NOTE: Left-hand shown, right-hand similar.
Attach the caliper.
  - Install new brake caliper retaining bolts.
  - Tighten to 34Nm.

All vehicles

16. Install both rear wheels and tires.
For additional information, refer to: Wheel and Tire (204-04 Wheels and Tires, Removal and Installation).
17. Attach the driveshaft to the rear drive axle flange.
   - Tighten to 88 Nm.

18. Install the front muffler and tail pipes.

19. NOTE: Left-hand shown, right-hand similar.
   Tighten both catalytic converter retaining clamps.
20. **CAUTION:** Using a suitable transmission jack, support the intermediate muffler.

Attach the front muffler exhaust hanger insulators.

21. **NOTE:** Right-hand shown, Left-hand similar.

Attach the rear muffler and tailpipe exhaust hanger insulator.

22. Install the support bracket.
- Tighten to 6 Nm.
Evaporative Emissions - Evaporative Emission Canister

VIN Range: N52048->N99999

Removal and Installation

**Special Tool(s)**

<tr>
<td>HTJ1200-2</td>
</tr>
</tbody>
</table>

**Removal**

All vehicles

1. Remove the left-hand rear shock absorber. For additional information, refer to: **Shock Absorber and Spring Assembly** (204-02 Rear Suspension, Removal and Installation).

2. **CAUTION:** The brake caliper must be supported at all times. Failure to follow this instruction may result in damage to the vehicle.
   - Detach the left-hand rear brake caliper and anchor plate.
     - Remove and discard the brake caliper anchor plate retaining bolts.

3. **CAUTION:** The brake caliper must be supported at all times. Failure to follow this instruction may result in damage to the vehicle.
   - **NOTE:** Mark the brake disc position in relation to the hub.
   - Remove the laft-hand brake disc.

4. **CAUTION:** The brake caliper must be supported at all times. Failure to follow this instruction may result in damage to the vehicle.
   - Using a suitable tie strap, secure the left-hand brake caliper to the upper arm.
5. Disconnect the left-hand rear wheel speed sensor electrical connector.

6. Detach the left-hand rear wheel speed sensor wiring harness.
   - Reposition the left-hand rear wheel speed sensor wiring harness.

7. Remove both of the mufflers and tail pipes.
   For additional information, refer to: Muffler and Tailpipe (309-00 Exhaust System, Removal and Installation).

8. Remove the front muffler.
   For additional information, refer to: Front Muffler (309-00 Exhaust System, Removal and Installation).

9. **WARNING:** Rotate the special tool height adjustment valve slowly. Failure to follow this instruction may result in personal injury.

   Install the special tool to support the left-hand side of the rear subframe.

10. Remove the rear subframe left-hand reinforcement plate retaining bolts.
11. Remove and discard the rear subframe left-hand rear retaining bolt.

12. Remove the rear subframe left-hand reinforcement plate.
   - Remove and discard the rear subframe left-hand front retaining bolt.

13. **WARNING:** Rotate the special tool height adjustment valve slowly. Failure to follow this instruction may result in personal injury.

   **CAUTIONS:**
   - Make sure the rear subframe weight is evenly supported on the special tool. Failure to follow this instruction may result in damage to the vehicle.
   - Make sure when lowering the rear subframe damage does not occur to the surrounding components. Failure to follow this instruction may result in damage to the vehicle.

   Using the special tool, lower the left-hand side of the rear subframe to a maximum of 152mm (6 inch)

**Vehicles with supercharger**

14. **NOTE:** Rear subframe shown removed for clarity.

   Disconnect the fuel pump driver module electrical connector.
15. NOTE: Rear subframe shown removed for clarity.
Remove the fuel pump driver module.
- Remove the retaining clip.

16. NOTE: Rear subframe shown removed for clarity.
Disconnect the evaporative emission canister vent solenoid vent hose.

17. NOTE: Rear subframe shown removed for clarity.
Disconnect the evaporative emission canister vent solenoid electrical connector.

18. NOTE: Rear subframe shown removed for clarity.
Disconnect the evaporative emission canister vapor pipes.
For additional information, refer to: Quick Release Coupling (310-00 Fuel System - General Information, General Procedures).
19. NOTE: Rear subframe shown removed for clarity. Detach the evaporative emission canister.

20. Remove the evaporative emission canister.

**Installation**

All vehicles

1. Install the evaporative emission canister.

2. NOTE: Rear subframe shown removed for clarity. Attach the evaporative emission canister.
   - Tighten to 7 Nm.
3. NOTE: Rear subframe shown removed for clarity.
Connect the evaporative emission canister vapor pipes.
For additional information, refer to: Quick Release Coupling (310-00 Fuel System - General Information, General Procedures).

4. NOTE: Rear subframe shown removed for clarity.
Connect the evaporative emission canister vent solenoid electrical connector.

5. NOTE: Rear subframe shown removed for clarity.
Connect the evaporative emission canister vent solenoid vent hose.

Vehicles with supercharger

6. NOTE: Rear subframe shown removed for clarity.
Install the fuel pump driver module.
- Install the retaining clip.
7. NOTE: Rear subframe shown removed for clarity.
Connect the fuel pump driver module electrical connector.

8. CAUTIONS:

⚠️ Make sure the rear subframe weight is evenly supported on the special tool. Failure to follow this instruction may result in damage to the vehicle.

⚠️ Make sure when raising the rear subframe damage does not occur to the surrounding components. Failure to follow this instruction may result in damage to the vehicle.

Using the special tool, raise the left-hand side of the rear subframe to the vehicle body.

9. NOTE: Install new rear subframe retaining bolts.
Loosely install the rear subframe left-hand front retaining bolt.
- Install the rear subframe left-hand reinforcement plate.

10. NOTE: Install new rear subframe retaining bolts.
Install the rear subframe left-hand rear retaining bolt.
- Tighten to 125 Nm.

11. Install the rear subframe left-hand reinforcement plate retaining bolts.
- Tighten to 47 Nm.
12. Tighten the rear subframe left-hand rear retaining bolt.
   - Tighten to 125 Nm.

13. **WARNING:** Rotate the special tool height adjustment valve slowly. Failure to follow this instruction may result in personal injury.

   Remove the special tool from the rear subframe.

14. Attach the front muffler.
    For additional information, refer to: Front Muffler (309-00 Exhaust System, Removal and Installation).

15. Attach both of the mufflers and tail pipes.
    For additional information, refer to: Muffler and Tailpipe (309-00 Exhaust System, Removal and Installation).

16. Connect the left-hand rear wheel speed sensor electrical connector.

17. Attach the left-hand rear wheel speed sensor wiring harness.
18. Install the left-hand brake disc.
   - Install the brake disc to the original position in relation to the hub.

19. **CAUTION:** The brake caliper must be supported at all times. Failure to follow this instruction may result in damage to the vehicle.
   - NOTE: Remove and discard the securing tie strap.
   - NOTE: Install new brake caliper anchor plate retaining bolts.
     Install the left-hand brake caliper and anchor plate.
     - Tighten to 103 Nm.

20. Install the left-hand rear shock absorber.
    For additional information, refer to: Shock Absorber and Spring Assembly (204-02 Rear Suspension, Removal and Installation).

21. Lower the vehicle.
Evaporative Emissions - Evaporative Emission Canister Purge Valve

VIN Range: M45255->N52047

Removal and Installation

Removal

1. Disconnect the evaporative emission canister purge valve electrical connector.

2. Disconnect the evaporative emission canister purge valve outlet hose.

3. Disconnect the evaporative emission canister purge valve inlet hose.

4. Remove the evaporative emission canister purge valve.

Installation

1. To install, reverse the removal procedure.
Evaporative Emissions - Evaporative Emission Canister Vent Solenoid

Removal

• WARNINGS:

⚠️ Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

⚠️ Do not carry or operate cellular phones when working on or near any fuel related components. Highly flammable vapours are always present and may ignite. Failure to follow these instructions may result in personal injury.

1. Raise and support the vehicle. For additional information, refer to: Lifting (100-02, Description and Operation).
2. Disconnect the evaporative emission canister vent solenoid vapor hose.
3. Disconnect the evaporative emission canister vent solenoid electrical connector.
4. Remove the evaporative emission canister vent solenoid.
   • Remove and discard the evaporative emission canister vent solenoid O-ring seal.

Installation
1. NOTE: Install a new evaporative emission canister vent solenoid O-ring seal.

   To install, reverse the removal procedure.
   • Tighten to 6 Nm.
Evaporative Emissions - Fuel Tank Pressure Sensor
Vehicles Built Up To: 01/2004

Removal

1. Remove the fuel tank. For additional information, refer to Section 310-01 Fuel Tank and Lines
2. Disconnect the fuel pressure sensor electrical connector.
3. Remove the fuel pressure sensor.

Installation

1. To install, reverse the removal procedure.

Engine Control Module (ECM)

The electronic engine control system consists of an engine control module (ECM), located behind the glove compartment, and a number of sensing and actuating devices. The sensors supply the ECM with input signals which relate to the engine operating conditions and driver requirements. The sensor information is evaluated by the ECM using the results to activate the appropriate response from the actuating devices. The system provides the necessary engine control accuracy and adaptability to:

- Minimize exhaust emissions and fuel consumption.
- Provide optimum driver control under all conditions.
- Minimize evaporative emissions.
- Provide system diagnostics.

In addition to these functions the ECM also interfaces with other vehicle systems through the controller area network (CAN).

Camshaft Position (CMP) Sensor

The camshaft position (CMP) sensors monitor the position of both camshafts to allow the ECM to control the phase of the inlet camshafts relative to the position of the crankshaft.

Variable Camshaft Timing Oil Control Solenoid

The variable camshaft timing oil control solenoid is a hydraulic actuator, which advances and retards the inlet camshaft timing, thereby altering the camshaft to crankshaft phasing for optimum engine performance.

Intake Manifold Tuning (IMT) Valve

There are two intake manifold tuning (IMT) valves, an upper and a lower, sometimes referred to as number one and two respectively. They are a two position (open and close) device used to create a variable air intake system. The IMT valve positions are switched by signals from the ECM to optimize torque across the engine's speed and load range. On vehicles fitted with a 2.5L engine the upper IMT valve opens between 4,500 and 6,400 rpm while the lower IMT valve opens between 3,700 and 6,400 rpm. On vehicles fitted with a 3.0L engine the upper IMT valve opens between 4,100 and 6,150 rpm while the lower IMT valve opens between 3,900 and 6,150 rpm.

Knock Sensors (KS)

The knock sensors (KS) detect combustion knock within the engine cylinders and sends a signal to the ECM. The ECM uses this information to gradually adjust the ignition timing until the combustion knock is eliminated.

Mass Air flow (MAF) Sensor

The mass air flow (MAF) sensor informs the ECM of the rate of air flow entering the engine by producing a voltage which is proportional to the rate of air flow increases. The ECM also takes into account the density of the air entering the air intake system so that it is possible to maintain the required air to fuel ratio, and to compensate for variations in atmospheric pressure.

Integral to the MAF sensor is the intake air temperature sensor (IAT) which measures the temperature of the air entering the air intake system. The ECM uses this information to compensate for higher than normal air intake temperatures.

Throttle Position (TP) Sensor

The ECM monitors the angle of the throttle blade within the throttle housing through the throttle position (TP) sensor. The TP sends a voltage to the ECM which is proportional to the angle of the throttle plate. The voltage from the TP increases with the angle of the throttle plate. There are two sensor tracks within the TP sensor.

Crankshaft Position (CKP) Sensor

The crankshaft position (CKP) sensor is an inductive pulse generator, which scans protrusions on a pulse ring fitted to the front of the crankshaft to inform the ECM of the crankshaft's position and speed. The CKP sensor produces an alternating voltage. The frequency of this voltage increases proportional to engine speed.

Engine Coolant Temperature (ECT) Sensor

The engine coolant temperature (ECT) sensor is a thermistor type sensor that provides an input signal to the ECM which is proportional to the engine coolant temperature. The ECT sensor is a negative temperature coefficient (NTC) sensor and its resistance decreases with a proportional increase in engine coolant temperature.

Oil Temperature Sensor

The oil temperature sensor is a thermistor type sensor that provides an input signal to the ECM which is proportional to the engine oil temperature.

Oil Pressure Switch

The oil pressure switch is connected to the instrument cluster and is not directly part of the electronic engine control system.

Heated Oxygen Sensor (HO2S)

The heated oxygen sensor (HO2S) is a linear characteristic type sensor, fitted forward of the exhaust system's catalytic converter. The ECM uses this as its primary sensor to measure the oxygen content of the exhaust gasses within the exhaust system to provide closed-loop fuelling control.

Catalyst Monitor Sensor

The catalyst monitor sensor is a non-linear characteristic type sensor fitted to the exhaust system's catalytic converter. The ECM uses this as its secondary sensor to measure the oxygen content of the exhaust gasses within the exhaust after they have passed through the catalytic converter. As well as providing additional closed-loop fuelling control the ECM uses this information to determine the efficiency of the catalytic converter.
1. Verify the customer concern by operating the system.

2. Visually inspect for obvious signs of mechanical and electrical damage.

### Visual Inspection Chart

<table>
<thead>
<tr>
<th>Mechanical</th>

</tbody>
</table>

3. Verify the following systems are working correctly:

- Air intake system
- Cooling system
- Charging system
- Fuel charging system

4. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

5. If the concern is not visually evident and the approved Jaguar diagnostic system is not available, use a fault code reader to retrieve the fault codes before proceeding to the Diagnostic Trouble Code (DTC)s Index Chart.

6. Make sure that a power supply is present to the ECM from fuse 32 of the engine compartment fuse box before carrying out diagnostic work on the electronic engine control system.

### Diagnostic Trouble Code (DTC) Index

</tr>
<tr>
<td><strong>B3: CHECK THE CKP SENSOR RESISTANCE</strong></td>
<td></td>
</tr>
</tbody>
</table>
Measure the resistance between pins 1 and 2 of the CKP sensor.

Is the resistance 250 to 450 ohms?

Yes  **GO to B4.**  

No  INSTALL a new CKP sensor.  
**REFER to: Crankshaft Position (CKP) Sensor (303-14A Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation).**  
Reconnect the sensor. CLEAR the DTCs. TEST the system for normal operation.

**B4: CHECK THE CKP SENSOR GROUND WIRE FOR OPEN CIRCUIT**

1. Disconnect the ECM electrical connector PI01.  
2. Disconnect the CKP sensor electrical connector PI21.  
3. Measure the resistance between the CKP sensor electrical connector PI21, pin 1 (B) and the ECM electrical connector PI01, pin 37 (B).

Is the resistance less than 5 ohms?

Yes  **GO to B5.**  

No  REPAIR the circuit. For additional information, refer to the wiring diagrams. Reconnect all connectors. CLEAR the DTCs. TEST the system for normal operation.

**B5: CHECK THE CKP SENSOR SIGNAL WIRE FOR OPEN CIRCUIT**

1. Measure the resistance between the CKP sensor electrical connector PI21, pin 2 (O) and the ECM electrical connector PI01, pin 36 (O).

Is the resistance less than 5 ohms?

Yes  **GO to B6.**  

No  REPAIR the circuit. For additional information, refer to the wiring diagrams. Reconnect all connectors. CLEAR the DTCs. TEST the system for normal operation.

**B6: CHECK THE CKP SENSOR GROUND WIRE FOR A SHORT TO GROUND**

1. Measure the resistance between the CKP sensor electrical connector PI21 pin 1 (B) and GROUND.

Is the resistance less than 10,000 ohms?

Yes  REPAIR the short to GROUND. For additional information, refer to the wiring diagrams. Reconnect all connectors. CLEAR the DTCs. TEST the system for normal operation.

No  **GO to B7.**

**B7: CHECK THE CKP SENSOR SIGNAL WIRE FOR A SHORT TO GROUND**

1. Measure the resistance between the CKP sensor electrical connector PI21 pin 2 (O) and GROUND.

Is the resistance less than 10,000 ohms?

Yes  REPAIR the short to GROUND. For additional information, refer to the wiring diagrams. Reconnect all connectors. CLEAR the DTCs. TEST the system for normal operation.

No  **GO to B8.**

**B8: CHECK THE CKP SENSOR GROUND WIRE FOR A SHORT TO BATTERY POSITIVE**

1. Turn the ignition switch to the ON position.  
2. Measure the voltage between the CKP sensor electrical connector PI21 pin 1 (B) and GROUND.

Is the voltage greater than 5 volts?

Yes  REPAIR the short to battery positive. For additional information, refer to the wiring diagrams. Reconnect all connectors. CLEAR the DTCs. TEST the system for normal operation.

No  **GO to B9.**

**B9: CHECK THE CKP SENSOR SIGNAL WIRE FOR A SHORT TO BATTERY POSITIVE**

1. Turn the ignition switch to the ON position.  
2. Measure the voltage between the CKP sensor electrical connector PI21 pin 2 (O) and GROUND.

Is the voltage greater than 5 volts?

Yes  REPAIR the short to battery positive. For additional information, refer to the wiring diagrams. Reconnect all connectors. CLEAR the DTCs. TEST the system for normal operation.

No  INSTALL a new CKP sensor.  
**REFER to: Crankshaft Position (CKP) Sensor (303-14A Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation).**  
Reconnect all connectors. CLEAR the DTCs. TEST the system for normal operation. If the concern persists INSTALL a new ECM.  
**REFER to: Engine Control Module (ECM) (303-14A Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation).**  
Before replacing a ECM, contact dealer technical support.

**PINPOINT TEST C : DTC P0340, P0341: RH CAMSHAFT POSITION (CMP) SENSOR**

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>C1: CHECK THE RH CMP SENSOR FOR CORRECT INSTALLATION</strong></td>
<td></td>
</tr>
</tbody>
</table>
1. Turn the ignition switch to the OFF position.  
2. Check the CMP sensor for correct installation.  

Is the CMP sensor correctly installed?

Yes  **GO to C2.**  

No  INSTALL the CMP sensor correctly.  
**REFER to: Camshaft Position (CMP) Sensor RH (303-14A Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation).**  
. CLEAR the DTCs. TEST the system for normal operation.

| **C2: CHECK THE RH CMP SENSOR FOR FOREIGN DEBRIS** |  
1. Remove the CMP sensor and inspect for foreign debris.  

Is the CMP sensor free of foreign debris?

Yes  GO to C3.
No
CLEAN the sensor and wheel. INSTALL the sensor.

CLEAR the DTCs. TEST the system for normal operation.

C3: CHECK THE RH CMP SENSOR RESISTANCE

1 Measure the resistance between pins 1 and 2 of the RH Camshaft position sensor.

Is the resistance 450 to 650 ohms?

Yes  GO to C4.
No
INSTALL a new CMP sensor.

CLEAR the DTCs. TEST the system for normal operation.

C4: CHECK THE RH CMP SENSOR SIGNAL WIRE FOR OPEN CIRCUIT

1 Disconnect the ECM electrical connector PI01.
2 Disconnect the CMP sensor electrical connector PI23.
3 Measure the resistance between the CMP sensor electrical connector PI23, pin 1 (Y) and the ECM electrical connector PI01, pin 94 (Y).

Is the resistance less than 5 ohms?

Yes  GO to C5.
No
REPAIR the circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.

C5: CHECK THE RH CMP GROUND WIRE FOR OPEN CIRCUIT

1 Measure the resistance between the CMP sensor electrical connector PI23, pin 2 (R) and the ECM electrical connector PI01, pin 95 (R).

Is the resistance less than 5 ohms?

Yes  GO to C6.
No
REPAIR the circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.

C6: CHECK THE RH CMP SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND

1 Measure the resistance between the CMP sensor electrical connector PI23, pin 1 (Y) and GROUND.

Is the resistance less than 10,000 ohms?

Yes
REPAIR the short to GROUND. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.
No  GO to C7.

C7: CHECK THE RH CMP SENSOR GROUND CIRCUIT FOR A SHORT TO GROUND

1 Measure the resistance between the CMP sensor electrical connector PI23, pin 2 (R) and GROUND.

Is the resistance less than 10,000 ohms?

Yes
REPAIR the short to GROUND. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.
No  GO to C8.

C8: CHECK THE RH CMP SENSOR SIGNAL CIRCUIT FOR A SHORT TO BATTERY POSITIVE

1 Measure the voltage between the CMP sensor electrical connector PI23, pin 1 (Y) and GROUND.

Is the voltage greater than 5 volt?

Yes
REPAIR the short to battery positive. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.
No  GO to C9.

C9: CHECK THE RH CMP SENSOR GROUND CIRCUIT FOR A SHORT TO BATTERY POSITIVE

1 Turn the ignition switch to the RUN position.
2 Measure the voltage between the CMP sensor electrical connector PI23, pin 2 (R) and GROUND.

Is the voltage greater than 5 volt?

Yes
REPAIR the short to battery positive. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.
No
INSTALL a new CMP sensor.

CLEAR DTCs. TEST the system for normal operation. If the DTC is repeated, INSTALL a new ECM.

REFER to: Engine Control Module (ECM) (303-14A Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation).

Before replacing a ECM, contact dealer technical support.

PINPOINT TEST D : DTC P0345, P0346, P1340, P1341: LH CAMSHAFT POSITION (CMP) SENSOR

TEST CONDITIONS

DETAILS/RESULTS/ACTIONS

D1: CHECK THE LH CMP SENSOR FOR CORRECT INSTALLATION

1 Turn the ignition switch to the OFF position.
2 Check the CMP sensor for correct installation.

Is the CMP sensor correctly installed?

Yes  GO to D2.
No
INSTALL the CMP sensor correctly. CLEAR the DTCs. TEST the system for normal operation.

**D2: CHECK THE LH CMP SENSOR FOR FOREIGN DEBRIS**

1. Remove the CMP sensor and inspect for foreign debris.
   
   - **Yes** GO to D3.
   
   - **No** CLEAN the sensor and wheel. INSTALL the sensor.
     CLEAR the DTCs. TEST the system for normal operation.

**D3: CHECK THE LH CMP SENSOR RESISTANCE**

1. Measure the resistance between pins 1 and 2 of the LH Camshaft position sensor.
   
   - **Yes** GO to D4.
   
   - **No** INSTALL a new CMP sensor.
     CLEAR the DTCs. TEST the system for normal operation.

**D4: CHECK THE LH CMP SENSOR SIGNAL WIRE FOR OPEN CIRCUIT**

1. Disconnect the ECM electrical connector PI01.
2. Disconnect the CMP sensor electrical connector PI22.
3. Measure the resistance between the CMP sensor electrical connector PI22, pin 1 (N) and the ECM electrical connector PI01, pin 68 (N).
   
   - **Yes** GO to D5.
   
   - **No** REPAIR the circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.

**D5: CHECK THE LH CMP GROUND WIRE FOR OPEN CIRCUIT**

1. Measure the resistance between the CMP sensor electrical connector PI22, pin 2 (G) and the ECM electrical connector PI01, pin 69 (G).
   
   - **Yes** GO to D6.
   
   - **No** REPAIR the circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.

**D6: CHECK THE LH CMP SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**

1. Measure the resistance between the CMP sensor electrical connector PI22, pin 1 (N) and GROUND.
   
   - **Yes** REPAIR the short to GROUND. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.
   
   - **No** GO to D7.

**D7: CHECK THE LH CMP SENSOR GROUND CIRCUIT FOR A SHORT TO GROUND**

1. Disconnect the ECM electrical connector, PI01.
2. Measure the resistance between the CMP sensor electrical connector PI22, pin 2 (G) and GROUND.
   
   - **Yes** REPAIR the short to GROUND. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.
   
   - **No** GO to D8.

**D8: CHECK THE LH CMP SENSOR SIGNAL CIRCUIT FOR A SHORT TO BATTERY POSITIVE**

1. Turn the ignition switch to the ON position.
2. Measure the voltage between the CMP sensor electrical connector PI22, pin 1 (N) and GROUND.
   
   - **Yes** REPAIR the short to battery positive. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.
   
   - **No** GO to D9.

**D9: CHECK THE LH CMP SENSOR GROUND CIRCUIT FOR A SHORT TO BATTERY POSITIVE**

1. Turn the ignition switch to the ON position.
2. Measure the voltage between the CMP sensor electrical connector PI22, pin 2 (G) and GROUND.
   
   - **Yes** REPAIR the short to battery positive. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.
   
   - **No** INSTALL a new CMP sensor.
     CLEAR the DTCs. TEST the system for normal operation. If the DTC is repeated, INSTALL a new ECM.
     REFER to: **Engine Control Module (ECM)** (303-14A Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation).
     Before replacing a ECM, contact dealer technical support.

**PINPOINT TEST E : DTC P0031, P0032. RH HO2S HEATER.**
**E1: CHECK THE POWER SUPPLY CIRCUIT TO THE RH HO2S HEATER**

1. Disconnect HO2S sensor electrical connector, PI10.
2. Turn the ignition switch to the ON position.
3. Measure the voltage between the RH HO2S electrical connector PI10, pin 1 (WG) and GROUND.

*Is the voltage less than 10 volts?*

- **Yes**
  - **GO to E6.**
- **No**
  - **GO to E2.**

**E2: CHECK THE GROUND CIRCUIT TO THE RH HO2S HEATER FOR OPEN CIRCUIT**

1. Turn the ignition switch to the OFF position.
2. Disconnect the ECM electrical connector PI01.
3. Measure the resistance between the RH HO2S electrical connector PI10, pin 2 (RU) and the ECM electrical connector PI01, pin 1 and pin 2 (RU).

*Is the resistance of each wire less than 5 ohms?*

- **Yes**
  - **GO to E3.**
- **No**
  - **REPAIR the circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.**

**E3: CHECK THE RH HO2S HEATER RESISTANCE**

1. Measure the resistance between pins 1 and 2 of the RH HO2S.

*Is the resistance 3.3 ohms?*

- **Yes**
  - **GO to E4.**
- **No**
  - **INSTALL a new RH HO2S. REFER to: Heated Oxygen Sensor (HO2S) (303-14A Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation). CLEAR the DTCs. TEST the system for normal operation.**

**E4: CHECK THE RH HO2S GROUND CIRCUIT FOR SHORT TO GROUND**

1. Measure the resistance between the RH HO2S electrical connector PI10, pin 2 (RU) and GROUND.

*Is the resistance less than 10,000 ohms?*

- **Yes**
  - **REPAIR the short to GROUND. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.**
- **No**
  - **GO to E5.**

**E5: CHECK THE RH HO2S GROUND CIRCUIT FOR SHORT TO BATTERY**

1. Check for a voltage between the RH HO2S electrical connector PI10, pin 2 (RU) and GROUND.

*Is the voltage greater than 5 volts?*

- **Yes**
  - **REPAIR the short to battery. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.**
- **No**
  - **INSTALL a new RH HO2S. REFER to: Heated Oxygen Sensor (HO2S) (303-14A Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation). CLEAR DTCs. TEST the system for normal operation. If the DTC is repeated, INSTALL a new ECM. REFER to: Engine Control Module (ECM) (303-14A Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation). Before replacing a ECM, contact dealer technical support.**

**E6: CHECK FUSE 20 OF THE FRONT POWER DISTRIBUTION BOX**

1. Check the fuse.

*Is the fuse OK?*

- **Yes**
  - **GO to E8.**
- **No**
  - **GO to E7.**

**E7: CHECK FUSE 20 OF THE FRONT POWER DISTRIBUTION BOX FOR A SHORT TO GROUND**

1. Measure the resistance between electrical connector FH32 pin 26 of the engine compartment fuse box and GROUND.

*Is the resistance less than 10,000 ohms?*

- **Yes**
  - **REPAIR short to ground between the engine compartment fuse box and the RH bank HO2S. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.**
- **No**
  - **INSTALL a new fuse. CLEAR the DTC. TEST the system for normal operation.**

**E8: CHECK THE POWER SUPPLY TO FUSE 20 OF THE FRONT POWER DISTRIBUTION BOX**

1. Turn the ignition switch to the ON position.
2. Measure the voltage between fuse 20 electrical connector FH32 pin 26 and GROUND.

*Is the voltage less than 10 volts?*

- **Yes**
  - **Repair the circuit from the ECM control relay to the engine compartment fuse box. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.**
- **No**
  - **Repair the circuit between the battery and the EMS relay. Test the relay, renew as necessary. CLEAR the DTC. TEST the system for normal operation.**

**PINPOINT TEST F: DTC P0181, P0182, P0183. FUEL TEMPERATURE SENSOR.**

**F1: CHECK THE FUEL TEMPERATURE SENSOR RESISTANCE**

1. Disconnect the fuel temperature sensor electrical connector, IL09.
2. Measure the resistance between pins 1 and 2 of the fuel temperature sensor.
Is the resistance 37.35 ohms at 20°C?
Yes
   GO to F2.
No
   INSTALL a new Fuel Temperature Sensor
   CLEAR the DTCs. TEST the system for normal operation.

F2: CHECK CONTINUITY OF THE FUEL TEMPERATURE SENSOR POWER SUPPLY CIRCUIT
1 Turn the ignition switch to the OFF position.
2 Disconnect the fuel temperature sensor electrical connector IL09.
3 Disconnect the ECM electrical connector PI01.
4 Measure the resistance between the fuel temperature sensor electrical connector IL09, pin 2 (WU) and the ECM electrical connector PI01, pin 50 (WU).
Is the resistance less than 5 ohms?
Yes
   GO to F3.
No
   REPAIR the circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.

F3: CHECK THE FUEL TEMPERATURE SENSOR GROUND CIRCUIT
1 Measure the resistance between the fuel temperature sensor electrical connector IL09 pin 1 (BG) and GROUND.
Is the resistance less than 5 ohms?
Yes
   GO to F4.
No
   REPAIR the circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.

F4: CHECK THE FUEL TEMPERATURE SENSOR CIRCUIT FOR A SHORT TO GROUND
1 Measure the resistance between the fuel temperature sensor electrical connector IL09 pin 2 (WU) and GROUND.
Is the resistance less than 10,000 ohms?
Yes
   REPAIR the short to GROUND. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.
No
   GO to F5.

F5: CHECK THE FUEL TEMPERATURE SENSOR GROUND CIRCUIT FOR A SHORT TO BATTERY
1 Disconnect the fuel temperature sensor electrical connector, IL09.
2 Turn the ignition switch to the OFF position.
3 Check for a voltage between IL09, pin 1 (BG) and GROUND.
Is a voltage present?
Yes
   REPAIR the short to battery. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.
No
   GO to F6.

F6: CHECK THE FUEL TEMPERATURE SENSOR CIRCUIT FOR A SHORT TO BATTERY POSITIVE
1 Connect the ECM electrical connector PI01.
2 Turn the ignition switch to the ON position.
3 Measure the voltage between the fuel temperature sensor electrical connector IL09, pin 2 (WU) and GROUND.
Is the voltage greater than 10 volts?
Yes
   REPAIR the short to battery positive. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.
No
   INSTALL a new fuel temperature sensor
   CLEAR the DTCs. TEST the system for normal operation. If the DTC is repeated, INSTALL a new ECM.
   REFER to: Engine Control Module (ECM) (303-14A Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation).
   Before replacing a ECM, contact dealer technical support.

PINPOINT TEST G : DTC P0327, P0328, P1648. KNOCK SENSOR (KS) RIGHT-HAND

G1: CHECK THE KS RESISTANCE
1 Disconnect the KS electrical connector, PI20.
2 Measure the resistance between pins 1 and 2 of the KS.
Is the resistance 180 - 220 Kohms?
Yes
   GO to G2.
No
   INSTALL a new Knock Sensor
   CLEAR the DTCs. TEST the system for normal operation.

G2: CHECK THE KS SIGNAL WIRE FOR OPEN CIRCUIT
1 Turn the ignition switch to the OFF position.
2 Disconnect the KS sensor electrical connector PI20.
3 Disconnect the ECM electrical connector PI01.
4 Measure the resistance between PI20, pin 1 (N) and PI01, pin 98 (N).
Is the resistance less than 5 ohms?
Yes
   GO to G3.
No
   REPAIR the circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.
G3: CHECK THE KS SIGNAL WIRE FOR SHORT TO BATTERY
1. Connect the KS sensor electrical connector PI20.
2. Connect the ECM electrical connector PI01.
3. Turn the ignition switch to the ON position.
4. Check for a voltage between PI20, pin 1 (N) and GROUND.

Is a voltage present?
- Yes
  REPAIR the short to battery. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.
- No
  GO to G4.

G4: CHECK THE KS SIGNAL WIRE FOR A SHORT TO GROUND
1. Measure the resistance between the KS sensor electrical connector PI20, pin 1 (N) and GROUND.

Is the resistance less than 10,000 ohms?
- Yes
  REPAIR the short to GROUND. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.
- No
  GO to G5.

G5: CHECK THE KS GROUND LEAD FOR OPEN CIRCUIT
1. Disconnect the KS electrical connector, PI20.
2. Disconnect the ECM electrical connector, PI01.
3. Measure the resistance between PI20, pin 2 (B) and PI01, pin 100 (BG).

Is the resistance less than 5 ohms?
- Yes
  GO to G6.
- No
  REPAIR the circuit between PI20, pin 2 (B) and PI01, pin 100 (BG). For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.

G6: CHECK THE KS GROUND LEAD FOR SHORT TO BATTERY
1. Connect the KS sensor electrical connector PI20.
2. Connect the ECM electrical connector PI01.
3. Turn the ignition switch to the ON position.
4. Check for a voltage between PI20, pin 1 (N) and GROUND.

Is a voltage present?
- Yes
  REPAIR the short to battery. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.
- No
  INSTALL a new KS
  CLEAR DTCs. TEST the system for normal operation. If the DTC is repeated, INSTALL a new ECM.
  REFER to: Engine Control Module (ECM) (303-14A Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation).
  Before replacing a ECM, contact dealer technical support.

|  
  GO to H3. |
| - No |
|  
  REPAIR the circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation. |
| H3: CHECK THE KS SIGNAL WIRE FOR SHORT TO BATTERY |
| 1. Connect the KS sensor electrical connector PI19. |
| 2. Connect the ECM electrical connector PI01. |
| 3. Turn the ignition switch to the ON position. |
| 4. Check for a voltage between PI19, pin 1 (N) and GROUND. |
| Is a voltage present? |
| - Yes |
|  
  REPAIR the short to battery. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation. |
| - No |
|  
  GO to H4. |
| H4: CHECK THE KS SIGNAL WIRE FOR A SHORT TO GROUND |
| 1. Measure the resistance between the KS sensor electrical connector PI19, pin 1 (N) and GROUND. |
Is the resistance less than 10,000 ohms?
Yes
  REPAIR the short to GROUND. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.
No
  GO to H5.

**H5: CHECK THE KS GROUND LEAD FOR OPEN CIRCUIT**

1. Disconnect the KS electrical connector, PI19.
2. Disconnect the ECM electrical connector, PI01.
3. Measure the resistance between PI19, pin 2 (B) and PI01, pin 100 (BG)

Is the resistance less than 5 ohms?
Yes
  GO to H6.
No
  REPAIR the circuit between PI19, pin 2 (B) and PI01, pin 100 (BG) For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.

**H6: CHECK THE KS GROUND LEAD FOR SHORT TO BATTERY**

1. Connect the KS sensor electrical connector PI19.
2. Connect the ECM electrical connector PI01.
3. Turn the ignition switch to the ON position.
4. Check for a voltage between PI19, pin 1 (N) and GROUND.

Is a voltage present?
Yes
  REPAIR the short to battery. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.
No
  INSTALL a new KS

**PINPOINT TEST I : DTC P0196, P0197, P0198. OIL TEMPERATURE SENSOR.**

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>I1: CHECK THE OIL TEMPERATURE SENSOR SIGNAL WIRE FOR OPEN CIRCUIT</td>

</tr>
</tbody>
</table>
  1. Turn the ignition switch to the OFF position.
  2. Disconnect the oil temperature sensor electrical connector PI24.
  3. Disconnect the ECM electrical connector PI01.
  4. Measure the resistance between the oil temperature sensor electrical connector PI24, pin 1 (Y) and the ECM electrical connector PI01, pin 78 (Y).

Is the resistance less than 5 ohms?
Yes
  GO to I2.
No
  REPAIR the circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.

| I2: CHECK THE OIL TEMPERATURE SENSOR GROUND CIRCUIT FOR OPEN CIRCUIT | 
  1. Measure the resistance between the oil temperature sensor electrical connector PI24, pin 2 (BG) and GROUND.

Is the resistance less than 5 ohms?
Yes
  GO to I3.
No
  REPAIR the circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.

| I3: CHECK THE OIL TEMPERATURE SENSOR GROUND CIRCUIT FOR SHORT TO BATTERY | 
  1. Connect ECM electrical connector, PI01
  2. Turn the ignition switch to the RUN position.
  3. Measure the voltage between the oil temperature sensor electrical connector PI24, pin 2 (BG) and GROUND.

Is a voltage present?
Yes
  REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.
No
  GO to I4.

| I4: CHECK THE OIL TEMPERATURE SENSOR CIRCUIT FOR A SHORT TO GROUND | 
  1. Measure the resistance between the oil temperature sensor electrical connector PI24, pin 1 (Y) and GROUND.

Is the resistance less than 10,000 ohms?
Yes
  REPAIR the short to GROUND. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.
No
  GO to I5.

| I5: CHECK THE OIL TEMPERATURE SENSOR CIRCUIT FOR A SHORT TO BATTERY POSITIVE | 
  1. Connect ECM electrical connector, PI01
  2. Turn the ignition switch to the ON position.
  3. Measure the voltage between the oil temperature sensor electrical connector PI24, pin 1 (Y) and GROUND.

Is the voltage greater than 10 volts?
Yes
  REPAIR the short to battery positive. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.
No
  INSTALL a new oil temperature sensor

REFER to: Oil Temperature Sensor (303-14A Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation).

</table>
K2: CHECK THE GROUND SUPPLY CIRCUIT TO THE RH CATALYST MONITOR HEATER FOR CONTINUITY

1. Turn the ignition switch to the OFF position.
2. Disconnect the ECM electrical connector PI01.
3. Measure the resistance between PI11, pin 2 (UY) and PI01, pin 92 (UY)

Is the resistance less than 5 ohms?

Yes  GO to K3.
No  REPAIR the circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.

K3: CHECK THE RH CATALYST MONITOR HEATER RESISTANCE

1. Measure the resistance between pins 1 and 2 of the RH Catalyst Monitor heater.

Is the resistance 5.0 ohms?

Yes  GO to K4.
No  INSTALL a new RH Catalyst Monitor Sensor. REFER to: Catalyst Monitor Sensor (303-14A Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation). CLEAR the DTCs. TEST the system for normal operation.

K4: CHECK THE GROUND SUPPLY CIRCUIT TO THE RH CATALYST MONITOR HEATER FOR SHORT TO GROUND

1. Measure the resistance between PI11, pin 2 (UY) and GROUND.

Is the resistance less than 10,000 ohms?

Yes  REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.
No  GO to K5.

K5: CHECK THE GROUND SUPPLY CIRCUIT TO THE RH CATALYST MONITOR HEATER FOR SHORT TO BATTERY

1. Connect the ECM electrical connector, PI01.
2. Turn the ignition switch to the ON position.
3. Check for a voltage at PI11, pin 2 (UY)

Is the voltage greater than 5 volts?

Yes  REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.
No  GO to K6.

K6: CHECK THE CONSTANT CIRCUIT OF THE RH CATALYST MONITOR SENSOR FOR OPEN CIRCUIT

1. Disconnect the RH catalyst monitor sensor electrical connector, PI11.
2. Disconnect the ECM electrical connector, PI01.
3. Measure the resistance between PI11, pin 3 (B) and PI01, pin 130 (BW)

Is the resistance less than 5 ohms?

Yes  GO to K7.
No  REPAIR the circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.

K7: CHECK THE CONSTANT CIRCUIT OF THE RH CATALYST MONITOR SENSOR FOR SHORT TO GROUND

1. Measure the resistance between PI01, pin 130 (BW) and GROUND.

Is the resistance less than 10,000 ohms?

Yes  REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.
No  GO to K8.

K8: CHECK THE CONSTANT CIRCUIT OF THE RH CATALYST MONITOR SENSOR FOR SHORT TO BATTERY

1. Connect the ECM electrical connector, PI01.
2. Turn the ignition switch to the ON position.
3. Measure the voltage between PI11, pin 3 (B) and GROUND.

Is the voltage greater than 5 volts?

Yes  REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.
No  GO to K9.

K9: CHECK THE VARIABLE CIRCUIT OF THE RH CATALYST MONITOR SENSOR FOR OPEN CIRCUIT

1. Disconnect the RH catalyst monitor sensor electrical connector PI11.
2. Disconnect the ECM electrical connector, PI01.
3. Measure the resistance between PI01, pin 128 (N) and PI11, pin 4 (N)

Is the resistance less than 5 ohms?

Yes  GO to K10.
No  REPAIR the circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.

K10: CHECK THE VARIABLE CIRCUIT OF THE RH CATALYST MONITOR SENSOR FOR SHORT TO GROUND

1. Measure the resistance between PI11, pin 4 (N) and GROUND.

Is the resistance less than 10,000 ohms?

Yes  REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.
No  GO to K11.

K11: CHECK THE VARIABLE CIRCUIT OF THE RH CATALYST MONITOR SENSOR FOR SHORT TO BATTERY

1. Connect the ECM electrical connector PI01.
2. Turn the ignition switch to the ON position.
3. Measure the voltage between PI11, pin 4 (N) and GROUND.

**Yes**
- REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.
- INSTALL a new RH Catalyst monitor sensor.
- CLEAR the DTCs. TEST the system for normal operation. If the DTC is repeated, INSTALL a new ECM.
- Before replacing a ECM, contact dealer technical support.

**No**
- Install a new RH Catalyst monitor sensor.
- CLEAR the DTCs. TEST the system for normal operation.
Disconnect the LH catalyst monitor sensor electrical connector PI13.

Turn the ignition switch to the ON position.

Measure the voltage between PI13, pin 1 (WR) and GROUND.

Is the voltage less than 10 volts?

Yes

REPAIR the circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.

No

GO to M2.

M2: CHECK THE GROUND SUPPLY CIRCUIT TO THE LH CATALYST MONITOR HEATER FOR CONTINUITY

1. Turn the ignition switch to the OFF position.
2. Disconnect the ECM electrical connector PI01.
3. Measure the resistance between PI13, pin 2 (RW) and PI01, pin 93 (RW)

Is the resistance less than 5 ohms?

Yes

GO to M4.

No

REPAIR the circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.

M3: CHECK THE LH CATALYST MONITOR HEATER RESISTANCE

1. Measure the resistance between pins 1 and 2 of the LH Catalyst Monitor heater.

Is the resistance 5.0 ohms?

Yes

GO to P4.

No

INSTALL a new LH Catalyst Monitor Sensor

CLEAR the DTCs. TEST the system for normal operation.

M4: CHECK THE GROUND SUPPLY CIRCUIT TO THE LH CATALYST MONITOR HEATER FOR SHORT TO GROUND

1. Measure the resistance between PI13, pin 2 (RW) and GROUND.

Is the resistance less than 10,000 ohms?

Yes

REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.

No

GO to M5.

M5: CHECK THE GROUND SUPPLY CIRCUIT TO THE LH CATALYST MONITOR HEATER FOR SHORT TO BATTERY

1. Connect the ECM electrical connector, PI01.
2. Turn the ignition switch to the ON position.
3. Check for a voltage at PI13, pin 2 (RW)

Is the voltage greater than 5 volts?

Yes

REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.

No

GO to M6.

M6: CHECK THE CONSTANT CIRCUIT OF THE LH CATALYST MONITOR SENSOR FOR OPEN CIRCUIT

1. Disconnect the LH catalyst monitor sensor electrical connector, PI13.
2. Disconnect the ECM electrical connector, PI01.
3. Measure the resistance between PI13, pin 3 (B) and PI01, pin 130 (BW)

Is the resistance less than 5 ohms?

Yes

GO to M7.

No

REPAIR the circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.

M7: CHECK THE CONSTANT CIRCUIT OF THE LH CATALYST MONITOR SENSOR FOR SHORT TO GROUND

1. Measure the resistance between PI01, pin 130 (BW) and GROUND.

Is the resistance less than 10,000 ohms?

Yes

REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.

No

GO to M8.

M8: CHECK THE CONSTANT CIRCUIT OF THE LH CATALYST MONITOR SENSOR FOR SHORT TO BATTERY

1. Connect the ECM electrical connector, PI01.
2. Turn the ignition switch to the ON position.
3. Measure the voltage between PI13, pin 3 (B) and GROUND.

Is the voltage greater than 5 volts?

Yes

REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.

No

GO to M9.

M9: CHECK THE VARIABLE CIRCUIT OF THE LH CATALYST MONITOR SENSOR FOR OPEN CIRCUIT

1. Disconnect the LH catalyst monitor sensor electrical connector PI13.
2. Disconnect the ECM electrical connector, PI01.
3. Measure the resistance between PI01, pin 129 (N) and PI13, pin 4 (N)

Is the resistance less than 5 ohms?

Yes

GO to M10.

No

REPAIR the circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.

M10: CHECK THE VARIABLE CIRCUIT OF THE LH CATALYST MONITOR SENSOR FOR SHORT TO GROUND
Measure the resistance between PI13, pin 4 (N) and GROUND.

| Yes | REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation. |
| No | GO to M11. |

**M11: CHECK THE VARIABLE CIRCUIT OF THE LH CATALYST MONITOR SENSOR FOR SHORT TO BATTERY**

1. Connect the ECM electrical connector PI01.
2. Turn the ignition switch to the ON position.
3. Measure the voltage between PI13, pin 4 (N) and GROUND.

| Yes | REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation. |
| No | INSTALL a new LH Catalyst monitor sensor. REFER to: Catalyst Monitor Sensor (303-14A Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation).
CLEAR the DTCs. TEST the system for normal operation. If the DTC is repeated, INSTALL a new ECM. Before replacing a ECM, contact dealer technical support. |

| Yes | REPAIR the circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation. |
CLEAR the DTC. TEST the system for normal operation.

O2: CHECK CONTINUITY OF THE INTAKE AIR TEMPERATURE (IAT) SENSOR POWER SUPPLY CIRCUIT

1. Turn the ignition switch to the OFF position.
2. Disconnect the MAF sensor electrical connector PI14.
3. Disconnect the ECM electrical connector PI01.
4. Measure the resistance between the MAF sensor electrical connector PI14, pin 4 (U) and the ECM electrical connector PI01, pin 71 (U).

Is the resistance less than 5 ohms?
Yes  GO to O3.
No  REPAIR the circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.

O3: CHECK CONTINUITY OF THE IAT SENSOR CIRCUIT

1. Measure the resistance between the MAF sensor electrical connector PI14, pin 5 (BG) and the ECM electrical connector PI01, pin 19 (BG).

Is the resistance less than 5 ohms?
Yes  GO to O4.
No  REPAIR the circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.

O4: CHECK THE IAT SENSOR POWER SUPPLY CIRCUIT FOR SHORT TO GROUND

1. Measure the resistance between the MAF sensor electrical connector PI14, pin 4 (U) and GROUND.

Is the resistance less than 10,000 ohms?
Yes  REPAIR the short to GROUND. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.
No  GO to O5.

O5: CHECK THE IAT SENSOR GROUND CIRCUIT FOR SHORT TO BATTERY

1. Connect the ECM electrical connector, PI01.
2. Turn the ignition switch to the ON position.
3. Check for voltage at PI14, pin 5 (BG)

Is the voltage greater than 5 volts?
Yes  REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.
No  INSTALL a new MAF sensor

CLEAR DTCs. TEST the system for normal operation. If the DTC is repeated, INSTALL a new ECM.

REFER to: Engine Control Module (ECM)  (303-14A Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation).
Before replacing a ECM, contact dealer technical support.

PINPOINT TEST P : DTC P0051, P0052. LH HO2S HEATER.

TEST CONDITIONS  DETAILS/RESULTS/ACTIONS

P1: CHECK THE POWER SUPPLY CIRCUIT TO THE LH HO2S HEATER

1. Disconnect the HO2S electrical connector, PI12.
2. Turn the ignition switch to the ON position.
3. Measure the voltage between PI12, pin 1 (WR) and GROUND.

Is the voltage less than 10 volts?
Yes  GO to P6.
   (This circuit includes the power distribution fuse box and the EMS relay.)
No  GO to P2.

P2: CHECK THE LH HO2S HEATER GROUND CIRCUIT FOR OPEN CIRCUIT

1. Turn the ignition switch to the OFF position.
2. Disconnect the ECM electrical connector PI01.
3. Measure the resistance between the LH bank HO2S electrical connector PI12, pin 2 (RW) and the ECM electrical connector PI01, pins 55 and pin 56 (RW).

Is the resistance of each wire less than 5 ohms?
Yes  GO to P3.
No  REPAIR the circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.

P3: CHECK THE LH HO2S HEATER RESISTANCE

1. Measure the resistance between pins 1 and 2 of the LH HO2S.

Is the resistance 3.3 ohms?
Yes  GO to P4.
No  INSTALL a new LH HO2S

CLEAR the DTCs. TEST the system for normal operation.

P4: CHECK THE LH HO2S HEATER CIRCUIT FOR SHORT TO GROUND

1. Measure the resistance between the LH bank HO2S electrical connector PI12, pin 2 (RW) and GROUND.
Is the resistance less than 10,000 ohms?
Yes
REPAIR the short to GROUND. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.
No
GO to P5.

P5: CHECK THE LH HO2S HEATER CIRCUIT FOR SHORT TO BATTERY
1. Connect the ECM electrical connector, PI01.
2. Turn the ignition switch to the OFF position.
3. Check for a voltage at PI12, pin 2 (RW)

Is the voltage greater than 5 volts?
Yes
REPAIR the short to battery. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.
No
GO to P6.

P6: CHECK FUSE 35 OF THE FRONT POWER DISTRIBUTION BOX
1. Check the fuse.
Is the fuse OK?
Yes
GO to P8.
No
GO to P7.

P7: CHECK FUSE 35 OF THE FRONT POWER DISTRIBUTION BOX FOR A SHORT TO GROUND
1. Measure the resistance between electrical connector FH32, pin 41 of the front power distribution box and GROUND.

Is the resistance less than 10,000 ohms?
Yes
REPAIR short to ground between the engine compartment fuse box and the LH bank HO2S. CLEAR the DTC. TEST the system for normal operation.
No
INSTALLED a new fuse. CLEAR the DTC. TEST the system for normal operation.

P8: CHECK THE POWER SUPPLY TO FUSE 35 OF THE FRONT POWER DISTRIBUTION BOX FOR A SHORT TO GROUND
1. Measure the voltage between fuse 42 electrical connector FH32, pin 47 and GROUND.

Is the voltage less than 10 volts?
Yes
Repair the circuit from the ECM control relay to the engine compartment fuse box. CLEAR the DTC. TEST the system for normal operation.
No
Repair the circuit from the compartment fuse box and the HO2S. CLEAR the DTC. TEST the system for normal operation.

PINPOINT TEST Q : DTC P1606. ECM RELAY.

<table>
<thead>
<tr>

<td>Turn the ignition switch to the ON position.</td>
<td></td>
</tr>
<tr>
<td>Does the ECM relay make an audible click?</td>
<td></td>
</tr>
</tbody>
</table>
Yes
GO to Q2.
No
GO to Q3.

| Q2: CHECK FOR POWER SUPPLY FROM THE ECM CONTROL RELAY |
| Measure the voltage between the ECM control relay FH32, pin E05 and GROUND. |
| Is the voltage less than 10 volts? |
Yes
GO to Q3.
No
REPAIR the circuit from the ECM control relay to the ECM. CLEAR the DTC. TEST the system for normal operation.

| Q3: CHECK FUSE 9 IN THE ENGINE COMPARTMENT FUSE BOX |
| Check the fuse. |
| Is the fuse OK? |
Yes
GO to Q4.
No
GO to Q8.

| Q4: CHECK THE POWER SUPPLY TO FUSE 9 IN THE ENGINE COMPARTMENT FUSE BOX |
| Measure the voltage between fuse 9 electrical connector FH32, pin 75 and GROUND. |
| Is the voltage less than 10 volts? |
Yes
Repair the circuit from the battery positive to the engine compartment fuse box. CLEAR the DTC. TEST the system for normal operation.
No
GO to Q5.

| Q5: CHECK THE POWER SUPPLY FROM FUSE 9 IN THE ENGINE COMPARTMENT FUSE BOX TO THE ECM CONTROL RELAY |
| Measure the voltage between the ECM control relay electrical connector FH32, pin 9 and GROUND. |
| Is a the voltage less than 10 volts? |
Yes
Repair the circuit from the engine compartment fuse box to the ECM control relay. CLEAR the DTC. TEST the system for normal operation.
No
INSTALL a new ECM control relay. CLEAR the DTC. TEST the system for normal operation.

| Q6: CHECK CONTINUITY OF THE ECM CONTROL RELAY GROUND CIRCUIT |
| Disconnect the ECM electrical connector EN16. |
| Remove the ECM control relay from the engine compartment fuse box. |
| Measure the resistance between the ECM electrical connector PI01, pin 40 and FH02, pin E02 of the engine compartment fuse box. |
Is the resistance less than 5 ohms?
Yes  **GO to Q7.**
No  REPAIR the circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation. (This circuit includes the power distribution fuse box and the EMS relay and diode.)

Q7: CHECK CONTINUITY OF THE ECM CONTROL RELAY WINDING

1. Measure the resistance of the ECM control relay winding between pins 1 and 2 of the ECM control relay.

   Is the resistance less than 60 ohms?
   Yes  INSTALL a new ECM control relay. CLEAR the DTC. TEST the system for normal operation.
   No  **GO to Q9.**

Q8: CHECK FUSE 9 OF THE ENGINE COMPARTMENT FUSE BOX FOR A SHORT TO GROUND

1. Measure the resistance between electrical connector FH32 pin 9 of the engine compartment fuse box and GROUND.

   Is the resistance less than 10,000 ohms?
   Yes  REPAIR short to ground between the engine compartment fuse box and the ECM control relay. CLEAR the DTC. TEST the system for normal operation.
   No  INSTALL a new fuse. CLEAR the DTC. TEST the system for normal operation.

Q9: CHECK THE ECM CONTROL RELAY DIODE

1. Remove the ECM control relay diode from the engine compartment fuse box.
2. Measure the continuity of ECM control relay diode.

   Is the resistance less than 5 ohms?
   Yes  Possible intermittent fault. Recheck DTCs.
   No  INSTALL a new ECM control relay diode. Make sure that the ECM control relay diode is installed correctly. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation. If DTC is repeated INSTALL a new ECM.

</table>
S1: CHECK THE RH VVT SOLENOID RESISTANCE

1. Disconnect the RH VVT solenoid electrical connector, PI16.
2. Measure the resistance between pins 1 and 2 of the RH VVT solenoid.

Is the resistance 8 ohms?
- Yes: GO to S2.
- No: INSTALL a new RH VVT solenoid.
  CLEAR the DTC. TEST the system for normal operation.

S2: CHECK THE GROUND CIRCUIT TO THE RH VVT SOLENOID.

1. Disconnect the RH VVT solenoid electrical connector, PI16.
2. Measure the resistance between the RH VVT solenoid electrical connector PI16, pin 2 (B) and GROUND.

Is the resistance less than 5 ohms?
- Yes: GO to S3.
- No: REPAIR the circuit between VVT solenoid electrical connector PI16, pin 2 (B) and GROUND. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

S3: CHECK CONTINUITY OF THE VVT SOLENOID SIGNAL WIRE.

1. Measure the resistance between VVT solenoid electrical connector PI16 pin 1 (Y) and ECM electrical connector PI01 pin 109 (Y).

Is the resistance less than 5 ohms?
- Yes: GO to S4.
- No: REPAIR the circuit between VVT solenoid electrical connector PI16, pin 1 (Y) and ECM electrical connector PI01 pin 109 (Y). For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

S4: CHECK FOR SHORT TO GROUND AT THE VVT SOLENOID SIGNAL WIRE

1. Disconnect the ECM electrical connector, PI01.
2. Measure the resistance between PI16, pin 1 (Y) and GROUND.

Is the resistance less than 10,000 ohms?
- Yes: REPAIR the short to GROUND. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
- No: GO to S5.

S5: CHECK FOR SHORT TO BATTERY AT THE VVT SOLENOID SIGNAL WIRE

1. TURN the ignition switch to the ON position.
2. Check for a voltage at PI16, pin 1 (Y)

Is the voltage greater than 5 volts?
- Yes: REPAIR the short circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
- No: GO to S6.

S6: CHECK RESISTANCE OF THE VVT SOLENOID.

1. Check the resistance between pins 1 and 2 of the RH VVT solenoid.

Is the resistance 8.0 ohms?
- Yes: INSTALL a new ECM.
  Before replacing a ECM, contact dealer technical support. CLEAR the DTC. TEST the system for normal operation.
- No: INSTALL a new RH VVT solenoid.
  CLEAR the DTC. TEST the system for normal operation.

PINPOINT TEST T: P0020, P1396. VVT LH.

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>

</table>

T1: CHECK THE LH VVT SOLENOID RESISTANCE

1. Disconnect the LH VVT solenoid electrical connector, PI17.
2. Measure the resistance between pins 1 and 2 of the LH VVT solenoid.

Is the resistance 8 ohms?
- Yes: GO to T2.
- No: INSTALL a new LH VVT solenoid.
  CLEAR the DTC. TEST the system for normal operation.

T2: CHECK GROUND CIRCUIT TO THE LH VVT SOLENOID.

1. Disconnect the LH VVT solenoid electrical connector, PI17.
2. Measure the resistance between the LH VVT solenoid electrical connector PI17, pin 2 (B) and GROUND.

Is the resistance less than 5 ohms?
- Yes: GO to T3.
- No: REPAIR the circuit between VVT solenoid electrical connector PI17, pin 2 (B) and GROUND. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

T3: CHECK CONTINUITY OF THE LH VVT SOLENOID SIGNAL WIRE.

1. Measure the resistance between VVT solenoid electrical connector PI17, pin 1 (YU) and ECM electrical connector PI01, pin 110 (YU)
Is the resistance less than 5 ohms?
Yes  GO to T4.
No  REPAIR the circuit between VVT solenoidal electrical connector PI17 pin 1 (YU) and ECM electrical connector PI01 pin 110 (YU) For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

T4: CHECK FOR SHORT TO GROUND AT THE LH VVT SOLENOID SIGNAL WIRE
1  Disconnect the ECM electrical connector, PI01.
2  Measure the resistance between PI17, pin 1 (YU) and GROUND.
Yes  REPAIR the short to GROUND. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
No  GO to T5.

T5: CHECK FOR SHORT TO BATTERY AT THE LH VVT SOLENOID SIGNAL WIRE
1  TURN the ignition switch to the ON position.
2  Check for a voltage at PI17, pin 1 (YU)
Is the voltage greater than 5 volts?
Yes  REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
No  GO to T6.

T6: CHECK RESISTANCE OF THE LH VVT SOLENOID.
1  Check the resistance between pins 1 and 2 of the LH VVT solenoid.
Is the resistance 8.0 ohms?
Yes  INSTALL a new ECM
   REFER to: Engine Control Module (ECM) (303-14A Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation).
   Before replacing a ECM, contact dealer technical support.
No  INSTALL a new LH vvt solenoid
   REFER to: Variable Camshaft Timing (VCT) Oil Control Solenoid (303-14A Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation).
   CLEAR the DTC. TEST the system for normal operation.

PINPOINT TEST U : P1549. IMT VALVE 1.

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
</table>
| U1: CHECK THE RH IMT VALVE RESISTANCE | 1  Disconnect the IMT valve electrical connector,PI30.
2  Measure the resistance between pins 1 and 2 of the IMT valve.
Is the resistance 30 ohms?
Yes  GO to U2.
No  INSTALL a new IMT valve. CLEAR the DTC. TEST the system for normal operation.
| U2: CHECK THE POWER SUPPLY CIRCUIT TO THE IMT VALVE 1. | 1  TURN the ignition switch to the ON position.
2  Measure the voltage between IMT valve 1 electrical connector PI30, pin 1 (NG) and GROUND.
Is the voltage greater than 10 volts?
Yes  GO to U3.
No  REPAIR the circuit between the IMT valve 1 electrical connector PI30, pin 1 (NG) and the Battery power bus 2.
   (This circuit includes the power distribution fuse box and the EMS control relay. For additional information, refer to wiring diagrams.)
   CLEAR the DTC. TEST the system for normal operation.
| U3: CHECK CONTINUITY OF THE IMT VALVE 1 SIGNAL WIRE | 1  Disconnect the ECM electrical connector, PI01.
2  Measure the resistance between the IMT valve 1 electrical connector PI30, pin 2 (OY) and the ECM electrical connector PI01, pin 38 (OY)
Is the resistance less than 5 ohms?
Yes  GO to U4.
No  REPAIR the circuit between the IMT valve 1 electrical connector PI30, pin 2 (OY) and the ECM electrical connector PI01, pin 38 (OY) For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
| U4: CHECK IMT VALVE SIGNAL WIRE FOR SHORT TO GROUND | 1  Measure the resistance between PI30, pin 2 (OY) and GROUND.
Is the resistance less than 10,000 ohms?
Yes  REPAIR the short to GROUND. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
No  GO to U5.
| U5: CHECK IMT VALVE SIGNAL WIRE FOR SHORT TO BATTERY | 1  Connect the ECM electrical connector, PI01.
2  TURN the ignition switch to the ON position.
3  Check for a voltage at PI30, pin 2 (OY)
Is the voltage greater than 5 volts?
Yes
REPAIR the short to battery. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
No
INSTALL a new IMT valve. CLEAR the DTC. TEST the system for normal operation. If the DTC is repeated, INSTALL a new ECM.
REPAIR the circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
Before replacing a ECM, contact dealer technical support. CLEAR the DTC. TEST the system for normal operation.

</tbody>
</table>
Is the resistance less than 10,000 ohms?

Yes  **GO to AC4.**

INSTALL a new air conditioning compressor clutch relay. For additional information, refer to the electrical guide. CLEAR the DTC. TEST the system for normal operation. If the DTC is repeated, INSTALL a new ECM. REFER to: Engine Control Module (ECM) (303-14A Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation).

Before replacing an ECM, contact dealer technical support.

AC4: CHECK THE CIRCUIT BETWEEN THE AIR CONDITIONING COMPRESSOR CLUTCH AND THE RELAY FOR SHORT TO BATTERY.

1. Measure the voltage between PI49, pin 1 (RG) and GROUND.

Is the voltage greater than 5 volts?

Yes  REPAIR the short circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

**GO to AC5.**

No  **GO to AC6.**

AC5: CHECK THE CIRCUIT BETWEEN THE AIR CONDITIONING COMPRESSOR CLUTCH AND THE ACCC RELAY FOR SHORT TO GROUND.

1. Measure the resistance between PI49, pin 1 (RG) and GROUND.

Is the resistance less than 10,000 ohms?

Yes  REPAIR the short circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

**GO to AC6.**

No  **GO to AC7.**

AC6: CHECK THE CIRCUIT BETWEEN FUSE 32 OF THE FRONT POWER DISTRIBUTION FUSE BOX AND THE ACCC RELAY FOR SHORT TO GROUND.

1. Remove fuse 32.

2. Measure the resistance between fuse box electrical connector, FH32, pin 38 and GROUND.

Is the resistance less than 10,000 ohms?

Yes  REPAIR the short circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

**GO to AC7.**

No  **GO to AC8.**

AC7: CHECK THE ACCC RELAY BASE FOR BATTERY VOLTAGE AT PIN 3.

1. Refit fuse 32.

2. Measure the voltage between the ACCC relay base, pin 3 and GROUND.

Is the voltage greater than 10 volts?

Yes  **GO to AC8.**

No  Check/replace fuses. REPAIR the circuit between the relay base and the battery power bus 1. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

AC8: CHECK THE CIRCUIT BETWEEN PIN 1 OF THE ACCC RELAY BASE AND THE POWER DISTRIBUTION FUSE BOX FOR SHORT TO GROUND.

1. Remove fuse 38.

2. Measure the resistance between the ACCC relay base, pin 1 and GROUND.

Is the resistance less than 10,000 ohms?

Yes  REPAIR the short circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

**GO to AC9.**

No  **GO to AC10.**

AC9: CHECK THE ACCC RELAY BASE FOR BATTERY VOLTAGE AT PIN 1.

1. Refit fuse 38.

2. Turn the ignition switch to the ON position.

3. Measure the voltage between ACCC relay base, pin 1, and GROUND.

Is the voltage greater than 10 volts?

Yes  **GO to AC10.**

No  Check/replace fuses. REPAIR the circuit between the relay base and the battery power bus 2. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation. (This circuit includes the EMS relay, and fuses 9.)

AC10: CHECK THE CIRCUIT BETWEEN THE ECM AND THE ACCC RELAY BASE FOR CONTINUITY.

1. Remove the ACCC relay.

2. Measure the resistance between the ECM electrical connector, PI01, pin 34 (BG) and ACCC relay base, pin 2.

Is the resistance less than 5 ohms?

Yes  **GO to AC11.**

No  REPAIR the circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

AC11: CHECK THE CIRCUIT BETWEEN THE ECM AND THE ACCC RELAY BASE FOR SHORT TO BATTERY.

1. Check for a voltage between the ECM electrical connector, PI01, pin 34 (BG) and GROUND.

Is the voltage greater than 5 volts?

Yes  REPAIR the short circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

**GO to AC12.**

No  **GO to AC13.**

AC12: CHECK THE CIRCUIT BETWEEN THE ECM AND THE ACCC RELAY BASE FOR SHORT TO GROUND.

1. Measure the resistance between the ECM electrical connector, PI01, pin 34 (BG) and GROUND.
Is the resistance less than 10,000 ohms?

Yes
- REPAIR the short circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
- INSTALL a new ACCC relay. CLEAR the DTC. TEST the system for normal operation.

No

PINPOINT TEST AD : P1516, P1517. P/N SWITCH STARTING/DRIVING MALFUNCTIONS.

</table>

Is the voltage greater than 10 volts?

Yes
- GO to AE2.

No
- REPAIR the circuit between the ECM and the battery. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
  (This circuit includes the ignition switch and the power distribution fuse box. (Fuse 28).)

AE2: CHECK THE START INPUT TO THE STARTER RELAY

1 Turn the ignition switch to the START position and hold.
2 Measure the voltage between the starter relay base, (R20) pin 1, and GROUND.

Is the voltage greater than 10 volts?

Yes
- GO to AE3.

No
- REPAIR the circuit between the Starter relay base and the battery. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
  (This circuit includes the ignition switch and the power distribution fuse box.)

AE3: CHECK THE START INPUT WIRE FOR SHORT TO BATTERY AT ECM

1 Turn the ignition switch to the ON position.
2 Measure the voltage between P101, pin 6, (Y) and GROUND.

Is the voltage greater than 10 volts?

Yes
- REPAIR the short circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No
- GO to AE4.

AE4: CHECK THE START INPUT WIRE FOR SHORT TO BATTERY AT RELAY

1 Turn the ignition switch to the ON position.
2 Measure the voltage between the starter relay base, pin 1, and GROUND.

Is the voltage greater than 10 volts?

Yes
- REPAIR the short circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No
- GO to AE5.

AE5: CHECK THE STARTER RELAY INPUT FROM THE ECM FOR CONTINUITY.

1 Measure the resistance between P101, pin 41 (GO) and relay base, pin 2.

Is the resistance less than 5 ohms?

Yes
- GO to AE6.

No
- REPAIR the open circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

AE6: CHECK THE STARTER RELAY INPUT FROM THE ECM FOR SHORT TO GROUND.

1 Disconnect ignition switch electrical connector, FC18.
2 Measure the resistance between P101, pin 41 (GO) and GROUND.

</tr>
</tbody>
</table>
Overview

There are changes to the engine management system (EMS) for 2006 MY, the most obvious of which will be the change to 7-digit diagnostic trouble codes (DTCs) from the familiar 5-digit, plus the addition of secondary air injection and changes to evaporative emissions to comply with stage four emissions requirements.

For more information on these systems, REFER to: Engine Emission Control - VIN Range: N52207->N99999 (303-08A Engine Emission Control - 2.5L/3.0L/4.2L, Description and Operation) / Evaporative Emissions - VIN Range: N52207->N99999 (303-13 Evaporative Emissions, Description and Operation).

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

<table>
<thead>
<tr>
<th>Mechanical</th>
<th>Electrical</th>
</tr>
</thead>
<tbody>
<tr>
<td>Engine oil level and condition</td>
<td>Fuses</td>

<td>Engine control module (ECM)</td>
</tr>
<tr>
<td>Poly-vee belt</td>
<td>Transmission control module (TCM)</td>
</tr>
<tr>
<td>Air cleaner condition</td>
<td></td>
</tr>
</tbody>
</table>

3. Verify the following systems are working correctly:

- Air intake system
- Cooling system
- Charging system
- Fuel charging system
- Ignition system

4. If an obvious cause for an observed or reported symptom is found, correct the cause (if possible) before proceeding to the next step.

5. If the cause is not visually evident, use the Jaguar approved diagnostic system or a scan tool to retrieve the fault codes before proceeding to the DTC Index, or the symptom chart if no DTCs are set.

- MAF sensor
- ECT sensor
- Harness

For Park/Neutral tests:
REFERR to: External Controls (307-05 Automatic Transmission/Transaxle External Controls, Diagnosis and Testing).

For TP sensor tests, GO to Pinpoint Test D, and GO to Pinpoint Test E. For MAF sensor tests, GO to Pinpoint Test A. For ECT sensor tests, GO to Pinpoint Test C.

DTC index

- NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

### DTC | Description | Possible causes | Action
--- | --- | --- | ---
P042000 | Catalyst system efficiency below threshold (right hand bank) | • Catalyst failure due to: overheating damage caused by misfire and/or lean combustion  
• Catalyst failure due to: poisoning caused by excessive oil consumption and/or contaminated fuel | Check the oil and fuel condition/level. Check the catalysts for damage.

REFER to: Exhaust System - VIN Range: N13089->N99999 (309-00 Exhaust System, Diagnosis and Testing).
P043000 | Catalyst system efficiency below threshold (left hand bank) | • Catalyst failure due to: overheating damage caused by misfire and/or lean combustion  
• Catalyst failure due to: poisoning caused by excessive oil consumption and/or contaminated fuel | Check the oil and fuel condition/level. Check the catalysts for damage.

REFER to: Exhaust System - VIN Range: N13089->N99999 (309-00 Exhaust System, Diagnosis and Testing).
P044100 | Evaporative emission system incorrect purge flow | • Purge valve range performance | For evaporative emissions tests, REFERENCE to: Evaporative Emissions - VIN Range: N52207->N99999 (303-13 Evaporative Emissions, Diagnosis and Testing).
P044700 | Diagnostic monitoring of fuel tank leakage (DMTL) system change-over valve (COV) control circuit open | • DMTL COV circuit ground short | For evaporative emissions tests, REFERENCE to: Evaporative Emissions - VIN Range: N52207->N99999 (303-13 Evaporative Emissions, Diagnosis and Testing).
P044800 | DMTL system COV control circuit shorted | • DMTL COV power supply circuit: high resistance, short circuit  
• DMTL COV to ECM drive circuit: high resistance, short circuit to power  
• DMTL COV failure | For evaporative emissions tests, REFERENCE to: Evaporative Emissions - VIN Range: N52207->N99999 (303-13 Evaporative Emissions, Diagnosis and Testing).
P045600 | Evaporative emission system leak detected (very small leak) | • DMTL system has detected a leak | For evaporative emissions tests, REFERENCE to: Evaporative Emissions - VIN Range: N52207->N99999 (303-13 Evaporative Emissions, Diagnosis and Testing).
P045800 | Evaporative emission system purge control valve circuit low | • Purge valve control circuit: short circuit to ground  
• Purge valve control circuit: high resistance  
• Purge valve failure | For evaporative emissions tests, REFERENCE to: Evaporative Emissions - VIN Range: N52207->N99999 (303-13 Evaporative Emissions, Diagnosis and Testing).
P045900 | Evaporative emission system purge control valve circuit high | • Purge valve control circuit: short circuit to power | For evaporative emissions tests, REFERENCE to: Evaporative Emissions - VIN Range: N52207->N99999 (303-13 Evaporative Emissions, Diagnosis and Testing).
P046129 | Fuel level sensor A circuit range/performance - signal invalid | • Fuel level sensor to rear electronic module (REM) circuits; intermittent short circuit or high resistance  
• Fuel level sensor failure  
• REM fault (incorrect fuel level data) | For fuel level sensor circuit tests, REFERENCE to: Fuel Tank and Lines - 2.5L/3.0L/4.2L, VIN Range: N52207->N99999 (310-01 Fuel Tank and Lines, Diagnosis and Testing).
P04612F | Fuel level sensor A circuit range/performance - signal erratic | • Fuel level sensor to rear electronic module (REM) circuits; intermittent short circuit or high resistance  
• Fuel level sensor failure  
• REM fault (incorrect fuel level data) | For fuel level sensor circuit tests, REFERENCE to: Fuel Tank and Lines - 2.5L/3.0L/4.2L, VIN Range: N52207->N99999 (310-01 Fuel Tank and Lines, Diagnosis and Testing).
P046200 | Fuel level sensor A circuit low input | • Fuel level sensor to rear electronic module (REM) circuits; intermittent short circuit to ground or high resistance  
• Fuel level sensor failure  
• REM fault (incorrect fuel level data) | For fuel level sensor circuit tests, REFERENCE to: Fuel Tank and Lines - 2.5L/3.0L/4.2L, VIN Range: N52207->N99999 (310-01 Fuel Tank and Lines, Diagnosis and Testing).
P046300 | Fuel level sensor A circuit high input | • Fuel level sensor to rear electronic module (REM) circuits; intermittent short circuit to power  
• Fuel level sensor failure  
• REM fault (incorrect fuel level data) | For fuel level sensor circuit tests, REFERENCE to: Fuel Tank and Lines - 2.5L/3.0L/4.2L, VIN Range: N52207->N99999 (310-01 Fuel Tank and Lines, Diagnosis and Testing).
P048023 | Fan 1 control circuit low | • Electric fan control circuit: short circuit to ground  
• Electric fan control circuit: high resistance | For cooling fan circuit tests, GO TO Pinpoint Test T.
P048024 | Fan 1 control circuit high | • Electric fan control circuit: short circuit to battery | For cooling fan circuit tests, GO TO Pinpoint Test T.
P048309 | Fan rationality check | • Cooling fan difficult to turn  
• Fan/Motor damaged | Clear any obstruction, replace the fan as necessary.
P048316 | Fan rationality check | • Fan control module reports battery voltage less than 9 volts | Check the battery condition. Check the charging system and fan circuits.
P048317 | Fan rationality check | • Fan control module reports battery voltage greater than 18 volts | Check the charging system and fan circuits.
P048397 | Fan rationality check | • Cooling fan jammed | Clear any obstruction, replace the fan as necessary.
P050082 | Vehicle speed sensor malfunction vehicle speed invalid signal received over CAN | • Vehicle speed: invalid signal received over CAN | Check for ABS DTCs.

**Pinpoint Tests**

**PINPOINT TEST A : MASS AIR FLOW (MAF) SENSOR CIRCUIT**

⚠️ **CAUTION:** When probing connectors to take measurements in the course of the pinpoint tests, use the adaptor kit, part number J948-1358-00.

- **NOTE:** When performing electrical voltage or resistance tests, always use a digital multimeter (DMM) accurate to 3 decimal places, and with an up-to-date calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.
- **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.
- **NOTE:** Before commencing this test, check the air filter for blockage, the engine air intake and breather systems for leaks, and the TP sensor for additional DTCs.

### DETAILS/RESULTS/ACTIONS

#### TEST CONDITIONS

**A1: CHECK THE MAF SENSOR SUPPLY CIRCUIT VOLTAGE**

- **NOTE:** Check for DTCs indicating IMT valve and purge valve faults before carrying out the MAF supply voltage pinpoint test.

1. Disconnect the MAF sensor electrical connector, PI14.
2. Key on, engine off.
3. Measure the voltage between:

<table>
<thead>
<tr>
<th>MAF sensor connector PI14, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 01 Negative terminal</td>
<td></td>
</tr>
</tbody>
</table>

   **Is the voltage greater than 10 volts?**
   - Yes **GO to A2.**
   - No **REPAIR** the circuit between the MAF sensor electrical connector and the battery. This circuit includes the EMS control relay and fuse 37 of the front power distribution box. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

**A2: CHECK THE MAF SENSOR SENSING CIRCUIT FOR SHORT CIRCUIT TO GROUND**

- **NOTE:** The short to GROUND may be intermittent. Move the wiring to attempt to reproduce the conditions under which the DTC was logged, and visually inspect the harness for any signs of chafing, see "visual inspection chart".

1. Key off.
2. Measure the resistance between:

<table>
<thead>
<tr>
<th>MAF sensor connector PI14, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 03 Negative terminal</td>
<td></td>
</tr>
</tbody>
</table>
**Is the resistance less than 10,000 ohms?**

- **Yes**
  - REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

- **No**
  - GO to A3.

**A3: CHECK THE MAF SENSOR SENSING CIRCUIT FOR SHORT CIRCUIT TO POWER**

1. Measure the resistance between:
   - MAF sensor connector PI14, harness side
   - Battery
   - Pin 03

2. Is the resistance less than 10,000 ohms?
   - **Yes**
     - REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
   - **No**
     - GO to A4.

**A4: CHECK THE MAF SENSOR GROUND CIRCUIT FOR SHORT CIRCUIT TO POWER**

1. Measure the resistance between:
   - MAF sensor connector PI14, harness side
   - Battery
   - Pin 02

2. Is the resistance less than 10,000 ohms?
   - **Yes**
     - REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
   - **No**
     - GO to A5.

**A5: CHECK THE MAF SENSOR SENSING CIRCUIT FOR HIGH RESISTANCE**

1. Disconnect the ECM electrical connector, PI300.
2. Measure the resistance between:
   - MAF sensor connector PI14, harness side
   - ECM connector PI300, harness side
   - Pin 03
   - Pin 70

3. Is the resistance greater than 5 ohms?
   - **Yes**
     - REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
   - **No**
     - GO to A6.

**A6: CHECK THE MAF SENSOR GROUND CIRCUIT FOR HIGH RESISTANCE**

1. Measure the resistance between:
   - MAF sensor connector PI14, harness side
   - ECM connector PI300, harness side
   - Pin 02
   - Pin 18

2. Is the resistance greater than 5 ohms?
   - **Yes**
     - REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
   - **No**
     - INSTALL a new MAF sensor.

**PINPOINT TEST B: INTAKE AIR TEMPERATURE (IAT) SENSOR CIRCUIT**

- **NOTE:** The IAT sensor is integral with the Mass Air Flow sensor.
- **NOTE:** Before commencing this test, check the air filter for blockage and the engine air intake and breather systems for leaks. REFER to: Intake Air Distribution and Filtering - VIN Range: NS2207->N99999 (303-12A, Diagnosis and Testing).

**TEST CONDITIONS**

<table>
<thead>
<tr>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>B1: CHECK THE IAT SENSING CIRCUIT FOR SHORT CIRCUIT TO GROUND</td>
</tr>
<tr>
<td>------------------------</td>

<tr>
<td>Measure the resistance between:</td>
</tr>
<tr>
<td>MAF sensor connector PI14, harness side</td>
</tr>
<tr>
<td>Battery</td>
</tr>
<tr>
<td>Pin 04</td>
</tr>
</tbody>
</table>

- **Yes**
  - REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

- **No**
  - GO to B2.

**B2: CHECK THE IAT SENSING CIRCUIT FOR SHORT CIRCUIT TO POWER**

1. Measure the resistance between:
   - MAF sensor connector PI14, harness side
   - Battery
   - Pin 04

2. Is the resistance less than 10,000 ohms?
   - **Yes**
     - REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

- **No**
  - GO to B3.

**B3: CHECK THE IAT SENSING CIRCUIT FOR HIGH RESISTANCE**

1. Disconnect the ECM electrical connector, PI300.
2. Measure the resistance between:
   - MAF sensor connector PI14, harness side
   - ECM connector PI300, harness side
   - Pin 04
   - Pin 66
Is the resistance greater than 5 ohms?
Yes
REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No
GO to B4.

**B4: CHECK THE IAT SENSOR GROUND CIRCUIT FOR HIGH RESISTANCE**

1. Measure the resistance between:
   - MAF sensor connector PI14, harness side
   - ECM connector PI300, harness side

   Pin 05
   Pin 12

Is the resistance greater than 5 ohms?
Yes
REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No
INSTALL a new MAF sensor.
REPLACE the high resistance circuit.
REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

**PINPOINT TEST C: ENGINE COOLANT TEMPERATURE (ECT) SENSOR CIRCUIT**

- **NOTE:** Before commencing this test, check the coolant level and condition, check the operation of the thermostat, rectify as necessary.

### PINPOINT TEST E : THROTTLE POSITION (TP) SENSOR 2 CIRCUIT

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
</table>

#### E1: CHECK THE TP SENSOR SUPPLY CIRCUIT VOLTAGE

1. Disconnect the TP sensor electrical connector, PI26.  
2. Key on, engine off.  
3. Measure the voltage between:  
   - **TP sensor connector PI26, harness side**  
   - **Battery**  
4. Is the voltage less than 4 volts?  
   - **Yes**: REPAIR the 5 volt supply circuit between the TP sensor and the ECM. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.  
   - **No**: GO to E2.

#### E2: CHECK THE TP SENSOR SUPPLY CIRCUIT FOR SHORT CIRCUIT TO POWER

1. Key off.  
2. Measure the resistance between:  
   - **TP sensor connector PI26, harness side**  
   - **Battery**  
3. Is the resistance less than 10,000 ohms?  
   - **Yes**: REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.  
   - **No**: GO to E3.

#### E3: CHECK THE TP SENSOR SENSING CIRCUIT TP2 FOR SHORT CIRCUIT TO GROUND

1. Measure the resistance between:  
   - **TP sensor connector PI26, harness side**  
   - **Battery**  
2. Is the resistance less than 10,000 ohms?  
   - **Yes**: REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.  
   - **No**: GO to D3.

### D3: CHECK THE TP SENSOR SENSING CIRCUIT TP1 FOR SHORT CIRCUIT TO GROUND

1. Measure the resistance between:  
   - **TP sensor connector PI26, harness side**  
   - **Battery**  
2. Is the resistance less than 10,000 ohms?  
   - **Yes**: REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.  
   - **No**: GO to D4.

### D4: CHECK THE TP SENSOR SENSING CIRCUIT TP1 FOR SHORT CIRCUIT TO POWER

1. Measure the resistance between:  
   - **TP sensor connector PI26, harness side**  
   - **Battery**  
2. Is the resistance less than 10,000 ohms?  
   - **Yes**: REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.  
   - **No**: GO to D5.

### D5: CHECK THE TP SENSOR SENSING CIRCUIT TP1 FOR HIGH RESISTANCE

1. Disconnect the ECM electrical connector, PI300.  
2. Measure the resistance between:  
   - **TP sensor connector PI26, harness side**  
   - **ECM connector PI300, harness side**  
   - **Pin 06**  
   - **Pin 65**  
3. Is the resistance greater than 5 ohms?  
   - **Yes**: REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.  
   - **No**: GO to D6.

### D6: CHECK THE TP SENSOR GROUND CIRCUIT FOR HIGH RESISTANCE

1. Measure the resistance between:  
   - **TP sensor connector PI26, harness side**  
   - **ECM connector PI300, harness side**  
   - **Pin 03**  
   - **Pin 11**  
2. Is the resistance greater than 5 ohms?  
   - **Yes**: REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.  
   - **No**: INSTALL a new TP sensor. REFER to: Throttle Body - VIN Range: N52207->N99999 (303-04A Fuel Charging and Controls - 2.5L/3.0L, Removal and Installation). CLEAR the DTC and test the system for normal operation.
Is the resistance less than 10,000 ohms?
Yes
  REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
  GO to E4.

E4: CHECK THE TP SENSOR SENSING CIRCUIT TP2 FOR SHORT CIRCUIT TO POWER
1. Measure the resistance between:
   TP sensor connector PI26, harness side Battery
   Pin 04 Positive terminal
Is the resistance less than 10,000 ohms?
Yes
  REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
  GO to E5.

E5: CHECK THE TP SENSOR SENSING CIRCUIT TP2 FOR HIGH RESISTANCE
1. Disconnect the ECM electrical connector, PI300.
2. Measure the resistance between:
   TP sensor connector PI26, harness side ECM connector PI300, harness side
   Pin 04 Pin 67
Is the resistance greater than 5 ohms?
Yes
  REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
  GO to E6.

E6: CHECK THE TP SENSOR GROUND CIRCUIT FOR HIGH RESISTANCE
1. Measure the resistance between:
   TP sensor connector PI26, harness side ECM connector PI300, harness side
   Pin 03 Pin 11
Is the resistance greater than 5 ohms?
Yes
  REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
  INSTALL a new TP sensor.
  REFER to: Throttle Body - VIN Range: N52207->N99999 (303-04A Fuel Charging and Controls - 2.5L/3.0L, Removal and Installation).
  CLEAR the DTC and test the system for normal operation.

PINPOINT TEST F : RIGHT-HAND H02S VARIABLE AND CONSTANT CIRCUITS

CAUTION: Under no circumstances must the sensor wiring be cut to facilitate removal, should this prove necessary.

  NOTE: Before commencing this test, check the sensor connections and harness, check for exhaust leaks, (a very small exhaust leak can cause this DTC to flag). See "visual inspection chart" and "possible causes".

TEST CONDITIONS DETAILS/RESULTS/ACTIONS

F1: CHECK THE H02S VARIABLE CIRCUIT FOR SHORT CIRCUIT TO GROUND
1. Disconnect the H02S electrical connector, PI10.
2. Measure the resistance between:
   H02S connector PI10, harness side Battery
   Pin 04 Negative terminal
Is the resistance less than 10,000 ohms?
Yes
  REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
  GO to F2.

F2: CHECK THE H02S VARIABLE CIRCUIT FOR SHORT CIRCUIT TO POWER
1. Measure the resistance between:
   H02S connector PI10, harness side Battery
   Pin 04 Positive terminal
Is the resistance less than 10,000 ohms?
Yes
  REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
  GO to F3.

F3: CHECK THE H02S CONSTANT CIRCUIT FOR SHORT CIRCUIT TO GROUND
1. Measure the resistance between:
   H02S connector PI10, harness side Battery
   Pin 03 Negative terminal
Is the resistance less than 10,000 ohms?
Yes
  REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
  GO to F4.

F4: CHECK THE H02S CONSTANT CIRCUIT FOR SHORT CIRCUIT TO POWER
1. Measure the resistance between:
   H02S connector PI10, harness side Battery
   Pin 03 Positive terminal
Is the resistance less than 10,000 ohms?
Yes
  REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
GO to F5.

F5: CHECK THE H02S VARIABLE CIRCUIT FOR HIGH RESISTANCE

1. Disconnect the ECM electrical connector, PI300.
2. Measure the resistance between:
   - H02S connector PI10, harness side
   - ECM connector PI300, harness side
   - Pin 04
   - Pin 28

Is the resistance greater than 5 ohms?
Yes
REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
GO to F6.

F6: CHECK THE H02S CONSTANT CIRCUIT FOR HIGH RESISTANCE

1. Measure the resistance between:
   - H02S connector PI10, harness side
   - ECM connector PI300, harness side
   - Pin 03
   - Pin 29

Is the resistance greater than 5 ohms?
Yes
REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
INSTALL a new H02S.
REFER to: Heated Oxygen Sensor (HO2S) (303-14A Electronic Engine Controls - 2.5L/3.0L, Removal and Installation).
CLEAR the DTC and test the system for normal operation.

PINPOINT TEST G : RIGHT-HAND H02S HEATER SUPPLY AND CONTROL CIRCUITS

CAUTION: Under no circumstances must the sensor wiring be cut to facilitate removal, should this prove necessary.

NOTE: Carry out a visual inspection of the HO2S connectors (integrity of connections may be affected by heat from catalytic converters).

TEST CONDITIONS

DETAILS/RESULTS/ACTIONS

G1: CHECK H02S HEATER POWER SUPPLY CIRCUIT

1. Disconnect the H02S electrical connector, PI10.
2. Key on, engine off.
3. Make sure the O2S heater relay is energized.
4. Measure the voltage between:
   - H02S connector PI10, harness side
   - Battery
   - Pin 01
   - Negative terminal

Is the voltage greater than 10 volts?
Yes
GO to G2.
No
REPAIR the power supply circuit to the H02S heater. This circuit includes the O2S heater relay and fuse 20 of the front power distribution box. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

G2: CHECK H02S HEATER CONTROL CIRCUIT FROM ECM FOR SHORT CIRCUIT TO GROUND

1. Key off.
2. Measure the resistance between:
   - H02S connector PI10, harness side
   - Battery
   - Pin 02
   - Negative terminal

Is the resistance less than 10,000 ohms?
Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
GO to G3.

G3: CHECK H02S HEATER CONTROL CIRCUIT FROM ECM FOR SHORT CIRCUIT TO POWER

1. Measure the resistance between:
   - H02S connector PI10, harness side
   - Battery
   - Pin 02
   - Positive terminal

Is the resistance less than 10,000 ohms?
Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
GO to G4.

G4: CHECK H02S HEATER CONTROL CIRCUIT FROM ECM FOR HIGH RESISTANCE

1. Disconnect the ECM electrical connector, PI300.
2. Measure the resistance between:
   - H02S connector PI10, harness side
   - ECM connector PI300, harness side
   - Pin 02
   - Pin 76

Is the resistance greater than 5 ohms?
Yes
REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
INSTALL a new H02S.
REFER to: Heated Oxygen Sensor (HO2S) (303-14A Electronic Engine Controls - 2.5L/3.0L, Removal and Installation).
CLEAR the DTC and test the system for normal operation.

PINPOINT TEST H : RIGHT-HAND CATALYST MONITOR SENSOR SENSING AND GROUND CIRCUITS

CAUTION: Under no circumstances must the sensor wiring be cut to facilitate removal, should this prove necessary.
I1: CHECK THE CATALYST MONITOR HEATER POWER SUPPLY CIRCUIT
1. Disconnect the catalyst monitor sensor electrical connector, PI11.
2. Key on, engine off.
3. Make sure the O2S heater relay is energized.
4. Measure the voltage between:
   Catalyst monitor connector PI11, harness side
   Battery
   Pin 01
   Is the voltage greater than 10 volts?
   Yes
   GO to I2.
   No
   REPAIR the power supply circuit to the catalyst monitor heater. This circuit includes the O2S heater relay and fuse 20 of the front power distribution box. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

I2: CHECK THE CATALYST MONITOR HEATER CONTROL CIRCUIT FOR SHORT CIRCUIT TO GROUND
1. Key off.
2. Measure the resistance between:
   Catalyst monitor connector PI11, harness side
   Battery
   Pin 02
   Is the resistance less than 10,000 ohms?
   Yes
   REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
   No
   GO to I3.

I3: CHECK THE CATALYST MONITOR HEATER CONTROL CIRCUIT FOR SHORT CIRCUIT TO POWER
1. Measure the resistance between:
   Catalyst monitor connector PI11, harness side
   Battery
   Pin 02
   Is the resistance less than 10,000 ohms?
   Yes
   REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
   No
   GO to I4.
Is the resistance less than 10,000 ohms?
Yes
   REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
   GO to I4.

I4: CHECK THE CATALYST MONITOR HEATER CONTROL CIRCUIT FOR HIGH RESISTANCE

1. Disconnect the ECM electrical connector, PI300.
2. Measure the resistance between:
<table>
<thead>
<tr>
<th>Catalyst monitor connector PI11, harness side</th>
<th>ECM connector PI300, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Pin 88</td>
</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?
Yes
   REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
   INSTALL a new catalyst monitor sensor.
   REFER to: Catalyst Monitor Sensor (303-14A Electronic Engine Controls - 2.5L/3.0L, Removal and Installation).
   CLEAR the DTC and test the system for normal operation. If the DTC is repeated, refer to the warranty policy and procedures manual if an ECM is suspect.

PINPOINT TEST J: LEFT-HAND H02S VARIABLE AND CONSTANT CIRCUITS

CAUTION: Under no circumstances must the sensor wiring be cut to facilitate removal, should this prove necessary.

• NOTE: Before commencing this test, check the sensor connections and harness, check for exhaust leaks, (a very small exhaust leak can cause this DTC to flag). See "visual inspection chart" and "possible causes".

</tr>
<tr>
<td>No</td>
<td>GO to L2.</td>
</tr>
</tbody>
</table>

L2: CHECK THE CATALYST MONITOR SENSOR SENSING CIRCUIT FOR SHORT CIRCUIT TO POWER
Measure the resistance between:

<table>
<thead>
<tr>
<th>Catalyst monitor connector PI13, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 04</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance less than 10,000 ohms?
Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No
GO to L3.

L3: CHECK THE CATALYST MONITOR SENSOR SENSING CIRCUIT FOR HIGH RESISTANCE

1 Disconnect the ECM electrical connector, PI300.
2 Measure the resistance between:

<table>
<thead>
<tr>
<th>Catalyst monitor connector PI13, harness side</th>
<th>ECM connector PI300, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 04</td>
<td>Pin 41</td>
</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?
Yes
REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No
GO to L4.

L4: CHECK THE CATALYST MONITOR SENSOR GROUND CIRCUIT FOR HIGH RESISTANCE

1 Measure the resistance between:

<table>
<thead>
<tr>
<th>Catalyst monitor connector PI13, harness side</th>
<th>ECM connector PI300, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 03</td>
<td>Pin 45</td>
</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?
Yes
REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No
INSTALL a new catalyst monitor sensor.
REFERENCE: Catalyst Monitor Sensor (303-14A Electronic Engine Controls - 2.5L/3.0L, Removal and Installation).
CLEAR the DTC and test the system for normal operation.

PINPOINT TEST M: LEFT-HAND CATALYST MONITOR SENSOR SUPPLY AND HEATER CONTROL CIRCUITS

CAUTION: Under no circumstances must the sensor wiring be cut to facilitate removal, should this prove necessary.

• NOTE: Carry out a visual inspection of the HO2S connectors (integrity of connections may be affected by heat from catalytic converters)

TEST CONDITIONS

M1: CHECK THE CATALYST MONITOR HEATER POWER SUPPLY CIRCUIT

1 Disconnect the catalyst monitor sensor electrical connector, PI13.
2 Key on, engine off.
3 Make sure the O2S heater relay is energized.
4 Measure the voltage between:

<table>
<thead>
<tr>
<th>Catalyst monitor connector PI13, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 01</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the voltage greater than 10 volts?
Yes
GO to M2.

No
REPAIR the power supply circuit to the catalyst monitor heater. This circuit includes the O2S heater relay and fuse 35 of the front power distribution box. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

M2: CHECK THE CATALYST MONITOR HEATER CONTROL CIRCUIT FOR SHORT CIRCUIT TO GROUND

1 Key off.
2 Measure the resistance between:

<table>
<thead>
<tr>
<th>Catalyst monitor connector PI13, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance less than 10,000 ohms?
Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No
GO to M3.

M3: CHECK THE CATALYST MONITOR HEATER CONTROL CIRCUIT FOR SHORT CIRCUIT TO POWER

1 Measure the resistance between:

<table>
<thead>
<tr>
<th>Catalyst monitor connector PI13, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance less than 10,000 ohms?
Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No
GO to M4.

M4: CHECK THE CATALYST MONITOR SENSOR HEATER CONTROL CIRCUIT FOR HIGH RESISTANCE

1 Disconnect the ECM electrical connector, PI300.
2 Measure the resistance between:

<table>
<thead>
<tr>
<th>Catalyst monitor connector PI13, harness side</th>
<th>ECM connector PI300, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Pin 89</td>
</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?
Yes
REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No
INSTALL a new catalyst monitor sensor.
## PINPOINT TEST N : ENGINE OIL TEMPERATURE (EOT) SENSOR CIRCUIT

### TEST CONDITIONS

<table>
<thead>
<tr>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
</table>

### N1: CHECK THE EOT SENSOR SENSING CIRCUIT FOR SHORT CIRCUIT TO GROUND

1. Disconnect the EOT sensor electrical connector, PI24.
2. Measure the resistance between:

<table>
<thead>
<tr>
<th>EOT sensor connector PI24, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Pin 23</td>
</tr>
</tbody>
</table>

- Is the resistance less than 10,000 ohms?
  - Yes: REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
  - No: GO to N2.

### N2: CHECK THE EOT SENSOR SENSING CIRCUIT FOR SHORT CIRCUIT TO POWER

1. Measure the resistance between:

<table>
<thead>
<tr>
<th>EOT sensor connector PI24, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Pin 02</td>
</tr>
</tbody>
</table>

- Is the resistance less than 10,000 ohms?
  - Yes: REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
  - No: GO to N3.

### N3: CHECK THE EOT SENSOR SENSING CIRCUIT FOR HIGH RESISTANCE

1. Disconnect the ECM electrical connector, PI300.
2. Measure the resistance between:

<table>
<thead>
<tr>
<th>EOT sensor connector PI24, harness side</th>
<th>ECM connector PI300, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Pin 01</td>
</tr>
</tbody>
</table>

- Is the resistance greater than 5 ohms?
  - Yes: REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
  - No: GO to N4.

### N4: CHECK THE EOT SENSOR GROUND CIRCUIT FOR HIGH RESISTANCE

1. Measure the resistance between:

<table>
<thead>
<tr>
<th>EOT sensor connector PI24, harness side</th>
<th>ECM connector PI300, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 01</td>
<td>Pin 01</td>
</tr>
</tbody>
</table>

- Is the resistance greater than 5 ohms?
  - Yes: REPAIR the high resistance circuit. This circuit includes harness splice, PIS49. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
  - No: INSTALL a new EOT sensor.
    - REFER to: Oil Temperature Sensor (303-14A Electronic Engine Controls - 2.5L/3.0L, Removal and Installation).
    - CLEAR the DTC and test the system for normal operation. If the DTC is repeated, refer to the warranty policy and procedures manual if an ECM is suspect.

## PINPOINT TEST O : RIGHT-HAND KNOCK SENSOR (KS) CIRCUIT

*NOTE: Before commencing this test, make sure that the sensor is making a good electrical contact with the cylinder block. See "possible causes".*

### TEST CONDITIONS

<table>
<thead>
<tr>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
</table>

### O1: CHECK KS SENSING CIRCUIT FOR SHORT CIRCUIT TO GROUND

1. Disconnect the KS electrical connector, PI43.
2. Measure the resistance between:

<table>
<thead>
<tr>
<th>KS connector PI43, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 01</td>
<td>Pin 01</td>
</tr>
</tbody>
</table>

- Is the resistance less than 10,000 ohms?
  - Yes: REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
  - No: GO to O2.

### O2: CHECK KS SENSING CIRCUIT FOR SHORT CIRCUIT TO POWER

1. Measure the resistance between:

<table>
<thead>
<tr>
<th>KS connector PI43, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 01</td>
<td>Pin 01</td>
</tr>
</tbody>
</table>

- Is the resistance less than 10,000 ohms?
  - Yes: REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
  - No: GO to O3.

### O3: CHECK KS SENSING CIRCUIT FOR HIGH RESISTANCE

1. Disconnect the ECM electrical connector, PI300.
2. Measure the resistance between:

<table>
<thead>
<tr>
<th>KS connector PI43, harness side</th>
<th>ECM connector PI300, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 01</td>
<td>Pin 01</td>
</tr>
</tbody>
</table>
Is the resistance greater than 5 ohms?

Yes

REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No

GO to O4.

O4: CHECK KS GROUND CIRCUIT FOR HIGH RESISTANCE

1. Measure the resistance between:
   - KS connector PI43, harness side
   - ECM connector PI300, harness side

Pin 02
Pin 19

Is the resistance greater than 5 ohms?

Yes

REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No

INSTALL a new KS.

REFER to: Knock Sensor (KS) RH (303-14A Electronic Engine Controls - 2.5L/3.0L, Removal and Installation).

CLEAR the DTC and test the system for normal operation.

PINPOINT TEST P: LEFT-HAND KNOCK SENSOR (KS) CIRCUIT

• NOTE: Before commencing this test, make sure that the sensor is making a good electrical contact with the cylinder block. See "possible causes".

TEST CONDITIONS

DETAILS/RESULTS/ACTIONS

P1: CHECK KS SENSING CIRCUIT FOR SHORT CIRCUIT TO GROUND

1. Disconnect the KS electrical connector, PI44.
2. Measure the resistance between:
   - KS connector PI44, harness side
   - Battery

Pin 01
Negative terminal

Is the resistance less than 10,000 ohms?

Yes

REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No

GO to P2.

P2: CHECK KS SENSING CIRCUIT FOR SHORT CIRCUIT TO POWER

1. Measure the resistance between:
   - KS connector PI44, harness side
   - Battery

Pin 01
Positive terminal

Is the resistance less than 10,000 ohms?

Yes

REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No

GO to P3.

P3: CHECK KS SENSING CIRCUIT FOR HIGH RESISTANCE

1. Disconnect the ECM electrical connector, PI300.
2. Measure the resistance between:
   - KS connector PI44, harness side
   - ECM connector PI300, harness side

Pin 01
Pin 43

Is the resistance greater than 5 ohms?

Yes

REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No

GO to P4.

P4: CHECK KS GROUND CIRCUIT FOR HIGH RESISTANCE

1. Measure the resistance between:
   - KS connector PI44, harness side
   - ECM connector PI300, harness side

Pin 02
Pin 20

Is the resistance greater than 5 ohms?

Yes

REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No

INSTALL a new KS.

REFER to: Knock Sensor (KS) LH (303-14A Electronic Engine Controls - 2.5L/3.0L, Removal and Installation).

CLEAR the DTC and test the system for normal operation.

PINPOINT TEST Q: CRANKSHAFT POSITION (CKP) SENSOR CIRCUIT

• NOTE: The clearance between the CKP sensor and the reluctor ring should be checked at 90° intervals. The air gap between the two should be no greater than 4.5 mm at any point.

TEST CONDITIONS

DETAILS/RESULTS/ACTIONS

Q1: CHECK THE CKP SENSOR FOR CORRECT INSTALLATION

1. Check the CKP sensor for correct installation.

Is the CKP sensor correctly installed?

Yes

GO to Q2.

No

INSTALL the CKP sensor correctly.

REFER to: Crankshaft Position (CKP) Sensor (303-14A Electronic Engine Controls - 2.5L/3.0L, Removal and Installation).

Reconnect the sensor. CLEAR the DTCs and test the system for normal operation.

Q2: CHECK THE CKP SENSOR FOR DEBRIS

1. Remove the CKP sensor and inspect for debris.
### Q3: CHECK THE CKP SENSOR SENSING CIRCUIT FOR SHORT CIRCUIT TO GROUND

1. Disconnect the CKP sensor electrical connector, PI21.
2. Measure the resistance between:

<table>
<thead>
<tr>
<th>CKP sensor connector PI21, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td></td>
</tr>
</tbody>
</table>

- **Is the resistance less than 10,000 ohms?**
  - Yes: REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
  - No: GO to Q4.

### Q4: CHECK THE CKP SENSOR SENSING CIRCUIT FOR SHORT CIRCUIT TO POWER

1. Measure the resistance between:

<table>
<thead>
<tr>
<th>CKP sensor connector PI21, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td></td>
</tr>
</tbody>
</table>

- **Is the resistance less than 10,000 ohms?**
  - Yes: REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
  - No: GO to Q5.

### Q5: CHECK THE CKP SENSOR SENSING CIRCUIT FOR HIGH RESISTANCE

1. Disconnect the ECM electrical connector, PI300.
2. Measure the resistance between:

<table>
<thead>
<tr>
<th>CKP sensor connector PI21, harness side</th>
<th>ECM connector PI300, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Pin 30</td>
</tr>
</tbody>
</table>

- **Is the resistance greater than 5 ohms?**
  - Yes: REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
  - No: GO to Q6.

### Q6: CHECK THE CKP SENSOR GROUND CIRCUIT FOR HIGH RESISTANCE

1. Measure the resistance between:

<table>
<thead>
<tr>
<th>CKP sensor connector PI21, harness side</th>
<th>ECM connector PI300, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 01</td>
<td>Pin 06</td>
</tr>
</tbody>
</table>

- **Is the resistance greater than 5 ohms?**
  - Yes: REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
  - No: INSTALL a new CKP sensor. REFER to: Crankshaft Position (CKP) Sensor (303-14A Electronic Engine Controls - 2.5L/3.0L, Removal and Installation). CLEAR the DTC and test the system for normal operation.

### PINPOINT TEST R: RIGHT-HAND CAMSHAFT POSITION (CMP) SENSOR CIRCUIT

#### TEST CONDITIONS

<table>
<thead>
<tr>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
</table>

### R1: CHECK THE CMP SENSOR FOR CORRECT INSTALLATION

1. Check the CMP sensor for correct installation.

- **Is the CMP sensor correctly installed?**
  - Yes: GO to R2.
  - No: INSTALL the CMP sensor correctly. REFER to: Camshaft Position (CMP) Sensor RH (303-14A Electronic Engine Controls - 2.5L/3.0L, Removal and Installation). CLEAR the DTCs and test the system for normal operation.

### R2: CHECK THE CMP SENSOR FOR FOREIGN DEBRIS

1. Remove the CMP sensor and inspect for foreign debris.

- **Is the CMP sensor free of foreign debris?**
  - Yes: GO to R3.
  - No: CLEAN the sensor and wheel. INSTALL the sensor. REFER to: Camshaft Position (CMP) Sensor RH (303-14A Electronic Engine Controls - 2.5L/3.0L, Removal and Installation). CLEAR the DTCs and test the system for normal operation.

### R3: CHECK THE CMP SENSOR SENSING CIRCUIT FOR SHORT CIRCUIT TO GROUND

1. Disconnect the CMP sensor electrical connector, PI23.
2. Measure the resistance between:

<table>
<thead>
<tr>
<th>CMP sensor connector PI23, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 01</td>
<td></td>
</tr>
</tbody>
</table>

- **Is the resistance less than 10,000 ohms?**
  - Yes: REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
  - No: INSTALL a new CMP sensor. REFER to: Camshaft Position (CMP) Sensor RH (303-14A Electronic Engine Controls - 2.5L/3.0L, Removal and Installation). CLEAR the DTC and test the system for normal operation.
R4: CHECK THE CMP SENSOR SENSING CIRCUIT FOR SHORT CIRCUIT TO POWER
1. Measure the resistance between:
   CMP sensor connector PI23, harness side   Battery
   Pin 01   Positive terminal

Is the resistance less than 10,000 ohms?
Yes
   REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
   GO to R5.

R5: CHECK THE CMP SENSOR SENSING CIRCUIT FOR HIGH RESISTANCE
1. Disconnect the ECM electrical connector, PI300.
2. Measure the resistance between:
   CMP sensor connector PI23, harness side   ECM connector PI300, harness side
   Pin 01   Pin 34

Is the resistance greater than 5 ohms?
Yes
   REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
   GO to R6.

R6: CHECK THE CMP SENSOR GROUND CIRCUIT FOR HIGH RESISTANCE
1. Measure the resistance between:
   CMP sensor connector PI23, harness side   ECM connector PI300, harness side
   Pin 02   Pin 07

Is the resistance greater than 5 ohms?
Yes
   REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
   INSTALL a new CMP sensor.
   REFER to: Camshaft Position (CMP) Sensor RH (303-14A Electronic Engine Controls - 2.5L/3.0L, Removal and Installation).
   CLEAR the DTC and test the system for normal operation.

PINPOINT TEST S : LEFT-HAND CAMSHAFT POSITION (CMP) SENSOR CIRCUIT
TEST CONDITIONS
DETAILS/RESULTS/ACTIONS
S1: CHECK THE CMP SENSOR FOR CORRECT INSTALLATION
1. Check the CMP sensor for correct installation.

Is the CMP sensor correctly installed?
Yes
   GO to S2.
No
   INSTALL the CMP sensor correctly.
   REFER to: Camshaft Position (CMP) Sensor LH (303-14A Electronic Engine Controls - 2.5L/3.0L, Removal and Installation).
   CLEAR the DTCs and test the system for normal operation.

S2: CHECK THE CMP SENSOR FOR FOREIGN DEBRIS
1. Remove the CMP sensor and inspect for foreign debris.

Is the CMP sensor free of foreign debris?
Yes
   GO to S3.
No
   CLEAN the sensor and wheel. INSTALL the sensor.
   REFER to: Camshaft Position (CMP) Sensor LH (303-14A Electronic Engine Controls - 2.5L/3.0L, Removal and Installation).
   CLEAR the DTCs and test the system for normal operation.

S3: CHECK THE CMP SENSOR SENSING CIRCUIT FOR SHORT CIRCUIT TO GROUND
1. Disconnect the CMP sensor electrical connector, PI22.
2. Measure the resistance between:
   CMP sensor connector PI22, harness side   Battery
   Pin 01   Negative terminal

Is the resistance less than 10,000 ohms?
Yes
   REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
   GO to S4.

S4: CHECK THE CMP SENSOR SENSING CIRCUIT FOR SHORT CIRCUIT TO POWER
1. Measure the resistance between:
   CMP sensor connector PI22, harness side   Battery
   Pin 01   Positive terminal

Is the resistance less than 10,000 ohms?
Yes
   REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
   GO to S5.

S5: CHECK THE CMP SENSOR SENSING CIRCUIT FOR HIGH RESISTANCE
1. Disconnect the ECM electrical connector, PI300.
2. Measure the resistance between:
   CMP sensor connector PI22, harness side   ECM connector PI300, harness side
   Pin 01   Pin 33
Is the resistance greater than 5 ohms?
Yes
REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
GO to S6.

S6: CHECK THE CMP SENSOR GROUND CIRCUIT FOR HIGH RESISTANCE

<table>
<thead>
<tr>
<th>Pin 02</th>
<th>Pin 08</th>
</tr>
</thead>
</table>

Is the resistance greater than 5 ohms?
Yes
REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
INSTALL a new CMP sensor.
REFER to: Camshaft Position (CMP) Sensor LH (303-14A Electronic Engine Controls - 2.5L/3.0L, Removal and Installation). CLEAR the DTC and test the system for normal operation.

# PINPOINT TEST T: RADIATOR COOLING FAN MODULE DRIVE CIRCUIT

## TEST CONDITIONS

### T1: CHECK THE RADIATOR FAN MODULE PERMANENT SUPPLY

1. Disconnect the fan module electrical connector, FH109.
2. Measure the voltage between:

<table>
<thead>
<tr>
<th>Fan module connector FH109, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 01</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the voltage less than 10 volts?
Yes
REPAIR the circuit between the cooling fan module and battery. This circuit includes fuse 13 of the front power distribution box and the mega fuses. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
GO to T2.

### T2: CHECK THE RADIATOR FAN MODULE EMS SWITCHED SUPPLY

1. Disconnect the fan module electrical connector, FH108.
2. Key on, engine off.
3. Make sure the EMS relay is energized.
4. Measure the voltage between:

<table>
<thead>
<tr>
<th>Fan module connector FH108, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the voltage less than 10 volts?
Yes
REPAIR the circuit between the cooling fan module and battery. This circuit includes fuse 38 of the front power distribution box and the EMS control relay. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
GO to T3.

### T3: CHECK THE RADIATOR FAN MODULE CONTROL CIRCUIT FOR SHORT CIRCUIT TO GROUND

1. Key off.
2. Measure the resistance between:

<table>
<thead>
<tr>
<th>Fan module connector FH108, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 01</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance less than 10,000 ohms?
Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
GO to T4.

### T4: CHECK THE RADIATOR FAN MODULE CONTROL CIRCUIT FOR SHORT CIRCUIT TO POWER

1. Measure the resistance between:

<table>
<thead>
<tr>
<th>Fan module connector FH108, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 01</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance less than 10,000 ohms?
Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
GO to T5.

### T5: CHECK THE RADIATOR FAN MODULE CONTROL CIRCUIT FOR HIGH RESISTANCE

1. Disconnect the ECM electrical connector, FH300.
2. Measure the resistance between:

<table>
<thead>
<tr>
<th>Fan module connector FH108, harness side</th>
<th>ECM connector FH300, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 01</td>
<td>Pin 49</td>
</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?
Yes
REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
GO to T6.

### T6: CHECK THE RADIATOR FAN MODULE GROUND FOR HIGH RESISTANCE

1. Measure the resistance between:

<table>
<thead>
<tr>
<th>Fan module connector FH109, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>
Is the resistance greater than 5 ohms?
Yes
REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
INSTALL a new radiator cooling fan module. CLEAR the DTC and test the system for normal operation.

PINPOINT TEST U : BATTERY POWER SUPPLY VOLTAGE

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>

## PINPOINT TEST X : THROTTLE MOTOR CONTROL CIRCUIT

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>X1: CHECK THE THROTTLE MOTOR TO ECM NEGATIVE CIRCUIT FOR HIGH RESISTANCE</strong></td>
<td></td>
</tr>
<tr>
<td>1  Disconnect the throttle motor electrical connector, PI26.</td>
<td></td>
</tr>
<tr>
<td>2  Disconnect the ECM electrical connector, PI300.</td>
<td></td>
</tr>
</tbody>
</table>
Measure the resistance between:

<table>
<thead>
<tr>
<th>Throttle motor connector PI26, harness side</th>
<th>ECM connector PI300, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 01</td>
<td>Pin 74</td>
</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?

Yes

REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No

GO to X2.

X2: CHECK THE THROTTLE MOTOR TO ECM POSITIVE CIRCUIT FOR HIGH RESISTANCE

<table>
<thead>
<tr>
<th>Throttle motor connector PI26, harness side</th>
<th>ECM connector PI300, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Pin 75</td>
</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?

Yes

REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No

INSTALL a new throttle body.

REFER to: Throttle Body - VIN Range: N52207->N99999 (303-04A Fuel Charging and Controls - 2.5L/3.0L, Removal and Installation).

CLEAR the DTC and test the system for normal operation.

PINPOINT TEST Y : FUEL RAIL PRESSURE (FRP) SENSOR CIRCUIT

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Y1: CHECK THE FRP SENSOR SUPPLY CIRCUIT VOLTAGE</td>
<td></td>
</tr>
<tr>
<td>1</td>
<td>Disconnect the FRP sensor electrical connector, IL12.</td>
</tr>
<tr>
<td>2</td>
<td>Key on, engine off.</td>
</tr>
</tbody>
</table>
| 3 | Measure the voltage between:  
| FRP sensor connector IL12, harness side | Battery |
| Pin 01 | Negative terminal |

Is the voltage less than 4 volts?

Yes

REPAIR the 5 volt supply circuit between the FRP sensor and the ECM. CLEAR the DTC and test the system for normal operation.

No

GO to Y2.

Y2: CHECK THE FRP SENSOR SUPPLY CIRCUIT FOR SHORT CIRCUIT TO POWER

| Key off. | Measure the resistance between:  
| FRP sensor connector IL12, harness side | Battery |
| Pin 01 | Positive terminal |

Is the resistance less than 10,000 ohms?

Yes

REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No

GO to Y3.

Y3: CHECK THE FRP SENSOR SIGNAL CIRCUIT FOR SHORT CIRCUIT TO GROUND

| Measure the resistance between:  
| FRP sensor connector IL12, harness side | Battery |
| Pin 03 | Negative terminal |

Is the resistance less than 10,000 ohms?

Yes

REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No

GO to Y4.

Y4: CHECK THE FRP SENSOR SIGNAL CIRCUIT FOR SHORT CIRCUIT TO POWER

| Measure the resistance between:  
| FRP sensor connector IL12, harness side | Battery |
| Pin 03 | Positive terminal |

Is the resistance less than 10,000 ohms?

Yes

REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No

GO to Y5.

Y5: CHECK THE FRP SENSOR SIGNAL CIRCUIT FOR HIGH RESISTANCE

| Disconnect the ECM sensor electrical connector, PI300. |
| Measure the resistance between:  
| FRP sensor connector IL12, harness side | ECM connector PI300, harness side |
| Pin 03 | Pin 71 |

Is the resistance greater than 5 ohms?

Yes

REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No

GO to Y6.

Y6: CHECK THE FRP SENSOR GROUND CIRCUIT FOR HIGH RESISTANCE

| Measure the resistance between:  
| FRP sensor connector IL12, harness side | ECM connector PI300, harness side |
| Pin 02 | Pin 10 |
Is the resistance greater than 5 ohms?
Yes
- REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
- INSTALL a new FRP sensor. CLEAR the DTC and test the system for normal operation.
No

PINPOINT TEST Z : STARTER RELAY SIGNAL
TEST CONDITIONS

Z1: CHECK THE STARTER RELAY TO ECM CIRCUIT FOR SHORT CIRCUIT TO GROUND

1. Key off.
2. Remove the starter relay.
3. Measure the resistance between:
   
<table>
<thead>
<tr>
<th>Starter relay base</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance less than 10,000 ohms?
Yes
- REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
- GO to Z2.

Z2: CHECK THE STARTER RELAY TO ECM CIRCUIT FOR SHORT CIRCUIT TO POWER

1. Measure the resistance between:
   
<table>
<thead>
<tr>
<th>Starter relay base</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance less than 10,000 ohms?
Yes
- REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
- GO to Z3.

Z3: CHECK THE STARTER RELAY TO ECM CIRCUIT FOR HIGH RESISTANCE

1. Disconnect the ECM electrical connector, EC300.
2. Measure the resistance between:
   
<table>
<thead>
<tr>
<th>Starter relay base</th>
<th>ECM connector EC300, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Pin 51</td>
</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?
Yes
- REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
- INSTALL a new starter relay. Clear the DTC and test the system for normal operation. If the DTC resets, refer to the warranty policy and procedures manual if an ECM is suspect.

PINPOINT TEST AA : RIGHT-HAND VARIABLE CAMSHAFT TIMING (VCT) OIL CONTROL SOLENOID CIRCUIT
TEST CONDITIONS

AA1: CHECK ECM TO VCT SOLENOID SUPPLY CIRCUIT VOLTAGE

1. Disconnect the VCT solenoid electrical connector, PI16.
2. Key on, engine off.
3. Measure the voltage between:
   
<table>
<thead>
<tr>
<th>VCT solenoid connector PI16, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the voltage greater than 10 volts?
Yes
- GO to AA2.
No
- REPAIR the circuit between the VCT solenoid electrical connector and battery. This circuit includes fuse 38 of the front power distribution box and the EMS control relay. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

AA2: CHECK VCT SOLENOID CONTROL CIRCUIT FOR HIGH RESISTANCE

1. Key off.
2. Disconnect the ECM electrical connector, PI300.
3. Measure the resistance between:
   
<table>
<thead>
<tr>
<th>VCT solenoid connector PI16, harness side</th>
<th>ECM connector PI300, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 01</td>
<td>Pin 86</td>
</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?
Yes
- REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
- INSTALL a new VCT oil control solenoid.
- REFER to: Variable Camshaft Timing (VCT) Oil Control Solenoid (303-14A Electronic Engine Controls - 2.5L/3.0L, Removal and Installation).
- CLEAR the DTC and test the system for normal operation.

PINPOINT TEST AB : LEFT-HAND VARIABLE CAMSHAFT TIMING (VCT) OIL CONTROL SOLENOID CIRCUIT
TEST CONDITIONS

AB1: CHECK ECM TO VCT SOLENOID SUPPLY CIRCUIT VOLTAGE

1. Disconnect the VCT solenoid electrical connector, PI17.
2. Key on, engine off.
Measure the voltage between:

<table>
<thead>
<tr>
<th>VCT solenoid connector PI17, harness side</th>
<th>Battery</th>
</tr>
</thead>
</table>

Is the voltage greater than 10 volts?

Yes  
GO to AB2.

No  
REPAIR the circuit between the VCT solenoid electrical connector and battery. This circuit includes fuse 38 of the front power distribution box and the EMS control relay. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

AB2: CHECK VCT SOLENOID CONTROL CIRCUIT FOR HIGH RESISTANCE

1. Key off.
2. Disconnect the ECM electrical connector, PI300.
3. Measure the resistance between:

<table>
<thead>
<tr>
<th>VCT solenoid connector PI17, harness side</th>
<th>ECM connector PI300, harness side</th>
</tr>
</thead>
</table>

Pin 01                  Pin 87

Is the resistance greater than 5 ohms?

Yes  
REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No  
INSTALL a new VCT oil control solenoid. REFER to: Variable Camshaft Timing (VCT) Oil Control Solenoid (303-14A Electronic Engine Controls - 2.5L/3.0L, Removal and Installation). CLEAR the DTC and test the system for normal operation.

PINPOINT TEST AC : EMS CONTROL RELAY CIRCUITS

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>AC1: CHECK THE EMS RELAY PERMANENT SUPPLY VOLTAGES</td>
<td></td>
</tr>
<tr>
<td>1. Remove the EMS relay.</td>
<td></td>
</tr>
<tr>
<td>2. Measure the voltage between:</td>
<td></td>
</tr>
<tr>
<td>EMS relay base, harness side</td>
<td>Battery</td>
</tr>
<tr>
<td>Pin 01</td>
<td>Negative terminal</td>
</tr>
<tr>
<td>Pin 03</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Are both voltages greater than 10 volts?

Yes  
GO to AC2.

No  
REPAIR the circuit between the relay base and battery. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

AC2: CHECK THE ECM TO EMS RELAY CONTROL CIRCUIT FOR SHORT CIRCUIT TO GROUND

Measure the resistance between:

<table>
<thead>
<tr>
<th>EMS relay base, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance less than 10,000 ohms?

Yes  
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No  
GO to AC3.

AC3: CHECK THE ECM TO EMS RELAY CONTROL CIRCUIT FOR SHORT CIRCUIT TO POWER

Measure the resistance between:

<table>
<thead>
<tr>
<th>EMS relay base, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance less than 10,000 ohms?

Yes  
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No  
GO to AC4.

AC4: CHECK THE ECM TO EMS RELAY CONTROL CIRCUIT FOR HIGH RESISTANCE

Disconnect the ECM electrical connector, FH300.

Measure the resistance between:

<table>
<thead>
<tr>
<th>EMS relay base, harness side</th>
<th>ECM connector FH300, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Pin 16</td>
</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?

Yes  
REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No  
GO to AC5.

AC5: CHECK THE EMS RELAY TO ECM IGNITION CIRCUITS FOR HIGH RESISTANCE

Measure the resistance between:

<table>
<thead>
<tr>
<th>EMS relay base, harness side</th>
<th>ECM connector FH300, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 05</td>
<td>Pin 04</td>
</tr>
<tr>
<td>Pin 05</td>
<td>Pin 06</td>
</tr>
</tbody>
</table>

Is either resistance greater than 5 ohms?

Yes  
REPAIR the high resistance circuit. These circuits include fuses 18 and 38 of the front power distribution box. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No  
INSTALL a new EMS control relay. CLEAR the DTC and test the system for normal operation.

PINPOINT TEST AD : MANIFOLD ABSOLUTE PRESSURE (MAP) SENSOR CIRCUIT
### TEST CONDITIONS
**AD1: CHECK THE MAP SENSOR SUPPLY CIRCUIT VOLTAGE**

1. Disconnect the MAP sensor electrical connector, PI29.
2. Key on, engine off.
3. Measure the voltage between:
   - MAP sensor connector PI29, harness side
   - Battery
   - Pin 02

   Is the voltage less than 4 volts?
   - Yes
     - REPAIR the 5 volt supply circuit between the MAP sensor and the ECM. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
   - No
     - GO to AD2.

### DETAILS/RESULTS/ACTIONS

**AD2: CHECK THE MAP SENSOR SUPPLY CIRCUIT FOR SHORT CIRCUIT TO POWER**

1. Key off.
2. Measure the resistance between:
   - MAP sensor connector PI29, harness side
   - Battery
   - Pin 02

   Is the resistance less than 10,000 ohms?
   - Yes
     - REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
   - No
     - GO to AD3.

### DETAILS/RESULTS/ACTIONS

**AD3: CHECK THE MAP SENSOR SENSING CIRCUIT FOR SHORT CIRCUIT TO GROUND**

1. Measure the resistance between:
   - MAP sensor connector PI29, harness side
   - Battery
   - Pin 01

   Is the resistance less than 10,000 ohms?
   - Yes
     - REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
   - No
     - GO to AD4.

### DETAILS/RESULTS/ACTIONS

**AD4: CHECK THE MAP SENSOR SENSING CIRCUIT FOR SHORT CIRCUIT TO POWER**

1. Measure the resistance between:
   - MAP sensor connector PI29, harness side
   - Battery
   - Pin 01

   Is the resistance less than 10,000 ohms?
   - Yes
     - REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
   - No
     - GO to AD5.

### DETAILS/RESULTS/ACTIONS

**AD5: CHECK THE MAP SENSOR SENSING CIRCUIT FOR HIGH RESISTANCE**

1. Disconnect the ECM electrical connector, PI300.
2. Measure the resistance between:
   - MAP sensor connector PI29, harness side
   - ECM connector PI300, harness side
   - Pin 01
   - Pin 69

   Is the resistance greater than 5 ohms?
   - Yes
     - REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
   - No
     - GO to AD6.

### DETAILS/RESULTS/ACTIONS

**AD6: CHECK THE MAP SENSOR GROUND CIRCUIT FOR HIGH RESISTANCE**

1. Measure the resistance between:
   - MAP sensor connector PI29, harness side
   - ECM connector PI300, harness side
   - Pin 04
   - Pin 10

   Is the resistance greater than 5 ohms?
   - Yes
     - REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
   - No
     - INSTALL a new MAP sensor.
     - REFER to: Manifold Absolute Pressure (MAP) Sensor (303-14A Electronic Engine Controls - 2.5L/3.0L, Removal and Installation).
     - CLEAR the DTC and test the system for normal operation.

### PINPOINT TEST AE : ENGINE FUEL TEMPERATURE (EFT) SENSOR CIRCUIT

**TEST CONDITIONS**

**AE1: CHECK THE EFT SENSOR SENSING CIRCUIT FOR SHORT CIRCUIT TO GROUND**

1. Disconnect the EFT sensor electrical connector, IL09.
2. Measure the resistance between:
   - EFT sensor connector IL09, harness side
   - Battery
   - Pin 02

   Is the resistance less than 10,000 ohms?
   - Yes
     - REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
   - No
     - GO to AE2.

### DETAILS/RESULTS/ACTIONS

**AE2: CHECK THE EFT SENSOR AE CIRCUIT FOR SHORT CIRCUIT TO POWER**
Measure the resistance between:

<table>
<thead>
<tr>
<th>EFT sensor connector IL09, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance less than 10,000 ohms?
Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
GO to AE3.

AE3: CHECK THE EFT SENSOR SENSING CIRCUIT FOR HIGH RESISTANCE

1 Disconnect the ECM electrical connector, PI300.
2 Measure the resistance between:

<table>
<thead>
<tr>
<th>EFT sensor connector IL09, harness side</th>
<th>ECM connector PI300, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Pin 46</td>
</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?
Yes
REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
GO to AE4.

AE4: CHECK THE EFT SENSOR GROUND CIRCUIT FOR HIGH RESISTANCE

1 Measure the resistance between:

<table>
<thead>
<tr>
<th>EFT sensor connector IL09, harness side</th>
<th>ECM connector PI300, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 01</td>
<td>Pin 15</td>
</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?
Yes
REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
INSTALL a new EFT sensor.
REFER to: Fuel Temperature Sensor (303-14A Electronic Engine Controls - 2.5L/3.0L, Removal and Installation).
CLEAR the DTC and test the system for normal operation.

PINPOINT TEST AF : AIR CONDITIONING (A/C) PRESSURE SENSOR CIRCUIT

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
</table>

AF1: CHECK THE A/C PRESSURE SENSOR POWER SUPPLY CIRCUIT VOLTAGE

1 Disconnect the A/C pressure sensor electrical connector, FH110.
2 Key on, engine off.
3 Measure the voltage between:

<table>
<thead>
<tr>
<th>A/C pressure sensor connector FH110, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the voltage less than 4 volts?
Yes
REPAIR the 5 volt supply circuit between the A/C pressure sensor and the ECM. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
GO to AF2.

AF2: CHECK THE A/C PRESSURE SENSOR POWER SUPPLY CIRCUIT FOR SHORT CIRCUIT TO POWER

1 Key off.
2 Measure the resistance between:

<table>
<thead>
<tr>
<th>A/C pressure sensor connector FH110, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance less than 10,000 ohms?
Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
GO to AF3.

AF3: CHECK THE A/C PRESSURE SENSOR SENSING CIRCUIT FOR SHORT CIRCUIT TO GROUND

1 Measure the resistance between:

<table>
<thead>
<tr>
<th>A/C pressure sensor connector FH110, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 03</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance less than 10,000 ohms?
Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
GO to AF4.

AF4: CHECK THE A/C PRESSURE SENSOR SENSING CIRCUIT FOR SHORT CIRCUIT TO POWER

1 Measure the resistance between:

<table>
<thead>
<tr>
<th>A/C pressure sensor connector FH110, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 03</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance less than 10,000 ohms?
Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
GO to AF5.

AF5: CHECK THE A/C PRESSURE SENSOR SENSING CIRCUIT FOR HIGH RESISTANCE

1 Disconnect the ECM electrical connector, FH300.
2 Measure the resistance between:

<table>
<thead>
<tr>
<th>A/C pressure sensor connector FH110, harness side</th>
<th>ECM connector FH300, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 03</td>
<td>Pin 12</td>
</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?
Yes
REPAIR the 5 volt supply circuit between the A/C pressure sensor and the ECM. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
Is the resistance greater than 5 ohms?
Yes
REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
GO to AF6.

AF6: CHECK THE A/C PRESSURE SENSOR GROUND CIRCUIT FOR HIGH RESISTANCE

1. Measure the resistance between:
   A/C pressure sensor connector FH110, harness side
   ECM connector FH300, harness side

Pin 01 Pin 08

Is the resistance greater than 5 ohms?
Yes
REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
INSTALL a new A/C pressure sensor.
REFER to: Pressure Cutoff Switch - 2.5L/3.0L/4.2L (412-03 Air Conditioning, Removal and Installation).
CLEAR the DTC and test the system for normal operation.

PINPOINT TEST AG : INTAKE MANIFOLD TUNING (IMT) VALVE 1 (TOP) CIRCUIT

TEST CONDITIONS

AG1: CHECK THE IMT VALVE POWER SUPPLY CIRCUIT VOLTAGE

1. Disconnect the IMT valve electrical connector, PI30.
2. Key on, engine off.
3. Measure the voltage between:
   IMT valve connector PI30, harness side
   Battery

Pin 01 Negative terminal

Is the voltage greater than 10 volts?
Yes
GO to AG2.
No
REPAIR the circuit between the IMT valve electrical connector and battery. This circuit includes fuse 37 of the front power distribution box and the EMS control relay. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

AG2: CHECK THE IMT VALVE DRIVE CIRCUIT FOR SHORT CIRCUIT TO GROUND

1. Key off.
2. Measure the resistance between:
   IMT valve connector PI30, harness side
   Battery

Pin 02 Negative terminal

Is the resistance less than 10,000 ohms?
Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
GO to AG3.

AG3: CHECK THE IMT VALVE DRIVE CIRCUIT FOR SHORT CIRCUIT TO POWER

1. Measure the resistance between:
   IMT valve connector PI30, harness side
   Battery

Pin 02 Positive terminal

Is the resistance less than 10,000 ohms?
Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
GO to AG4.

AG4: CHECK THE IMT VALVE DRIVE CIRCUIT FOR HIGH RESISTANCE

1. Disconnect the ECM electrical connector, PI300.
2. Measure the resistance between:
   IMT valve connector PI30, harness side
   ECM connector PI300, harness side

Pin 02 Pin 84

Is the resistance greater than 5 ohms?
Yes
INSTALL a new IMT valve,
REFER to: Intake Manifold Tuning (IMT) Valve LH (303-14A Electronic Engine Controls - 2.5L/3.0L, Removal and Installation).
CLEAR the DTC and test the system for normal operation.
No
GO to AG4.

PINPOINT TEST AH : INTAKE MANIFOLD TUNING (IMT) VALVE 2 (BOTTOM) CIRCUIT

TEST CONDITIONS

AH1: CHECK THE IMT VALVE POWER SUPPLY CIRCUIT VOLTAGE

1. Disconnect the IMT valve electrical connector, PI31.
2. Key on, engine off.
3. Measure the voltage between:
   IMT valve connector PI31, harness side
   Battery

Pin 01 Negative terminal

Is the voltage greater than 10 volts?
Yes
GO to AH2.
No
REPAIR the circuit between the IMT valve electrical connector and battery. This circuit includes fuse 37 of the front power distribution box and the EMS control relay. For additional information, refer to the wiring diagrams. CLEAR the
DTC and test the system for normal operation.

**AH2: CHECK THE IMT VALVE DRIVE CIRCUIT FOR SHORT CIRCUIT TO GROUND**

1. Key off.
2. Measure the resistance between:
   - IMT valve connector PI31, harness side
   - Battery
   - Pin 02

   Is the resistance less than 10,000 ohms?
   - Yes
     - REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
   - No
     - GO to AH3.

**AH3: CHECK THE IMT VALVE DRIVE CIRCUIT FOR SHORT CIRCUIT TO POWER**

1. Measure the resistance between:
   - IMT valve connector PI31, harness side
   - Battery
   - Pin 02

   Is the resistance less than 10,000 ohms?
   - Yes
     - REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
   - No
     - GO to AH4.

**AH4: CHECK THE IMT VALVE DRIVE CIRCUIT FOR HIGH RESISTANCE**

1. Disconnect the ECM electrical connector, PI300.
2. Measure the resistance between:
   - IMT valve connector PI31, harness side
   - ECM connector PI300, harness side
   - Pin 02
   - Pin 90

   Is the resistance greater than 5 ohms?
   - Yes
     - REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
   - No
     - INSTALL a new IMT valve. REFER to: Intake Manifold Tuning (IMT) Valve LH (303-14A Electronic Engine Controls - 2.5L/3.0L, Removal and Installation). CLEAR the DTC and test the system for normal operation.

**PINPOINT TEST AI : BRAKE SWITCH**

**TEST CONDITIONS**

### AI1: CHECK THE OPERATION OF THE BRAKE SWITCH (PEDAL RELEASED)

1. Key off.
2. Disconnect the brake switch electrical connector, CA37.
3. Make sure the brake pedal is not pressed.
4. Measure the resistance between:
   - Brake switch connector CA37, component side
   - Brake switch connector CA37, component side
   - Pin 01
   - Pin 02

   Is the resistance greater than 5 ohms?
   - Yes
     - GO to AI2.
   - No
     - INSTALL a new brake switch. CLEAR the DTC and test the system for normal operation.

### AI2: CHECK THE OPERATION OF THE BRAKE SWITCH (PEDAL PRESSED)

1. Press the brake pedal.
2. Measure the resistance between:
   - Brake switch connector CA37, component side
   - Brake switch connector CA37, component side
   - Pin 01
   - Pin 02

   Is the resistance greater than 5 ohms?
   - Yes
     - INSTALL a new brake switch. CLEAR the DTC and test the system for normal operation.
   - No
     - GO to AI3.

### AI3: CHECK THE POWER SUPPLY TO THE BRAKE PEDAL SWITCH

1. Key on, engine off.
2. Measure the voltage between:
   - Brake switch connector CA37, harness side
   - Battery
   - Pin 01

   Is the voltage less than 10 volts?
   - Yes
     - REPAIR the circuit between the brake switch and battery. This circuit includes fuse 35 of the primary junction box. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
   - No
     - GO to AI4.

### AI4: CHECK THE BRAKE SWITCH SIGNAL CIRCUIT FOR SHORT CIRCUIT TO GROUND

1. Key off.
2. Measure the resistance between:
   - Brake switch connector CA37, harness side
   - Battery
   - Pin 02

   Is the resistance less than 10,000 ohms?
   - Yes
     - REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
   - No
     - GO to AI5.

### AI5: CHECK THE BRAKE SWITCH SIGNAL CIRCUIT FOR SHORT CIRCUIT TO POWER
Measure the resistance between:

<table>
<thead>
<tr>
<th>Pin 02</th>
<th>Pin 02</th>
</tr>
</thead>
<tbody>
<tr>
<td>Brake switch connector CA37, harness side</td>
<td>Positive terminal</td>
</tr>
<tr>
<td>Battery</td>
<td>Battery</td>
</tr>
</tbody>
</table>

Is the resistance less than 10,000 ohms?

Yes
- REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No
- GO to A16.

**PINPOINT TEST AJ : AIR CONDITIONING (A/C) COMPRESSOR CLUTCH CONTROL CIRCUIT**

**TEST CONDITIONS**

**DETAILS/RESULTS/ACTIONS**

**AJ1: CHECK THE A/C CLUTCH RELAY CONTROL CIRCUIT FOR SHORT CIRCUIT TO GROUND**

1. Remove the A/C clutch relay.
2. Key on, engine off.
3. Measure the resistance between:

<table>
<thead>
<tr>
<th>Pin 02</th>
<th>Pin 02</th>
</tr>
</thead>
<tbody>
<tr>
<td>A/C clutch relay base</td>
<td>Negative terminal</td>
</tr>
<tr>
<td>Battery</td>
<td>Battery</td>
</tr>
</tbody>
</table>

Is the resistance less than 10,000 ohms?

Yes
- REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No
- GO to AJ2.

**AJ2: CHECK THE A/C CLUTCH RELAY CONTROL CIRCUIT FOR SHORT CIRCUIT TO POWER**

1. Measure the resistance between:

<table>
<thead>
<tr>
<th>Pin 02</th>
<th>Pin 02</th>
</tr>
</thead>
<tbody>
<tr>
<td>A/C clutch relay base</td>
<td>Positive terminal</td>
</tr>
<tr>
<td>Battery</td>
<td>Battery</td>
</tr>
</tbody>
</table>

Is the resistance less than 10,000 ohms?

Yes
- REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No
- GO to AJ3.

**AJ3: CHECK THE A/C CLUTCH RELAY CONTROL CIRCUIT FOR HIGH RESISTANCE**

1. Disconnect the ECM electrical connector, FH300.
2. Measure the resistance between:

<table>
<thead>
<tr>
<th>Pin 02</th>
<th>Pin 02</th>
</tr>
</thead>
<tbody>
<tr>
<td>A/C clutch relay base</td>
<td>Pin 53</td>
</tr>
<tr>
<td>ECM connector FH300, harness side</td>
<td>ECM connector FH300, harness side</td>
</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?

Yes
- REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No
- INSTALL a new A/C clutch relay. CLEAR the DTC and test the system for normal operation. If the DTC is reset, refer to the warranty policy and procedures manual if an ECM is suspect.

**PINPOINT TEST AK : CLUTCH PEDAL SWITCH**

**TEST CONDITIONS**

**DETAILS/RESULTS/ACTIONS**

**AK1: CHECK THE OPERATION OF THE CLUTCH PEDAL SWITCH (PEDAL RELEASED)**

1. Key off.
2. Disconnect the clutch pedal electrical connector, (right hand drive vehicles) CA285 or (left hand drive vehicles) CA291.
3. Make sure the clutch pedal is not pressed.
4. Measure the resistance between:

<table>
<thead>
<tr>
<th>Pin 01</th>
<th>Pin 02</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clutch pedal switch connector CA285, component side</td>
<td>Clutch pedal switch connector CA285, component side</td>
</tr>
<tr>
<td>Pin 01</td>
<td>Pin 02</td>
</tr>
<tr>
<td>Clutch pedal switch connector CA291, component side</td>
<td>Clutch pedal switch connector CA291, component side</td>
</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?

Yes
- GO to AK2.

No
- INSTALL a new clutch pedal switch. CLEAR the DTC and test the system for normal operation.

**AK2: CHECK THE OPERATION OF THE CLUTCH PEDAL SWITCH (PEDAL PRESSED)**

1. Press the clutch pedal.
Measure the resistance between:

<table>
<thead>
<tr>
<th>Right hand drive vehicles</th>
<th>Clutch pedal switch connector CA285, component side</th>
<th>Clutch pedal switch connector CA285, component side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 01</td>
<td>Pin 02</td>
<td>Pin 02</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Left hand drive vehicles</th>
<th>Clutch pedal switch connector CA291, component side</th>
<th>Clutch pedal switch connector CA291, component side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 01</td>
<td>Pin 02</td>
<td>Pin 02</td>
</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?
Yes
INSTALL a new clutch pedal switch. CLEAR the DTC and test the system for normal operation.
No
GO to AK3.

**AK3: CHECK THE CLUTCH PEDAL SWITCH TO ECM INPUT CIRCUIT FOR SHORT CIRCUIT TO GROUND**

Measure the resistance between:

<table>
<thead>
<tr>
<th>Right hand drive vehicles</th>
<th>Clutch pedal switch connector CA285, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 01</td>
<td></td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Left hand drive vehicles</th>
<th>Clutch pedal switch connector CA291, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 01</td>
<td></td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance less than 10,000 ohms?
Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
GO to AK4.

**AK4: CHECK THE CLUTCH PEDAL SWITCH TO ECM INPUT CIRCUIT FOR SHORT CIRCUIT TO POWER**

Measure the resistance between:

<table>
<thead>
<tr>
<th>Right hand drive vehicles</th>
<th>Clutch pedal switch connector CA285, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 01</td>
<td></td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Left hand drive vehicles</th>
<th>Clutch pedal switch connector CA291, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 01</td>
<td></td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance less than 10,000 ohms?
Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
GO to AK5.

**AK5: CHECK THE CLUTCH PEDAL SWITCH TO ECM INPUT CIRCUIT FOR HIGH RESISTANCE**

1. Disconnect ECM electrical connector FH300
2. Measure the resistance between:

<table>
<thead>
<tr>
<th>Right hand drive vehicles</th>
<th>Clutch pedal switch connector CA285, harness side</th>
<th>ECM connector FH300, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 01</td>
<td>Pin 43</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Left hand drive vehicles</th>
<th>Clutch pedal switch connector CA291, harness side</th>
<th>ECM connector FH300, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 01</td>
<td>Pin 43</td>
<td></td>
</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?
Yes
REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
GO to AK6.

**AK6: CHECK THE CLUTCH PEDAL SWITCH GROUND CIRCUIT FOR HIGH RESISTANCE**

Measure the resistance between:

<table>
<thead>
<tr>
<th>Right hand drive vehicles</th>
<th>Clutch pedal switch connector CA285, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td></td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Left hand drive vehicles</th>
<th>Clutch pedal switch connector CA291, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td></td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?
Yes
REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
Refer to the warranty policy and procedures manual if an ECM is suspect.
Overview

There are changes to the engine management system (EMS) for 2006 MY, the most obvious of which will be the change to 7-digit diagnostic trouble codes (DTCs) from the familiar 5-digit, plus the addition of secondary air injection and changes to evaporative emissions to comply with stage four emissions requirements.

For more information on these systems, REFER to: Evaporative Emissions - VIN Range: N52048->N99999 (303-13 Evaporative Emissions, Description and Operation).

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

<table>
<thead>
<tr>
<th>Mechanical</th>
<th>Electrical</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Engine oil level and condition</td>
<td>• Fuses</td>
</tr>
<tr>
<td>• Cooling system coolant level</td>
<td>• Wiring harness</td>
</tr>
<tr>
<td>• Fuel level</td>
<td>• Electrical connector(s)</td>
</tr>
<tr>
<td>• Fuel contamination/grade/quality</td>
<td>• Sensor(s)</td>
</tr>
<tr>
<td>• Throttle body</td>
<td>• Engine control module (ECM)</td>
</tr>
<tr>
<td>• Park/Neutral belt</td>
<td>• Transmission control module (TCM)</td>
</tr>
<tr>
<td>• Poly-vee belt</td>
<td></td>
</tr>
<tr>
<td>• Air cleaner condition</td>
<td></td>
</tr>
</tbody>
</table>

3. Verify the following systems are working correctly:

- Air intake system
- Cooling system
- Charging system
- Fuel charging system
- Ignition system

4. If an obvious cause for an observed or reported symptom is found, correct the cause (if possible) before proceeding to the next step.

5. If the cause is not visually evident, use the Jaguar approved diagnostic system or a scan tool to retrieve the fault codes before proceeding to the DTC Index, or the symptom chart if no DTCs are set.

Symptom Chart

</tbody>
</table>
**Preliminary Steps**

- **CAUTION:** When probing connectors to take measurements in the course of the pinpoint tests, use the adaptor kit, part number 3548-1358-00.
- **NOTE:** When performing electrical voltage or resistance tests, always use a digital multimeter (DMM) accurate to 3 decimal places, and with an up-to-date calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.
- **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.
- **NOTE:** Before commencing this test, check the air filter for blockage, the engine air intake and breather systems for leaks, and the TP sensor for additional DTCs.

## TEST CONDITIONS

### DETAILS/RESULTS/ACTIONS

<table>
<thead>
<tr>
<th>Test</th>
<th>Conditions</th>
</tr>
</thead>
</table>
| A1: | **CHECK THE MAF SENSOR SUPPLY CIRCUIT VOLTAGE**  
**NOTE:** Check for DTCs indicating IMT valve and purge valve faults before carrying out the MAF supply voltage pinpoint test. |
| 1   | Disconnect the MAF sensor electrical connector, PI14. |
| 2   | Key on, engine off. |
| 3   | Measure the voltage between:  
MAF sensor connector PI14, harness side  
Battery  
| Pin 01 | Negative terminal |
| Is the voltage greater than 10 volts? |
| Yes | GO to A2.  
REPAIR the circuit between the MAF sensor electrical connector and the battery. This circuit includes the EMS control relay and fuse 37 of the front power distribution box. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation. |
| No  | REPAIR the circuit between the MAF sensor electrical connector and the battery. This circuit includes the EMS control relay and fuse 37 of the front power distribution box. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation. |

### A2: CHECK THE MAF SENSOR SENSING CIRCUIT FOR SHORT CIRCUIT TO GROUND  
**NOTE:** The short to GROUND may be intermittent. Move the wiring to attempt to reproduce the conditions under which the DTC was logged, and visually inspect the harness for any signs of chafing, see "visual inspection chart".
| Key off.  
Measure the resistance between: |
| MAF sensor connector PI14, harness side  
Battery  
| Pin 03 | Negative terminal |
| Is the resistance less than 10,000 ohms? |
| Yes | REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation. |
| No  | GO to A3. |

### A3: CHECK THE MAF SENSOR SENSING CIRCUIT FOR SHORT CIRCUIT TO POWER  
Measure the resistance between:  
MAF sensor connector PI14, harness side  
Battery  
| Pin 03 | Positive terminal |
| Is the resistance less than 10,000 ohms? |
| Yes | REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation. |
| No  | GO to A4. |

### A4: CHECK THE MAF SENSOR GROUND CIRCUIT FOR SHORT CIRCUIT TO POWER  
Measure the resistance between:  
MAF sensor connector PI14, harness side  
Battery  
| Pin 02 | Positive terminal |
| Is the resistance less than 10,000 ohms? |
| Yes | REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation. |
| No  | GO to A5. |

### A5: CHECK THE MAF SENSOR SENSING CIRCUIT FOR HIGH RESISTANCE  
Disconnect the ECM electrical connector, PI300.  
Measure the resistance between:  
MAF sensor connector PI14, harness side  
ECM connector PI300, harness side  
| Pin 03 | Pin 70 |
| Is the resistance greater than 5 ohms? |
| Yes | REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation. |
| No  | GO to A6. |

### A6: CHECK THE MAF SENSOR GROUND CIRCUIT FOR HIGH RESISTANCE  
Measure the resistance between:  
MAF sensor connector PI14, harness side  
ECM connector PI300, harness side  
| Pin 02 | Pin 18 |
| Is the resistance greater than 5 ohms? |
| Yes | REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation. |
| No  | INSTALL a new MAF sensor.  
CLEAR the DTC and test the system for normal operation. |

### PINPOINT TEST B : INTAKE AIR TEMPERATURE (IAT) SENSOR CIRCUIT

C4: CHECK THE ECT SENSOR GROUND CIRCUIT FOR HIGH RESISTANCE

Measure the resistance between:

<table>
<thead>
<tr>
<th>ECT sensor connector PI25, harness side</th>
<th>ECM connector PI300, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 01</td>
<td>Pin 12</td>
</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?

Yes
- REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No
- INSTALL a new ECT sensor.
  CLEAR the DTC. TEST the system for normal operation.

PINPOINT TEST D: THROTTLE POSITION (TP) SENSOR 1 CIRCUIT

D1: CHECK THE TP SENSOR SUPPLY CIRCUIT VOLTAGE

1. Disconnect the TP sensor electrical connector, PI26.
2. Key on, engine off.
3. Measure the voltage between:

<table>
<thead>
<tr>
<th>TP sensor connector PI26, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 05</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the voltage less than 4 volts?

Yes
- REPAIR the 5 volt supply circuit between the TP sensor and the ECM. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No
- GO to D2.

D2: CHECK THE TP SENSOR SUPPLY CIRCUIT FOR SHORT CIRCUIT TO POWER

1. Key off.
2. Measure the resistance between:

<table>
<thead>
<tr>
<th>TP sensor connector PI26, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 05</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance less than 10,000 ohms?

Yes
- REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No
- GO to D3.

D3: CHECK THE TP SENSOR SENSING CIRCUIT TP1 FOR SHORT CIRCUIT TO GROUND

1. Measure the resistance between:

<table>
<thead>
<tr>
<th>TP sensor connector PI26, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 06</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance less than 10,000 ohms?

Yes
- REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No
- GO to D4.

D4: CHECK THE TP SENSOR SENSING CIRCUIT TP1 FOR SHORT CIRCUIT TO POWER

1. Measure the resistance between:

<table>
<thead>
<tr>
<th>TP sensor connector PI26, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 06</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance less than 10,000 ohms?

Yes
- REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No
- GO to D5.

D5: CHECK THE TP SENSOR SENSING CIRCUIT TP1 FOR HIGH RESISTANCE

1. Disconnect the ECM electrical connector, PI300.
2. Measure the resistance between:

<table>
<thead>
<tr>
<th>TP sensor connector PI26, harness side</th>
<th>ECM connector PI300, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 06</td>
<td>Pin 65</td>
</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?

Yes
- REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No
- GO to D6.

D6: CHECK THE TP SENSOR GROUND CIRCUIT FOR HIGH RESISTANCE

1. Measure the resistance between:

<table>
<thead>
<tr>
<th>TP sensor connector PI26, harness side</th>
<th>ECM connector PI300, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 03</td>
<td>Pin 11</td>
</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?

Yes
- REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No
- INSTALL a new TP sensor.
  CLEAR the DTC and test the system for normal operation.
PINPOINT TEST E : THROTTLE POSITION (TP) SENSOR 2 CIRCUIT

TEST CONDITIONS DETAILS/RESULTS/ACTIONS

E1: CHECK THE TP SENSOR SUPPLY CIRCUIT VOLTAGE

1. Disconnect the TP sensor electrical connector, PI26.
2. Key on, engine off.
3. Measure the voltage between:
   TP sensor connector PI26, harness side Battery
   Pin 05 Negative terminal

Is the voltage less than 4 volts?
Yes
   REPAIR the 5 volt supply circuit between the TP sensor and the ECM. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
   GO to E2.

E2: CHECK THE TP SENSOR SUPPLY CIRCUIT FOR SHORT CIRCUIT TO POWER

1. Key off.
2. Measure the resistance between:
   TP sensor connector PI26, harness side Battery
   Pin 05 Positive terminal

Is the resistance less than 10,000 ohms?
Yes
   REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
   GO to E3.

E3: CHECK THE TP SENSOR SENSING CIRCUIT TP2 FOR SHORT CIRCUIT TO GROUND

1. Measure the resistance between:
   TP sensor connector PI26, harness side Battery
   Pin 04 Negative terminal

Is the resistance less than 10,000 ohms?
Yes
   REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
   GO to E4.

E4: CHECK THE TP SENSOR SENSING CIRCUIT TP2 FOR SHORT CIRCUIT TO POWER

1. Measure the resistance between:
   TP sensor connector PI26, harness side Battery
   Pin 04 Positive terminal

Is the resistance less than 10,000 ohms?
Yes
   REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
   GO to E5.

E5: CHECK THE TP SENSOR SENSING CIRCUIT TP2 FOR HIGH RESISTANCE

1. Disconnect the ECM electrical connector, PI300.
2. Measure the resistance between:
   TP sensor connector PI26, harness side ECM connector PI300, harness side
   Pin 04 Pin 67

Is the resistance greater than 5 ohms?
Yes
   REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
   GO to E6.

E6: CHECK THE TP SENSOR GROUND CIRCUIT FOR HIGH RESISTANCE

1. Measure the resistance between:
   TP sensor connector PI26, harness side ECM connector PI300, harness side
   Pin 03 Pin 11

Is the resistance greater than 5 ohms?
Yes
   REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
   INSTALL a new TP sensor.
   REFER to: Throttle Body - VIN Range: N52048->N99999 (303-04A Fuel Charging and Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation). CLEAR the DTC and test the system for normal operation.

PINPOINT TEST F : RIGHT-HAND H02S VARIABLE AND CONSTANT CIRCUITS

NOTE: Before commencing this test, check the sensor connections and harness, check for exhaust leaks, (a very small exhaust leak can cause this DTC to flag). See “visual inspection chart” and “possible causes”.

TEST CONDITIONS DETAILS/RESULTS/ACTIONS

F1: CHECK THE H02S VARIABLE CIRCUIT FOR SHORT CIRCUIT TO GROUND

1. Disconnect the H02S electrical connector, PI10.
2. Measure the resistance between:
   H02S connector PI10, harness side Battery
   Pin 04 Negative terminal
Is the resistance less than 10,000 ohms?
Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
GO to F2.

F2: CHECK THE HO2S VARIABLE CIRCUIT FOR SHORT CIRCUIT TO POWER
1 Measure the resistance between:
   | H02S connector PI10, harness side | Battery |
Pin 04 | Positive terminal |
Is the resistance less than 10,000 ohms?
Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
GO to F3.

F3: CHECK THE HO2S CONSTANT CIRCUIT FOR SHORT CIRCUIT TO GROUND
1 Measure the resistance between:
   | H02S connector PI10, harness side | Battery |
Pin 03 | Negative terminal |
Is the resistance less than 10,000 ohms?
Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
GO to F4.

F4: CHECK THE HO2S CONSTANT CIRCUIT FOR SHORT CIRCUIT TO POWER
1 Measure the resistance between:
   | H02S connector PI10, harness side | Battery |
Pin 03 | Positive terminal |
Is the resistance less than 10,000 ohms?
Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
GO to F5.

F5: CHECK THE HO2S VARIABLE CIRCUIT FOR HIGH RESISTANCE
1 Disconnect the ECM electrical connector, PI300.
2 Measure the resistance between:
   | H02S connector PI10, harness side | ECM connector PI300, harness side |
Pin 04 | Pin 28 |
Is the resistance greater than 5 ohms?
Yes
REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
GO to F6.

F6: CHECK THE HO2S CONSTANT CIRCUIT FOR HIGH RESISTANCE
1 Measure the resistance between:
   | H02S connector PI10, harness side | ECM connector PI300, harness side |
Pin 03 | Pin 29 |
Is the resistance greater than 5 ohms?
Yes
REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
INSTALL a new HO2S.

CLEAR the DTC and test the system for normal operation.

PINPOINT TEST G : RIGHT-HAND HO2S HEATER SUPPLY AND CONTROL CIRCUITS

CAUTION: Under no circumstances must the sensor wiring be cut to facilitate removal, should this prove necessary.

NOTE: Carry out a visual inspection of the HO2S connectors (integrity of connections may be affected by heat from catalytic converters).

TEST CONDITIONS

G1: CHECK HO2S HEATER POWER SUPPLY CIRCUIT
1 Disconnect the HO2S electrical connector, PI10.
2 Key on, engine off.
3 Make sure the O2S heater relay is energized.
4 Measure the voltage between:
   | H02S connector PI10, harness side | Battery |
Pin 01 | Negative terminal |
Is the voltage greater than 10 volts?
Yes
GO to G2.
No
REPAIR the power supply circuit to the HO2S heater. This circuit includes the O2S heater relay and fuse 20 of the front power distribution box. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

G2: CHECK HO2S HEATER CONTROL CIRCUIT FROM ECM FOR SHORT CIRCUIT TO GROUND
1 Key off.
2 Measure the resistance between:
   | H02S connector PI10, harness side | Battery |
Pin 02 | Negative terminal |
Is the resistance less than 10,000 ohms?

Yes
  REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No
  GO to G3.

G3: CHECK H02S HEATER CONTROL CIRCUIT FROM ECM FOR SHORT CIRCUIT TO POWER

1. Measure the resistance between:
   - H02S connector PI10, harness side
   - Battery
   - Pin 02
   - Positive terminal

Is the resistance less than 10,000 ohms?

Yes
  REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No
  GO to G4.

G4: CHECK H02S HEATER CONTROL CIRCUIT FROM ECM FOR HIGH RESISTANCE

1. Disconnect the ECM electrical connector, PI300.
2. Measure the resistance between:
   - H02S connector PI10, harness side
   - ECM connector PI300, harness side
   - Pin 02
   - Pin 76

Is the resistance greater than 5 ohms?

Yes
  REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No
  INSTALL a new H02S.
  CLEAR the DTC and test the system for normal operation.

PINPOINT TEST H : RIGHT-HAND CATALYST MONITOR SENSOR SENSING AND GROUND CIRCUITS

CAUTION: Under no circumstances must the sensor wiring be cut to facilitate removal, should this prove necessary.

Test Conditions

<table>
<thead>
<tr>
<th>DETAILS/RESULTS/ACTIONS</th>
<th>TEST CONDITIONS</th>
</tr>
</thead>
</table>

H1: CHECK THE CATALYST MONITOR SENSOR SENSING CIRCUIT FOR SHORT CIRCUIT TO GROUND

1. Disconnect the catalyst monitor electrical connector, PI11.
2. Measure the resistance between:
   - Catalyst monitor connector PI11, harness side
   - Battery
   - Pin 04
   - Negative terminal

Is the resistance less than 10,000 ohms?

Yes
  REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No
  GO to H2.

H2: CHECK THE CATALYST MONITOR SENSOR SENSING CIRCUIT FOR SHORT CIRCUIT TO POWER

1. Measure the resistance between:
   - Catalyst monitor connector PI11, harness side
   - Battery
   - Pin 04
   - Positive terminal

Is the resistance less than 10,000 ohms?

Yes
  REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No
  GO to H3.

H3: CHECK THE CATALYST MONITOR SENSOR SENSING CIRCUIT FOR HIGH RESISTANCE

1. Disconnect the ECM electrical connector, PI300.
2. Measure the resistance between:
   - Catalyst monitor connector PI11, harness side
   - ECM connector PI300, harness side
   - Pin 04
   - Pin 40

Is the resistance greater than 5 ohms?

Yes
  REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No
  GO to H4.

H4: CHECK THE CATALYST MONITOR SENSOR GROUND CIRCUIT FOR HIGH RESISTANCE

1. Measure the resistance between:
   - Catalyst monitor connector PI11, harness side
   - ECM connector PI300, harness side
   - Pin 03
   - Pin 22

Is the resistance greater than 5 ohms?

Yes
  REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No
  INSTALL a new catalyst monitor sensor.
  CLEAR the DTC and test the system for normal operation.

PINPOINT TEST I : RIGHT-HAND CATALYST MONITOR SENSOR SUPPLY AND HEATER CONTROL CIRCUITS

CAUTION: Under no circumstances must the sensor wiring be cut to facilitate removal, should this prove necessary.

* NOTE: Carry out a visual inspection of the H02S connectors (integrity of connections may be affected by heat from catalytic converters).
I1: CHECK THE CATALYST MONITOR HEATER POWER SUPPLY CIRCUIT

1. Disconnect the catalyst monitor sensor electrical connector, PI11.
2. Key on, engine off.
3. Make sure the O2S heater relay is energized.
4. Measure the voltage between:
   | Catalyst monitor connector PI11, harness side | Battery |
   | Pin 01 Negative terminal |

   Is the voltage greater than 10 volts?
   Yes Go to I2.
   No REPAIR the power supply circuit to the catalyst monitor heater. This circuit includes the O2S heater relay and fuse 20 of the front power distribution box. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

I2: CHECK THE CATALYST MONITOR HEATER CONTROL CIRCUIT FOR SHORT CIRCUIT TO GROUND

1. Key off.
2. Measure the resistance between:
   | Catalyst monitor connector PI11, harness side | Battery |
   | Pin 02 Negative terminal |

   Is the resistance less than 10,000 ohms?
   Yes REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
   No Go to I3.

I3: CHECK THE CATALYST MONITOR HEATER CONTROL CIRCUIT FOR SHORT CIRCUIT TO POWER

1. Measure the resistance between:
   | Catalyst monitor connector PI11, harness side | Battery |
   | Pin 02 Positive terminal |

   Is the resistance less than 10,000 ohms?
   Yes REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
   No Go to I4.

I4: CHECK THE CATALYST MONITOR HEATER CONTROL CIRCUIT FOR HIGH RESISTANCE

1. Disconnect the ECM electrical connector, PI300.
2. Measure the resistance between:
   | Catalyst monitor connector PI11, harness side | ECM connector PI300, harness side |
   | Pin 02 Pin 88 |

   Is the resistance greater than 5 ohms?
   Yes REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
   No INSTALL a new catalyst monitor sensor.
   CLEAR the DTC and test the system for normal operation. If the DTC is repeated, refer to the warranty policy and procedures manual if an ECM is suspect.

PINPOINT TEST J: LEFT-HAND H02S VARIABLE AND CONSTANT CIRCUITS

CAUTION: Under no circumstances must the sensor wiring be cut to facilitate removal, should this prove necessary.

• NOTE: Before commencing this test, check the sensor connections and harness, check for exhaust leaks, (a very small exhaust leak can cause this DTC to flag). See "visual inspection chart" and "possible causes".

J1: CHECK THE H02S VARIABLE CIRCUIT FOR SHORT CIRCUIT TO GROUND

1. Disconnect the H02S electrical connector, PI12.
2. Measure the resistance between:
   | H02S connector PI12, harness side | Battery |
   | Pin 04 Negative terminal |

   Is the resistance less than 10,000 ohms?
   Yes REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
   No Go to J2.

J2: CHECK THE H02S VARIABLE CIRCUIT FOR SHORT TO CIRCUIT TO POWER

1. Measure the resistance between:
   | H02S connector PI12, harness side | Battery |
   | Pin 04 Positive terminal |

   Is the resistance less than 10,000 ohms?
   Yes REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
   No Go to J3.

J3: CHECK THE H02S CONSTANT CIRCUIT FOR SHORT CIRCUIT TO GROUND

1. Measure the resistance between:
   | H02S connector PI12, harness side | Battery |
   | Pin 03 Negative terminal |
Is the resistance less than 10,000 ohms?
Yes
   REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
   GO to J4.
No

J4: CHECK THE HO2S CONSTANT CIRCUIT FOR SHORT TO CIRCUIT TO POWER
1 Measure the resistance between:
   H02S connector PI12, harness side  Battery  Positive terminal
Is the resistance less than 10,000 ohms?
Yes
   REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
   GO to J5.
No

J5: CHECK THE HO2S VARIABLE CIRCUIT FOR HIGH RESISTANCE
1 Disconnect the ECM electrical connector, PI300.
2 Measure the resistance between:
   H02S connector PI12, harness side  ECM connector PI300, harness side  Pin 04  Pin 26
Is the resistance greater than 5 ohms?
Yes
   REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
   GO to J6.
No

J6: CHECK THE HO2S CONSTANT CIRCUIT FOR HIGH RESISTANCE
1 Measure the resistance between:
   H02S connector PI12, harness side  ECM connector PI300, harness side  Pin 03  Pin 27
Is the resistance greater than 5 ohms?
Yes
   REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
   INSTALL a new HO2S.
   CLEAR the DTC and test the system for normal operation. If the DTC is repeated, refer to the warranty policy and procedures manual if an ECM is suspect.
   GO to K4.
No

PINPOINT TEST K: LEFT-HAND HO2S HEATER SUPPLY AND CONTROL CIRCUITS

CAUTION: Under no circumstances must the sensor wiring be cut to facilitate removal, should this prove necessary.
• NOTE: Carry out a visual inspection of the HO2S connectors (integrity of connections may be affected by heat from catalytic converters).

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
</table>

K1: CHECK HO2S HEATER POWER SUPPLY CIRCUIT
1 Disconnect the HO2S electrical connector, PI12.
2 Key on, engine off.
3 Make sure the O2S heater relay is energized.
4 Measure the voltage between:
   H02S connector PI12, harness side  Battery  Negative terminal
Is the voltage greater than 10 volts?
Yes
   GO to K2.
No
   REPAIR the power supply circuit to the HO2S heater. This circuit includes the O2S heater relay and fuse 35 of the front power distribution box. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

K2: CHECK HO2S HEATER CONTROL CIRCUIT FROM ECM FOR SHORT CIRCUIT TO GROUND
1 Key off.
2 Measure the resistance between:
   H02S connector PI12, harness side  Battery  Negative terminal
Is the resistance less than 10,000 ohms?
Yes
   REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
   GO to K3.
No

K3: CHECK HO2S HEATER CONTROL CIRCUIT FROM ECM FOR SHORT CIRCUIT TO POWER
1 Measure the resistance between:
   H02S connector PI12, harness side  Battery  Positive terminal
Is the resistance less than 10,000 ohms?
Yes
   REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
   GO to K4.
No

K4: CHECK HO2S HEATER CONTROL CIRCUIT FROM ECM FOR HIGH RESISTANCE
1 Disconnect the ECM electrical connector, PI300.
Measure the resistance between:

<table>
<thead>
<tr>
<th>Pin 02</th>
<th>Pin 77</th>
</tr>
</thead>
</table>

Is the resistance greater than 5 ohms?

Yes
- REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No
- INSTALL a new H02S.
- CLEAR the DTC and test the system for normal operation. If the DTC is repeated, refer to the warranty policy and procedures manual if an ECM is suspect.

CAUTION: Under no circumstances must the sensor wiring be cut to facilitate removal, should this prove necessary.

• NOTE: Carry out a visual inspection of the HO2S connectors (integrity of connections may be affected by heat from catalytic converters)

Is the resistance less than 10,000 ohms?

Yes

REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No

GO to M4.

M4: CHECK THE CATALYST MONITOR SENSOR HEATER CONTROL CIRCUIT FOR HIGH RESISTANCE

1. Disconnect the ECM electrical connector, PI300.
2. Measure the resistance between:

<table>
<thead>
<tr>
<th>Catalyst monitor connector PI13, harness side</th>
<th>ECM connector PI300, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Pin 89</td>
</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?

Yes

REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No

INSTALL a new catalyst monitor sensor.

REFER to: Catalyst Monitor Sensor (303-14A Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation). CLEAR the DTC and test the system for normal operation.

PINPOINT TEST N : ENGINE OIL TEMPERATURE (EOT) SENSOR CIRCUIT

TEST CONDITIONS | DETAILS/RESULTS/ACTIONS
---|---
N1: CHECK THE EOT SENSOR SENSING CIRCUIT FOR SHORT CIRCUIT TO GROUND
1. Disconnect the EOT sensor electrical connector, PI24.
2. Measure the resistance between:

<table>
<thead>
<tr>
<th>EOT sensor connector PI24, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance less than 10,000 ohms?

Yes

REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No

GO to N2.

N2: CHECK THE EOT SENSOR SENSING CIRCUIT FOR SHORT CIRCUIT TO POWER

Measure the resistance between:

<table>
<thead>
<tr>
<th>EOT sensor connector PI24, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance less than 10,000 ohms?

Yes

REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No

GO to N3.

N3: CHECK THE EOT SENSOR SENSING CIRCUIT FOR HIGH RESISTANCE

1. Disconnect the ECM electrical connector, PI300.
2. Measure the resistance between:

<table>
<thead>
<tr>
<th>EOT sensor connector PI24, harness side</th>
<th>ECM connector PI300, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Pin 23</td>
</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?

Yes

REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No

GO to N4.

N4: CHECK THE EOT SENSOR GROUND CIRCUIT FOR HIGH RESISTANCE

1. Measure the resistance between:

<table>
<thead>
<tr>
<th>EOT sensor connector PI24, harness side</th>
<th>ECM connector PI300, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 01</td>
<td>Pin 10</td>
</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?

Yes

REPAIR the high resistance circuit. This circuit includes harness splice, PIS49. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No

INSTALL a new EOT sensor.

REFER to: Oil Temperature Sensor (303-14A Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation). CLEAR the DTC and test the system for normal operation. If the DTC is repeated, refer to the warranty policy and procedures manual if an ECM is suspect.

PINPOINT TEST O : RIGHT-HAND KNOCK SENSOR (KS) CIRCUIT
### Test Conditions

<table>
<thead>
<tr>
<th>Test Conditions</th>
<th>Details/Results/Actions</th>
</tr>
</thead>
</table>
| **O1: CHECK KS SENSING CIRCUIT FOR SHORT CIRCUIT TO GROUND** | Disconnect the KS electrical connector, PI43.  
1. Measure the resistance between:  
   - KS connector PI43, harness side  
   - Battery  
   - Pin 01  
   - Negative terminal  
   - Is the resistance less than 10,000 ohms?  
     - Yes: REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.  
     - No: GO to O2.  

| **O2: CHECK KS SENSING CIRCUIT FOR SHORT CIRCUIT TO POWER** | Measure the resistance between:  
   - KS connector PI43, harness side  
   - Battery  
   - Pin 01  
   - Positive terminal  
   - Is the resistance less than 10,000 ohms?  
     - Yes: REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.  
     - No: GO to O3.  

| **O3: CHECK KS SENSING CIRCUIT FOR HIGH RESISTANCE** | Disconnect the ECM electrical connector, PI300.  
1. Measure the resistance between:  
   - KS connector PI43, harness side  
   - ECM connector PI300, harness side  
   - Pin 01  
   - Pin 42  
   - Is the resistance greater than 5 ohms?  
     - Yes: REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.  
     - No: INSTALL a new KS. REFER to: *Knock Sensor (KS) RH (303-14A Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation)*. CLEAR the DTC and test the system for normal operation.  

| **O4: CHECK KS GROUND CIRCUIT FOR HIGH RESISTANCE** | Measure the resistance between:  
   - KS connector PI44, harness side  
   - ECM connector PI300, harness side  
   - Pin 02  
   - Pin 19  
   - Is the resistance greater than 5 ohms?  
     - Yes: REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.  
     - No: INSTALL a new KS. REFER to: *Knock Sensor (KS) RH (303-14A Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation)*. CLEAR the DTC and test the system for normal operation.  

### Pinpoint Test P: Left-Hand Knock Sensor (KS) Circuit

**NOTE:** Before commencing this test, make sure that the sensor is making a good electrical contact with the cylinder block. See “possible causes.”

   - ECM connector PI300, harness side  
   - Pin 01  
   - Pin 43  
   - Is the resistance greater than 5 ohms?  
     - Yes: REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.  
     - No: INSTALL a new KS. REFER to: *Knock Sensor (KS) RH (303-14A Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation)*. CLEAR the DTC and test the system for normal operation.  

---

**NOTE:** Before commencing this test, make sure that the sensor is making a good electrical contact with the cylinder block. See “possible causes.”
P4: CHECK KS GROUND CIRCUIT FOR HIGH RESISTANCE

Measure the resistance between:

<table>
<thead>
<tr>
<th>KS connector PI44, harness side</th>
<th>ECM connector PI300, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Pin 20</td>
</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?

Yes

REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No

INSTALL a new KS.

REFER to: Knock Sensor (KS) LH (303-14A Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation).

CLEAR the DTC and test the system for normal operation.

PINPOINT TEST Q: CRANKSHAFT POSITION (CKP) SENSOR CIRCUIT

• NOTE: The clearance between the CKP sensor and the reluctor ring should be checked at 90° intervals. The air gap between the two should be no greater than 4.5 mm at any point.

PINPOINT TEST R: RIGHT-HAND CAMSHAFT POSITION (CMP) SENSOR CIRCUIT
R1: CHECK THE CMP SENSOR FOR CORRECT INSTALLATION

1. Check the CMP sensor for correct installation.

Is the CMP sensor correctly installed?

Yes  **GO to R2.**

No  INSTALL the CMP sensor correctly.

**REFER to:** Camshaft Position (CMP) Sensor RH (303-14A Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation).

CLEAR the DTCs and test the system for normal operation.

R2: CHECK THE CMP SENSOR FOR FOREIGN DEBRIS

1. Remove the CMP sensor and inspect for foreign debris.

Is the CMP sensor free of foreign debris?

Yes  **GO to R3.**

No  CLEAN the sensor and wheel. INSTALL the sensor.

**REFER to:** Camshaft Position (CMP) Sensor RH (303-14A Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation).

CLEAR the DTCs and test the system for normal operation.

R3: CHECK THE CMP SENSOR SENSING CIRCUIT FOR SHORT CIRCUIT TO GROUND

1. Disconnect the CMP sensor electrical connector, PI23.

2. Measure the resistance between:

<table>
<thead>
<tr>
<th>CMP sensor connector PI23, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 01</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance less than 10,000 ohms?

Yes  REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No  **GO to R4.**

R4: CHECK THE CMP SENSOR SENSING CIRCUIT FOR SHORT CIRCUIT TO POWER

1. Measure the resistance between:

<table>
<thead>
<tr>
<th>CMP sensor connector PI23, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 01</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance less than 10,000 ohms?

Yes  REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No  **GO to R5.**

R5: CHECK THE CMP SENSOR SENSING CIRCUIT FOR HIGH RESISTANCE

1. Disconnect the ECM electrical connector, PI300.

2. Measure the resistance between:

<table>
<thead>
<tr>
<th>CMP sensor connector PI23, harness side</th>
<th>ECM connector PI300, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 01</td>
<td>Pin 34</td>
</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?

Yes  REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No  **GO to R6.**

R6: CHECK THE CMP SENSOR GROUND CIRCUIT FOR HIGH RESISTANCE

1. Measure the resistance between:

<table>
<thead>
<tr>
<th>CMP sensor connector PI23, harness side</th>
<th>ECM connector PI300, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Pin 07</td>
</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?

Yes  REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No  INSTALL a new CMP sensor.

**REFER to:** Camshaft Position (CMP) Sensor RH (303-14A Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation).

CLEAR the DTC and test the system for normal operation.

PINPOINT TEST S: LEFT-HAND CAMSHAFT POSITION (CMP) SENSOR CIRCUIT

S1: CHECK THE CMP SENSOR FOR CORRECT INSTALLATION

1. Check the CMP sensor for correct installation.

Is the CMP sensor correctly installed?

Yes  **GO to S2.**

No  INSTALL the CMP sensor correctly.

**REFER to:** Camshaft Position (CMP) Sensor LH (303-14A Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation).

CLEAR the DTCs and test the system for normal operation.

S2: CHECK THE CMP SENSOR FOR FOREIGN DEBRIS

1. Remove the CMP sensor and inspect for foreign debris.
Is the CMP sensor free of foreign debris?
Yes
  GO to S3.
No
  CLEAN the sensor and wheel. INSTALL the sensor.
  CLEAR the DTCs and test the system for normal operation.

S3: CHECK THE CMP SENSOR SENSING CIRCUIT FOR SHORT CIRCUIT TO GROUND
1. Disconnect the CMP sensor electrical connector, PI22.
2. Measure the resistance between:
   | CMP sensor connector PI22, harness side | Battery |
   | Pin 01 | Negative terminal |

   Is the resistance less than 10,000 ohms?
Yes
  REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
  GO to S4.

S4: CHECK THE CMP SENSOR SENSING CIRCUIT FOR SHORT CIRCUIT TO POWER
1. Measure the resistance between:
   | CMP sensor connector PI22, harness side | Battery |
   | Pin 01 | Positive terminal |

   Is the resistance less than 10,000 ohms?
Yes
  REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
  GO to S5.

S5: CHECK THE CMP SENSOR SENSING CIRCUIT FOR HIGH RESISTANCE
1. Disconnect the ECM electrical connector, PI300.
2. Measure the resistance between:
   | CMP sensor connector PI22, harness side | ECM connector PI300, harness side |
   | Pin 01 | Pin 33 |

   Is the resistance greater than 5 ohms?
Yes
  REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
  GO to S6.

S6: CHECK THE CMP SENSOR GROUND CIRCUIT FOR HIGH RESISTANCE
1. Measure the resistance between:
   | CMP sensor connector PI22, harness side | ECM connector PI300, harness side |
   | Pin 02 | Pin 08 |

   Is the resistance greater than 5 ohms?
Yes
  REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
  INSTALL a new CMP sensor.
  CLEAR the DTC and test the system for normal operation.

PINPOINT TEST T: RADIATOR COOLING FAN MODULE DRIVE CIRCUIT
TEST CONDITIONS DETAILS/RESULTS/ACTIONS
T1: CHECK THE RADIATOR FAN MODULE PERMANENT SUPPLY
1. Disconnect the fan module electrical connector, FH109.
2. Measure the voltage between:
   | Fan module connector FH109, harness side | Battery |
   | Pin 01 | Negative terminal |

   Is the voltage less than 10 volts?
Yes
  REPAIR the circuit between the cooling fan module and battery. This circuit includes fuse 13 of the front power distribution box and the mega fuses. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
  GO to T2.

T2: CHECK THE RADIATOR FAN MODULE EMS SWITCHED SUPPLY
1. Disconnect the fan module electrical connector, FH108.
2. Key on, engine off.
3. Make sure the EMS relay is energized.
4. Measure the voltage between:
   | Fan module connector FH108, harness side | Battery |
   | Pin 02 | Negative terminal |

   Is the voltage less than 10 volts?
Yes
  REPAIR the circuit between the cooling fan module and battery. This circuit includes fuse 38 of the front power distribution box and the EMS control relay. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
  GO to T3.

T3: CHECK THE RADIATOR FAN MODULE CONTROL CIRCUIT FOR SHORT CIRCUIT TO GROUND
1. Key off.
**Measure the resistance between:**

<table>
<thead>
<tr>
<th>Pin 01</th>
<th>Battery</th>
</tr>
</thead>
</table>

**Is the resistance less than 10,000 ohms?**

- **Yes**
  - REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
  - **GO to T4.**

- **No**
  - **GO to T5.**

**T4: CHECK THE RADIATOR FAN MODULE CONTROL CIRCUIT FOR SHORT CIRCUIT TO POWER**

| Pin 01 | Positive terminal |

**Is the resistance less than 10,000 ohms?**

- **Yes**
  - REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

- **No**
  - **GO to T5.**

**T5: CHECK THE RADIATOR FAN MODULE CONTROL CIRCUIT FOR HIGH RESISTANCE**

| Pin 01 | Pin 49 |

**Is the resistance greater than 5 ohms?**

- **Yes**
  - REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

- **No**
  - **GO to T6.**

**T6: CHECK THE RADIATOR FAN MODULE GROUND FOR HIGH RESISTANCE**

| Pin 02 | Negative terminal |

**Is the resistance greater than 5 ohms?**

- **Yes**
  - REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

- **No**
  - INSTALL a new radiator cooling fan module. CLEAR the DTC and test the system for normal operation.

**PINPOINT TEST U : BATTERY POWER SUPPLY VOLTAGE**

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>

Is the resistance less than 10,000 ohms?

Yes
- REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No
- **GO to W4.**
Is the resistance less than 10,000 ohms?
Yes
   REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
   GO to W5.

**W5: CHECK THE APP SENSOR SENSING CIRCUIT 2 FOR HIGH RESISTANCE**
1. Disconnect the ECM electrical connector, FH300.
2. Measure the resistance between:
   - **APP sensor connector CA88, harness side**
   - **ECM connector FH300, harness side**
   - Pin 01
   - Pin 38

Is the resistance greater than 5 ohms?
Yes
   REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
   GO to W6.

**W6: CHECK THE APP SENSOR GROUND CIRCUIT FOR HIGH RESISTANCE**
1. Measure the resistance between:
   - **APP sensor connector CA88, harness side**
   - **ECM connector FH300, harness side**
   - Pin 03
   - Pin 07

Is the resistance greater than 5 ohms?
Yes
   INSTALL a new APP sensor.
   REFER to: Accelerator Pedal (310-02 Acceleration Control, Removal and Installation).
   CLEAR the DTC and test the system for normal operation.
No
   GO to X1.

**PINPOINT TEST X: THROTTLE MOTOR CONTROL CIRCUIT**

<table>

| | |

---
Measure the resistance between:

<table>
<thead>
<tr>
<th>FRP sensor connector IL12, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 03</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance less than 10,000 ohms?

Yes

REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No

GO to Y4.

Y4: CHECK THE FRP SENSOR SIGNAL CIRCUIT FOR SHORT CIRCUIT TO POWER

Measure the resistance between:

<table>
<thead>
<tr>
<th>FRP sensor connector IL12, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 03</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance less than 10,000 ohms?

Yes

REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No

GO to Y5.

Y5: CHECK THE FRP SENSOR SIGNAL CIRCUIT FOR HIGH RESISTANCE

Disconnect the ECM sensor electrical connector, PI300.

Measure the resistance between:

<table>
<thead>
<tr>
<th>FRP sensor connector IL12, harness side</th>
<th>ECM connector PI300, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 03</td>
<td>Pin 71</td>
</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?

Yes

REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No

GO to Y6.

Y6: CHECK THE FRP SENSOR GROUND CIRCUIT FOR HIGH RESISTANCE

Measure the resistance between:

<table>
<thead>
<tr>
<th>FRP sensor connector IL12, harness side</th>
<th>ECM connector PI300, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Pin 10</td>
</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?

Yes

REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No

INSTALL a new FRP sensor. CLEAR the DTC and test the system for normal operation.

PINPOINT TEST Z: STARTER RELAY SIGNAL

TEST CONDITIONS

Z1: CHECK THE STARTER RELAY TO ECM CIRCUIT FOR SHORT CIRCUIT TO GROUND

Key off.

Remove the starter relay.

Measure the resistance between:

<table>
<thead>
<tr>
<th>Starter relay base</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance less than 10,000 ohms?

Yes

REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No

GO to Z2.

Z2: CHECK THE STARTER RELAY TO ECM CIRCUIT FOR SHORT CIRCUIT TO POWER

Measure the resistance between:

<table>
<thead>
<tr>
<th>Starter relay base</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance less than 10,000 ohms?

Yes

REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No

GO to Z3.

Z3: CHECK THE STARTER RELAY TO ECM CIRCUIT FOR HIGH RESISTANCE

Disconnect the ECM electrical connector, EC300.

Measure the resistance between:

<table>
<thead>
<tr>
<th>Starter relay base</th>
<th>ECM connector EC300, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Pin 51</td>
</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?

Yes

REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No

INSTALL a new starter relay. Clear the DTC and test the system for normal operation. If the DTC resets, refer to the warranty policy and procedures manual if an ECM is suspect.

PINPOINT TEST AA: RIGHT-HAND VARIABLE CAMSHAFT TIMING (VCT) OIL CONTROL SOLENOID CIRCUIT

TEST CONDITIONS

AA1: CHECK ECM TO VCT SOLENOID SUPPLY CIRCUIT VOLTAGE

Disconnect the VCT solenoid electrical connector, PI16.

Key on, engine off.
Measure the voltage between:

<table>
<thead>
<tr>
<th>VCT solenoid connector PI16, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the voltage greater than 10 volts?

Yes  
GO to AA2.

No  
REPAIR the circuit between the VCT solenoid electrical connector and battery. This circuit includes fuse 38 of the front power distribution box and the EMS control relay. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

**AA2: CHECK VCT SOLENOID CONTROL CIRCUIT FOR HIGH RESISTANCE**

1. Key off.
2. Disconnect the ECM electrical connector, PI300.
3. Measure the resistance between:

<table>
<thead>
<tr>
<th>VCT solenoid connector PI16, harness side</th>
<th>ECM connector PI300, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 01</td>
<td>Pin 86</td>
</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?

Yes  
REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No  
INSTALL a new VCT oil control solenoid.

REFER to: [Variable Camshaft Timing (VCT) Oil Control Solenoid](303-14A Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation). CLEAR the DTC and test the system for normal operation.

**PINPOINT TEST AB : LEFT-HAND VARIABLE CAMSHAFT TIMING (VCT) OIL CONTROL SOLENOID CIRCUIT**

**TEST CONDITIONS**

**DETAILS/RESULTS/ACTIONS**

**AB1: CHECK ECM TO VCT SOLENOID SUPPLY CIRCUIT VOLTAGE**

1. Disconnect the VCT solenoid electrical connector, PI17.
2. Key on, engine off.
3. Measure the voltage between:

<table>
<thead>
<tr>
<th>VCT solenoid connector PI17, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the voltage greater than 10 volts?

Yes  
GO to AB2.

No  
REPAIR the circuit between the VCT solenoid electrical connector and battery. This circuit includes fuse 38 of the front power distribution box and the EMS control relay. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

**AB2: CHECK VCT SOLENOID CONTROL CIRCUIT FOR HIGH RESISTANCE**

1. Key off.
2. Disconnect the ECM electrical connector, PI300.
3. Measure the resistance between:

<table>
<thead>
<tr>
<th>VCT solenoid connector PI17, harness side</th>
<th>ECM connector PI300, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 01</td>
<td>Pin 87</td>
</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?

Yes  
REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No  
INSTALL a new VCT oil control solenoid.

REFER to: [Variable Camshaft Timing (VCT) Oil Control Solenoid](303-14A Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation). CLEAR the DTC and test the system for normal operation.

**PINPOINT TEST AC : EMS CONTROL RELAY CIRCUITS**

**TEST CONDITIONS**

**DETAILS/RESULTS/ACTIONS**

**AC1: CHECK THE EMS RELAY PERMANENT SUPPLY VOLTAGES**

1. Remove the EMS relay.
2. Measure the voltage between:

<table>
<thead>
<tr>
<th>EMS relay base, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 01</td>
<td>Negative terminal</td>
</tr>
<tr>
<td>Pin 03</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Are both voltages greater than 10 volts?

Yes  
GO to AC2.

No  
REPAIR the circuit between the relay base and battery. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

**AC2: CHECK THE ECM TO EMS RELAY CONTROL CIRCUIT FOR SHORT CIRCUIT TO GROUND**

1. Measure the resistance between:

<table>
<thead>
<tr>
<th>EMS relay base, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance less than 10,000 ohms?

Yes  
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No  
GO to AC3.

**AC3: CHECK THE ECM TO EMS RELAY CONTROL CIRCUIT FOR SHORT CIRCUIT TO POWER**
Measure the resistance between:

<table>
<thead>
<tr>
<th>EMS relay base, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance less than 10,000 ohms?

Yes
- REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No
- **GO to AC4.**

**AC4: CHECK THE ECM TO EMS RELAY CONTROL CIRCUIT FOR HIGH RESISTANCE**

| 1 | Disconnect the ECM electrical connector, FH300. |
| 2 | Measure the resistance between: |
| EMS relay base, harness side | ECM connector FH300, harness side |
| Pin 02 | Pin 16 |

Is the resistance greater than 5 ohms?

Yes
- REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No
- **GO to AC5.**

**AC5: CHECK THE EMS RELAY TO ECM IGNITION CIRCUITS FOR HIGH RESISTANCE**

| 1 | Measure the resistance between: |
| EMS relay base, harness side | ECM connector FH300, harness side |
| Pin 05 | Pin 04 |
| Pin 05 | Pin 06 |

Is either resistance greater than 5 ohms?

Yes
- REPAIR the high resistance circuit. These circuits include fuses 18 and 38 of the front power distribution box. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No
- INSTALL a new EMS control relay. CLEAR the DTC and test the system for normal operation.

**PINPOINT TEST AD : MANIFOLD ABSOLUTE PRESSURE (MAP) SENSOR CIRCUIT**

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
</table>

**AD1: CHECK THE MAP SENSOR SUPPLY CIRCUIT VOLTAGE**

| 1 | Disconnect the MAP sensor electrical connector, PI29. |
| 2 | Key on, engine off. |
| 3 | Measure the voltage between: |
| MAP sensor connector PI29, harness side | Battery |
| Pin 02 | Negative terminal |

Is the voltage less than 4 volts?

Yes
- REPAIR the 5 volt supply circuit between the MAP sensor and the ECM. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No
- **GO to AD2.**

**AD2: CHECK THE MAP SENSOR SUPPLY CIRCUIT FOR SHORT CIRCUIT TO POWER**

| 1 | Key off. |
| 2 | Measure the resistance between: |
| MAP sensor connector PI29, harness side | Battery |
| Pin 02 | Positive terminal |

Is the resistance less than 10,000 ohms?

Yes
- REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No
- **GO to AD3.**

**AD3: CHECK THE MAP SENSOR SENSING CIRCUIT FOR SHORT CIRCUIT TO GROUND**

| 1 | Measure the resistance between: |
| MAP sensor connector PI29, harness side | Battery |
| Pin 01 | Negative terminal |

Is the resistance less than 10,000 ohms?

Yes
- REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No
- **GO to AD4.**

**AD4: CHECK THE MAP SENSOR SENSING CIRCUIT FOR SHORT CIRCUIT TO POWER**

| 1 | Measure the resistance between: |
| MAP sensor connector PI29, harness side | Battery |
| Pin 01 | Positive terminal |

Is the resistance less than 10,000 ohms?

Yes
- REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No
- **GO to AD5.**

**AD5: CHECK THE MAP SENSOR SENSING CIRCUIT FOR HIGH RESISTANCE**

| 1 | Disconnect the ECM electrical connector, PI300. |
| 2 | Measure the resistance between: |
| MAP sensor connector PI29, harness side | ECM connector PI300, harness side |
| Pin 01 | Pin 69 |
Is the resistance greater than 5 ohms?

Yes
- REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No
- GO to AD6.

AD6: CHECK THE MAP SENSOR GROUND CIRCUIT FOR HIGH RESISTANCE

1. Measure the resistance between:
   - MAP sensor connector PI29, harness side
   - ECM connector PI300, harness side
   - Pin 04
   - Pin 10

Is the resistance greater than 5 ohms?

Yes
- REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No
- INSTALL a new MAP sensor.
- REFER to: Manifold Absolute Pressure (MAP) Sensor (303-14A Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation).
- CLEAR the DTC and test the system for normal operation.

PINPOINT TEST AE : ENGINE FUEL TEMPERATURE (EFT) SENSOR CIRCUIT

TEST CONDITIONS

AE1: CHECK THE EFT SENSOR SENSING CIRCUIT FOR SHORT CIRCUIT TO GROUND

1. Disconnect the EFT sensor electrical connector, IL09.
2. Measure the resistance between:
   - EFT sensor connector IL09, harness side
   - Battery
   - Pin 02
   - Negative terminal

Is the resistance less than 10,000 ohms?

Yes
- REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No
- GO to AE2.

AE2: CHECK THE EFT SENSOR SENSING CIRCUIT FOR SHORT CIRCUIT TO POWER

1. Measure the resistance between:
   - EFT sensor connector IL09, harness side
   - Battery
   - Pin 02
   - Positive terminal

Is the resistance less than 10,000 ohms?

Yes
- REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No
- GO to AE3.

AE3: CHECK THE EFT SENSOR SENSING CIRCUIT FOR HIGH RESISTANCE

1. Disconnect the ECM electrical connector, PI300.
2. Measure the resistance between:
   - EFT sensor connector IL09, harness side
   - ECM connector PI300, harness side
   - Pin 02
   - Pin 46

Is the resistance greater than 5 ohms?

Yes
- REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No
- INSTALL a new EFT sensor.
- CLEAR the DTC and test the system for normal operation.

PINPOINT TEST AF : AIR CONDITIONING (A/C) PRESSURE SENSOR CIRCUIT

TEST CONDITIONS

AF1: CHECK THE A/C PRESSURE SENSOR POWER SUPPLY CIRCUIT VOLTAGE

1. Disconnect the A/C pressure sensor electrical connector, FH110.
2. Key on, engine off.
3. Measure the voltage between:
   - A/C pressure sensor connector FH110, harness side
   - Battery
   - Pin 02
   - Negative terminal

Is the voltage less than 4 volts?

Yes
- REPAIR the 5 volt supply circuit between the A/C pressure sensor and the ECM. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No
- GO to AF2.

AF2: CHECK THE A/C PRESSURE SENSOR POWER SUPPLY CIRCUIT FOR SHORT CIRCUIT TO POWER

1. Key off.
Measure the resistance between:

<table>
<thead>
<tr>
<th>A/C pressure sensor connector FH110, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance less than 10,000 ohms?
Yes
- REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
- GO to AF3.

**AF3: CHECK THE A/C PRESSURE SENSOR SENSING CIRCUIT FOR SHORT CIRCUIT TO GROUND**

<table>
<thead>
<tr>
<th>Measure the resistance between:</th>
</tr>
</thead>
<tbody>
<tr>
<td>A/C pressure sensor connector FH110, harness side</td>
</tr>
<tr>
<td>Pin 03</td>
</tr>
</tbody>
</table>

Is the resistance less than 10,000 ohms?
Yes
- REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
- GO to AF4.

**AF4: CHECK THE A/C PRESSURE SENSOR SENSING CIRCUIT FOR SHORT CIRCUIT TO POWER**

<table>
<thead>
<tr>
<th>Measure the resistance between:</th>
</tr>
</thead>
<tbody>
<tr>
<td>A/C pressure sensor connector FH110, harness side</td>
</tr>
<tr>
<td>Pin 03</td>
</tr>
</tbody>
</table>

Is the resistance less than 10,000 ohms?
Yes
- REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
- GO to AF5.

**AF5: CHECK THE A/C PRESSURE SENSOR SENSING CIRCUIT FOR HIGH RESISTANCE**

1. Disconnect the ECM electrical connector, FH300.
2. Measure the resistance between:

<table>
<thead>
<tr>
<th>A/C pressure sensor connector FH110, harness side</th>
<th>ECM connector FH300, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 03</td>
<td>Pin 12</td>
</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?
Yes
- REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
- GO to AF6.

**AF6: CHECK THE A/C PRESSURE SENSOR GROUND CIRCUIT FOR HIGH RESISTANCE**

<table>
<thead>
<tr>
<th>Measure the resistance between:</th>
</tr>
</thead>
<tbody>
<tr>
<td>A/C pressure sensor connector FH110, harness side</td>
</tr>
<tr>
<td>Pin 01</td>
</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?
Yes
- REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
- INSTALL a new A/C pressure sensor.

REFER to: Pressure Cutoff Switch - V8 4.2L Petrol/V8 S/C 4.2L Petrol/2.5L NA V6 - AJV6/3.0L NA V6 - A327 (412-03 Air Conditioning, Removal and Installation).
CLEAR the DTC and test the system for normal operation.

**PINPOINT TEST AG : INTAKE MANIFOLD TUNING (IMT) VALVE 1 (TOP) CIRCUIT**

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
</table>

**AG1: CHECK THE IMT VALVE POWER SUPPLY CIRCUIT VOLTAGE**

1. Disconnect the IMT valve electrical connector, PI30.
2. Key on, engine off.
3. Measure the voltage between:

<table>
<thead>
<tr>
<th>IMT valve connector PI30, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 01</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the voltage greater than 10 volts?
Yes
- GO to AG2.
No
- REPAIR the circuit between the IMT valve electrical connector and battery. This circuit includes fuse 37 of the front power distribution box and the EMS control relay. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

**AG2: CHECK THE IMT VALVE DRIVE CIRCUIT FOR SHORT CIRCUIT TO GROUND**

1. Key off.
2. Measure the resistance between:

<table>
<thead>
<tr>
<th>IMT valve connector PI30, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance less than 10,000 ohms?
Yes
- REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
- GO to AG3.

**AG3: CHECK THE IMT VALVE DRIVE CIRCUIT FOR SHORT CIRCUIT TO POWER**

1. Measure the resistance between:

<table>
<thead>
<tr>
<th>IMT valve connector PI30, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>
Is the resistance less than 10,000 ohms?
Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
GO to AG4.

AG4: CHECK THE IMT VALVE DRIVE CIRCUIT FOR HIGH RESISTANCE
1. Disconnect the ECM electrical connector, PI300.
2. Measure the resistance between:
   IMT valve connector PI30, harness side   ECM connector PI300, harness side
   Pin 02   Pin 90
Is the resistance greater than 5 ohms?
Yes
REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
INSTALL a new IMT valve,
REFER to: Intake Manifold Tuning (IMT) Valve LH (303-14A Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation).
CLEAR the DTC and test the system for normal operation.

PINPOINT TEST AH : INTAKE MANIFOLD TUNING (IMT) VALVE 2 (BOTTOM) CIRCUIT

AH1: CHECK THE IMT VALVE POWER SUPPLY CIRCUIT VOLTAGE
1. Disconnect the IMT valve electrical connector, PI31.
2. Key on, engine off.
3. Measure the voltage between:
   IMT valve connector PI31, harness side   Battery
   Pin 01   Negative terminal
Is the voltage greater than 10 volts?
Yes
GO to AH2.
No
REPAIR the circuit between the IMT valve electrical connector and battery. This circuit includes fuse 37 of the front power distribution box and the EMS control relay. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

AH2: CHECK THE IMT VALVE DRIVE CIRCUIT FOR SHORT CIRCUIT TO GROUND
1. Key off.
2. Measure the resistance between:
   IMT valve connector PI31, harness side   Battery
   Pin 02   Negative terminal
Is the resistance less than 10,000 ohms?
Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
GO to AH3.

AH3: CHECK THE IMT VALVE DRIVE CIRCUIT FOR SHORT CIRCUIT TO POWER
1. Measure the resistance between:
   IMT valve connector PI31, harness side   Battery
   Pin 02   Positive terminal
Is the resistance less than 10,000 ohms?
Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
GO to AH4.

AH4: CHECK THE IMT VALVE DRIVE CIRCUIT FOR HIGH RESISTANCE
1. Disconnect the ECM electrical connector, PI300.
2. Measure the resistance between:
   IMT valve connector PI31, harness side   ECM connector PI300, harness side
   Pin 02   Pin 90
Is the resistance greater than 5 ohms?
Yes
REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
INSTALL a new IMT valve,
REFER to: Intake Manifold Tuning (IMT) Valve LH (303-14A Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation).
CLEAR the DTC and test the system for normal operation.

PINPOINT TEST AI : BRAKE SWITCH

AI1: CHECK THE OPERATION OF THE BRAKE SWITCH (PEDAL RELEASED)
1. Key off.
2. Disconnect the brake switch electrical connector, CA37.
3. Make sure the brake pedal is not pressed.
4. Measure the resistance between:
   Brake switch connector CA37, component side   Brake switch connector CA37, component side
   Pin 01   Pin 02
Is the resistance greater than 5 ohms?

Yes

GO to AI2.

No

INSTALL a new brake switch. CLEAR the DTC and test the system for normal operation.

AI2: CHECK THE OPERATION OF THE BRAKE SWITCH (PEDL PRESSED)

1. Press the brake pedal.
2. Measure the resistance between:
   - Brake switch connector CA37, component side Pin 01
   - Brake switch connector CA37, component side Pin 02

Is the resistance greater than 5 ohms?

Yes

INSTALL a new brake switch. CLEAR the DTC and test the system for normal operation.

No

GO to AI3.

AI3: CHECK THE POWER SUPPLY TO THE BRAKE PEDAL SWITCH

1. Key on, engine off.
2. Measure the voltage between:
   - Brake switch connector CA37, harness side Pin 01
   - Battery Negative terminal

Is the voltage less than 10 volts?

Yes

REPAIR the circuit between the brake switch and battery. This circuit includes fuse 35 of the primary junction box. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No

GO to AI4.

AI4: CHECK THE BRAKE SWITCH SIGNAL CIRCUIT FOR SHORT CIRCUIT TO GROUND

1. Key off.
2. Measure the resistance between:
   - Brake switch connector CA37, harness side Pin 02
   - Battery Negative terminal

Is the resistance less than 10,000 ohms?

Yes

REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No

GO to AI5.

AI5: CHECK THE BRAKE SWITCH SIGNAL CIRCUIT FOR SHORT CIRCUIT TO POWER

1. Measure the resistance between:
   - Brake switch connector CA37, harness side Pin 02
   - Battery Positive terminal

Is the resistance less than 10,000 ohms?

Yes

REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No

GO to AI6.

AI6: CHECK THE BRAKE SWITCH SIGNAL CIRCUIT FOR HIGH RESISTANCE

1. Disconnect the ECM electrical connector, FH300.
2. Measure the resistance between:
   - Brake switch connector CA37, harness side Pin 02
   - ECM connector FH300, harness side Pin 41

Is the resistance greater than 5 ohms?

Yes

REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No

REFER to the warranty policy and procedures manual if an ECM is suspect.

PINPOINT TEST AJ: AIR CONDITIONING (A/C) COMPRESSOR CLUTCH CONTROL CIRCUIT

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
</table>

AJ1: CHECK THE A/C CLUTCH RELAY CONTROL CIRCUIT FOR SHORT CIRCUIT TO GROUND

1. Remove the A/C clutch relay.
2. Key on, engine off.
3. Measure the resistance between:
   - A/C clutch relay base Pin 02
   - Battery Negative terminal

Is the resistance less than 10,000 ohms?

Yes

REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No

GO to AJ2.

AJ2: CHECK THE A/C CLUTCH RELAY CONTROL CIRCUIT FOR SHORT CIRCUIT TO POWER

1. Measure the resistance between:
   - A/C clutch relay base Pin 02
   - Battery Positive terminal

Is the resistance less than 10,000 ohms?

Yes

REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No

GO to AJ3.

AJ3: CHECK THE A/C CLUTCH RELAY CONTROL CIRCUIT FOR HIGH RESISTANCE
Disconnect the ECM electrical connector, FH300.

Measure the resistance between:

<table>
<thead>
<tr>
<th>A/C clutch relay base</th>
<th>ECM connector FH300, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Pin 53</td>
</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?

Yes

REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No

INSTALL a new A/C clutch relay. CLEAR the DTC and test the system for normal operation. If the DTC is reset, refer to the warranty policy and procedures manual if an ECM is suspect.

### PINPOINT TEST AK : CLUTCH PEDAL SWITCH

#### TEST CONDITIONS

**AK1: CHECK THE OPERATION OF THE CLUTCH PEDAL SWITCH (PEDAL RELEASED)**

1. Key off.
2. Disconnect the clutch pedal electrical connector, (right hand drive vehicles) CA285 or (left hand drive vehicles) CA291.
3. Make sure the clutch pedal is not pressed.
4. Measure the resistance between:

   | Right hand drive vehicles |
   | Clutch pedal switch connector CA285, component side | Clutch pedal switch connector CA285, component side |
   | Pin 01 | Pin 02 |

   | Left hand drive vehicles |
   | Clutch pedal switch connector CA291, component side | Clutch pedal switch connector CA291, component side |
   | Pin 01 | Pin 02 |

Is the resistance greater than 5 ohms?

Yes

GO to AK2.

No

INSTALL a new clutch pedal switch. CLEAR the DTC and test the system for normal operation.

**AK2: CHECK THE OPERATION OF THE CLUTCH PEDAL SWITCH (PEDAL PRESSED)**

1. Press the clutch pedal.
2. Measure the resistance between:

   | Right hand drive vehicles |
   | Clutch pedal switch connector CA285, component side | Clutch pedal switch connector CA285, component side |
   | Pin 01 | Pin 02 |

   | Left hand drive vehicles |
   | Clutch pedal switch connector CA291, component side | Clutch pedal switch connector CA291, component side |
   | Pin 01 | Pin 02 |

Is the resistance greater than 5 ohms?

Yes

INSTALL a new clutch pedal switch. CLEAR the DTC and test the system for normal operation.

No

GO to AK3.

**AK3: CHECK THE CLUTCH PEDAL SWITCH TO ECM INPUT CIRCUIT FOR SHORT CIRCUIT TO GROUND**

1. Measure the resistance between:

   | Right hand drive vehicles |
   | Clutch pedal switch connector CA285, harness side | Battery |
   | Pin 01 | Negative terminal |

   | Left hand drive vehicles |
   | Clutch pedal switch connector CA291, harness side | Battery |
   | Pin 01 | Negative terminal |

Is the resistance less than 10,000 ohms?

Yes

REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No

GO to AK4.

**AK4: CHECK THE CLUTCH PEDAL SWITCH TO ECM INPUT CIRCUIT FOR SHORT CIRCUIT TO POWER**

1. Measure the resistance between:

   | Right hand drive vehicles |
   | Clutch pedal switch connector CA285, harness side | Battery |
   | Pin 01 | Positive terminal |

   | Left hand drive vehicles |
   | Clutch pedal switch connector CA291, harness side | Battery |
   | Pin 01 | Positive terminal |

Is the resistance less than 10,000 ohms?

Yes

REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No

GO to AK5.

**AK5: CHECK THE CLUTCH PEDAL SWITCH TO ECM INPUT CIRCUIT FOR HIGH RESISTANCE**

1. Disconnect ECM electrical connector FH300
2. Measure the resistance between:

   | Right hand drive vehicles |
   | Clutch pedal switch connector CA285, harness side | ECM connector FH300, harness side |
   | Pin 01 | Pin 43 |
Left hand drive vehicles

<table>
<thead>
<tr>
<th>Clutch pedal switch connector CA291, harness side</th>
<th>ECM connector FH300, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 01</td>
<td>Pin 43</td>
</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?

Yes

REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No

GO to AK6.

AK6: CHECK THE CLUTCH PEDAL SWITCH GROUND CIRCUIT FOR HIGH RESISTANCE

1. Measure the resistance between:

<table>
<thead>
<tr>
<th>Right hand drive vehicles</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clutch pedal switch connector CA285, harness side</td>
<td>Negative terminal</td>
</tr>
<tr>

<td></td>
</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?

Yes

REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No

Refer to the warranty policy and procedures manual if an ECM is suspect.
Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27 - Powertrain Control Module (PCM) Long Drive Cycle Self-Test

General Procedures

WARNING: Where possible, all road tests should be on well surfaced and dry roads. Always comply with speed limits and local traffic regulations.

- NOTE: This procedure is an overcheck only. If fault codes are found, interrogation of the relevant system must be carried out and claimed against.
- NOTE: The vehicle must exceed 50mph (80 km/h) during the road test.

1. Connect the diagnostic equipment to the vehicle.
2. Follow on screen prompts and check for engine management fault codes.
3. Clear the fault codes following the on screen procedure.
4. Disconnect the diagnostic equipment from the vehicle.
5. NOTE: Make sure cruise control is not engaged.

Make sure the engine temperature is above 60 °C (140 °F).

Carry out a road test and perform the following operations.

1. Accelerate to 55 mph (88 km/h) in 5th gear and cruise for 2 minutes with the engine speed at or above 1800rpm.
2. Lift off the throttle and allow the vehicle to decelerate until the engine speed is less than 1000 rpm.
3. Stop the vehicle.
4. Release brake, allow the vehicle to move with no throttle for 1 minute.
5. Road test is now complete.

6. Connect the diagnostic equipment to the vehicle.
7. NOTE: If fault codes are found, interrogation of the relevant system must be carried out and claimed against.

Follow on screen prompts and check for engine management fault codes.

8. Disconnect the diagnostic equipment from the vehicle.
General Procedures

• NOTE: This procedure is an overcheck only. If fault codes are found, interrogation of the relevant system must be carried out and claimed against.

1. Connect the diagnostic equipment to the vehicle.
2. Follow on screen prompts and check for engine management fault codes.
3. Clear the fault codes following the on screen procedure.
4. Start the engine.
   • Allow the engine to idle for 30 seconds.
   • Raise the engine speed to 1500 rpm and hold for 3 minutes until a temperature of 70°C (158 ºF) is achieved.
   • Allow the engine to idle for 30 seconds.
   • Switch off the engine.
5. NOTE: If fault codes are found, interrogation of the relevant system must be carried out and claimed against.
   Follow on screen prompts and check for engine management fault codes.
6. Disconnect the diagnostic equipment from the vehicle.
Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27 - Brake Pedal Position (BPP) Switch

Removal

1. Switch the ignition on.
2. Position the front seat fully rearwards.
3. Switch the ignition off.
4. Remove the driver's side footwell trim panel.
   • Release the 3 clips.

5. Release the brake pedal position (BPP) switch.
   • Rotate the BPP switch 45 degrees counter-clockwise.

6. Remove the BPP switch.
   • Disconnect the electrical connector.

Installation

1. CAUTIONS:
Make sure that the brake pedal remains in the rest position during this procedure.

The bracket is keyed to avoid incorrect orientation. Failure to correctly align the switch may result in damage to the vehicle.

Make sure that the pedal box, booster-to-brake pedal assembly and switch bracket are all installed correctly before installing the switch.

Install the BPP switch.

- Locate the BPP switch in the bracket.
- Rotate the BPP switch 45 degrees clockwise.

2. Connect the electrical connector.
3. Install the driver's side footwell trim panel.

- Align the trim panel with the guide.
- Install the 3 clips.
Removal

1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 Battery, Mounting and Cables.

2. Remove the air cleaner outlet pipe. For additional information, refer to Section 303-12A Intake Air Distribution and Filtering / 303-12B Intake Air Distribution and Filtering / 303-12C Intake Air Distribution and Filtering.

3. Remove the CMP sensor.
   1. Disconnect the CMP sensor electrical connector
   2. Remove the CMP sensor.
      • Remove and discard the CMP sensor O-ring seal.

Installation

1. To install, reverse the removal procedure.
   • Install a new CMP sensor O-ring seal.
   • Tighten the CMP sensor retaining bolt to 7 Nm.
1. Remove the throttle body. For additional information, refer to Section 303-04A Fuel Charging and Controls / 303-04B Fuel Charging and Controls / 303-04C Fuel Charging and Controls / 303-04D Fuel Charging and Controls - Turbocharger.

2. Remove the CMP sensor.
   1. Disconnect the CMP sensor electrical connector
   2. Remove the CMP sensor.
      • Remove and discard the CMP sensor O-ring seal.

**Installation**

1. To install, reverse the removal procedure.
   • Install a new CMP sensor O-ring seal.
   • Tighten the CMP sensor retaining bolt to 7 Nm.
**Removal**

1. Raise and support the vehicle, For additional information, refer to Section [100-02 Jacking and Lifting](#).
2. Disconnect the catalyst monitor sensor.

3. **CAUTION:** Make sure the wiring harness is not twisted or damaged on removal. Failure to follow this instruction may result in damage to the vehicle.

   Using the Snap-on tool S6176, remove the catalyst monitor sensor.

**Installation**

1. **CAUTION:** Make sure the wiring harness is not twisted or damaged on installation. Failure to follow this instruction may result in damage to the vehicle.

   To install, reverse the removal procedure.
   - Tighten to 45 Nm.
Removal

1. Disconnect the battery ground cable.
   For additional information, refer to Section 414-01 Battery, Mounting and Cables.

2. Remove the air deflector
   For additional information, refer to Section 501-02 Front End Body Panels.

3. Disconnect the crankshaft position (CKP) sensor electrical connector.

4. Remove the CKP sensor.
   - Remove and discard the CKP sensor O-ring seal.

Installation

1. To install, reverse the removal procedure.
   - Install a new CKP sensor O-ring seal.
   - Tighten to 7 Nm.
Removal

1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 Battery, Mounting and Cables.

2. Remove the cabin air filter. For additional information, refer to Section 412-01 Air Distribution and Filtering.

3. Remove the engine compartment support.

4. Remove the cabin air filter housing retaining nut.

5. Remove the cabin air filter housing.
6. Remove the engine compartment panel.

7. NOTE: The engine control module (ECM) electrical connector retaining bolt remains captive in the electrical connector. Using the special tool, disconnect the ECM electrical connector.

8. Remove the passenger side instrument panel lower trim panel.

9. Remove the ECM.
   - Remove the ECM retaining bracket.
   - Release the ECM retaining tangs.
   - Remove the ECM.

**Installation**

1. **CAUTION:** Make sure the electrical connector locate correctly in the engine control module. Do not force or overtighten the electrical connector. Failure to follow these instructions may cause damage to the electrical connector.

   To install, reverse the removal procedure.
2. Tighten to 6 Nm.
Removal

1. WARNINGS:

⚠️ Never remove the coolant expansion tank pressure cap under any circumstances while the engine is operating. Failure to follow this instruction may result in personal injury.

⚠️ To avoid hot coolant or steam blowing out of the cooling system, use extreme care when removing the coolant expansion tank pressure cap. Wait until the engine has cooled down, then insulate the coolant pressure cap with a suitable cloth and slowly loosen the coolant expansion tank pressure cap until the cooling system pressure is released. Do not remove the coolant expansion tank pressure cap. Step back while the pressure is released from the system. When all of the pressure has been released slowly remove the coolant expansion tank pressure cap (still with the suitable cloth in position) from the coolant expansion tank. Failure to follow this instruction may result in personal injury.

Release the cooling system pressure.

- Remove the coolant expansion tank pressure cap.

2. Remove the engine coolant temperature (ECT) sensor.

1. Disconnect the ECT electrical connector.
2. Remove the ECT sensor.
- Remove and discard the ECT sensor sealing washer.

Installation

1. To install, reverse the removal procedure.

- Install a new ECT sensor sealing washer.
- Tighten the ECT sensor to 17 Nm.
- Fill the cooling system up to the MAX mark on the coolant expansion tank.
Removal

1. WARNINGS:
   - Never remove the coolant expansion tank pressure cap under any circumstances while the engine is operating. Failure to follow this instruction may result in personal injury.
   - To avoid hot coolant or steam blowing out of the cooling system, use extreme care when removing the coolant expansion tank pressure cap. Wait until the engine has cooled down, then insulate the coolant pressure cap with a suitable cloth and slowly loosen the coolant expansion tank pressure cap until the cooling system pressure is released. Do not remove the coolant expansion tank pressure cap. Step back while the pressure is released from the system. When all of the pressure has been released slowly remove the coolant expansion tank pressure cap (still with the suitable cloth in position) from the coolant expansion tank. Failure to follow this instruction may result in personal injury.

   Release the cooling system pressure.
   - Remove the coolant expansion tank pressure cap.

2. Remove the air cleaner outlet pipe.
   For additional information, refer to: Air Cleaner Outlet Pipe - VIN Range: N52048->N99999 (303-12A Intake Air Distribution and Filtering - 2.5L NA V6 - AJ6/3.0L NA V6 - AJ27, Removal and Installation).

3. Disconnect the engine coolant temperature (ECT) sensor electrical connector.

4. Remove the ECT sensor.
   - Remove the ECT sensor retaining clip.
   - Remove and discard the ECT sensor sealing washer.

Installation

1. To install, reverse the removal procedure.
   - Install a new ECT sensor sealing washer.

2. Fill the cooling system up to the MAX mark on the coolant expansion tank.
Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27 - Fuel Temperature Sensor
Removal and Installation

Removal

1. Disconnect the battery ground cable.
2. Remove the air outlet tube. For additional information, refer to Section 303-12A Intake Air Distribution and Filtering Section 303-12B Intake Air Distribution and Filtering Section 303-12C Intake Air Distribution and Filtering.
3. Detach the spring lock coupling safety clip.
4. Disconnect the electrical connector.
5. Remove the fuel temperature sensor. For additional information, refer to Section 310-00 Fuel System - General Information.

Installation

1. To install, reverse removal procedure.
Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27 - Heated Oxygen Sensor (HO2S)
Removal and Installation

**General Equipment**
Snap-on tool S6176

**Removal**
1. Remove the air deflector.
   For additional information, refer to Section [501-02 Front End Body Panels](#).
2. **CAUTION:** Make sure the wiring harness is not twisted or damaged on removal. Failure to follow this instruction may result in damage to the vehicle.
   Using the Snap-on tool S6176, remove the HO2S.
   1. Disconnect the HO2S electrical connector.
   2. Using the Snap-on tool S6176, remove the HO2S.

**Installation**
1. **CAUTION:** Make sure the wiring harness is not twisted or damaged on installation. Failure to follow this instruction may result in damage to the vehicle.
   To install, reverse the removal procedure.
   - Tighten to 45 Nm.
Removal

1. Remove the cowl vent screen. For additional information, refer to Section 501-02 Front End Body Panels.
2. Remove the engine compartment support.
3. Disconnect the intake manifold tuning (IMT) valve electrical connector.
4. Remove the IMT valve.

Installation

1. To install, reverse the removal procedure.
   - Tighten to 10 Nm.
Removal

1. Remove the fuel supply manifold. For additional information, refer to Section 303-04A Fuel Charging and Controls / 303-04B Fuel Charging and Controls / 303-04C Fuel Charging and Controls / 303-04D Fuel Charging and Controls - Turbocharger.

2. Disconnect the knock sensor electrical connector.

3. Remove the knock sensor.

Installation

1. To install, reverse the removal procedure.
   - Tighten to 25 Nm.
Removal

1. Remove the air deflector.
   
   For additional information, refer to Section 501-02 Front End Body Panels.

2. Disconnect the knock sensor electrical connector.

3. Remove the knock sensor.

Installation

1. To install, reverse the removal procedure.
**Removal**

1. Remove the cowl vent screen. For additional information, refer to: Cowl Panel Grille (501-02 Front End Body Panels, Removal and Installation).

2. Remove the engine compartment support.

3. Disconnect the manifold absolute pressure (MAP) sensor electrical connector.

4. Remove the MAP sensor.
   - Remove the and discard the MAP sensor O-ring seal.

**Installation**

1. To install, reverse the removal procedure.
   - Install a new MAP sensor O-ring seal.
   - Tighten to 10 Nm.

2. **NOTE:** For NAS vehicles only.
   If required, carry out a short drive cycle.
   For additional information, refer to: Powertrain Control Module (PCM) Short Drive Cycle Self-Test (303-14A Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, General Procedures).
Removal

1. Remove the mass airflow (MAF) sensor.
   1. Disconnect the MAF sensor electrical connector.
   2. Remove the mass airflow MAF sensor.
      • Remove and discard the MAF sensor O-ring seal.

Installation

1. To install, reverse the removal procedure.
   • Install a new MAF sensor O-ring seal.

2. NOTE: For NAS vehicles only.

If required, carry out a short drive cycle.
For additional information, refer to: Powertrain Control Module (PCM) Short Drive Cycle Self-Test (303-14A Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, General Procedures).
Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27 - Oil Temperature Sensor
Removal and Installation

Removal

1. Remove the air conditioning A/C compressor. For additional information, refer to Section 412-03 Air Conditioning.
2. Disconnect the oil temperature sensor electrical connector.
3. Remove the oil temperature sensor.

Installation

1. NOTE: If the oil temperature sensor is to be re-used apply a small bead of sealant meeting Jaguar specification on the first three threads of the oil temperature sensor.

   To install, reverse the removal procedure
   • Tighten to 15 Nm.
Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27 - Variable Camshaft Timing (VCT) Oil Control Solenoid

Removal

1. Remove the valve cover. For additional information, refer to: (303-01B Engine - V8 4.2L Petrol/V8 S/C 4.2L Petrol)
   
   Valve Cover RH - VIN Range: M45255->N52047 (In-vehicle Repair), 
   Valve Cover RH - VIN Range: N52048->N99999 (In-vehicle Repair).

2. Remove the variable camshaft timing oil control solenoid.

Installation

1. To install, reverse the removal procedure.
   - Tighten to 10 Nm.

2. NOTE: For NAS vehicles only.
   
   If required, carry out a short drive cycle. 
   For additional information, refer to: Powertrain Control Module (PCM) Short Drive Cycle Self-Test (303-14A Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, General Procedures).

The electronic engine control system consists of an engine control module (ECM), located behind the glove compartment, and a number of sensing and actuating devices. The sensors supply the ECM with input signals which relate to the engine operating conditions and driver requirements. The sensor information is evaluated by the ECM using the results to activate the appropriate response from the actuating devices. The system provides the necessary engine control accuracy and adaptability to:

- Minimize exhaust emissions and fuel consumption.
- Provide optimum driver control under all conditions.
- Minimize evaporative emissions.
- Provide system diagnostics.

In addition to these functions the ECM also interfaces with other vehicle systems through the controller area network (CAN).

Camshaft Position (CMP) Sensor

The camshaft position (CMP) sensors monitor the position of both camshafts to allow the ECM to control the phase of the inlet camshafts relative to the position of the crankshaft.

Variable Camshaft Timing Oil Control Solenoid

The variable camshaft timing oil control solenoid is a hydraulic actuator, which advances and retards the inlet camshaft timing, thereby altering the camshaft to crankshaft phasing for optimum engine performance.

Knock Sensors (KS)

The knock sensors (KS) detect combustion knock within the engine cylinders and send a signal to the ECM. The ECM uses this information to gradually adjust the ignition timing until the combustion knock is eliminated.

Mass Air flow (MAF) Sensor

The mass air flow (MAF) sensor informs the ECM of the rate of air flow entering the engine by producing a voltage which is proportional to the rate of air flow into the engine. The voltage produced by the MAF sensor increases as the rate of air flow increases. The ECM takes into account the density of the air entering the intake system so that it is possible to maintain the required air to fuel ratio, and to compensate for variations in atmospheric pressure.

Integral to the MAF sensor is the intake air temperature sensor (IAT) which measures the temperature of the air entering the intake system. The ECM uses this information to compensate for higher than normal air intake temperatures.

Throttle Position (TP) Sensor

The ECM monitors the angle of the throttle blade within the throttle housing through the throttle position (TP) sensor. The TP sends a voltage to the ECM which is proportional to the angle of the throttle plate. The voltage from the TP increases with the angle of the throttle plate. There are two sensor tracks within the TP sensor.

Crankshaft Position (CKP) Sensor

The crankshaft position (CKP) sensor is an inductive pulse generator, which scans protrusions on a pulse ring fitted to the flywheel to inform the ECM of the crankshaft’s position and speed. The CKP sensor produces an alternating voltage. The frequency of this voltage increases proportional to engine speed.

Engine Coolant Temperature (ECT) Sensor

The engine coolant temperature (ECT) sensor is a thermistor type sensor that provides an input signal to the ECM which is proportional to the engine coolant temperature. The ECT sensor is a negative temperature coefficient (NTC) sensor and its resistance decreases with a proportional increase in engine coolant temperature.

Oil Temperature Sensor

The oil temperature sensor is a thermistor type sensor that provides an input signal to the ECM which is proportional to the engine oil temperature.

Oil Pressure Switch

The oil pressure switch is connected to the instrument cluster and is not directly part of the electronic engine control system.

Heated Oxygen Sensor (HO2S)

The heated oxygen sensor (HO2S) is a linear characteristic type sensor, fitted forward of the exhaust system’s catalytic converter. The ECM uses this as its primary sensor to measure the oxygen content of the exhaust gasses within the exhaust system to provide closed-loop fuelling control.

Catalyst Monitor Sensor

The catalyst monitor sensor is a non-linear characteristic type sensor fitted to the exhaust system’s catalytic converter. The ECM uses this as its secondary sensor to measure the oxygen content of the exhaust gasses within the exhaust after they have passed through the catalytic converter. As well as providing additional closed-loop fuelling control the ECM uses this information to determine the efficiency of the catalytic converter.

Intake Air Temperature (IAT) Sensor. Vehicles with supercharger.

Vehicles with supercharger have an additional intake air temperature sensor located on the right-hand charge air cooler. The IAT measures the temperature of the air entering the charge air cooler. The ECM uses this information to compensate for higher than normal air intake temperatures.
**Diagnosis and Testing**

1. Verify the customer concern by operating the system.
2. Visually inspect for obvious signs of mechanical and electrical damage.

### Visual Inspection Chart

<table>
<thead>
<tr>
<th>Mechanical</th>
<th>Electrical</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Engine oil level</td>
<td>• Fuses. (9, 31, 32, 37)</td>
</tr>
<tr>
<td>• Cooling system coolant level</td>

<tr>
<td>• Fuel Contamination</td>
<td>• Electrical connector(s)</td>
</tr>
<tr>
<td>• Throttle body</td>
<td>• Sensor(s)</td>
</tr>
<tr>
<td></td>
<td>• Engine control module (ECM)</td>
</tr>
</tbody>
</table>

3. Verify the following systems are working correctly:

   - Air intake system
   - Cooling system
   - Charging system
   - Fuel charging system

4. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

5. If the concern is not visually evident and the approved Jaguar diagnostic system is not available, use a fault code reader to retrieve the fault codes before proceeding to the Diagnostic Trouble Code (DTC) Index Chart.

6. Make sure that a power supply is present to the ECM from fuse 32 of the engine compartment fuse box before carrying out diagnostic work on the electronic engine control system.

### Diagnostic Trouble Code (DTC) Index

**PINPOINT TEST A : DTC P0116, P0117, P0118, P0125. ECT SENSOR.**

**TEST CONDITIONS**

**DETAILS/RESULTS/ACTIONS**

A1: CHECK THE ECT SENSOR RESISTANCE

1. Measure the resistance between pins 1 and 2 of the Engine Coolant Temperature sensor.
2. Is the resistance 2437 to 2464 ohms at 20°C?
   - Yes: GO to A2.
   - No: INSTALL a new ECT sensor. CLEAR the DTCs. TEST the system for normal operation.

A2: CHECK THE ENGINE COOLANT TEMPERATURE (ECT) SENSOR SIGNAL WIRE FOR OPEN CIRCUIT

1. Turn the ignition switch to the OFF position.
2. Disconnect the ECT sensor electrical connector PI25.
3. Disconnect the ECM electrical connector, PI01.
4. Measure the resistance between the ECT sensor electrical connector PI25, pin 2 (UY) and the ECM electrical connector PI01, pin 70 (UY).
   - Is the resistance less than 5 ohms?
     - Yes: GO to A3.
     - No: REPAIR the circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.

A3: CHECK THE ECT SENSOR SIGNAL WIRE FOR A SHORT TO GROUND

1. Measure the resistance between the ECT sensor electrical connector PI25, pin 2 (UY) and PI01, pin 19.
2. Is the resistance less than 10,000 ohms?
   - Yes: REPAIR the short to GROUND. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.
   - No: GO to A4.

A4: CHECK THE ECT SENSOR GROUND CIRCUIT

1. Measure the resistance between the ECT sensor electrical connector PI25, pin 1 (BG) and GROUND.
2. Is the resistance less than 5 ohms?
   - Yes: GO to A5.
   - No: REPAIR the circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.

A5: CHECK THE ECT SENSOR GROUND CIRCUIT FOR A SHORT TO BATTERY POSITIVE

1. Turn the ignition switch to the ON position.
2. Measure the voltage between the ECT electrical connector PI25, pin 1 (BG) and GROUND.
3. Is there a voltage present?
   - Yes: REPAIR the circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.
   - No: GO to A6.

A6: CHECK THE ECT SENSOR CIRCUIT FOR A SHORT TO BATTERY POSITIVE

1. Connect the ECM electrical connector PI01.
2. Turn the ignition switch to the ON position.
3. Measure the voltage between the ECT sensor electrical connector PI25, pin 2 (UY) and GROUND.
4. Is the voltage greater than 5 volts?
   - Yes: REPAIR the short to battery positive. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.
   - No:
INSTALL a new ECT sensor. CLEAR the DTCs. TEST the system for normal operation. If the DTC is repeated, INSTALL a new ECM.
REFER to: Engine Control Module (ECM) (303-14A Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation).
Before replacing an ECM, contact dealer technical support.

PINPOINT TEST B : DTC P0335, P0336, P1245, P1246. CRANKSHAFT POSITION (CKP) SENSOR.

<table>

<tr>
<td>No</td>
<td>INSTALL the CKP sensor correctly. REFER to: Crankshaft Position (CKP) Sensor (303-14B Electronic Engine Controls - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Removal and Installation). Reconnect the sensor. CLEAR the DTCs. TEST the system for normal operation.</td>
</tr>
</tbody>
</table>

| **B2: CHECK THE CKP SENSOR FOR DEBRIS** | |
| 1. Remove the CKP sensor and inspect for debris. | |
| Is the CKP sensor and flywheel teeth free of debris? | |
| Yes | GO to B3. |
| No | CLEAN the sensor and wheel. INSTALL the sensor. REFER to: Crankshaft Position (CKP) Sensor (303-14B Electronic Engine Controls - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Removal and Installation). Reconnect the sensor. CLEAR the DTCs. TEST the system for normal operation. |

| **B3: CHECK THE CKP SENSOR RESISTANCE** | |
| 1. Measure the resistance between pins 1 and 2 of the CKP sensor. | |
| Is the resistance 250 to 450 ohms? | |
| Yes | GO to B4. |
| No | INSTALL a new CKP sensor. REFER to: Crankshaft Position (CKP) Sensor (303-14B Electronic Engine Controls - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Removal and Installation). Reconnect the sensor. CLEAR the DTCs. TEST the system for normal operation. |

| **B4: CHECK THE CKP SENSOR GROUND WIRE FOR OPEN CIRCUIT** | |
| 1. Disconnect the ECM electrical connector PI01. | |
| 2. Disconnect the CKP sensor electrical connector PI21. | |
| 3. Measure the resistance between the CKP sensor electrical connector PI21, pin 1 (B) and the ECM electrical connector PI01, pin 37 (B). | |
| Is the resistance less than 5 ohms? | |
| Yes | GO to B5. |
| No | REPAIR the circuit. For additional information, refer to the wiring diagrams. Reconnect all connectors. CLEAR the DTCs. TEST the system for normal operation. |

| **B5: CHECK THE CKP SENSOR SIGNAL WIRE FOR OPEN CIRCUIT** | |
| 1. Measure the resistance between the CKP sensor electrical connector PI21, pin 2 (O) and the ECM electrical connector PI01, pin 36 (O). | |
| Is the resistance less than 5 ohms? | |
| Yes | GO to B6. |
| No | REPAIR the circuit. For additional information, refer to the wiring diagrams. Reconnect all connectors. CLEAR the DTCs. TEST the system for normal operation. |

| **B6: CHECK THE CKP SENSOR GROUND WIRE FOR A SHORT TO GROUND** | |
| 1. Measure the resistance between the CKP sensor electrical connector PI21 pin 1 (B) and GROUND. | |
| Is the resistance less than 10,000 ohms? | |
| Yes | REPAIR the short to GROUND. For additional information, refer to the wiring diagrams. Reconnect all connectors. CLEAR the DTCs. TEST the system for normal operation. |
| No | GO to B7. |

| **B7: CHECK THE CKP SENSOR SIGNAL WIRE FOR A SHORT TO GROUND** | |
| 1. Measure the resistance between the CKP sensor electrical connector PI21 pin 2 (O) and GROUND. | |
| Is the resistance less than 10,000 ohms? | |
| Yes | REPAIR the short to GROUND. For additional information, refer to the wiring diagrams. Reconnect all connectors. CLEAR the DTCs. TEST the system for normal operation. |
| No | GO to B8. |

| **B8: CHECK THE CKP SENSOR GROUND WIRE FOR A SHORT TO BATTERY POSITIVE** | |
| 1. Turn the ignition switch to the ON position. | |
| 2. Measure the voltage between the CKP sensor electrical connector PI21 pin 1 (B) and GROUND. | |
| Is the voltage greater than 5 volts? | |
| Yes | REPAIR the short to battery positive. For additional information, refer to the wiring diagrams. Reconnect all connectors. CLEAR the DTCs. TEST the system for normal operation. |
| No | GO to B9. |

| **B9: CHECK THE CKP SENSOR SIGNAL WIRE FOR A SHORT TO BATTERY POSITIVE** | |
| 1. Turn the ignition switch to the ON position. | |
| 2. Measure the voltage between the CKP sensor electrical connector PI21 pin 2 (O) and GROUND. | |
Is the voltage greater than 5 volts?
Yes
REPAIR the short to battery positive. For additional information, refer to the wiring diagrams. Reconnect all connectors. CLEAR the DTCs. TEST the system for normal operation.

No
INSTALL a new CKP sensor.
REFER to: Crankshaft Position (CKP) Sensor (303-14B Electronic Engine Controls - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Removal and Installation). Reconnect all connectors. CLEAR the DTCs. TEST the system for normal operation. If the concern persists INSTALL a new ECM.
REFER to: Engine Control Module (ECM) (303-14A Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation).

Before replacing an ECM, contact dealer technical support.

</table>

| **C2: CHECK THE BANK 1 CMP SENSOR FOR FOREIGN DEBRIS** | |
| 1 Remove the CMP sensor and inspect for foreign debris. | |
| Is the CMP sensor free of foreign debris? | |
| Yes | GO to C3. |
| No | CLEAN the sensor and wheel. INSTALL the sensor. |
| CLEAR the DTCs. TEST the system for normal operation. | |

| **C3: CHECK THE BANK 1 CMP SENSOR RESISTANCE** | |
| 1 Measure the resistance between pins 1 and 2 of the bank 1 Camshaft position sensor. | |
| Is the resistance 450 to 650 ohms? | |
| Yes | GO to C4. |
| No | INSTALL a new CMP sensor, |
| CLEAR the DTCs. TEST the system for normal operation. | |

| **C4: CHECK THE BANK 1 CMP SENSOR SIGNAL WIRE FOR OPEN CIRCUIT** | |
| 1 Disconnect the ECM electrical connector PI01. | |
| 2 Disconnect the CMP sensor electrical connector PI23. | |
| 3 Measure the resistance between the CMP sensor electrical connector PI23, pin 1 (Y) and the ECM electrical connector PI01, pin 94 (Y). | |
| Is the resistance less than 5 ohms? | |
| Yes | GO to C5. |
| No | REPAIR the circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation. | |

| **C5: CHECK THE BANK 1 CMP GROUND WIRE FOR OPEN CIRCUIT** | |
| 1 Measure the resistance between the CMP sensor electrical connector PI23, pin 2 (R) and the ECM electrical connector PI01, pin 95 (R). | |
| Is the resistance less than 5 ohms? | |
| Yes | GO to C6. |
| No | REPAIR the circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation. | |

| **C6: CHECK THE BANK 1 CMP SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND** | |
| 1 Measure the resistance between the CMP sensor electrical connector PI23, pin 1 (Y) and GROUND. | |
| Is the resistance less than 10,000 ohms? | |
| Yes | REPAIR the short to GROUND. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation. | |
| No | GO to C7. | |

| **C7: CHECK THE BANK 1 CMP SENSOR GROUND CIRCUIT FOR A SHORT TO GROUND** | |
| 1 Measure the resistance between the CMP sensor electrical connector PI23, pin 2 (R) and GROUND. | |
| Is the resistance less than 10,000 ohms? | |
| Yes | REPAIR the short to GROUND. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation. | |
| No | GO to C8. | |

| **C8: CHECK THE BANK 1 CMP SENSOR SIGNAL CIRCUIT FOR A SHORT TO BATTERY POSITIVE** | |
| 1 Measure the voltage between the CMP sensor electrical connector PI23, pin 1 (Y) and GROUND. | |
Is the voltage greater than 1 volt?
Yes
REPAIR the short to battery positive. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.
No
GO to C9.

C9: CHECK THE BANK 1 CMP SENSOR GROUND CIRCUIT FOR A SHORT TO BATTERY POSITIVE

1 Turn the ignition switch to the RUN position.
2 Measure the voltage between the CMP sensor electrical connector PI23, pin 2 (R) and GROUND.

Is the voltage greater than 1 volt?
Yes
REPAIR the short to battery positive. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.
No
INSTALL a new CMP sensor,
CLEAR DTCs. TEST the system for normal operation. If the DTC is repeated, INSTALL a new ECM.
Before replacing an ECM, contact dealer technical support.

PINPOINT TEST D : DTC DTC P0345, P0346, P1340, P1341: BANK 2 CAMSHAFT POSITION (CMP) SENSOR

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>D1: CHECK THE BANK 2 CMP SENSOR FOR CORRECT INSTALLATION</td>
<td></td>
</tr>
</tbody>
</table>
1 Turn the ignition switch to the OFF position.
2 Check the CMP sensor for correct installation.

Is the CMP sensor correctly installed?
Yes
GO to D2.
No
INSTALL the CMP sensor correctly.
CLEAR the DTCs. TEST the system for normal operation.

D2: CHECK THE BANK 2 CMP SENSOR FOR FOREIGN DEBRIS

1 Remove the CMP sensor and inspect for foreign debris.

Is the CMP sensor free of foreign debris?
Yes
GO to D3.
No
CLEAN the sensor and wheel. INSTALL the sensor.
CLEAR the DTCs. TEST the system for normal operation.

D3: CHECK THE BANK 2 CMP SENSOR RESISTANCE

1 Measure the resistance between pins 1 and 2 of the bank 2 Camshaft position sensor.

Is the resistance 450 to 650 ohms?
Yes
GO to D4.
No
INSTALL a new CMP sensor.
CLEAR the DTCs. TEST the system for normal operation.

D4: CHECK THE BANK 2 CMP SENSOR SIGNAL WIRE FOR OPEN CIRCUIT

1 Disconnect the ECM electrical connector PI01.
2 Disconnect the CMP sensor electrical connector PI22.
3 Measure the resistance between the CMP sensor electrical connector PI22, pin 1 (N) and the ECM electrical connector PI01, pin 68 (N).

Is the resistance less than 5 ohms?
Yes
GO to D5.
No
REPAIR the circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.

D5: CHECK THE BANK 2 CMP GROUND WIRE FOR OPEN CIRCUIT

1 Measure the resistance between the CMP sensor electrical connector PI22, pin 2 (G) and the ECM electrical connector PI01, pin 69 (G).

Is the resistance less than 5 ohms?
Yes
GO to D6.
No
REPAIR the circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.

D6: CHECK THE BANK 2 CMP SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND

1 Measure the resistance between the CMP sensor electrical connector PI22, pin 1 (N) and GROUND.

Is the resistance less than 10,000 ohms?
Yes
REPAIR the short to GROUND. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.
No
GO to D7.

D7: CHECK THE BANK 2 CMP SENSOR GROUND CIRCUIT FOR A SHORT TO GROUND

1 Disconnect the ECM electrical connector, PI01.
2 Measure the resistance between the CMP sensor electrical connector PI22, pin 2 (G) and GROUND.

</tbody>
</table>
Is the resistance 180 - 220 Kohms?
Yes
   GO to H2.
No
   INSTALL a new Knock Sensor, REFER to: Knock Sensor (KS) LH (303-14B Electronic Engine Controls - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Removal and Installation).

H2: CHECK THE KS SIGNAL WIRE FOR OPEN CIRCUIT

1. Turn the ignition switch to the OFF position.
2. Disconnect the KS sensor electrical connector PI19.
3. Disconnect the ECM electrical connector PI01.
4. Measure the resistance between PI19, pin 1 (N) and PI01, pin 99 (N).

Is the resistance less than 5 ohms?
Yes
   GO to H3.
No
   REPAIR the circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.

H3: CHECK THE KS SIGNAL WIRE FOR SHORT TO BATTERY

1. Connect the KS sensor electrical connector PI19.
2. Connect the ECM electrical connector PI01.
3. Turn the ignition switch to the ON position.
4. Check for a voltage between PI19, pin 1 (N) and GROUND.

Is a voltage present?
Yes
   REPAIR the short to battery. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.
No
   GO to H4.

H4: CHECK THE KS SIGNAL WIRE FOR A SHORT TO GROUND

1. Measure the resistance between the KS sensor electrical connector PI19, pin 1 (N) and GROUND.

Is the resistance less than 10,000 ohms?
Yes
   REPAIR the short to GROUND. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.
No
   GO to H5.

H5: CHECK THE KS GROUND LEAD FOR OPEN CIRCUIT

1. Disconnect the KS electrical connector, PI19.
2. Disconnect the ECM electrical connector, PI01.
3. Measure the resistance between PI19, pin2 (B) and PI01, pin 100 (BG)

Is the resistance less than 5 ohms?
Yes
   GO to H6.
No
   REPAIR the circuit between PI19, pin2 (B) and PI01, pin 100 (BG) For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.

H6: CHECK THE KS GROUND LEAD FOR SHORT TO BATTERY

1. Connect the KS sensor electrical connector PI19.
2. Connect the ECM electrical connector PI01.
3. Turn the ignition switch to the ON position.
4. Check for a voltage between PI19, pin 1 (N) and GROUND.

Is a voltage present?
Yes
   REPAIR the short to battery. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.
No
   INSTALL a new KS, REFER to: Knock Sensor (KS) LH (303-14B Electronic Engine Controls - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Removal and Installation).
   CLEAR DTCs. TEST the system for normal operation. If the DTC is repeated, INSTALL a new ECM.
   REFER to: Engine Control Module (ECM) (303-14A Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation).
   Before replacing an ECM, contact dealer technical support.

PINPOINT TEST I : DTC P0196, P0197, P0198. OIL TEMPERATURE SENSOR.

TEST CONDITIONS | DETAILS/RESULTS/ACTIONS
I1: CHECK THE OIL TEMPERATURE SENSOR SIGNAL WIRE FOR OPEN CIRCUIT

1. Turn the ignition switch to the OFF position.
2. Disconnect the oil temperature sensor electrical connector PI24.
3. Disconnect the ECM electrical connector PI01.
4. Measure the resistance between the oil temperature sensor electrical connector PI24, pin 1 (Y) and the ECM electrical connector PI01, pin 78 (Y).

Is the resistance less than 5 ohms?
Yes
   GO to I2.
No
   REPAIR the circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.

I2: CHECK THE OIL TEMPERATURE SENSOR GROUND CIRCUIT FOR OPEN CIRCUIT

1. Measure the resistance between the oil temperature sensor electrical connector PI24, pin 2 (BG) and GROUND.

Is the resistance less than 5 ohms?
Yes
   GO to I3.
No
13: CHECK THE OIL TEMPERATURE SENSOR GROUND CIRCUIT FOR SHORT TO BATTERY

1. Connect ECM electrical connector, PI01
2. Turn the ignition switch to the RUN position.
3. Measure the voltage between the oil temperature sensor electrical connector PI24, pin 2 (BG) and GROUND.

Is a voltage present?
Yes
   REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.

No
   GO to 14.

14: CHECK THE OIL TEMPERATURE SENSOR CIRCUIT FOR A SHORT TO GROUND

1. Measure the resistance between the oil temperature sensor electrical connector PI24, pin 1 (Y) and GROUND.

Is the resistance less than 10,000 ohms?
Yes
   REPAIR the short to GROUND. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.

No
   GO to 15.

15: CHECK THE OIL TEMPERATURE SENSOR CIRCUIT FOR A SHORT TO BATTERY POSITIVE

1. Connect ECM electrical connector, PI01
2. Turn the ignition switch to the ON position.
3. Measure the voltage between the oil temperature sensor electrical connector PI24, pin 1 (Y) and GROUND.

Is the voltage greater than 10 volts?
Yes
   REPAIR the short to battery positive. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.

No
   INSTALL a new oil temperature sensor, REFER to: Oil Temperature Sensor (303-14B Electronic Engine Controls - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Removal and Installation). CLEAR DTCs. TEST the system for normal operation. If the DTC is repeated, INSTALL a new ECM. REFER to: Engine Control Module (ECM) (303-14A Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation). Before replacing an ECM, contact dealer technical support.

PINPOINT TEST J: DTC P0131, P0132, P0133, P1646. BANK 1 HO2S.

</table>
| Yes | REPAIR the circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.
(This circuit includes the power distribution fuse box and EMS control relay.) |
| No | GO to K2. |

K2: CHECK THE GROUND SUPPLY CIRCUIT TO THE BANK 1 CATALYST MONITOR HEATER FOR CONTINUITY
1. Turn the ignition switch to the OFF position.
2. Disconnect the ECM electrical connector P101.
3. Measure the resistance between P111, pin 2 (UY) and P101, pin 92 (UY).

Is the resistance less than 5 ohms?
Yes
GO to K3.

No
REPAIR the circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.

K3: CHECK THE BANK 1 CATALYST MONITOR HEATER RESISTANCE
1. Measure the resistance between pins 1 and 2 of the bank 1 Catalyst Monitor heater.

Is the resistance 5.0 ohms?
Yes
GO to K4.

No
INSTALL a new bank 1 Catalyst Monitor,
REFER to: Catalyst Monitor Sensor (303-14B Electronic Engine Controls - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Removal and Installation).
CLEAR the DTCs. TEST the system for normal operation.

K4: CHECK THE GROUND SUPPLY CIRCUIT TO THE BANK 1 CATALYST MONITOR HEATER FOR SHORT TO GROUND
1. Measure the resistance between P111, pin 2 (UY) and GROUND.

Is the resistance less than 10,000 ohms?
Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.

No
GO to K5.

K5: CHECK THE GROUND SUPPLY CIRCUIT TO THE BANK 1 CATALYST MONITOR HEATER FOR SHORT TO BATTERY
1. Connect the ECM electrical connector, P101.
2. Turn the ignition switch to the ON position.
3. Check for a voltage at P111, pin 2 (UY).

Is the voltage greater than 1 volt?
Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.

No
GO to K6.

K6: CHECK THE CONSTANT CIRCUIT OF THE BANK 1 CATALYST MONITOR SENSOR FOR OPEN CIRCUIT
1. Disconnect the bank 1 catalyst monitor sensor electrical connector, P111.
2. Disconnect the ECM electrical connector, P101.
3. Measure the resistance between P111, pin 3 (B) and P101, pin 130 (BW).

Is the resistance less than 5 ohms?
Yes
GO to K7.

No
REPAIR the circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.

K7: CHECK THE CONSTANT CIRCUIT OF THE BANK 1 CATALYST MONITOR SENSOR FOR SHORT TO GROUND
1. Measure the resistance between P101, pin 130 (BW) and GROUND.
Is the resistance less than 10,000 ohms?
Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.
No
GO to K8.

K8: CHECK THE CONSTANT CIRCUIT OF THE BANK 1 CATALYST MONITOR SENSOR FOR SHORT TO BATTERY
1 Connect the ECM electrical connector, PI01.
2 Turn the ignition switch to the ON position.
3 Measure the voltage between PI11, pin 3 (B) and GROUND.

Is the voltage greater than 5 volts?
Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.
No
GO to K9.

K9: CHECK THE VARIABLE CIRCUIT OF THE BANK 1 CATALYST MONITOR SENSOR FOR OPEN CIRCUIT
1 Disconnect the bank 1 HO2S electrical connector PI11.
2 Disconnect the ECM electrical connector, PI01.
3 Measure the resistance between PI01, pin 128 (N) and PI11, pin 4 (N)

Is the resistance less than 5 ohms?
Yes
GO to K10.
No
REPAIR the circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.

K10: CHECK THE VARIABLE CIRCUIT OF THE BANK 1 CATALYST MONITOR SENSOR FOR SHORT TO GROUND
1 Measure the resistance between PI11, pin 4 (N) and GROUND.

Is the resistance less than 10,000 ohms?
Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.
No
GO to K11.

K11: CHECK THE VARIABLE CIRCUIT OF THE BANK 1 CATALYST MONITOR SENSOR FOR SHORT TO BATTERY
1 Connect the ECM electrical connector PI01.
2 Turn the ignition switch to the ON position.
3 Measure the voltage between PI11, pin 4 (N) and GROUND.

Is the voltage greater than 1 volt?
Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.
No
INSTALL a new bank 1 Catalyst monitor sensor,
REFER to: Catalyst Monitor Sensor (303-14B Electronic Engine Controls - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Removal and Installation).
CLEAR the DTCs. TEST the system for normal operation. If the DTC is repeated, INSTALL a new ECM.
REFER to: Engine Control Module (ECM) (303-14A Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation).
Before replacing an ECM, contact dealer technical support.

PINPOINT TEST L : DTC P0051, P0052, P0151, P0152, P0153, P1647. BANK 2 HO2S.

<table>
<thead>

</tr>
</tbody>
</table>

Is the resistance less than 5 ohms?
Yes
GO to L2.
No
REPAIR the circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.

L2: CHECK THE CONSTANT CIRCUIT OF THE BANK 2 HO2S FOR SHORT TO GROUND
1 Measure the resistance between PI01, pin 108 (N) and GROUND.

Is the resistance less than 10,000 ohms?
Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.
No
GO to L3.

L3: CHECK THE CONSTANT CIRCUIT OF THE BANK 2 HO2S FOR SHORT TO BATTERY
1 Connect the ECM electrical connector PI01.
2 Turn the ignition switch to the ON position.
3 Measure the voltage between PI12, pin 4 (N) and GROUND.

Is the voltage greater than 5 volts?
Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.
No
GO to L4.

L4: CHECK THE VARIABLE CIRCUIT OF THE BANK 2 HO2S FOR OPEN CIRCUIT
1 Disconnect the bank 1 HO2S electrical connector, PI12.  
2 Disconnect the ECM electrical connector, PI01.  
3 Measure the resistance between PI01, pin 107 (G) and PI12, pin 3 (G)
Is the resistance less than 5 ohms?
Yes
GO to L5.
No
REPAIR the circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.

L5: CHECK THE VARIABLE CIRCUIT OF THE BANK 2 HO2S FOR SHORT TO GROUND
1 Measure the resistance between PI01, pin 107 (G) and GROUND.

Is the resistance less than 10,000 ohms?
Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.
No
GO to L6.

L6: CHECK THE VARIABLE CIRCUIT OF THE BANK 2 HO2S FOR SHORT TO BATTERY
1 Connect the ECM electrical connector PI01.
2 Turn the ignition switch to the ON position.
3 Measure the voltage between PI12, pin 3 (G) and GROUND.

Is the voltage greater than 1 volt?
Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.
No
INSTALL a new bank 2 HO2S, REFER to: Heated Oxygen Sensor (HO2S) (303-14B Electronic Engine Controls - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Removal and Installation). CLEAR the DTCs. TEST the system for normal operation. If the DTC is repeated, INSTALL a new ECM. REFER to: Engine Control Module (ECM) (303-14A Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation). Before replacing an ECM, contact dealer technical support.

PINPOINT TEST M: DTC P0057, P0058, P0157, P0158, P0160. BANK 2 CATALYST MONITOR.

TEST CONDITIONS | DETAILS/RESULTS/ACTIONS
---|---
M1: CHECK THE POWER SUPPLY CIRCUIT TO THE BANK 2 CATALYST MONITOR HEATER
1 Turn the ignition switch to the OFF position.
2 Disconnect the bank 2 catalyst monitor sensor electrical connector PI13.
3 Turn the ignition switch to the ON position.
4 Measure the voltage between PI13, pin 1 (WR) and GROUND.

Is the voltage less than 10 volts?
Yes
REPAIR the circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.
No
GO to M2.

M2: CHECK THE GROUND SUPPLY CIRCUIT TO THE BANK 2 CATALYST MONITOR HEATER FOR CONTINUITY
1 Turn the ignition switch to the OFF position.
2 Disconnect the ECM electrical connector PI01.
3 Measure the resistance between PI13, pin 2 (RW) and PI01, pin 93 (RW)

Is the resistance less than 5 ohms?
Yes
GO to M3.
No
REPAIR the circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.

M3: CHECK THE BANK 2 CATALYST MONITOR HEATER RESISTANCE
1 Measure the resistance between pins 1 and 2 of the bank 2 Catalyst Monitor heater.

Is the resistance 5.0 ohms?
Yes
GO to M4.
No
INSTALL a new bank 2 Catalyst Monitor, REFER to: Catalyst Monitor Sensor (303-14B Electronic Engine Controls - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Removal and Installation). CLEAR the DTCs. TEST the system for normal operation.

M4: CHECK THE GROUND SUPPLY CIRCUIT TO THE BANK 2 CATALYST MONITOR HEATER FOR SHORT TO GROUND
1 Measure the resistance between PI13, pin 2 (RW) and GROUND.

Is the resistance less than 10,000 ohms?
Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.
No
GO to M5.

M5: CHECK THE GROUND SUPPLY CIRCUIT TO THE BANK 2 CATALYST MONITOR HEATER FOR SHORT TO BATTERY
1 Connect the ECM electrical connector, PI01.
2 Turn the ignition switch to the ON position.
3 Check for a voltage at PI13, pin 2 (RW)

Is the voltage greater than 1 volt?
Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.
No
GO to M6.

M6: CHECK THE CONSTANT CIRCUIT OF THE BANK 2 CATALYST MONITOR SENSOR FOR OPEN CIRCUIT
1 Disconnect the bank 2 catalyst monitor sensor electrical connector, PI13.
2 Disconnect the ECM electrical connector, PI01.
Measure the resistance between PI13, pin 3 (B) and PI01, pin 130 (BW)

Is the resistance less than 5 ohms?

Yes

**GO to M7.**

No

REPAIR the circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.

**M7: CHECK THE CONSTANT CIRCUIT OF THE BANK 2 CATALYST MONITOR SENSOR FOR SHORT TO GROUND**

1. Measure the resistance between PI01, pin 130 (BW) and GROUND.

Is the resistance less than 10,000 ohms?

Yes

REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.

No

**GO to M8.**

**M8: CHECK THE CONSTANT CIRCUIT OF THE BANK 2 CATALYST MONITOR SENSOR FOR SHORT TO BATTERY**

1. Connect the ECM electrical connector, P101.
2. Turn the ignition switch to the ON position.
3. Measure the voltage between PI13, pin 3 (B) and GROUND.

Is the voltage greater than 5 volts?

Yes

REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.

No

**GO to M9.**

**M9: CHECK THE VARIABLE CIRCUIT OF THE BANK 2 CATALYST MONITOR SENSOR FOR OPEN CIRCUIT**

1. Disconnect the bank 2 HO2S electrical connector PI13.
2. Disconnect the ECM electrical connector, P101.
3. Measure the resistance between PI01, pin 129 (N) and PI13, pin 4 (N)

Is the resistance less than 5 ohms?

Yes

**GO to M10.**

No

REPAIR the circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.

**M10: CHECK THE VARIABLE CIRCUIT OF THE BANK 2 CATALYST MONITOR SENSOR FOR SHORT TO GROUND**

1. Measure the resistance between PI13, pin 4 (N) and GROUND.

Is the resistance less than 10,000 ohms?

Yes

REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.

No

**GO to M11.**

**M11: CHECK THE VARIABLE CIRCUIT OF THE BANK 2 CATALYST MONITOR SENSOR FOR SHORT TO BATTERY**

1. Connect the ECM electrical connector P101.
2. Turn the ignition switch to the ON position.
3. Measure the voltage between PI13, pin 4 (N) and GROUND.

Is the voltage greater than 1 volt?

Yes

REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.

No

INSTALL a new bank 2 Catalyst monitor sensor,

**Refer to: Catalyst Monitor Sensor (303-14B Electronic Engine Controls - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Removal and Installation).

**CLEAR the DTCs. TEST the system for normal operation. If the DTC is repeated, INSTALL a new ECM.

**Refer to: Engine Control Module (ECM) (303-14A Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation).**

Before replacing an ECM, contact dealer technical support.

**PINPOINT TEST N : DTC P0101, P0102, P0103, P1104. MAF SENSOR.**

O2: CHECK CONTINUITY OF THE INTAKE AIR TEMPERATURE (IAT) SENSOR POWER SUPPLY CIRCUIT

1. Turn the ignition switch to the OFF position.
2. Disconnect the MAF sensor electrical connector PI14.
3. Disconnect the ECM electrical connector PI01.
4. Measure the resistance between the MAF sensor electrical connector PI14, pin 4 (U) and the ECM electrical connector PI01, pin 71 (U).

Is the resistance less than 5 ohms?

Yes
   GO to O3.

No
   REPAIR the circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.

O3: CHECK CONTINUITY OF THE IAT SENSOR CIRCUIT

1. Measure the resistance between the MAF sensor electrical connector PI14, pin 5 (BG) and the ECM electrical connector PI01, pin 19 (BG).

Is the resistance less than 5 ohms?

Yes
   GO to O4.

No
   REPAIR the circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.

O4: CHECK THE IAT SENSOR POWER SUPPLY CIRCUIT FOR SHORT TO GROUND

1. Measure the resistance between the MAF sensor electrical connector PI14, pin 4 (U) and GROUND.

Is the resistance less than 10,000 ohms?

Yes
   REPAIR the short to GROUND. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.

No
   GO to O5.

O5: CHECK THE IAT SENSOR GROUND CIRCUIT FOR SHORT TO BATTERY

1. Connect the ECM electrical connector, PI01.
2. Turn the ignition switch to the ON position.
3. Check for voltage at PI14, pin 5 (BG)

Is the voltage greater than 1 volt?

Yes
   REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.

No
   INSTALL a new MAF sensor.
   CLEAR DTCs. TEST the system for normal operation. If the DTC is repeated, INSTALL a new ECM.
   REFER to: Engine Control Module (ECM) (303-14A Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation).
   Before replacing an ECM, contact dealer technical support.

PINPOINT TEST P : DTC P0051, P0052. BANK 2 HO2S HEATER.
P1: CHECK THE POWER SUPPLY CIRCUIT TO THE BANK 2 HO2S HEATER

1. Disconnect the HO2S electrical connector, PI12.
2. Turn the ignition switch to the ON position.
3. Measure the voltage between PI12, pin 1 (WR) and GROUND.

Is the voltage less than 10 volts?
Yes: Go to P6.
(This circuit includes the power distribution fuse box and the EMS relay.)
No: Go to P2.

P2: CHECK THE BANK 2 HO2S HEATER GROUND CIRCUIT FOR OPEN CIRCUIT

1. Turn the ignition switch to the OFF position.
2. Disconnect the ECM electrical connector PI01.
3. Measure the resistance between the LH bank HO2S electrical connector PI12, pin 2 (RW) and the ECM electrical connector PI01, pins 55 and pin 56 (RW).

Is the resistance of each wire less than 5 ohms?
Yes: Go to P3.
No: Repair the circuit. For additional information, refer to the wiring diagrams. Clear the DTCs. Test the system for normal operation.

P3: CHECK THE BANK 2 HO2S HEATER RESISTANCE

1. Measure the resistance between pins 1 and 2 of the bank 2 HO2S.

Is the resistance 3.3 ohms?
Yes: Go to P4.
No: Install a new bank 2 HO2S.
Refer to: Heated Oxygen Sensor (HO2S) (303-14B Electronic Engine Controls - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Removal and Installation). Clear the DTCs. Test the system for normal operation.

P4: CHECK THE BANK 2 HO2S HEATER CIRCUIT FOR SHORT TO GROUND

1. Measure the resistance between the LH bank HO2S electrical connector PI12, pin 2 (RW) and GROUND.

Is the resistance less than 10,000 ohms?
Yes: Repair the short to GROUND. For additional information, refer to the wiring diagrams. Clear the DTCs. Test the system for normal operation.
No: Go to P5.

P5: CHECK THE BANK 2 HO2S HEATER CIRCUIT FOR SHORT TO BATTERY

1. Connect the ECM electrical connector, PI01.
2. Turn the ignition switch to the OFF position.
3. Check for a voltage at PI12, pin 2 (RW)

Is the voltage greater than 1 volt?
Yes: Repair the short to battery. For additional information, refer to the wiring diagrams. Clear the DTCs. Test the system for normal operation.
No: Go to P6.

P6: CHECK FUSE 35 OF THE FRONT POWER DISTRIBUTION BOX

1. Check the fuse.

Is the fuse OK?
Yes: Go to P8.
No: Go to P7.

P7: CHECK FUSE 35 OF THE FRONT POWER DISTRIBUTION BOX FOR A SHORT TO GROUND

1. Measure the resistance between electrical connector FH32, pin 41 of the front power distribution box and GROUND.

Is the resistance less than 10,000 ohms?
Yes: Repair short to ground between the engine compartment fuse box and the LH bank HO2S. Clear the DTC. Test the system for normal operation.
No: Install a new fuse. Clear the DTC. Test the system for normal operation.

P8: CHECK THE POWER SUPPLY TO FUSE 35 OF THE FRONT POWER DISTRIBUTION BOX FOR A SHORT TO GROUND

1. Measure the voltage between fuse 42 electrical connector FH32, pin 47 and GROUND.

Is the voltage less than 10 volts?
Yes: Repair the circuit from the ECM control relay to the engine compartment fuse box. Clear the DTC. Test the system for normal operation.
No: Repair the circuit from the compartment fuse box and the HO2S. Clear the DTC. Test the system for normal operation.

PINPOINT TEST Q: DTC P1606. ECM RELAY.

Q1: CHECK THE ECM CONTROL RELAY

1. Turn the ignition switch to the ON position.

Does the ECM relay make an audible click?
Yes: Go to Q2.
No: Go to Q3.

Q2: CHECK FOR POWER SUPPLY FROM THE ECM CONTROL RELAY

1. Measure the voltage from the ECM control relay to the engine compartment fuse box.
Q3: CHECK FUSE IN THE ENGINE COMPARTMENT FUSE BOX

1. Check the fuse.

2. Is the fuse OK?
   - Yes: Go to Q4.
   - No: Go to Q8.

Q4: CHECK THE POWER SUPPLY TO FUSE IN THE ENGINE COMPARTMENT FUSE BOX

1. Measure the voltage between fuse electrical connector FH32, pin 75 and GROUND.

2. Is the voltage less than 10 volts?
   - Yes: Repair the circuit from the battery positive to the engine compartment fuse box. CLEAR the DTC. TEST the system for normal operation.
   - No: Go to Q5.

Q5: CHECK THE POWER SUPPLY FROM FUSE IN THE ENGINE COMPARTMENT FUSE BOX TO THE ECM CONTROL RELAY

1. Measure the voltage between the ECM control relay electrical connector FH32, pin 9 and GROUND.

2. Is the voltage less than 10 volts?
   - Yes: Repair the circuit from the engine compartment fuse box to the ECM control relay. CLEAR the DTC. TEST the system for normal operation.
   - No: INSTALL a new ECM control relay. CLEAR the DTC. TEST the system for normal operation.

Q6: CHECK CONTINUITY OF THE ECM CONTROL RELAY GROUND CIRCUIT

1. Disconnect the ECM electrical connector PI01.
2. Remove the ECM control relay from the engine compartment fuse box.
3. Measure the resistance between the ECM electrical connector PI01, pin 40 and FH02, pin E02 of the engine compartment fuse box.

4. Is the resistance less than 5 ohms?
   - Yes: Go to Q7.
   - No: REPAIR the circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

   (This circuit includes the power distribution fuse box and the EMS relay and diode.)

Q7: CHECK CONTINUITY OF THE ECM CONTROL RELAY WINDING

1. Measure the resistance of the ECM control relay winding between pins 1 and 2 of the ECM control relay.

2. Is the resistance less than 60 ohms?
   - Yes: INSTALL a new ECM control relay. CLEAR the DTC. TEST the system for normal operation.
   - No: Go to Q8.

Q8: CHECK FUSE OF THE ENGINE COMPARTMENT FUSE BOX FOR A SHORT TO GROUND

1. Measure the resistance between electrical connector FH32 pin 9 of the engine compartment fuse box and GROUND.

2. Is the resistance less than 10,000 ohms?
   - Yes: REPAIR short to ground between the engine compartment fuse box and the ECM control relay. CLEAR the DTC. TEST the system for normal operation.
   - No: INSTALL a new fuse. CLEAR the DTC. TEST the system for normal operation.

Q9: CHECK THE ECM CONTROL RELAY DIODE

1. Remove the ECM control relay diode from the engine compartment fuse box.
2. Measure the continuity of ECM control relay diode.

3. Is the resistance less than 5 ohms?
   - Yes: Possible intermittent fault. Recheck DTCs.
   - No: INSTALL a new ECM control relay diode. Make sure that the ECM control relay diode is installed correctly. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

R1: CHECK THE GROUND CIRCUIT TO THE MAP SENSOR

1. Measure the resistance between the MAP sensor electrical connector PI29, pin 4 (BG) and GROUND.

2. Is the resistance less than 5 ohms?
   - Yes: Go to R2.
   - No: REPAIR the circuit between the MAP sensor and GROUND. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

R2: CHECK THE POWER SUPPLY CIRCUIT TO THE MAP SENSOR

1. Turn the ignition switch to the RUN position.
2. Measure the voltage between the MAP sensor electrical connector PI29, pin 2 (OY) and GROUND.

3. Is the voltage greater than 5 volts?
   - Yes: Go to R3.
   - No: REPAIR the circuit between the MAP sensor electrical connector PI29 pin 2 (OY) and the EMS 5V supply from the ECM. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

R3: CHECK CONTINUITY OF THE MAP SENSOR SIGNAL WIRE.

1. Remove the ECM control relay diode from the engine compartment fuse box.
2. Measure the resistance between the MAP sensor PI29, pin 4 (BG) and GROUND.

3. Is the resistance less than 5 ohms?
   - Yes: Possible intermittent fault. Recheck DTCs.
   - No: INSTALL a new ECM control relay diode. Make sure that the ECM control relay diode is installed correctly. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
Measure the resistance of the circuit between MAP sensor electrical connector PI29, pin 1 (BK) and ECM electrical connector PI01, pin 127 (BK)

Is the resistance less than 5 ohms?
Yes
  GO to R4.
No
  REPAIR the circuit between the MAP sensor electrical connector PI29, pin 1 (BK) and ECM electrical connector PI01, pin 127 (BK). For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

R4: CHECK THE MAP SENSOR SIGNAL WIRE FOR SHORT TO GROUND

1 Disconnect the ECM electrical connector, PI01.
2 Disconnect the MAP sensor electrical connector, PI29.
3 Measure the resistance between PI29, pin 1 (BK) and GROUND.

Is the resistance less than 10,000 ohms?
Yes
  REPAIR the short to GROUND. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
No
  GO to R5.

R5: CHECK THE MAP SENSOR SIGNAL WIRE FOR SHORT TO BATTERY

1 Connect the ECM electrical connector, PI01.
2 Turn the ignition switch to the ON position.
3 Check for a voltage at PI29, pin 1 (BK)

Is the voltage greater than 1 volt?
Yes
  Repair the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
No
  INSTALL a new MAP sensor. CLEAR the DTC. TEST the system for normal operation.

PINPOINT TEST S : P0010, P1384. VVT BANK 1.

TEST CONDITIONS | DETAILS/RESULTS/ACTIONS
---|---
S1: CHECK THE BANK 1 VVT SOLENOID RESISTANCE
1 Disconnect the bank 1 VVT solenoid electrical connector, PI16.
2 Measure the resistance between pins 1 and 2 of the bank 1 VVT solenoid.
Is the resistance 8 ohms?
Yes
  GO to S2.
No
  INSTALL a new bank 1 VVT solenoid. REFER to: Variable Camshaft Timing (VCT) Oil Control Solenoid (303-14B Electronic Engine Controls - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Removal and Installation). CLEAR the DTC. TEST the system for normal operation.

S2: CHECK THE GROUND CIRCUIT TO THE BANK 1 VVT SOLENOID.
1 Disconnect the bank 1 VVT solenoid electrical connector, PI16.
2 Measure the resistance between the bank 1 VVT solenoid electrical connector PI16, pin 2 (B) and GROUND.
Is the resistance less than 5 ohms?
Yes
  GO to S3.
No
  REPAIR the circuit between VVT solenoid electrical connector PI16, pin 2 (B) and GROUND. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

S3: CHECK CONTINUITY OF THE VVT SOLENOID SIGNAL WIRE.
1 Measure the resistance between VVT solenoid electrical connector PI16 pin 1 (Y) and ECM electrical connector PI01 pin 109 (Y)
Is the resistance less than 5 ohms?
Yes
  GO to S4.
No
  REPAIR the circuit between VVT solenoid electrical connector PI16, pin 1 (Y) and ECM electrical connector PI01 pin 109 (Y). For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

S4: CHECK FOR SHORT TO GROUND AT THE VVT SOLENOID SIGNAL WIRE
1 Disconnect the ECM electrical connector, PI01.
2 Measure the resistance between PI16, pin 1 (Y) and GROUND.
Is the resistance less than 10,000 ohms?
Yes
  REPAIR the short to GROUND. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
No
  GO to S5.

S5: CHECK FOR SHORT TO BATTERY AT THE VVT SOLENOID SIGNAL WIRE
1 TURN the ignition switch to the ON position.
2 Check for a voltage at PI16, pin 1 (Y)
Is the voltage greater than 1 volt?
Yes
  REPAIR the short circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
No
  GO to S6.

S6: CHECK RESISTANCE OF THE VVT SOLENOID.
1 Check the resistance between pins 1 and 2 of the bank 1 VVT solenoid.
Is the resistance 6.5 - 8.5 ohms?
Yes
  INSTALL a new ECM. REFER to: Engine Control Module (ECM) (303-14A Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation).
Before replacing an ECM, contact dealer technical support. CLEAR the DTC. TEST the system for normal operation.

INSTALL a new bank 1 VVT solenoid.
REFER to: Variable Camshaft Timing (VCT) Oil Control Solenoid (303-14B Electronic Engine Controls - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Removal and Installation).
CLEAR the DTC. TEST the system for normal operation.

PINPOINT TEST T : P0020, P1396. VVT BANK 2.

</thead>
<tbody>
<tr>
<td>1 Measure the voltage between MAP Sensor electrical connector PI29, pin 2 (OY) and GROUND.</td>
<td></td>
</tr>
</tbody>
</table>

Is the voltage greater than 6 volts?
Yes
   REPAIR the circuit between the MAP Sensor electrical connector PI29, pin 2(0Y) and the sensor 5 volt supply bus.
   (The short could be in any of the other sensors in this circuit, or in any of the spurs in this circuit. For additional information, refer to wiring diagrams.)
   CLEAR the DTC. TEST the system for normal operation.
No
   GO to X5.
5: CHECK THE POWER SUPPLY CIRCUIT TO THE FTP SENSOR.

★ NOTE: Access to the FTP sensor involves the removal of the fuel tank. To reduce the amount of work necessary, a slave harness could be used. This can be connected at the access port beneath the rear seat. Tests can then be carried out via the slave harness and sensor. If system operation is normal with the slave harness and sensor, the fault lies in the vehicle's harness or sensor.

1. Disconnect the FTP sensor electrical connector, FP1. (see note above)
2. Turn the ignition switch to the ON position.
3. Measure the voltage between FTP Sensor electrical connector FP1, pin 3 (OY) and GROUND.

Is the voltage greater than 4 volts?
Yes
   GO to X6.
No
   REPAIR the circuit between the FTP Sensor electrical connector FP1, pin 3 (OY) and the sensor 5 volt supply bus. (The fault could be in any of the other sensors in this circuit, or in any of the spurs in this circuit. For additional information, refer to wiring diagrams.)
   CLEAR the DTC. TEST the system for normal operation.

X6: CHECK THE POWER SUPPLY CIRCUIT TO THE FTP SENSOR FOR SHORT TO BATTERY.

1. Measure the voltage between FTP Sensor electrical connector FP1, pin 3 (OY) and GROUND.

Is the voltage greater than 6 volts?
Yes
   REPAIR the circuit between the FTP Sensor electrical connector FP1, pin 3 (OY) and the sensor 5 volt supply bus. (The short could be in any of the other sensors in this circuit, or in any of the spurs in this circuit. For additional information, refer to wiring diagrams.)
   CLEAR the DTC. TEST the system for normal operation.
No
   GO to X7.

X7: CHECK THE POWER SUPPLY CIRCUIT TO THE ACCELERATOR PEDAL POSITION SENSOR.

1. Disconnect the APP sensor electrical connector.
2. Turn the ignition switch to the ON position.
3. Measure the voltage between APP Sensor electrical connector CA88, pin 2 (OY) and GROUND.

Is the voltage greater than 4 volts?
Yes
   GO to X8.
No
   REPAIR the circuit between the APP Sensor electrical connector CA88, pin 2 (OY) and the sensor 5 volt supply bus. (The fault could be in any of the other sensors in this circuit, or in any of the spurs in this circuit. For additional information, refer to wiring diagrams.)
   CLEAR the DTC. TEST the system for normal operation.

X8: CHECK THE POWER SUPPLY CIRCUIT TO THE ACCELERATOR PEDAL POSITION SENSOR FOR SHORT TO BATTERY.

1. Measure the voltage between APP Sensor electrical connector CA88, pin 2 (OY) and GROUND.

Is the voltage greater than 6 volts?
Yes
   REPAIR the circuit between the APP Sensor electrical connector CA88, pin 2 (OY) and the sensor 5 volt supply bus. (The short could be in any of the other sensors in this circuit, or in any of the spurs in this circuit. For additional information, refer to wiring diagrams.)
   CLEAR the DTC. TEST the system for normal operation.
No
   GO to X9.

X9: CHECK THE POWER SUPPLY CIRCUIT TO THE THROTTLE POSITION SENSOR.

1. Turn the ignition switch to the ON position.
2. Measure the voltage between TP Sensor electrical connector PI26 PI26, pin 2 (OY) and GROUND.

Is the voltage greater than 4 volts?
Yes
   GO to X10.
No
   REPAIR the circuit between the TP Sensor electrical connector PI26, pin 2 (OY) and the sensor 5 volt supply bus. (The short could be in any of the other sensors in this circuit, or in any of the spurs in this circuit. For additional information, refer to wiring diagrams.)
   CLEAR the DTC. TEST the system for normal operation.

X10: CHECK THE POWER SUPPLY CIRCUIT TO THE THROTTLE POSITION SENSOR FOR SHORT TO BATTERY.

1. Measure the voltage between TP Sensor electrical connector PI26, pin 2 (OY) and GROUND.

Is the voltage greater than 6 volts?
Yes
   REPAIR the circuit between the TP Sensor electrical connector PI26, pin 2 (OY) and the sensor 5 volt supply bus. (The short could be in any of the other sensors in this circuit, or in any of the spurs in this circuit. For additional information, refer to wiring diagrams.)
   CLEAR the DTC. TEST the system for normal operation.
No
   GO to X11.

X11: CHECK THE POWER SUPPLY CIRCUIT TO THE AIR CONDITIONING PRESSURE SENSOR.

1. Turn the ignition switch to the ON position.
2. Measure the voltage between ACP sensor electrical connector FH110, pin 2 (OY) and GROUND.

Is the voltage greater than 4 volts?
Yes
   GO to X12.
No
   REPAIR the circuit between the ACP sensor electrical connector FH110, pin 2 (OY) and the sensor 5 volt supply bus. (The fault could be in any of the other sensors in this circuit, or in any of the spurs in this circuit. For additional information, refer to wiring diagrams.)
   CLEAR the DTC. TEST the system for normal operation.

X12: CHECK THE POWER SUPPLY CIRCUIT TO THE AIR CONDITIONING PRESSURE SENSOR FOR SHORT TO BATTERY.
Measure the voltage between ACP sensor electrical connector, FH110, pin 2 (OY) and GROUND.

Is the voltage greater than 6 volts?

Yes
- REPAIR the circuit between the ACP sensor electrical connector, FH110, pin 2 (OY) and the sensor 5 volt supply bus. (The short could be in any of the other sensors in this circuit, or in any of the spurs in this circuit. For additional information, refer to wiring diagrams.)
- CLEAR the DTC. TEST the system for normal operation.

No
- No electrical fault in power supply circuit. Recheck DTCs, using the Jaguar approved diagnostic system, or code reader. (This fault could also be a PSV failure within the ECM.)

REPAIR the circuit between the ACP sensor electrical connector, FH110, pin 2 (OY) and the sensor 5 volt supply bus.

(The short could be in any of the other sensors in this circuit, or in any of the spurs in this circuit. For additional information, refer to wiring diagrams.)

CLEAR the DTC. TEST the system for normal operation.

---

- CLEAR the DTC. TEST the system for normal operation. |

Y2: CHECK THE GROUND CIRCUIT TO THE ENGINE OIL TEMPERATURE SENSOR. | Measure the resistance between EOT Sensor electrical connector PI24, pin 2 (BG) and GROUND. |
| Is the resistance less than 5 ohms? | Yes
- GO to Y3.

No
- REPAIR the circuit between the EOT Sensor electrical connector PI24, pin 2 (BG) and GROUND. (This circuit includes the ECM. For additional information, refer to wiring diagrams.)
- CLEAR the DTC. TEST the system for normal operation. |

Y3: CHECK THE GROUND CIRCUIT TO THE FUEL INJECTION PRESSURE SENSOR. | Measure the resistance between IP Sensor electrical connector PI28, pin 2 (BG) and GROUND. |
| Is the resistance less than 5 ohms? | Yes
- GO to Y4.

No
- REPAIR the circuit between the IP Sensor electrical connector PI28, pin 2 (BG) and GROUND. (This circuit includes the ECM. For additional information, refer to wiring diagrams.)
- CLEAR the DTC. TEST the system for normal operation. |

Y4: CHECK THE GROUND CIRCUIT TO THE ENGINE FUEL TEMPERATURE SENSOR. | Measure the resistance between EFT Sensor electrical connector PI27, pin 1 (BG) and GROUND. |
| Is the resistance less than 5 ohms? | Yes
- GO to Y5.

No
- REPAIR the circuit between the EFT Sensor electrical connector PI27, pin 1 (BG) and GROUND. (This circuit includes the ECM. For additional information, refer to wiring diagrams.)
- CLEAR the DTC. TEST the system for normal operation. |

Y5: CHECK THE GROUND CIRCUIT TO THE MAP SENSOR. | Measure the resistance between MAP Sensor electrical connector PI29, pin 4 (BG) and GROUND. |
| Is the resistance less than 5 ohms? | Yes
- GO to Y6.

No
- REPAIR the circuit between the MAP Sensor electrical connector PI29, pin 4 (BG) and GROUND. (This circuit includes the ECM. For additional information, refer to wiring diagrams.)
- CLEAR the DTC. TEST the system for normal operation. |

Y6: CHECK THE GROUND CIRCUIT TO THE FTP SENSOR.

• NOTE: Access to the FTP sensor involves the removal of the fuel tank. To reduce the amount of work necessary, a slave harness could be used. This can be connected at the access port beneath the rear seat. Tests can then be carried out via the slave harness and sensor. If system operation is normal with the slave harness and sensor, the fault lies in the vehicle's harness or sensor.

Measure the resistance between FTP Sensor electrical connector FP01, pin 2 (BG) and GROUND. |
| Is the resistance less than 5 ohms? | Yes
- GO to Y7.

No
- REPAIR the circuit between the FTP Sensor electrical connector FP01, pin 2 (BG) and GROUND. (This circuit includes the ECM. For additional information, refer to wiring diagrams.)
- CLEAR the DTC. TEST the system for normal operation. |

Y7: CHECK THE GROUND CIRCUIT TO THE ACCELERATOR PEDAL POSITION SENSOR. (TRACK 1) | Measure the resistance between APP Sensor electrical connector CA88, pin 6 (BG) and GROUND. |
| Is the resistance less than 5 ohms? | Yes
- GO to Y8.

No
- REPAIR the circuit between the APP Sensor electrical connector CA88, pin 6 (BG) and GROUND. (This circuit includes the ECM. For additional information, refer to wiring diagrams.)
- CLEAR the DTC. TEST the system for normal operation. |

Y8: CHECK THE GROUND CIRCUIT TO THE THROTTLE POSITION SENSOR. | Measure the resistance between TP Sensor electrical connector PI26, pin 1 (BG) and GROUND. |
Is the resistance less than 5 ohms?
Yes
   GO to Y9.
No
   REPAIR the circuit between the TP Sensor electrical connector PI26, pin 1 (BG) and GROUND. 
   (This circuit includes the ECM. For additional information, refer to wiring diagrams.)
   CLEAR the DTC. TEST the system for normal operation.

Y9: CHECK THE GROUND CIRCUIT TO THE ACCELERATOR PEDAL POSITION SENSOR. (TRACK 3)

Is the resistance less than 5 ohms?
Yes
   GO to Y10.
No
   REPAIR the circuit between the APP Sensor electrical connector CA88, pin 3 (BG) and GROUND. 
   (This circuit includes the ECM. For additional information, refer to wiring diagrams.)
   CLEAR the DTC. TEST the system for normal operation.

Y10: CHECK THE GROUND CIRCUIT TO THE AIR CONDITIONING PRESSURE SENSOR.

Is the resistance less than 5 ohms?
Yes
   No electrical fault in ground circuit. Recheck DTCs.
   No
   REPAIR the circuit between the ACP sensor electrical connector, FH110, pin 1 (BG) and GROUND. 
   (This circuit includes the ECM. For additional information, refer to wiring diagrams.)
   CLEAR the DTC. TEST the system for normal operation.

PINPOINT TEST Z : P0480. RADIATOR COOLING FAN MODULE DRIVE.

Z1: CHECK THE PULSE WIDTH MODULATED SIGNAL TO THE COOLING FAN MODULE.

Is a PWM signal present?
Yes
   INSTALL a new Cooling Fan Module.
   REFER to: Cooling Module - Vehicles Without: Supercharger (303-03A Engine Cooling - V8 4.2L Petrol/V8 S/C 4.2L Petrol/2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation).
   CLEAR the DTC. TEST the system for normal operation.
No
   GO to Z2.

Z2: CHECK CONTINUITY OF THE RADIATOR COOLING FAN MODULE SIGNAL WIRE.

Is the resistance less than 5 ohms?
Yes
   INSTALL a new ECM.
   REFER to: Engine Control Module (ECM) (303-14A Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation).
   Before replacing an ECM, contact dealer technical support.
   No
   REPAIR the circuit between the Radiator Cooling Fan Module electrical connector FH108, pin 3 (WU) and the ECM electrical connector PI01, pin 51 (WU) For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

PINPOINT TEST AA : P0646, P0647. AIR CONDITIONING CLUTCH RELAY DRIVE.

AA1: CHECK THE GROUND SUPPLY TO THE AIR CONDITIONING CLUTCH.

WARNING: This test involves working in proximity to rotating parts. Make sure due care is exercised. Failure to follow this instruction may result in personal injury.

Is the resistance less than 5 ohms?
Yes
   REPAIR the circuit between PI49, pin 2, (B) and GROUND. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
No
   GO to AA2.

AA2: CHECK THE CIRCUIT INTEGRITY BETWEEN THE ECM AND THE AIR CONDITIONING CLUTCH.

Is the voltage greater than 10 volts?
Yes
   GO to AA3.
No
   GO to AA4.

AA3: CHECK THE AIR CONDITIONING CLUTCH RELAY TO ECM CIRCUIT FOR SHORT TO GROUND.

Is the resistance less than 5 ohms?
Yes
   NO
No
   REPAIR the circuit between PI01, pin 34 (BG) and GROUND.
Is the resistance less than 10,000 ohms?

Yes
   GO to AA4.
   INSTALL a new air conditioning compressor clutch relay. For additional information, refer to the electrical guide.
   CLEAR the DTC. TEST the system for normal operation. If the DTC is repeated, INSTALL a new ECM.
   Before replacing an ECM, contact dealer technical support.

No
   INSTALL a new air conditioning compressor clutch relay. For additional information, refer to the electrical guide.
   CLEAR the DTC. TEST the system for normal operation. If the DTC is repeated, INSTALL a new ECM.
   Before replacing an ECM, contact dealer technical support.

AA4: CHECK THE CIRCUIT BETWEEN THE AIR CONDITIONING COMPRESSOR CLUTCH AND THE RELAY FOR SHORT TO BATTERY.

1. Measure the voltage between PI49, pin 1 (RG) and GROUND.

Is the voltage greater than 1 volt?

Yes
   REPAIR the short circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
   GO to AA5.

No
   GO to AA6.

AA5: CHECK THE CIRCUIT BETWEEN THE AIR CONDITIONING COMPRESSOR CLUTCH AND THE ACCC RELAY FOR SHORT TO GROUND.

1. Measure the resistance between PI49, pin 1 (RG) and GROUND.

Is the resistance less than 10,000 ohms?

Yes
   REPAIR the short circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
   GO to AA6.

No
   GO to AA7.

AA6: CHECK THE CIRCUIT BETWEEN FUSE 32 OF THE FRONT POWER DISTRIBUTION FUSE BOX AND THE ACCC RELAY FOR SHORT TO GROUND.

1. Remove fuse 32.
   2. Measure the resistance between fuse box electrical connector, FH32, pin 38 and GROUND.

Is the resistance less than 10,000 ohms?

Yes
   REPAIR the short circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
   GO to AA7.

No
   GO to AA8.

AA7: CHECK THE ACCC RELAY BASE FOR BATTERY VOLTAGE AT PIN 3.

1. Refit fuse 32.
   2. Measure the voltage between the ACCC relay base, pin 3 and GROUND.

Is the voltage greater than 10 volts?

Yes
   GO to AA8.
   Check/replace fuses. REPAIR the circuit between the relay base and the battery power bus 1. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No
   GO to AA9.

AA8: CHECK THE CIRCUIT BETWEEN PIN 1 OF THE ACCC RELAY BASE AND THE POWER DISTRIBUTION FUSE BOX FOR SHORT TO GROUND.

1. Remove fuse 38.
   2. Measure the resistance between the ACCC relay base, pin 1 and GROUND.

Is the resistance less than 10,000 ohms?

Yes
   REPAIR the short circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
   GO to AA9.

No
   GO to AA10.

AA9: CHECK THE ACCC RELAY BASE FOR BATTERY VOLTAGE AT PIN 1

1. Refit fuse 38.
   2. Turn the ignition switch to the ON position.
   3. Measure the voltage between ACCC relay base, pin 1, and GROUND.

Is the voltage greater than 10 volts?

Yes
   GO to AA10.
   Check/replace fuses. REPAIR the circuit between the relay base and the battery power bus 2. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation. (This circuit includes the EMS relay, and fuses 9.)

No
   GO to AA11.

AA10: CHECK THE CIRCUIT BETWEEN THE ECM AND THE ACCC RELAY BASE FOR CONTINUITY.

1. Remove the ACCC relay.
   2. Measure the resistance between the ECM electrical connector, PI01, pin 34 (BG) and ACCC relay base, pin 2.

Is the resistance less than 5 ohms?

Yes
   GO to AA11.

No
   REPAIR the circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

AA11: CHECK THE CIRCUIT BETWEEN THE ECM AND THE ACCC RELAY BASE FOR SHORT TO BATTERY.

1. Check for a voltage between the ECM electrical connector, PI01, pin 34 (BG) and ACCC relay base.

Is the voltage greater than 1 volt?

Yes
   REPAIR the short circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
   GO to AA12.

No
   GO to AA12.

AA12: CHECK THE CIRCUIT BETWEEN THE ECM AND THE ACCC RELAY BASE FOR SHORT TO GROUND.

1. Measure the resistance between the ECM electrical connector, PI01, pin 34 (BG) and GROUND.
PINPOINT TEST AB : P1516, P1517. P/N SWITCH STARTING/DRIVING MALFUNCTIONS.

<table>
<thead>
<tr>

</table>
| No | REPAIR the circuit between the ECM and the battery. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
(This circuit includes the ignition switch and the power distribution fuse box. (Fuse 28).) |

**AC2: CHECK THE START INPUT TO THE STARTER RELAY**

| 1 Turn the ignition switch to the START position and hold. | |
| 2 Measure the voltage between the starter relay base, (R20) pin 1, and GROUND. | |
| Is the voltage greater than 10 volts? | |
| Yes | **GO to AC3.** |
| No | REPAIR the circuit between the Starter relay base and the battery. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
(This circuit includes the ignition switch and the power distribution fuse box.) |

**AC3: CHECK THE START INPUT WIRE FOR SHORT TO BATTERY AT ECM**

| 1 Turn the ignition switch to the ON position. | |
| 2 Measure the voltage between PI01, pin 6, (Y) and GROUND. | |
| Is the voltage greater than 10 volts? | |
| Yes | REPAIR the short circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation. |
| No | **GO to AC4.** |

**AC4: CHECK THE START INPUT WIRE FOR SHORT TO BATTERY AT RELAY**

| 1 Turn the ignition switch to the ON position. | |
| 2 Measure the voltage between the starter relay base, pin 1, and GROUND. | |
| Is the voltage greater than 10 volts? | |
| Yes | REPAIR the short circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation. |
| No | **GO to AC5.** |

**AC5: CHECK THE STARTER RELAY INPUT FROM THE ECM FOR CONTINUITY.**

| 1 Measure the resistance between PI01, pin 41 (GO) and relay base, pin 2. | |
| Is the resistance less than 5 ohms? | |
| Yes | **GO to AC6.** |
| No | REPAIR the open circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation. |

**AC6: CHECK THE STARTER RELAY INPUT FROM THE ECM FOR SHORT TO GROUND.**

| 1 Disconnect ignition switch electrical connector, FC18. | |
| 2 Measure the resistance between PI01, pin 41 (GO) and GROUND. | |
Is the resistance less than 10,000 ohms?
Yes
- REPAIR the short circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
- GO to AC7.
No

AC7: CHECK THE STARTER RELAY INPUT FROM THE ECM FOR SHORT TO BATTERY.

1 Measure the voltage between the starter relay base, pin 2, and GROUND.

Is the voltage greater than 1 volt?
Yes
- REPAIR the short circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
No
- INSTALL a new starter relay. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation. If the DTC is repeated, INSTALL a new ECM.
  REFER to: Engine Control Module (ECM) (303-14A Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation).
  Before replacing an ECM, contact dealer technical support.

PINPOINT TEST AD : P0096, P0097, P0098 SUPERCHARGER INTAKE AIR TEMPERATURE SENSOR TEST CONDITIONS DETAILS/RESULTS/ACTIONS
AD1: CHECK THE SUPERCHARGER INTAKE AIR TEMPERATURE SENSOR SIGNAL WIRE FOR OPEN CIRCUIT
1 Turn the ignition switch to the OFF position.
2 Disconnect the supercharger IAT sensor electrical connector PI43.
3 Disconnect the ECM electrical connector PI01.
4 Measure the resistance between the oil temperature sensor electrical connector PI43, pin 1 (YU) and the ECM electrical connector PI01, pin 72 (YU).

Is the resistance less than 5 ohms?
Yes
- GO to AD2.
No
- REPAIR the circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.

AD2: CHECK THE SUPERCHARGER INTAKE AIR TEMPERATURE SENSOR GROUND CIRCUIT FOR OPEN CIRCUIT
1 Measure the resistance between the oil temperature sensor electrical connector PI43, pin 2 (BG) and GROUND.

Is the resistance less than 5 ohms?
Yes
- GO to AD3.
No
- REPAIR the circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.

AD3: CHECK THE SUPERCHARGER INTAKE AIR TEMPERATURE SENSOR GROUND CIRCUIT FOR SHORT TO BATTERY
1 Connect ECM electrical connector, PI01
2 Turn the ignition switch to the RUN position.
3 Measure the voltage between the oil temperature sensor electrical connector PI43, pin 2 (BG) and GROUND.

Is a voltage present?
Yes
- REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.
No
- GO to AD4.

AD4: CHECK THE SUPERCHARGER INTAKE AIR TEMPERATURE SENSOR CIRCUIT FOR A SHORT TO GROUND
1 Measure the resistance between the oil temperature sensor electrical connector PI43, pin 1 (YU) and GROUND.

Is the resistance less than 10,000 ohms?
Yes
- REPAIR the short to GROUND. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.
No
- GO to AD5.

AD5: CHECK THE SUPERCHARGER INTAKE AIR TEMPERATURE SENSOR CIRCUIT FOR A SHORT TO BATTERY POSITIVE
1 Connect ECM electrical connector, PI01
2 Turn the ignition switch to the ON position.
3 Measure the voltage between the oil temperature sensor electrical connector PI43, pin 1 (YU) and GROUND.

Is the voltage greater than 10 volts?
Yes
- REPAIR the short to battery positive. For additional information, refer to the wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.
No
- INSTALL a new oil temperature sensor.
  REFER to: Intake Air Temperature (IAT) Sensor (303-14B Electronic Engine Controls - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Removal and Installation).
  CLEAR DTCs. TEST the system for normal operation. If the DTC is repeated, INSTALL a new ECM.
  REFER to: Engine Control Module (ECM) (303-14A Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation).
  Before replacing an ECM, contact dealer technical support.

PINPOINT TEST AE : P1410 SUPERCHARGER AIR CLEANER ADDITIONAL AIR INLET ACTUATOR TEST CONDITIONS DETAILS/RESULTS/ACTIONS
AE1: CHECK THE FUSE 37 IN THE FPDB.
1 CHECK fuse 37 in the FPDB.

Is the fuse OK?
Yes
- GO to AE3.
No
- GO to AE2.
### AE2: CHECK FOR A SHORT TO GROUND BETWEEN THE FPDB AND THE SUPERCHARGER AIR CLEANER ADDITIONAL AIR INLET ACTUATOR

1. **DISCONNECT** the supercharger air cleaner additional air inlet actuator electrical connector FH010.
2. **MEASURE** the resistance between supercharger air cleaner additional air inlet actuator electrical connector FH010 pin 1 (GU) and ground.

#### Is the resistance less than 10,000 ohms?

- **Yes**
  - Repair the circuit between supercharger air cleaner additional air inlet actuator electrical connector FH010 pin 1 (GU) and the FPDB. INSTALL a new fuse. CLEAR the DTC. TEST the system for normal operation.

- **No**
  - INSTALL a new fuse. CLEAR the DTC. TEST the system for normal operation.

### AE3: CHECK FOR BATTERY VOLTAGE AT THE SUPERCHARGER AIR CLEANER ADDITIONAL AIR INLET ACTUATOR

1. **CHECK** the voltage at supercharger air cleaner additional air inlet actuator electrical connector FH010 pin 1 (GU).

#### Is the voltage less than 10 volts?

- **Yes**
  - REPAIR the circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

- **No**
  - GO to AE4.

### AE4: CHECK THE CONTINUITY BETWEEN THE SUPERCHARGER AIR CLEANER ADDITIONAL AIR INLET ACTUATOR AND ECM

1. **DISCONNECT** the ECM electrical connector PI01.
2. **MEASURE** the resistance between the supercharger air cleaner additional air inlet actuator electrical connector FH010 pin 2 (U) and ECM electrical connector PI01 pin 14 (U).

#### Is the resistance less than 5 ohms?

- **Yes**
  - REPAIR the circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

- **No**
  - INSTALL a new supercharger air cleaner additional air inlet actuator. CLEAR the DTC. TEST the system for normal operation. If the DTC is repeated, INSTALL a new ECM.

  **REFER to:** Engine Control Module (ECM) (303-14A Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation).

  Before replacing an ECM, contact dealer technical support.
Overview

There are changes to the engine management system (EMS) for 2006 MY, the most obvious of which will be the change to 7-digit diagnostic trouble codes (DTCs) from the familiar 5-digit, plus the addition of secondary air injection and changes to evaporative emissions and exhaust gas recirculation to comply with stage four emissions requirements.

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. If the cause is not visually evident, use the Jaguar approved diagnostic system or a scan tool to retrieve the fault codes before proceeding to the DTC Index, or the symptom chart if no DTCs are set.

**Difficult to start hot**
- Injector leak
- Engine fuel temperature (EFT) sensor
- Intake air temperature (IAT) sensor
- Mass air flow (MAF) sensor
- Evaporative emissions
- purge valve
- Fuel pump
- Ignition system

For fuel system tests, REFER to: **Fuel Charging and Controls - VIN Range:** N52048->N99999 (303-04B Fuel Charging and Controls - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Diagnosis and Testing). For purge valve tests, REFER to: **Evaporative Emissions - VIN Range:** N52048->N99999 (303-13 Evaporative Emissions, Diagnosis and Testing).

**Difficult to start after hot soak (vehicle standing after engine has reached operating temperature)**
- Injector leak
- EFT sensor
- IAT sensor
- MAF sensor
- Evaporative emissions
- purge valve
- Fuel pump
- Ignition system

For fuel system tests, REFER to: **Fuel Charging and Controls - VIN Range:** N52048->N99999 (303-04B Fuel Charging and Controls - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Diagnosis and Testing). For EFT sensor tests, GO to Pinpoint Test A. For IAT sensor tests, GO to Pinpoint Test C. For MAF sensor tests, GO to Pinpoint Test B. For purge valve tests, REFER to: **Evaporative Emissions - VIN Range:** N52048->N99999 (303-13 Evaporative Emissions, Diagnosis and Testing).

**Engine cranks too fast/slow**
- Compressions high/low
- Battery
- Starting system

Check compressions, REFER to: **Engine - V8 4.2L Petrol/V8 S/C 4.2L Petrol/2.5L NA V6 - AJV6/3.0L NA V6 - AJ27** (303-00 Engine System - General Information, Diagnosis and Testing). For battery information, REFER to: **Battery** (414-01 Battery, Mounting and Cables, Diagnosis and Testing). For starting system tests, REFER to: **Starting System** (303-06 Starting System, Diagnosis and Testing).

**Engine stalls**
- Breather system disconnected/restricted
- ECM relay
- MAF sensor
- Ignition system
- Air filter restricted
- Fuel lines
- Fuel rail pressure (FRP) sensor
- Air leakage

Check the engine breather system, REFER to: **Engine Emission Control - VIN Range:** N80181->N99999 (303-08A Engine Emission Control - V8 4.2L Petrol/V8 S/C 4.2L Petrol/2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Diagnosis and Testing). For ECM relay tests, GO to Pinpoint Test AE. For MAF sensor tests, GO to Pinpoint Test A. For ignition system tests, REFER to: **Engine Ignition - VIN Range:** N52048->N99999 (303-07B Engine Ignition - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Diagnosis and Testing). For air filter information, REFER to: **Intake Air Distribution and Filtering** - VIN Range: N52048->N99999 (303-12B Intake Air Distribution and Filtering - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Diagnosis and Testing). For fuel system, REFER to: **Fuel Charging and Controls - VIN Range:** N52048->N99999 (303-04B Fuel Charging and Controls - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Diagnosis and Testing). For FRP sensor tests, GO to Pinpoint Test AL and GO to Pinpoint Test Z. For intake system information, REFER to: **Intake Air Distribution and Filtering - VIN Range:** N52048->N99999 (303-12B Intake Air Distribution and Filtering - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Diagnosis and Testing).

**Engine stalls on overrun**
- ECM relay
- Throttle position (TP) sensors

For ECM relay tests, GO to Pinpoint Test AE. For TP sensor tests, GO to Pinpoint Test E and GO to Pinpoint Test F. For fuel system tests, REFER to: **Fuel Charging and Controls - VIN Range:** N52048->N99999 (303-04B Fuel Charging and Controls - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Diagnosis and Testing).

**Engine stalls at steady speed**
- ECM relay
- CKP sensor
- TP sensors

For ECM relay tests, GO to Pinpoint Test AE. For fuel system, REFER to: **Fuel Charging and Controls - VIN Range:** N52048->N99999 (303-04B Fuel Charging and Controls - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Diagnosis and Testing). For CKP sensor tests, GO to Pinpoint Test R. For TP sensor tests, GO to Pinpoint Test E and GO to Pinpoint Test F.

**Engine stalls with speed control enabled**
- ECM relay

For ECM relay tests, GO to Pinpoint Test AE.

**Engine stalls when maneuvering**
- ECM relay
- TP sensors
- Additional engine loads (PAS, air conditioning, etc)
- Transmission malfunction
- CAN malfunction

For ECM relay tests, GO to Pinpoint Test AE. For TP sensor tests, GO to Pinpoint Test E and GO to Pinpoint Test F. For accessory drive information, REFER to: Accessory Drive Belt - 4.2L (303-05, Removal and Installation). For transmission information, REFER to: **Diagnostic Strategy - VIN Range:** N52048->N99999 (307-01 Automatic Transmission/Transaxle, Diagnosis and Testing).

**Pinpoint Tests**

**CAUTION:** When probing connectors to take measurements during the pinpoint tests, use the adaptor kit, part number 3548-1358-00.
NOTE: When performing electrical voltage or resistance tests, always use a digital multimeter (DMM) accurate to 3 decimal places, and with an up-to-date calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.

NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

NOTE: Before commencing this test, check the air filter for blockage, the engine air intake and breather systems for leaks, and the TP sensor for additional DTCs.

### TEST CONDITIONS

#### A1: CHECK THE MAF SENSOR SENSING CIRCUIT FOR HIGH RESISTANCE

1. Key off.
2. Disconnect the ECM electrical connector, PI300.
3. Disconnect the MAF sensor electrical connector, PI14.
4. Measure the resistance between:
   
<table>
<thead>
<tr>
<th>ECM connector PI300, harness side</th>
<th>MAF connector PI14, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 70</td>
<td>Pin 03</td>
</tr>
</tbody>
</table>

   Is the resistance greater than 5 ohms?
   
   Yes
   - REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
   
   No
   - GO to A2.

#### A2: CHECK THE MAF SENSOR SENSING CIRCUIT FOR SHORT CIRCUIT TO POWER

1. Key on, engine off.
2. Measure the voltage between:
   
<table>
<thead>
<tr>
<th>MAF connector PI14, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 03</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

   Is the voltage greater than 3 volts?
   
   Yes
   - REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
   
   No
   - GO to A3.

#### A3: CHECK THE MAF SENSOR SENSING CIRCUIT FOR SHORT CIRCUIT TO GROUND

1. Key off.
2. Measure the resistance between:
   
<table>
<thead>
<tr>
<th>MAF connector PI14, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 03</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

   Is the resistance less than 10,000 ohms?
   
   Yes
   - REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
   
   No
   - GO to A4.

#### A4: CHECK THE MAF SENSOR SUPPLY CIRCUIT VOLTAGE

1. Reconnect the ECM electrical connector, PI300.
2. Key on, engine off.
3. Measure the voltage between:
   
<table>
<thead>
<tr>
<th>MAF connector PI14, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 01</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

   Is the voltage greater than 10 volts?
   
   Yes
   - INSTALL a new MAF sensor.
     CLEAR the DTC. TEST the system for normal operation.
   
   No
   - REPAIR the circuit between the MAF sensor electrical connector and BATTERY. This circuit includes the EMS control relay, fuse 37 of the front power distribution box, and the high power protection module. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

### PINPOINT TEST B: MASS AIR FLOW (MAF) SENSOR GROUND MALFUNCTION

#### B1: CHECK THE MAF SENSOR GROUND

1. Disconnect the MAF sensor electrical connector, PI14.
2. Key on, engine off.
3. Measure the resistance between:
   
<table>
<thead>
<tr>
<th>MAF sensor connector PI14, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

   Is the resistance greater than 5 ohms?
   
   Yes
   - GO to B2.
   
   No
   - INSTALL a new MAF sensor.
     CLEAR the DTC. TEST the system for normal operation.

#### B2: CHECK THE MAF SENSOR GROUND CIRCUIT FOR HIGH RESISTANCE

1. Key off.
2. Disconnect the ECM electrical connector, PI300.
3. Measure the resistance between:
   
<table>
<thead>
<tr>
<th>MAF sensor connector PI14, harness side</th>
<th>ECM connector PI300, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Pin 18</td>
</tr>
</tbody>
</table>

   Is the resistance greater than 5 ohms?
   
   Yes
   - GO to B2.
   
   No
   - INSTALL a new MAF sensor.
     CLEAR the DTC. TEST the system for normal operation.
Is the resistance greater than 5 ohms?
Yes
REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No
GO to B3.

B3: CHECK THE MAF SENSOR GROUND CIRCUIT FOR SHORT CIRCUIT TO POWER

1 Key on, engine off.
2 Measure the voltage between:
   | MAF sensor connector PI14, harness side | Battery |
   | Pin 02 | Negative terminal |

Is the voltage greater than 3 volts?
Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No
Refer to the warranty policy and procedures manual if an ECM is suspect.

PINPOINT TEST C: INTAKE AIR TEMPERATURE (IAT) SENSOR CIRCUIT RANGE/PERFORMANCE, HIGH/LOW VOLTAGE

• NOTE: Before commencing this test, check the air filter for blockage and the engine air intake and breather systems for leaks. REFER to: Intake Air Distribution and Filtering - VIN Range: N52048->N99999 (303-12B Intake Air Distribution and Filtering - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Diagnosis and Testing).

TEST CONDITIONS

DETAILS/RESULTS/ACTIONS

C1: CHECK THE IAT SENSOR SENSING CIRCUIT FOR HIGH RESISTANCE

Is the resistance greater than 5 ohms?
Yes
REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No
GO to C2.

C2: CHECK THE IAT SENSOR SENSING CIRCUIT FOR SHORT CIRCUIT TO POWER

Key on, engine off.
Measure the voltage between:
   | MAF sensor connector PI14, harness side | Battery |
   | Pin 04 | Negative terminal |

Is the voltage greater than 3 volts?
Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No
GO to C3.

C3: CHECK THE IAT SENSOR SENSING CIRCUIT FOR SHORT CIRCUIT TO GROUND

Key off.
Measure the resistance between:
   | MAF sensor connector PI14, harness side | Battery |
   | Pin 04 | Negative terminal |

Is the resistance less than 10,000 ohms?
Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No
INSTALL a new MAF sensor.
CLEAR the DTC. TEST the system for normal operation.

PINPOINT TEST D: ENGINE COOLANT TEMPERATURE (ECT) SENSOR CIRCUIT RANGE/PERFORMANCE, HIGH/LOW VOLTAGE

• NOTE: Before commencing this test, check the coolant level and condition, check the operation of the thermostat, rectify as necessary.

TEST CONDITIONS

DETAILS/RESULTS/ACTIONS

D1: CHECK THE ECT SENSOR SENSING CIRCUIT FOR HIGH RESISTANCE

Is the resistance greater than 5 ohms?
Yes
REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No
GO to D2.

D2: CHECK THE ECT SENSOR SENSING CIRCUIT FOR SHORT CIRCUIT TO POWER

Key on, engine off.
Measure the voltage between:

ECT sensor connector PI25, harness side | Battery
--- | ---
Pin 02 | Negative terminal

**Yes**
- REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

**No**
- **GO to D3.**

**D3: CHECK THE ECT SENSOR SENSING CIRCUIT FOR SHORT CIRCUIT TO GROUND**

1. Turn the ignition switch to the OFF position.
2. Measure the resistance between:

ECT sensor connector PI25, harness side | Battery
--- | ---
Pin 02 | Negative terminal

**Is the resistance less than 10,000 ohms?**

**Yes**
- INSTALL a new ECT sensor. REFER to: **Engine Coolant Temperature (ECT) Sensor (303-14B Electronic Engine Controls - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Removal and Installation).** CLEAR the DTC. TEST the system for normal operation.

**No**
- **GO to D3.**

**PINPOINT TEST E : THROTTLE POSITION (TP) SENSOR RANGE/PERFORMANCE, HIGH/LOW VOLTAGE**

<table>

</tbody>
</table>

**E2: CHECK THE TP SENSOR SENSING CIRCUIT TP1 FOR SHORT CIRCUIT TO POWER**

1. Key on, engine off.
2. Measure the voltage between:

TP sensor connector PI26, harness side | Battery
--- | ---
Pin 06 | Negative terminal

TP sensor connector PI303, harness side | Battery
--- | ---
Pin 01 | Negative terminal

**Is the voltage greater than 5 volts?**

**Yes**
- REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

**No**
- **GO to E3.**

**E3: CHECK THE TP SENSOR SENSING CIRCUIT TP1 FOR SHORT CIRCUIT TO GROUND**

1. Key off.
2. Measure the resistance between:

TP sensor connector PI26, harness side | Battery
--- | ---
Pin 06 | Negative terminal

TP sensor connector PI303, harness side | Battery
--- | ---
Pin 01 | Negative terminal

**Is the resistance less than 10,000 ohms?**

**Yes**

**No**

**PINPOINT TEST F : THROTTLE POSITION (TP) SENSOR CIRCUIT TP2 HIGH/LOW VOLTAGE**
**F1: CHECK TP SENSOR SENSING CIRCUIT TP2 FOR HIGH RESISTANCE**

1. Key off.
2. Disconnect the ECM electrical connector, PI300.
3. Disconnect the TP sensor electrical connector, (vehicles with supercharger) PI26 or (vehicles without supercharger) PI303.
4. Measure the resistance between:
   - Vehicles with supercharger
     - ECM connector PI300, harness side
     - TP sensor connector PI26, harness side
     - Pin 67
     - Pin 04
   - Vehicles without supercharger
     - ECM connector PI300, harness side
     - TP sensor connector PI303, harness side
     - Pin 67
     - Pin 03

   Is the resistance greater than 5 ohms?
   - Yes
     - REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
   - No
     - GO to F2.

**F2: CHECK TP SENSOR SENSING CIRCUIT TP2 FOR SHORT CIRCUIT TO POWER**

1. Key on, engine off.
2. Measure the voltage between:
   - Vehicles with supercharger
     - TP sensor connector PI26, harness side
     - Battery
     - Pin 04
     - Positive terminal
   - Vehicles without supercharger
     - TP sensor connector PI303, harness side
     - Battery
     - Pin 03
     - Positive terminal

   Is the voltage greater than 5 volts?
   - Yes
     - REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
   - No
     - GO to F3.

**F3: CHECK TP SENSOR SENSING CIRCUIT TP2 FOR SHORT CIRCUIT TO GROUND**

1. Measure the resistance between:
   - Vehicles with supercharger
     - TP sensor connector PI26, harness side
     - Battery
     - Pin 04
     - Negative terminal
   - Vehicles without supercharger
     - TP sensor connector PI303, harness side
     - Battery
     - Pin 03
     - Negative terminal

   Is the resistance less than 10,000 ohms?
   - Yes
     - REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
   - No
     - INSTALL a new TP sensor.

**PINPOINT TEST G : RIGHT-HAND H02S SENSING CIRCUIT LOW/HIGH CURRENT, SLOW RESPONSE, ECM CONTROL MALFUNCTION**

**CAUTION:** Under no circumstances must the sensor wiring be cut to facilitate removal, should this prove necessary.

**NOTE:** Before commencing this test, check the sensor connections and harness, check for exhaust leaks, (a very small exhaust leak can cause this DTC to flag. Check the EGR pipes for cracks/leaks) engine misfire, etc. See "visual inspection chart" and "possible causes".

**G1: CHECK THE H02S VARIABLE CIRCUIT FOR HIGH RESISTANCE**

1. Key off.
2. Disconnect the H02S electrical connector, PI10.
3. Disconnect the ECM electrical connector, PI300.
4. Measure the resistance between:
   - ECM connector PI300, harness side
   - H02S connector PI10, harness side
   - Pin 28
   - Pin 04

   Is the resistance greater than 5 ohms?
   - Yes
     - REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
   - No
     - GO to G2.

**G2: CHECK THE H02S VARIABLE CIRCUIT FOR SHORT CIRCUIT TO POWER**

1. Key on, engine off.
2. Measure the voltage between:
   - H02S connector PI10, harness side
   - Battery
   - Pin 04
     - Negative terminal

<tbody>
<tr>
<td>Pin 04</td>
<td>Pin 04</td>
</tr>
</tbody>
</table>

Is the resistance less than 10,000 ohms?
Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
No
GO to G4.

G4: CHECK THE HO2S CONSTANT CIRCUIT FOR HIGH RESISTANCE

1. Measure the resistance between:

<table>
<thead>
<tr>
<th>ECM connector PI300, harness side</th>
<th>HO2S connector PI10, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 29</td>
<td>Pin 03</td>
</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?
Yes
REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
No
GO to G5.

G5: CHECK THE HO2S CONSTANT CIRCUIT FOR SHORT CIRCUIT TO POWER

1. Measure the voltage between:

<table>
<thead>
<tr>
<th>HO2S connector PI10, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 03</td>
<td>Pin 03</td>
</tr>
</tbody>
</table>

Is the voltage greater than 3 volts?
Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
No
INSTALL a new HO2S.

G6: CHECK THE HO2S CONSTANT CIRCUIT FOR SHORT CIRCUIT TO GROUND

1. Measure the resistance between:

<table>
<thead>
<tr>
<th>HO2S connector PI10, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 03</td>
<td>Pin 03</td>
</tr>
</tbody>
</table>

Is the resistance less than 10,000 ohms?
Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
No
INSTALL a new HO2S.

PINPOINT TEST H : RIGHT-HAND HO2S HEATER CONTROL CIRCUIT HIGH/LOW CURRENT

CAUTION: Under no circumstances must the sensor wiring be cut to facilitate removal, should this prove necessary.
NOTE: Carry out a visual inspection of the HO2S connectors (integrity of connections may be affected by heat from catalytic converters).

TEST CONDITIONS

DETAILS/RESULTS/ACTIONS

H1: CHECK HO2S HEATER POWER SUPPLY CIRCUIT

1. Key off.
2. Disconnect the HO2S electrical connector, PI10.
3. Key on, engine off.
4. Make sure the O2S heater relay is engenergized.
5. Measure the voltage between:

<table>
<thead>
<tr>
<th>HO2S connector PI10, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 01</td>
<td>Pin 01</td>
</tr>
</tbody>
</table>

Is the voltage greater than 10 volts?
Yes
GO to H2.
No
REPAIR the power supply circuit to the HO2S heater. This circuit includes the HO2S heater relay, fuse 20 of the front power distribution box, and the high power protection module. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

H2: CHECK HO2S HEATER CONTROL CIRCUIT FROM ECM FOR HIGH RESISTANCE

1. Key off.
2. Disconnect the ECM electrical connector, PI300.
3. Measure the resistance between:

<table>
<thead>
<tr>
<th>HO2S connector PI10, harness side</th>
<th>ECM connector PI300, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Pin 76</td>
</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?
Yes
REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
No
GO to H3.

H3: CHECK HO2S HEATER CONTROL CIRCUIT FROM ECM FOR SHORT CIRCUIT TO POWER
1. Key on, engine off.
2. Measure the voltage between:

<table>
<thead>
<tr>
<th>HO2S connector PI10, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the voltage greater than 3 volts?
Yes  REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
No  GO to H4.

H4: CHECK HO2S HEATER CONTROL CIRCUIT FROM ECM FOR SHORT CIRCUIT TO GROUND
1. Key off.
2. Measure the resistance between:

<table>
<thead>
<tr>
<th>HO2S connector PI10, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance less than 10,000 ohms?
Yes  REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
No  INSTALL a new HO2S.
CLEAR the DTC. TEST the system for normal operation. If the DTC is repeated, refer to the warranty policy and procedures manual if an ECM is suspect.

PINPOINT TEST I: RIGHT-HAND CATALYST MONITOR SENSOR SENSING CIRCUIT LOW/HIGH VOLTAGE, NO ACTIVITY

CAUTION: Under no circumstances must the sensor wiring be cut to facilitate removal, should this prove necessary.

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
</table>

I1: CHECK THE CATALYST MONITOR SENSOR SENSING CIRCUIT FOR HIGH RESISTANCE
1. Key off.
2. Disconnect the catalyst monitor sensor electrical connector, PI11.
3. Disconnect the ECM electrical connector, PI300.
4. Measure the resistance between:

<table>
<thead>
<tr>
<th>Catalyst monitor sensor connector PI11, harness side</th>
<th>ECM connector PI300, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 04</td>
<td>Pin 40</td>
</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?
Yes  REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
No  GO to I2.

I2: CHECK THE CATALYST MONITOR SENSOR SENSING CIRCUIT FOR SHORT CIRCUIT TO POWER
1. Key on, engine off.
2. Measure the voltage between:

<table>
<thead>
<tr>
<th>Catalyst monitor sensor connector PI11, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 04</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the voltage greater than 3 volts?
Yes  REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
No  GO to I3.

I3: CHECK THE CATALYST MONITOR SENSOR SENSING CIRCUIT FOR SHORT CIRCUIT TO GROUND
1. Key off.
2. Measure the resistance between:

<table>
<thead>
<tr>
<th>Catalyst monitor sensor connector PI11, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 04</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance less than 10,000 ohms?
Yes  REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
No  GO to I4.

I4: CHECK THE CATALYST MONITOR SENSOR GROUND CIRCUIT FOR HIGH RESISTANCE
1. Measure the resistance between:

<table>
<thead>
<tr>
<th>Catalyst monitor sensor connector PI11, harness side</th>
<th>ECM connector PI300, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 03</td>
<td>Pin 22</td>
</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?
Yes  REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
No  INSTALL a new catalyst monitor sensor.
REFER to: Catalyst Monitor Sensor (303-14B Electronic Engine Controls - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Removal and Installation).
CLEAR the DTC. TEST the system for normal operation.

PINPOINT TEST J: RIGHT-HAND CATALYST MONITOR SENSOR HEATER CONTROL CIRCUIT LOW/HIGH RESISTANCE

CAUTION: Under no circumstances must the sensor wiring be cut to facilitate removal, should this prove necessary.
### J1: CHECK THE POWER SUPPLY TO THE CATALYST MONITOR HEATER

<table>

Is the resistance greater than 5 ohms?

Yes
REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No
GO to K5.

**K5: CHECK THE HO2S CONSTANT CIRCUIT FOR SHORT CIRCUIT TO POWER**

1. Key on, engine off.
2. Measure the voltage between:
   - HO2S connector PI12, harness side
   - Battery
   - Pin 03
   - Negative terminal

Is the voltage greater than 3 volts?

Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No
GO to K6.

**K6: CHECK THE HO2S CONSTANT CIRCUIT FOR SHORT CIRCUIT TO GROUND**

1. Measure the resistance between:
   - HO2S connector PI12, harness side
   - Battery
   - Pin 03
   - Negative terminal

Is the resistance less than 10,000 ohms?

Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No
INSTALL a new HO2S.

CLEAR the DTC. TEST the system for normal operation. If the DTC is repeated, refer to the warranty policy and procedures manual if an ECM is suspect.

**PINPOINT TEST L : LEFT-HAND HO2S HEATER CONTROL CIRCUIT HIGH/LOW CURRENT**

**CAUTION:** Under no circumstances must the sensor wiring be cut to facilitate removal, should this prove necessary.

**NOTE:** Carry out a visual inspection of the HO2S connectors (integrity of connections may be affected by heat from catalytic converters).

**TEST CONDITIONS**

**DETAILS/RESULTS/ACTIONS**

**L1: CHECK HO2S HEATER POWER SUPPLY CIRCUIT**

1. Disconnect the HO2S electrical connector, PI12.
2. Key on, engine off.
3. Make sure the O2S heater relay is energized.
4. Measure the voltage between:
   - HO2S connector PI12, harness side
   - Battery
   - Pin 01
   - Negative terminal

Is the voltage greater than 10 volts?

Yes
GO to L2.

No
REPAIR the power supply circuit to the HO2S heater. This circuit includes the heater relay and fuse 35 of the front power distribution box. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

**L2: CHECK HO2S HEATER CONTROL CIRCUIT FROM ECM FOR HIGH RESISTANCE**

1. Key off.
2. Disconnect the ECM electrical connector, PI300.
3. Measure the resistance between:
   - HO2S connector PI12, harness side
   - ECM connector PI300, harness side
   - Pin 02
   - Pin 77

Is the resistance greater than 5 ohms?

Yes
REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No
GO to L3.

**L3: CHECK HO2S HEATER CONTROL CIRCUIT FROM ECM FOR SHORT CIRCUIT TO POWER**

1. Key on, engine off.
2. Measure the voltage between:
   - HO2S connector PI12, harness side
   - Battery
   - Pin 02
   - Negative terminal

Is the voltage greater than 3 volts?

Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No
GO to L4.

**L4: CHECK HO2S HEATER CONTROL CIRCUIT FROM ECM FOR SHORT CIRCUIT TO GROUND**

1. Measure the resistance between:
   - HO2S connector PI12, harness side
   - Battery
   - Pin 02
   - Negative terminal

Is the resistance less than 10,000 ohms?

Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No
INSTALL a new HO2S.

**PINPOINT TEST M : LEFT-HAND CATALYST MONITOR SENSOR SENSING CIRCUIT LOW/HIGH VOLTAGE, NO ACTIVITY**

**CAUTION:** Under no circumstances must the sensor wiring be cut to facilitate removal, should this prove necessary.

</table>

**M1: CHECK THE CATALYST MONITOR SENSOR SENSING CIRCUIT FOR HIGH RESISTANCE**

1. Key off.
2. Disconnect the catalyst monitor sensor electrical connector, PI13.
3. Disconnect the ECM electrical connector, PI300.
4. Measure the resistance between:
   - Catalyst monitor sensor PI13, harness side
   - ECM connector PI300, harness side
   - Pin 04
   - Pin 41

   Is the resistance greater than 5 ohms?
   - Yes: REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
   - No: GO to M2.

**M2: CHECK THE CATALYST MONITOR SENSOR SENSING CIRCUIT FOR SHORT CIRCUIT TO POWER**

1. Key on, engine off.
2. Measure the voltage between:
   - Catalyst monitor sensor PI13, harness side
   - Battery
   - Pin 04
   - Negative terminal

   Is the voltage greater than 3 volts?
   - Yes: REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
   - No: GO to M3.

**M3: CHECK THE CATALYST MONITOR SENSOR SENSING CIRCUIT FOR SHORT CIRCUIT TO GROUND**

1. Key off.
2. Measure the resistance between:
   - Catalyst monitor sensor PI13, harness side
   - Battery
   - Pin 04
   - Negative terminal

   Is the resistance less than 10,000 ohms?
   - Yes: REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
   - No: GO to M4.

**M4: CHECK THE CATALYST MONITOR SENSOR GROUND CIRCUIT FOR HIGH RESISTANCE**

1. Measure the resistance between:
   - Catalyst monitor sensor PI13, harness side
   - ECM connector PI300, harness side
   - Pin 03
   - Pin 45

   Is the resistance greater than 5 ohms?
   - Yes: REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
   - No: INSTALL a new catalyst monitor sensor.

**PINPOINT TEST N : LEFT-HAND CATALYST MONITOR SENSOR HEATER CONTROL CIRCUIT LOW/HIGH RESISTANCE**

**CAUTION:** Under no circumstances must the sensor wiring be cut to facilitate removal, should this prove necessary.

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
</table>

**N1: CHECK THE POWER SUPPLY TO THE CATALYST MONITOR SENSOR HEATER**

1. Disconnect the catalyst monitor sensor electrical connector, PI13.
2. Key on, engine off.
3. Make sure the 02S heater relay is energized.
4. Measure the voltage between:
   - Catalyst monitor sensor connector PI13, harness side
   - Battery
   - Pin 01
   - Negative terminal

   Is the voltage greater than 10 volts?
   - Yes: GO to N2.
   - No: REPAIR the power supply circuit to the catalyst monitor sensor heater. This circuit includes the heater relay and fuse 35 of the front power distribution box. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

**N2: CHECK THE CATALYST MONITOR SENSOR HEATER CONTROL CIRCUIT FOR HIGH RESISTANCE**

1. Key off.
2. Disconnect the ECM electrical connector, PI300.
3. Measure the resistance between:
   - Catalyst monitor sensor connector PI13, harness side
   - ECM connector PI300, harness side
   - Pin 02
   - Pin 89

   Is the resistance greater than 5 ohms?
   - Yes: GO to N3.
   - No: REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
### PINPOINT TEST O: ENGINE OIL TEMPERATURE (EOT) SENSOR RANGE/PERFORMANCE, HIGH/LOW VOLTAGE

</table>
Is the voltage greater than 3 volts?
Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
No
GO to P3.

P3: CHECK KS SENSING CIRCUIT FOR SHORT CIRCUIT TO GROUND
1. Key off.
2. Measure the resistance between:
   KS connector PI19, harness side
   Battery
   Pin 04
   Negative terminal
   Is the resistance less than 10,000 ohms?
   Yes
   REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
   No
   GO to P4.

P4: CHECK KS GROUND CIRCUIT FOR HIGH RESISTANCE
1. Measure the resistance between:
   KS connector PI19, harness side
   ECM connector PI300, harness side
   Pin 03
   Pin 19
   Is the resistance greater than 5 ohms?
   Yes
   INSTALL a new KS.
   REFER to: Knock Sensor (KS) LH (303-14B Electronic Engine Controls - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Removal and Installation).
   CLEAR the DTC. TEST the system for normal operation.
   No
   GO to Q2.

PINPOINT TEST Q : LEFT-HAND KNOCK SENSOR (KS) HIGH/LOW VOLTAGE
• NOTE: Before commencing this test, make sure that the sensor is making a good electrical contact with the cylinder block. See "possible causes".

1. Measure the resistance between:
   - CKP sensor connector PI21, harness side
   - ECM connector PI300, harness side

<table>
<thead>
<tr>
<th>Is the resistance greater than 5 ohms?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
</tr>
<tr>
<td>No</td>
</tr>
</tbody>
</table>

### PINPOINT TEST S: RIGHT-HAND CAMSHAFT POSITION (CMP) SENSOR CIRCUIT RANGE/PERFORMANCE, CIRCUIT MALFUNCTION

#### TEST CONDITIONS

#### S1: CHECK THE CMP SENSOR FOR CORRECT INSTALLATION

1. **Key off.**
2. Check the CMP sensor for correct installation.

<table>
<thead>
<tr>
<th>Is the CMP sensor correctly installed?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
</tr>
<tr>
<td>No</td>
</tr>
</tbody>
</table>
S2: CHECK THE CMP SENSOR FOR FOREIGN DEBRIS

Yes

Go to S3.

No

CLEAN the sensor and wheel. INSTALL the sensor.

CLEAR the DTCs. TEST the system for normal operation.

S3: CHECK THE CMP SENSOR SENSING CIRCUIT FOR HIGH RESISTANCE

1 Disconnect the CMP sensor electrical connector, PI23.
2 Disconnect the ECM electrical connector, PI300.
3 Measure the resistance between:

<table>
<thead>
<tr>
<th>CMP sensor connector PI23, harness side</th>
<th>ECM connector PI300, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Pin 34</td>
</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?

Yes

REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No

Go to S4.

S4: CHECK THE CMP SENSOR SENSING CIRCUIT FOR SHORT CIRCUIT TO POWER

1 Key on, engine off.
2 Measure the voltage between:

<table>
<thead>
<tr>
<th>CMP sensor connector PI23, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the voltage greater than 3 volts?

Yes

REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No

Go to S5.

S5: CHECK THE CMP SENSOR SENSING CIRCUIT FOR SHORT CIRCUIT TO GROUND

1 Key off.
2 Measure the resistance between:

<table>
<thead>
<tr>
<th>CMP sensor connector PI23, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance less than 10,000 ohms?

Yes

REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No

Go to S6.

S6: CHECK THE CMP SENSOR GROUND CIRCUIT FOR HIGH RESISTANCE

1 Measure the resistance between:

<table>
<thead>
<tr>
<th>CMP sensor connector PI23, harness side</th>
<th>ECM connector PI300, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 01</td>
<td>Pin 07</td>
</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?

Yes

REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No

INSTALL a new CMP sensor.

CLEAR the DTC. TEST the system for normal operation.

PINPOINT TEST T : LEFT-HAND CAMSHAFT POSITION (CMP) SENSOR CIRCUIT MALFUNCTION

RANGE/PERFORMANCE

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>T1: CHECK THE CMP SENSOR FOR CORRECT INSTALLATION</td>
</tr>
<tr>
<td>T2: CHECK THE CMP SENSOR FOR FOREIGN DEBRIS</td>
</tr>
<tr>
<td>T3: CHECK THE CMP SENSOR SENSING CIRCUIT FOR HIGH RESISTANCE</td>
</tr>
</tbody>
</table>

DETAILS/RESULTS/ACTIONS

T1: CHECK THE CMP SENSOR FOR CORRECT INSTALLATION

Check the CMP sensor for correct installation.

Is the CMP sensor correctly installed?

Yes

Go to T2.

No

INSTALL the CMP sensor correctly.

CLEAR the DTCs. TEST the system for normal operation.

T2: CHECK THE CMP SENSOR FOR FOREIGN DEBRIS

Remove the CMP sensor and inspect for foreign debris.

Is the CMP sensor free of foreign debris?

Yes

Go to T3.

No

CLEAN the sensor and wheel. INSTALL the sensor.

CLEAR the DTCs. TEST the system for normal operation.

T3: CHECK THE CMP SENSOR SENSING CIRCUIT FOR HIGH RESISTANCE

Key off.
Disconnect the CMP sensor electrical connector, PI22.

Disconnect the ECM electrical connector, PI300.

Measure the resistance between:

<table>
<thead>
<tr>
<th>CMP sensor connector PI22, harness side</th>
<th>ECM connector PI300, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 01</td>
<td>Pin 08</td>
</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?

Yes: REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No: GO to T4.

T4: CHECK THE CMP SENSOR SENSING CIRCUIT FOR SHORT CIRCUIT TO POWER

1. Key on, engine off.
2. Measure the voltage between:

<table>
<thead>
<tr>
<th>CMP sensor connector PI22, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 01</td>
<td>Pin 01</td>
</tr>
</tbody>
</table>

Is the voltage greater than 3 volts?

Yes: REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No: GO to T5.

T5: CHECK THE CMP SENSOR SENSING CIRCUIT FOR SHORT CIRCUIT TO GROUND

1. Key off.
2. Measure the resistance between:

<table>
<thead>
<tr>
<th>CMP sensor connector PI22, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 01</td>
<td>Pin 02</td>
</tr>
</tbody>
</table>

Is the resistance less than 10,000 ohms?

Yes: REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No: GO to T6.

T6: CHECK THE CMP SENSOR GROUND CIRCUIT FOR HIGH RESISTANCE

1. Measure the resistance between:

<table>
<thead>
<tr>
<th>CMP sensor connector PI22, harness side</th>
<th>ECM connector PI300, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Pin 08</td>
</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?

Yes: REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No: INSTALL a new CMP sensor.

CLEAR the DTC. TEST the system for normal operation.

PINPOINT TEST U: RADIATOR COOLING FAN MODULE DRIVE CIRCUIT MALFUNCTION

TEST CONDITIONS | DETAILS/RESULTS/ACTIONS
--- | ---
U1: CHECK THE RADIATOR FAN MODULE PERMANENT SUPPLY
1. Disconnect the fan module electrical connector, FH109.
2. Measure the voltage between:

<table>
<thead>
<tr>
<th>Fan module connector FH109, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 01</td>
<td>Pin 01</td>
</tr>
</tbody>
</table>

Is the voltage less than 10 volts?

Yes: REPAIR the circuit between the cooling fan module and battery. This circuit includes fuse 13 of the front power distribution box (80A) and the mega fuses. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No: Reconnect electrical connector, GCU04. GO to U2.

U2: CHECK THE RADIATOR FAN MODULE GROUND
1. Measure the resistance between:

<table>
<thead>
<tr>
<th>Fan module connector FH109, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Pin 02</td>
</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?

Yes: REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No: GO to U3.

U3: CHECK THE RADIATOR FAN MODULE EMS SWITCHED SUPPLY
1. Disconnect the fan module electrical connector, FH108.
2. Key on, engine off.
3. Make sure the EMS relay is engaged.
4. Measure the voltage between:

<table>
<thead>
<tr>
<th>Fan module connector FH108, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Pin 02</td>
</tr>
</tbody>
</table>

Is the voltage less than 10 volts?

Yes: REPAIR the circuit between the cooling fan module and battery. This circuit includes fuse 38 of the front power distribution box and the EMS control relay. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No:
GO to U4.

**U4: CHECK THE ECM TO RADIATOR FAN MODULE CIRCUIT FOR HIGH RESISTANCE**

1. Key off.
2. Disconnect the ECM electrical connector, FH300.
3. Measure the resistance between:
   - Fan module connector FH108, harness side
   - ECM connector FH300, harness side

<table>
<thead>
<tr>
<th>Pin 01</th>
<th>Pin 49</th>
</tr>
</thead>
</table>

Is the resistance greater than 5 ohms?

**Yes**
- REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

**No**
- GO to U5.

**U5: CHECK THE ECM TO RADIATOR FAN MODULE CIRCUIT FOR SHORT CIRCUIT TO POWER**

1. Key on, engine off.
2. Measure the voltage between:
   - Fan module connector FH108, harness side
   - Battery
   - Pin 01
   - Negative terminal

Is the voltage greater than 3 volts?

**Yes**
- REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

**No**
- GO to U6.

**U6: CHECK THE ECM TO RADIATOR FAN MODULE CIRCUIT FOR SHORT CIRCUIT TO GROUND**

1. Key off.
2. Measure the resistance between:
   - Fan module connector FH108, harness side
   - Battery
   - Pin 01
   - Negative terminal

Is the resistance less than 10,000 ohms?

**Yes**
- REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

**No**
- INSTALL a new radiator cooling fan module. CLEAR the DTC. TEST the system for normal operation.

---

**PINPOINT TEST V : BATTERY POWER SUPPLY VOLTAGE MALFUNCTION**

**TEST CONDITIONS**

**DETAILS/RESULTS/ACTIONS**

**V1: CHECK THE BATTERY POWER SUPPLY TO THE ECM**

1. Disconnect the ECM electrical connector, FH300.
2. Measure the voltage between:
   - ECM connector PI300, harness side
   - Battery
   - Pin 54
   - Negative terminal

Is the voltage greater than 10 volts?

**Yes**
- Recheck the DTCs.

**No**
- REPAIR the battery power supply circuit. This circuit includes fuse 33 of the front power distribution box. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

---

**PINPOINT TEST W : ACCELERATOR PEDAL POSITION (APP) SENSOR SENSING CIRCUIT 1 HIGH/LOW VOLTAGE**

**TEST CONDITIONS**

**DETAILS/RESULTS/ACTIONS**

**W1: CHECK THE APP SENSOR SENSING CIRCUIT 1 FOR HIGH RESISTANCE**

1. Key off.
2. Disconnect the ECM electrical connector, FH300.
3. Disconnect the APP sensor electrical connector, CA88.
4. Measure the resistance between:
   - ECM connector FH300, harness side
   - APP sensor connector CA88, harness side
   - Pin 24
   - Pin 04

Is the resistance greater than 5 ohms?

**Yes**
- REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

**No**
- GO to W2.

**W2: CHECK THE APP SENSOR SENSING CIRCUIT 1 FOR SHORT CIRCUIT TO POWER**

1. Key on, engine off.
2. Measure the voltage between:
   - APP sensor connector CA88, harness side
   - Battery
   - Pin 04
   - Negative terminal

Is the voltage greater than 3 volts?

**Yes**
- REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

**No**
- GO to W3.

**W3: CHECK THE APP SENSOR SENSING CIRCUIT 1 FOR SHORT CIRCUIT TO GROUND**

1. Key off.
2. Measure the resistance between:
   - APP sensor connector CA88, harness side
   - Battery
   - Pin 04
   - Negative terminal
Is the resistance less than 10,000 ohms?
Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
No
GO to W4.

**W4: CHECK THE APP SENSOR GROUND CIRCUIT 1 FOR HIGH RESISTANCE**

1. Measure the resistance between:
   - **APP sensor connector CA88, harness side**
   - **ECM connector FH300, harness side**
   - Pin 06
   - Pin 08

   Is the resistance greater than 5 ohms?
   Yes
   REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
   No
   GO to W5.

**W5: CHECK THE APP SENSOR SUPPLY VOLTAGE AT THE SENSOR**

1. Reconnect the ECM electrical connector, FH300.
2. Key on, engine off.
3. Measure the voltage between:
   - **APP sensor connector CA88, harness side**
   - **Battery**
   - Pin 05
   - Negative terminal

   Is the voltage less than 4 volts?
   Yes
   GO to W6.
   No
   INSTALL a new APP sensor.
   REFER to: [Accelerator Pedal](310-02 Acceleration Control, Removal and Installation).
   CLEAR the DTC. TEST the system for normal operation.

**W6: CHECK THE APP SENSOR SUPPLY VOLTAGE CIRCUIT FOR HIGH RESISTANCE**

1. Key off.
2. Disconnect the ECM electrical connector, FH300.
3. Measure the resistance between:
   - **APP sensor connector CA88, harness side**
   - **ECM connector FH300, harness side**
   - Pin 05
   - Pin 19

   Is the resistance greater than 5 ohms?
   Yes
   REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
   No
   Check the ECM power supplies (recheck DTCs).

   REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
   No
   GO to X3.

| **X3: CHECK THE APP SENSOR SENSING CIRCUIT 2 FOR SHORT CIRCUIT TO GROUND** |
| 1. Key off. |
| 2. Measure the resistance between:
   - **APP sensor connector CA88, harness side**
   - **Battery**
   - Pin 01
   - Negative terminal |

   Is the resistance less than 10,000 ohms?
   Yes
   REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
   No
   GO to X4.

| **X4: CHECK THE APP SENSOR GROUND CIRCUIT 2 FOR HIGH RESISTANCE** |
| 1. Measure the resistance between:
   - **APP sensor connector CA88, harness side**
   - **ECM connector FH300, harness side**
   - Pin 03
   - Pin 07 |
Is the resistance greater than 5 ohms?
Yes
REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
No
GO to X5.

X5: CHECK THE APP SENSOR SUPPLY VOLTAGE AT THE SENSOR

1
Reconnect the ECM electrical connector, FH300.
2
Key on, engine off.
3
Measure the voltage between:

<table>
<thead>
<tr>
<th>APP sensor connector CA88, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the voltage less than 4 volts?
Yes
GO to X6.
No
INSTALL a new APP sensor.
REFER to: Accelerator Pedal (310-02 Acceleration Control, Removal and Installation). CLEAR the DTC. TEST the system for normal operation.

X6: CHECK THE APP SENSOR SUPPLY VOLTAGE CIRCUIT FOR HIGH RESISTANCE

1
Key off.
2
Disconnect the ECM electrical connector, FH300.
3
Measure the resistance between:

<table>
<thead>
<tr>
<th>APP sensor connector CA88, harness side</th>
<th>ECM connector FH300, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Pin 32</td>
</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?
Yes
REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
No
Check the ECM power supplies (recheck DTCs).

PINPOINT TEST Y : THROTTLE MOTOR CONTROL CIRCUIT MALFUNCTION

TEST CONDITIONS

DETAILS/RESULTS/ACTIONS

Y1: CHECK THE THROTTLE MOTOR NEGATIVE TO ECM CIRCUIT FOR HIGH RESISTANCE

1
Key off.
2
Disconnect the throttle motor electrical connector, (vehicles with supercharger) PI26 or (vehicles without supercharger) PI303.
3
Disconnect the ECM electrical connector, PI300.
4
Measure the resistance between:

<table>
<thead>
<tr>
<th>Vehicles with supercharger</th>
<th>Vehicles without supercharger</th>
</tr>
</thead>
<tbody>
<tr>
<td>Throttle motor connector PI26, harness side</td>
<td>Throttle motor connector PI303, harness side</td>
</tr>
<tr>
<td>Pin 02</td>
<td>Pin 06</td>
</tr>
<tr>
<td>ECM connector PI300, harness side</td>
<td>ECM connector PI300, harness side</td>
</tr>
<tr>
<td>Pin 74</td>
<td>Pin 74</td>
</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?
Yes
REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
No
GO to Y2.

Y2: CHECK THE THROTTLE MOTOR POWER SUPPLY CIRCUIT FOR HIGH RESISTANCE

1
Measure the resistance between:

<table>
<thead>
<tr>
<th>Vehicles with supercharger</th>
<th>Vehicles without supercharger</th>
</tr>
</thead>
<tbody>
<tr>
<td>Throttle motor connector PI26, harness side</td>
<td>Throttle motor connector PI303, harness side</td>
</tr>
<tr>
<td>Pin 01</td>
<td>Pin 05</td>
</tr>
<tr>
<td>ECM connector PI300, harness side</td>
<td>ECM connector PI300, harness side</td>
</tr>
<tr>
<td>Pin 75</td>
<td>Pin 75</td>
</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?
Yes
REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
No
INSTALL a new throttle body.

PINPOINT TEST Z : SENSOR SUPPLY VOLTAGE MALFUNCTION, HIGH/LOW VOLTAGE

TEST CONDITIONS

DETAILS/RESULTS/ACTIONS

Z1: CHECK THE SUPPLY VOLTAGE AT THE MANIFOLD ABSOLUTE PRESSURE (MAP) SENSOR

1
Disconnect the MAP sensor electrical connector, (vehicles with supercharger) PI301 or (vehicles without supercharger) PI29.
2
Key on, engine off.
3
Measure the voltage between:

<table>
<thead>
<tr>
<th>MAP sensor connector PI301, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Negative terminal</td>
<td></td>
</tr>
</tbody>
</table>
MAP sensor connector PI301, harness side  Battery
Pin 02  Negative terminal

Vehicles without supercharger

MAP sensor connector PI29, harness side  Battery
Pin 02  Negative terminal

Is the voltage less than 5 volts?
Yes
   REPAIR the circuit between the MAP sensor and the ECM. This circuit includes splice PIS84 on V8 vehicles with supercharger only. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
No
   GO to Z2.

Z2: CHECK THE SUPPLY VOLTAGE AT THE FUEL RAIL PRESSURE (FRP) SENSOR

1  Disconnect the FRP sensor electrical connector, PI28.
2  Measure the voltage between:

FRP sensor connector PI28, harness side  Battery
Pin 01  Negative terminal

Is the voltage less than 5 volts?
Yes
   REPAIR the circuit between the FRP sensor and battery. This circuit includes splice PIS84 on V8 vehicles with supercharger only. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
No
   CHECK for DTCs indicating a sensor fault. Refer to the DTC index.

PINPOINT TEST AA : SENSOR GROUND CIRCUITS OPEN CIRCUIT

TEST CONDITIONS  DETAILS/RESULTS/ACTIONS

AA1: CHECK THE SENSOR GROUND AT THE MANIFOLD ABSOLUTE PRESSURE (MAP) SENSOR

1  Key off.
2  Disconnect the ECM electrical connector, PI300.
3  Disconnect the MAP sensor electrical connector, (vehicles with supercharger) PI301 or (vehicles without supercharger) PI29.
4  Measure the resistance between:

Vehicles with supercharger

MAP sensor electrical connector PI301, harness side  ECM connector PI300, harness side
Pin 04  Pin 12

Vehicles without supercharger

MAP sensor electrical connector PI29, harness side  ECM connector PI300, harness side
Pin 04  Pin 10

Is the resistance greater than 5 ohms?
Yes
   REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
No
   GO to AA2.

AA2: CHECK THE SENSOR GROUND AT THE ENGINE COOLANT TEMPERATURE (ECT) SENSOR

1  Disconnect the ECT sensor electrical connector, PI25.
2  Measure the resistance between:

ECT sensor electrical connector PI25, harness side  ECM connector PI300, harness side
Pin 01  Pin 12

Is the resistance greater than 5 ohms?
Yes
   REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
No
   GO to AA3.

AA3: CHECK THE SENSOR GROUND AT THE MASS AIR FLOW (MAF) SENSOR

1  Disconnect the MAF sensor electrical connector, PI14.
2  Measure the resistance between:

MAF sensor electrical connector PI14, harness side  ECM connector PI300, harness side
Pin 02  Pin 18

Is the resistance greater than 5 ohms?
Yes
   REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
No
   CHECK for DTCs indicating a sensor fault. Refer to the warranty policy and procedures manual if an ECM is suspect.

PINPOINT TEST AB : STARTER RELAY SIGNAL

TEST CONDITIONS  DETAILS/RESULTS/ACTIONS

AB1: CHECK THE STARTER RELAY TO ECM CIRCUIT FOR SHORT CIRCUIT TO GROUND

1  Key off.
2  Remove the starter relay.
3  Measure the resistance between:

Starter relay base  Battery
Pin 02  Negative terminal

Is the resistance less than 10,000 ohms?
Yes
   REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
   GO to AB2.
AB2: CHECK THE STARTER RELAY TO ECM CIRCUIT FOR SHORT CIRCUIT TO POWER

<table>
<thead>
<tr>
<th>Pin 02</th>
<th>Pin 86</th>
</tr>
</thead>
<tbody>
<tr>
<td>Measure the resistance between:</td>
<td>Battery</td>
</tr>
</tbody>
</table>

Is the resistance less than 10,000 ohms?

Yes
- REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No
- GO to AB3.

AB3: CHECK THE STARTER RELAY TO ECM CIRCUIT FOR HIGH RESISTANCE

<table>
<thead>
<tr>
<th>Pin 02</th>
<th>Pin 51</th>
</tr>
</thead>
<tbody>
<tr>
<td>Measure the resistance between:</td>
<td>ECM connector EC300, harness side</td>
</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?

Yes
- REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No
- INSTALL a new starter relay. Clear the DTC and test the system for normal operation. If the DTC resets, refer to the warranty policy and procedures manual if an ECM is suspect.

PINPOINT TEST AC : RIGHT-HAND VARIABLE CAMSHAFT TIMING (VCT) OIL CONTROL SOLENOID MALFUNCTION, CIRCUIT MALFUNCTION

**NOTE:** Check fuses, etc before beginning pinpoint tests, see visual inspection.

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>DETAILS/RESULTS/ACTIONS</td>
</tr>
</tbody>
</table>

AC1: CHECK ECM TO VCT SOLENOID CIRCUIT FOR HIGH RESISTANCE

Key off.

1. Disconnect the VCT electrical connector, PI16.
2. Disconnect the ECM electrical connector, PI300.
3. Measure the resistance between:

<table>
<thead>
<tr>
<th>Pin 01</th>
<th>Pin 86</th>
</tr>
</thead>
<tbody>
<tr>
<td>VCT connector PI16, harness side</td>
<td>ECM connector PI300, harness side</td>
</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?

Yes
- REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No
- GO to AC2.

AC2: CHECK ECM TO VCT SOLENOID CIRCUIT FOR SHORT CIRCUIT TO POWER

Key on, engine off.

1. Measure the voltage between:

<table>
<thead>
<tr>
<th>Pin 01</th>
<th>Negative terminal</th>
</tr>
</thead>
<tbody>
<tr>
<td>VCT connector PI16, harness side</td>
<td>Battery</td>
</tr>
</tbody>
</table>

Is the voltage greater than 3 volts?

Yes
- REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No
- GO to AC3.

AC3: CHECK ECM TO VCT SOLENOID CIRCUIT FOR SHORT CIRCUIT TO GROUND

Key off.

1. Measure the resistance between:

<table>
<thead>
<tr>
<th>Pin 01</th>
<th>Negative terminal</th>
</tr>
</thead>
<tbody>
<tr>
<td>VCT connector PI16, harness side</td>
<td>Battery</td>
</tr>
</tbody>
</table>

Is the resistance less than 10,000 ohms?

Yes
- REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No
- GO to AC4.

AC4: CHECK VCT SOLENOID POWER

Key on, engine off.

1. Measure the voltage between:

<table>
<thead>
<tr>
<th>Pin 02</th>
<th>Negative terminal</th>
</tr>
</thead>
<tbody>
<tr>
<td>VCT connector PI16, harness side</td>
<td>Battery</td>
</tr>
</tbody>
</table>

Is the voltage less than 10 volts?

Yes
- REPAIR the circuit between the VCT solenoid and battery. This circuit includes fuse 39 of the front power distribution box and the EMS control relay. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No
- INSTALL a new VCT solenoid.
- REFER to: [Variable Camshaft Timing (VCT) Oil Control Solenoid](303-14B Electronic Engine Controls - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Removal and Installation).
- CLEAR the DTC. TEST the system for normal operation.

PINPOINT TEST AD : LEFT-HAND VARIABLE CAMSHAFT TIMING (VCT) OIL CONTROL SOLENOID MALFUNCTION, CIRCUIT MALFUNCTION

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>DETAILS/RESULTS/ACTIONS</td>
</tr>
</tbody>
</table>

AD1: CHECK ECM TO VCT SOLENOID CIRCUIT FOR HIGH RESISTANCE

Key off.
2. Disconnect the VCT electrical connector, PI17.
3. Disconnect the ECM electrical connector, PI300.
4. Measure the resistance between:

<table>
<thead>
<tr>
<th>VCT connector PI17, harness side</th>
<th>ECM connector PI300, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 01</td>
<td>Pin 87</td>
</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?

**Yes**
- REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

**No**
- GO to AD2.

---

**AD2: CHECK ECM TO VCT SOLENOID CIRCUIT FOR SHORT CIRCUIT TO POWER**

1. Key on, engine off.
2. Measure the voltage between:

<table>
<thead>
<tr>
<th>VCT connector PI17, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 01</td>
<td></td>
</tr>
</tbody>
</table>

Is the voltage greater than 3 volts?

**Yes**
- REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

**No**
- GO to AD3.

---

**AD3: CHECK ECM TO VCT SOLENOID CIRCUIT FOR SHORT CIRCUIT TO GROUND**

1. Key on, engine off.
2. Measure the resistance between:

<table>
<thead>
<tr>
<th>VCT connector PI17, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 01</td>
<td></td>
</tr>
</tbody>
</table>

Is the resistance less than 10,000 ohms?

**Yes**
- REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

**No**
- GO to AD4.

---

**AD4: CHECK VCT SOLENOID POWER**

1. Key on, engine off.
2. Measure the voltage between:

<table>
<thead>
<tr>
<th>VCT connector PI17, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td></td>
</tr>
</tbody>
</table>

Is the voltage less than 10 volts?

**Yes**
- REPAIR the circuit between the VCT solenoid and battery. This circuit includes fuse 39 of the front power distribution box and the EMS control relay. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

**No**
- INSTALL a new VCT solenoid.
- REFER to: [Variable Camshaft Timing (VCT) Oil Control Solenoid](303-14B Electronic Engine Controls - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Removal and Installation).
- CLEAR the DTC. TEST the system for normal operation.

---

**PINPOINT TEST AE : EMS CONTROL RELAY MALFUNCTION**

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>AE1: CHECK THE EMS RELAY PERMANENT SUPPLY</strong></td>
<td></td>
</tr>
</tbody>
</table>
1. Key off.
2. Remove the EMS relay.
3. Measure the voltage between:

<table>
<thead>
<tr>
<th>Relay base</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 01</td>
<td></td>
</tr>
<tr>
<td>Pin 03</td>
<td></td>
</tr>
</tbody>
</table>

Are both voltages greater than 10 volts?

**Yes**
- GO to AE2.

**No**
- REPAIR the circuit between the relay base and battery. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

---

**AE2: CHECK THE ECM TO EMS RELAY CONTROL CIRCUIT FOR HIGH RESISTANCE**

1. Disconnect the ECM electrical connector, FH300.
2. Measure the resistance between:

<table>
<thead>
<tr>
<th>Relay base</th>
<th>ECM connector FH300, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Pin 16</td>
</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?

**Yes**
- REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

**No**
- GO to AE3.

---

**AE3: CHECK THE EMS RELAY TO ECM SUPPLY CIRCUIT FOR HIGH RESISTANCE**

1. Measure the resistance between:

<table>
<thead>
<tr>
<th>Relay base</th>
<th>ECM connector FH300, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 05</td>
<td>Pin 04</td>
</tr>
<tr>
<td>Pin 06</td>
<td></td>
</tr>
</tbody>
</table>

Is either resistance greater than 5 ohms?

**Yes**
- REPAIR the high resistance circuit. These circuits include fuses 18 and 39 of the front power distribution box. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
PINPOINT TEST AF : MANIFOLD ABSOLUTE PRESSURE (MAP) SENSOR SENSING CIRCUIT MALFUNCTION, HIGH/LOW VOLTAGE

<table>

<tr>
<td>EFT sensor connector PI27, harness side</td>
<td>Battery</td>
</tr>
<tr>
<td>Pin 02 Pin 46</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>
Is the voltage greater than 3 volts?
Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
No
GO to AG3.

AG3: CHECK THE EFT SENSOR SENSING CIRCUIT FOR SHORT CIRCUIT TO GROUND
1 Measure the resistance between:
   EFT sensor connector PI27, harness side Battery
Pin 02 Negative terminal

   Is the resistance less than 10,000 ohms?
   Yes
   REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
   No
   INSTALL a new EFT sensor. REFER to Fuel Temperature Sensor (303-14B Electronic Engine Controls - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Removal and Installation).
   CLEAR the DTC. TEST the system for normal operation.

PINPOINT TEST AH : AIR CONDITIONING (A/C) PRESSURE SENSOR CIRCUIT LOW/HIGH VOLTAGE

GO to AJ2.
No
REPAIR the circuit between the air cleaner solenoid valve and battery. This circuit includes splice FHS04, FHS60, fuse 37 of the front power distribution box and the EMS relay. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

AJ2: CHECK THE AIR CLEANER SOLENOID VALVE TO ECM CIRCUIT FOR HIGH RESISTANCE

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>

</tbody>
</table>

   Air cleaner solenoid valve connector FH10, harness side
   
   Pin 02
   
   ECM connector PI300, harness side
   
   Pin 49

Is the resistance greater than 5 ohms?
Yes
REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
No
GO to A13.

AJ3: CHECK THE AIR CLEANER SOLENOID VALVE TO ECM CIRCUIT FOR SHORT CIRCUIT TO POWER

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>

<td></td>
</tr>
</tbody>
</table>

   Air cleaner solenoid valve connector FH10, harness side
   
   Pin 02
   
   Battery
   
   Negative terminal

Is the voltage greater than 3 volts?
Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
No
GO to AJ4.

AJ4: CHECK THE AIR CLEANER SOLENOID VALVE TO ECM CIRCUIT FOR SHORT CIRCUIT TO GROUND

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>AJ4: CHECK THE AIR CLEANER SOLENOID VALVE TO ECM CIRCUIT FOR SHORT CIRCUIT TO GROUND</strong></td>
<td></td>
</tr>
<tr>
<td>1. Measure the resistance between:</td>
<td></td>
</tr>
</tbody>
</table>

   Air cleaner solenoid valve connector FH10, harness side
   
   Pin 02
   
   Battery
   
   Negative terminal

Is the resistance less than 10,000 ohms?
Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
No
INSTALL a new air cleaner solenoid valve. CLEAR the DTC. TEST the system for normal operation.

PINPOINT TEST AK: CHECK THE AUXILIARY COOLANT PUMP FUNCTION

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>AK1: CHECK THE POWER SUPPLY TO THE AUXILIARY COOLANT PUMP</strong></td>
<td></td>
</tr>
<tr>
<td>1. Key off.</td>
<td></td>
</tr>
<tr>
<td>2. Disconnect the auxiliary coolant pump electrical connector, CP02.</td>
<td></td>
</tr>
<tr>
<td>3. Key on, engine off.</td>
<td></td>
</tr>
<tr>
<td>4. Make sure the EMS relay is energized.</td>
<td></td>
</tr>
<tr>
<td>5. Make sure the auxiliary coolant pump relay is engaged.</td>
<td></td>
</tr>
<tr>
<td>6. Measure the voltage between:</td>
<td></td>
</tr>
</tbody>
</table>

   Auxiliary coolant pump connector CP02, harness side
   
   Pin 02
   
   Battery
   
   Negative terminal
Is the voltage less than 10 volts?
Yes
REPAIR the circuit between the auxiliary coolant pump and battery. This circuit includes fuse 36 of the front power distribution box, the auxiliary coolant pump relay and the EMS relay. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
No
GO to AK2.

AK2: CHECK THE AUXILIARY COOLANT PUMP GROUND

1 Measure the resistance between:
   | Auxiliary coolant pump connector CP02, harness side | Battery
   | Pin 01 | Negative terminal

Is the resistance greater than 5 ohms?
Yes
REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
INSTALL a new auxiliary coolant pump.
REFER to: Water Pump (303-03B Supercharger Cooling, Removal and Installation).
CLEAR the DTC. TEST the system for normal operation.

PINPOINT TEST AL : FUEL RAIL PRESSURE (FRP) SENSOR CIRCUIT

TEST CONDITIONS

AL1: CHECK THE FRP SENSOR SUPPLY CIRCUIT VOLTAGE

1 Key off.
2 Disconnect the FRP sensor electrical connector, PI28.
3 Key on, engine off.
4 Measure the voltage between:
   | FRP sensor connector PI28, harness side | Battery
   | Pin 01 | Negative terminal

Is the voltage less than 4 volts?
Yes
REPAIR the 5 volt supply circuit between the FRP sensor and the ECM. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
GO to AL2.

AL2: CHECK THE FRP SENSOR SIGNAL CIRCUIT FOR SHORT CIRCUIT TO GROUND

1 Key off.
2 Measure the resistance between:
   | FRP sensor connector PI28, harness side | Battery
   | Pin 03 | Negative terminal

Is the resistance less than 10,000 ohms?
Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
GO to AL3.

AL3: CHECK THE FRP SENSOR SIGNAL CIRCUIT FOR SHORT CIRCUIT TO POWER

1 Measure the resistance between:
   | FRP sensor connector PI28, harness side | Battery
   | Pin 03 | Positive terminal

Is the resistance less than 10,000 ohms?
Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
GO to AL4.

AL4: CHECK THE FRP SENSOR SIGNAL CIRCUIT FOR HIGH RESISTANCE

1 Disconnect the ECM sensor electrical connector, PI300.
2 Measure the resistance between:
   | FRP sensor connector PI28, harness side | ECM connector PI300, harness side
   | Pin 03 | Pin 71

Is the resistance greater than 5 ohms?
Yes
REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
GO to AL5.

AL5: CHECK THE FRP SENSOR GROUND CIRCUIT FOR HIGH RESISTANCE

1 Measure the resistance between:
   | FRP sensor connector PI28, harness side | ECM connector PI300, harness side
   | Pin 02 | Pin 10

Is the resistance greater than 5 ohms?
Yes
REPAIR the high resistance circuit. This circuit includes splice PIS49. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
No
INSTALL a new FRP sensor. CLEAR the DTC and test the system for normal operation.

PINPOINT TEST AM : MANIFOLD ABSOLUTE PRESSURE/TEMPERATURE (MAPT) SENSOR PRESSURE SENSING CIRCUIT

TEST CONDITIONS

AM1: CHECK THE POWER SUPPLY TO THE MAPT SENSOR

1 Key off.
Disconnect the MAPT connector, PI29.

Key on, engine off.

Measure the voltage between:

<table>
<thead>
<tr>
<th>MAPT sensor connector PI29, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the voltage greater than 4 volts?

Yes

Go to AM2.

No

CHECK the circuit between the MAPT sensor and the ECM. Refer to the warranty policy and procedures manual if an ECM is suspect.

AM2: CHECK THE GROUND TO THE MAPT SENSOR

Measure the resistance between:

<table>
<thead>
<tr>
<th>MAPT sensor connector PI29, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 04</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?

Yes

REPAIR the high resistance circuit. This circuit includes splice PIS49 and the ECM. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation. Refer to the warranty policy and procedures manual if an ECM is suspect.

Go to AM3.

No

AM3: CHECK THE MAPT PRESSURE SENSING CIRCUIT FOR SHORT CIRCUIT TO GROUND

Disconnect the ECM connector, PI29.

Measure the resistance between:

<table>
<thead>
<tr>
<th>MAPT sensor connector PI29, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 01</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance less than 10,000 ohms?

Yes

REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No

Go to AM4.

AM4: CHECK THE MAPT PRESSURE SENSING CIRCUIT FOR SHORT CIRCUIT TO POWER

Measure the resistance between:

<table>
<thead>
<tr>
<th>MAPT sensor connector PI29, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 01</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance less than 10,000 ohms?

Yes

REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No

Go to AM5.

AM5: CHECK THE MAPT PRESSURE SENSING CIRCUIT FOR HIGH RESISTANCE

Measure the resistance between:

<table>
<thead>
<tr>
<th>MAPT sensor connector PI29, harness side</th>
<th>ECM connector PI300, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 01</td>
<td>Pin 69</td>
</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?

Yes

REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation. Refer to the warranty policy and procedures manual if an ECM is suspect.

No

INSTALL a new MAPT sensor. CLEAR the DTC. TEST the system for normal operation.

PINPOINT TEST AN: BRAKE SWITCH

TEST CONDITIONS | DETAILS/RESULTS/ACTIONS
AN1: CHECK THE OPERATION OF THE BRAKE SWITCH (PEDAL RELEASED)

1. Key off.
2. Disconnect the brake switch electrical connector, CA37.
3. Make sure the brake pedal is not pressed.
4. Measure the resistance between:

<table>
<thead>
<tr>
<th>Brake switch connector CA37, component side</th>
<th>Brake switch connector CA37, component side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 01</td>
<td>Pin 02</td>
</tr>
</tbody>
</table>

Is the resistance greater than 10 ohms?

Yes

Go to AN2.

No

INSTALL a new brake switch. CLEAR the DTC, test the system for normal operation.

AN2: CHECK THE OPERATION OF THE BRAKE SWITCH (PEDAL PRESSED)

1. Press the brake pedal.
2. Measure the resistance between:

<table>
<thead>
<tr>
<th>Brake switch connector CA37, component side</th>
<th>Brake switch connector CA37, component side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 01</td>
<td>Pin 02</td>
</tr>
</tbody>
</table>

Is the resistance greater than 10 ohms?

Yes

INSTALL a new brake switch. CLEAR the DTC, test the system for normal operation.

No

Go to AN3.

AN3: CHECK THE POWER SUPPLY TO THE BRAKE PEDAL SWITCH

1. Key on, engine off.
2. Measure the voltage between:

<table>
<thead>
<tr>
<th>Brake switch connector CA37, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 01</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>
**Is the voltage less than 10 volts?**  
**Yes**  
REPAIR the circuit between the brake switch and battery. This circuit includes fuse 35 of the primary junction box. For additional information, refer to the wiring diagrams. CLEAR the DTC, test the system for normal operation.  
**No**  
GO to AN4.

### AN4: CHECK THE BRAKE SWITCH SIGNAL CIRCUIT FOR SHORT CIRCUIT TO GROUND

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Key off.</td>
</tr>
</tbody>
</table>
| 2    | Measure the resistance between:  
  **Brake switch connector CA37, harness side**  
  Pin 02  
  **Battery**  
  Negative terminal |

Is the resistance less than 10,000 ohms?  
**Yes**  
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC, test the system for normal operation.  
**No**  
GO to AN5.

### AN5: CHECK THE BRAKE SWITCH SIGNAL CIRCUIT FOR SHORT CIRCUIT TO POWER

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
</table>
| 1    | Measure the resistance between:  
  **Brake switch connector CA37, harness side**  
  Pin 02  
  **Battery**  
  Positive terminal |

Is the resistance less than 10,000 ohms?  
**Yes**  
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC, test the system for normal operation.  
**No**  
GO to AN6.

### AN6: CHECK THE BRAKE SWITCH SIGNAL CIRCUIT FOR HIGH RESISTANCE

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Disconnect the ECM electrical connector, FH300.</td>
</tr>
</tbody>
</table>
| 2    | Measure the resistance between:  
  **Brake switch connector CA37, harness side**  
  Pin 02  
  **ECM connector FH300, harness side**  
  Pin 41 |

Is the resistance greater than 5 ohms?  
**Yes**  
REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.  
**No**  
REFER to the warranty policy and procedures manual if an ECM is suspect.

### PINPOINT TEST AO : AIR CONDITIONING (A/C) COMPRESSOR CLUTCH CONTROL CIRCUIT

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>AO1: CHECK THE A/C CLUTCH RELAY CONTROL CIRCUIT FOR HIGH RESISTANCE</td>
<td></td>
</tr>
<tr>
<td>1</td>
<td>Remove the A/C clutch relay.</td>
</tr>
<tr>
<td>2</td>
<td>Disconnect the ECM electrical connector, FH300.</td>
</tr>
</tbody>
</table>
| 3    | Measure the resistance between:  
  **A/C clutch relay base**  
  Pin 02  
  **ECM connector FH300, harness side**  
  Pin 53 |

Is the resistance greater than 5 ohms?  
**Yes**  
REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.  
**No**  
GO to AO2.

### AO2: CHECK THE A/C CLUTCH RELAY CONTROL CIRCUIT FOR SHORT CIRCUIT TO GROUND

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Key on, engine off.</td>
</tr>
</tbody>
</table>
| 2    | Measure the resistance between:  
  **A/C clutch relay base**  
  Pin 02  
  **Battery**  
  Negative terminal |

Is the resistance less than 10,000 ohms?  
**Yes**  
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.  
**No**  
GO to AO3.

### AO3: CHECK THE A/C CLUTCH RELAY CONTROL CIRCUIT FOR SHORT CIRCUIT TO POWER

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
</table>
| 1    | Measure the resistance between:  
  **A/C clutch relay base**  
  Pin 02  
  **Battery**  
  Positive terminal |

Is the resistance less than 10,000 ohms?  
**Yes**  
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.  
**No**  
INSTALL a new A/C clutch relay. CLEAR the DTC. TEST the system for normal operation. If the DTC is reset, refer to the warranty policy and procedures manual if an ECM is suspect.
Electronics, Engine Controls - V8 4.2L Petrol/V8 S/C 4.2L Petrol - Powertrain Control Module (PCM) Long Drive Cycle Self-Test

General Procedures

**WARNING:** Where possible, all road tests should be on well surfaced and dry roads. Always comply with speed limits and local traffic regulations.

- **NOTE:** This procedure is an overcheck only. If fault codes are found, interrogation of the relevant system must be carried out and claimed against.

- **NOTE:** The vehicle must exceed 50mph (80 km/h) during the road test.

1. Connect the diagnostic equipment to the vehicle.
2. Follow on screen prompts and check for engine management fault codes.
3. Clear the fault codes following the on screen procedure.
4. Disconnect the diagnostic equipment from the vehicle.
5. **NOTE:** Make sure cruise control is not engaged.

Make sure the engine temperature is above 60 °C (140 °F).

Carry out a road test and perform the following operations.

1. Accelerate to 55 mph (88 km/h) in 5th gear and cruise for 2 minutes with the engine speed at or above 1800rpm.
2. Lift off the throttle and allow the vehicle to decelerate until the engine speed is less than 1000 rpm.
3. Stop the vehicle.
4. Release brake, allow the vehicle to move with no throttle for 1 minute.
5. Road test is now complete.

6. Connect the diagnostic equipment to the vehicle.
7. **NOTE:** If fault codes are found, interrogation of the relevant system must be carried out and claimed against.

Follow on screen prompts and check for engine management fault codes.
8. Disconnect the diagnostic equipment from the vehicle.
Electronic Engine Controls - V8 4.2L Petrol/V8 S/C 4.2L Petrol - Powertrain Control Module (PCM) Short Drive Cycle Self-Test

General Procedures

• NOTE: This procedure is an overcheck only. If fault codes are found, interrogation of the relevant system must be carried out and claimed against.

1. Connect the diagnostic equipment to the vehicle.
2. Follow on screen prompts and check for engine management fault codes.
3. Clear the fault codes following the on screen procedure.
4. Start the engine.
   • Allow the engine to idle for 30 seconds.
   • Raise the engine speed to 1500 rpm and hold for 3 minutes until a temperature of 70ºC (158 ºF) is achieved.
   • Allow the engine to idle for 30 seconds.
   • Switch off the engine.

5. NOTE: If fault codes are found, interrogation of the relevant system must be carried out and claimed against.
   Follow on screen prompts and check for engine management fault codes.
6. Disconnect the diagnostic equipment from the vehicle.
Electronic Engine Controls - V8 4.2L Petrol/V8 S/C 4.2L Petrol - Brake Pedal Position (BPP) Switch
Removal and Installation

Removal

1. Switch the ignition on.
2. Position the front seat fully rearwards.
3. Switch the ignition off.
4. Remove the driver's side footwell trim panel.
   - Release the 3 clips.
5. Release the brake pedal position (BPP) switch.
   - Rotate the BPP switch 45 degrees counter-clockwise.
6. Remove the BPP switch.
   - Disconnect the electrical connector.

Installation

1. CAUTIONS:
Make sure that the brake pedal remains in the rest position during this procedure.

The bracket is keyed to avoid incorrect orientation. Failure to correctly align the switch may result in damage to the vehicle.

Make sure that the pedal box, booster-to-brake pedal assembly and switch bracket are all installed correctly before installing the switch.

Install the BPP switch.

- Locate the BPP switch in the bracket.
- Rotate the BPP switch 45 degrees clockwise.

2. Connect the electrical connector.

3. Install the driver's side footwell trim panel.

- Align the trim panel with the guide.
- Install the 3 clips.
Removal

1. Remove the cowl vent screen. For additional information, refer to Section 501-02 Front End Body Panels.

2. Remove the engine compartment support.

3. Disconnect the camshaft position sensor (CMP) electrical connector.

4. Remove the CMP sensor.
   - Remove and discard the CMP sensor O-ring seal.

Installation

1. To install, reverse removal procedure.
   - Install a new CMP O-ring seal.
   - Tighten to 7 Nm.
**Removal**

All vehicles

1. Remove the cowl panel grille.
   For additional information, refer to: [Cowl Panel Grille](#) (501-02 Front End Body Panels, Removal and Installation).

2. Remove the fuel temperature sensor.
   For additional information, refer to: [Fuel Temperature Sensor](#) (303-14B Electronic Engine Controls - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Removal and Installation).

3. Remove the engine compartment support.

Vehicles without supercharger

4. Detach the wiring harness retaining bracket.

All vehicles

5. Disconnect the camshaft position (CMP) sensor electrical connector.
6. Remove the CMP sensor.
   - Remove and discard the CMP O-ring seal.

**Installation**

1. To install reverse the removal procedure.
   - Install a new CMP O-ring seal.
   - Tighten to 7 Nm.
Removal

1. Raise and support the vehicle. For additional information, refer to: Lifting (100-02 Jacking and Lifting, Description and Operation).
2. Disconnect the catalyst monitor sensor.

3. **CAUTION:** Make sure the wiring harness is not twisted or damaged on removal. Failure to follow this instruction may result in damage to the vehicle.

Using the Snap-on tool S6176, remove the catalyst monitor sensor.

Installation

1. **CAUTION:** Make sure the wiring harness is not twisted or damaged on installation. Failure to follow this instruction may result in damage to the vehicle.

   To install, reverse the removal procedure.
   - Tighten to 45 Nm.

2. **NOTE:** For NAS vehicles only.

   If required, carry out a long drive cycle. For additional information, refer to: Powertrain Control Module (PCM) Long Drive Cycle Self-Test (303-14A Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, General Procedures).
Removal

1. Raise and support the vehicle. For additional information refer to Section 100-02 Jacking and Lifting.
2. Disconnect the crankshaft position sensor electrical connector.

3. Remove the crankshaft position sensor.

Installation

1. To install, reverse removal procedure.
Removal and Installation

**Special Tool(s)**

<table>
<thead>
<tr>
<th>Tool Description</th>
<th>Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>5 point security torx bit</td>
<td>418-535</td>
</tr>
</tbody>
</table>

**Removal**

1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 Battery, Mounting and Cables.

2. Remove the cabin air filter. For additional information, refer to Section 412-01 Air Distribution and Filtering.

3. Remove the engine compartment support.

4. Remove the cabin air filter housing retaining nut.

5. Remove the cabin air filter housing.
6. Remove the engine compartment panel.

7. NOTE: The engine control module (ECM) electrical connector retaining bolt remains captive in the electrical connector. Using the special tool, disconnect the ECM electrical connector.

8. Remove the passenger side instrument panel lower trim panel.

9. Remove the ECM.
   - Remove the ECM retaining bracket.
   - Release the ECM retaining tangs.
   - Remove the ECM.

Installation

1. CAUTION: Make sure the electrical connector locate correctly in the engine control module. Do not force or overtighten the electrical connector. Failure to follow these instructions may cause damage to the electrical connector.

   To install, reverse the removal procedure.
2. Tighten to 6 Nm.
Removal

All vehicles

1. **WARNINGS:**

⚠️ Never remove the coolant expansion tank pressure cap under any circumstances while the engine is operating. Failure to follow this instruction may result in personal injury.

⚠️ To avoid hot coolant or steam blowing out of the cooling system, use extreme care when removing the coolant expansion tank pressure cap. Wait until the engine has cooled down, then insulate the coolant pressure cap with a suitable cloth and slowly loosen the coolant expansion tank pressure cap until the cooling system pressure is released. Do not remove the coolant expansion tank pressure cap. Step back while the pressure is released from the system. When all of the pressure has been released slowly remove the coolant expansion tank pressure cap (still with the suitable cloth in position) from the coolant expansion tank. Failure to follow this instruction may result in personal injury.

Release the cooling system pressure.

- Remove the coolant expansion tank pressure cap.

Vehicles with supercharger

2. Disconnect the engine coolant temperature (ECT) sensor electrical connector.

3. Remove the ECT.

- Remove and discard the ECT sealing washer.

Vehicles without supercharger

4. Remove the air cleaner outlet pipe.

For additional information, refer to: [Air Cleaner Outlet Pipe](303-12B Intake Air Distribution and Filtering - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Removal and Installation).
5. Remove the engine coolant temperature (ECT) sensor electrical connector.
   1. Disconnect the ECT sensor electrical connector.
   2. Remove the ECT sensor.
   • Remove and discard the ECT sealing washer.

**Installation**

**All vehicles**

1. To install, reverse the removal procedure.
   • Install a new ECT sealing washer.
   • Fill the cooling system up to the MAX mark on the coolant expansion tank.

**Vehicles with supercharger**

2. Tighten to 17 Nm.

**Vehicles without supercharger**

3. Tighten to 17 Nm.
Removal

1. Remove the fuel temperature sensor.
   1. Disconnect the electrical connector.
   2. Remove the fuel temperature sensor.

Installation

1. To install, reverse the removal procedure.
   1. Tighten to 7 Nm.
General Equipment
Snap-on tool S6176

Removal

1. Remove the air deflector. For additional information, refer to Section 501-02 Front End Body Panels.
2. Disconnect the heated oxygen (HO2S) sensor.

3. CAUTION: Make sure the wiring harness is not twisted or damaged on removal. Failure to follow this instruction may result in damage to the vehicle.

Using the Snap-on tool S6176, remove the HO2S.

Installation

1. CAUTION: Make sure the wiring harness is not twisted or damaged on installation. Failure to follow this instruction may result in damage to the vehicle.

To install, reverse the removal procedure.
- Tighten to 45 Nm.
Electronic Engine Controls - V8 4.2L Petrol/V8 S/C 4.2L Petrol - Intake Air Temperature (IAT) Sensor
Removal and Installation

Removal

1. Disconnect the intake air temperature (IAT) sensor electrical connector.

2. Remove the IAT sensor.
   - Remove and discard the IAT sensor sealing washer.

Installation

1. To install, reverse the removal procedure.
   - Install a new IAT sensor sealing washer.
   - Tighten to 35 Nm.
Removal

Vehicles with supercharger

1. Remove the supercharger. For additional information, refer to: (303-12B Intake Air Distribution and Filtering - V8 4.2L Petrol/V8 S/C 4.2L Petrol)

   Supercharger - VIN Range: M45255->N52047 (Removal and Installation),
   Supercharger - VIN Range: N52048->N99999 (Removal and Installation).

2. Remove the noise isolator.

Vehicles without supercharger

3. Remove the intake manifold. For additional information, refer to: (303-01B Engine - V8 4.2L Petrol/V8 S/C 4.2L Petrol)

   Intake Manifold - VIN Range: M45255->N52047 (In-vehicle Repair),
   Intake Manifold - VIN Range: N52048->N99999 (In-vehicle Repair).

All vehicles

4. Remove the knock sensor (KS).

Installation

1. To install, reverse the removal procedure.
   - Tighten to 25 Nm.
Removal

Vehicles without supercharger

1. Remove the intake manifold. For additional information, refer to:
   (303-01B Engine - V8 4.2L Petrol/V8 S/C 4.2L Petrol)
   Intake Manifold - VIN Range: M45255->N52047 (In-vehicle Repair),
   Intake Manifold - VIN Range: N52048->N99999 (In-vehicle Repair).

Vehicles with supercharger

2. Remove the exhaust gas recirculation (EGR) valve.
   For additional information, refer to: Exhaust Gas Recirculation (EGR)
   Valve (303-08A Engine Emission Control - V8 4.2L Petrol/V8 S/C 4.2L
   Petrol/2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation).

3. Disconnect the air intake elbow pipes.

4. NOTE: Make sure that the correct location of the ground strap is noted.
   Remove the air intake elbow retaining bracket lower retaining bolts.

5. Detach the air intake elbow.
   - Remove and discard the gasket.
   - Remove and discard the retaining bolt seals.
6. Remove the air intake elbow.
   • Disconnect the manifold absolute pressure (MAP) sensor electrical connector.

7. NOTE: Vehicles without supercharger shown, vehicles with supercharger similar.
   Remove the MAP sensor.
   • Remove and discard the MAP sensor O-ring seal.

**Installation**

All vehicles

1. NOTE: Vehicles without supercharger shown, vehicles with supercharger similar.
   Install the MAP sensor.
   • Install a new MAP sensor O-ring seal.
   • Tighten to 10 Nm.

Vehicles with supercharger

2. Connect the MAP sensor electrical connector.
3. Install the air intake elbow.
   - Install a new gasket.
   - Install new retaining bolt seals.
   - Tighten to 24 Nm.

4. NOTE: Make sure that the ground strap is correctly installed to the location noted.
   Install the air intake elbow retaining bracket lower retaining bolts.
   - Tighten to 20 Nm.

5. Connect the air intake elbow pipes.

6. Install the EGR valve.
   For additional information, refer to: Exhaust Gas Recirculation (EGR) Valve (303-08A Engine Emission Control - V8 4.2L Petrol/V8 S/C 4.2L Petrol/2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation).

Vehicles without supercharger

7. Install the intake manifold. For additional information, refer to: Intake Manifold - VIN Range: M45255->N52047 (In-vehicle Repair), Intake Manifold - VIN Range: N52048->N99999 (In-vehicle Repair).

8. NOTE: For NAS vehicles only.
   If required, carry out a short drive cycle.
   For additional information, refer to: Powertrain Control Module (PCM) Short Drive Cycle Self-Test (303-14A Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, General Procedures).
Electronic Engine Controls - V8 4.2L Petrol/V8 S/C 4.2L Petrol - Mass Air Flow (MAF) Sensor
Removal and Installation

Removal

1. Remove the mass airflow (MAF) sensor.
   1. Disconnect the MAF sensor electrical connector.
   2. Remove the mass airflow MAF sensor.
   ● Remove and discard the MAF sensor O-ring seal.

Installation

1. To install, reverse the removal procedure.
   ● Install a new MAF sensor O-ring seal.
   ● Tighten MAF sensor retaining screws to 2 Nm.

2. NOTE: For NAS vehicles only.

   If required, carry out a short drive cycle.
   For additional information, refer to: Powertrain Control Module (PCM) Short Drive Cycle Self-Test (303-14A Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, General Procedures).
Removal

1. Remove the air deflector.
   For additional information, refer to: Air Deflector (501-02 Front End Body Panels, Removal and Installation).

2. Disconnect the oil temperature sensor electrical connector.

3. Remove the oil temperature sensor.

Installation

1. NOTE: Apply a small bead of sealant meeting Jaguar specification on the first three threads of the oil temperature sensor.

   To install, reverse the removal procedure

   • Tighten to 15 Nm.
Electronic Engine Controls - V8 4.2L Petrol/V8 S/C 4.2L Petrol - Variable Camshaft Timing (VCT) Oil Control Solenoid

Removal

1. Remove the valve cover. For additional information, refer to: (303-01B Engine - V8 4.2L Petrol/V8 S/C 4.2L Petrol)

   **Valve Cover RH - VIN Range: M45255->N52047** (In-vehicle Repair),
   **Valve Cover RH - VIN Range: N52048->N99999** (In-vehicle Repair).

2. Remove the variable camshaft timing (VCT) oil control solenoid.

Installation

1. To install, reverse the removal procedure.
   - Tighten to 10 Nm.

2. NOTE: For NAS vehicles only.
   If required, carry out a short drive cycle.
   For additional information, refer to: Powertrain Control Module (PCM) Short Drive Cycle Self-Test (303-14A Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, General Procedures).

System Components

All engine functions are controlled by the Siemens common rail ECM.

ECM

The ECM is a high capacity processor which employs advanced software strategies that continuously control the engines operating parameters. It gathers information from a number of sensors and provides output to the actuators. The ECM also operates a port deactivation system, which closes or opens flaps in the inlet system to provide the optimum swirl and flow conditions throughout the operating range of the engine.

In addition, the ECM controls the actuation of the exhaust gas recirculation (EGR) system, the variable geometry turbochargers and the throttle, giving faster and more accurate response. A full torque-based strategy supports multiple injection control and integration with transmission and braking controllers. Transient torque and boost control enables vehicle performance to be optimised without compromising engine durability.

CKP Sensor

The CKP sensor signal is used to determine:

- the quantity of fuel to be injected
- the start of fuel delivery
- the quantity of exhaust gases to be recirculated

The CKP sensor is located at the rear of the crankshaft behind the flywheel.

The CKP sensor is a Hall effect sensor which scans a magnetic disc on the crankshaft. The air gap between the magnetic disc and the CKP is predetermined by the mounting of the sensor.

CMP Sensor

The CMP is located on the cylinder head behind the left-hand camshaft timing belt pulley.

The CMP sensor is Hall effect type and is required to identify cylinder number 1. (This is to synchronise engine to camshaft timing). The sensor scans a web incorporated into the left-hand camshaft timing belt pulley. The air gap between the magnetic ring and the CMP sensor is predetermined by the mounting of the sensor.

ECT Sensor

The ECT sensor is an NTC type sensor and is fitted into the top water outlet hose. The sensor has a bayonet type fitting.

KS

The KS registers increased vibrations which occur due to increased combustion noise. The ECM uses the signal as a correction factor for calculating the quantity and timing of the fuel to be injected during the injection phase.

There are two KS fitted to each bank of the cylinder block.

MAF Sensor

The MAF sensor is used to calculate the air mass. The MAF sensor is capable of detecting the mass air flow extremely precisely.
On engines with a variable turbocharger, the MAF sensor is used solely to control the EGR and not the fuel metering. The MAF sensor also incorporates the intake air temperature (IAT) sensor.

**MAP Sensor**
The MAP sensor is located in the top of the throttle valve.
The MAP sensor measures the charging pressure in the intake pipe and sends the ECM an analog voltage signal.

**Charge Air Temperature Sensor**
The charge air temperature sensor measures the intake air or the charge air temperature and supplies the ECM with an analog signal.
The charge air temperature sensor is located in the air intake plenum chamber.

**Intake Air Temperature (IAT) Sensor**
The IAT sensor measures the intake air temperature and supplies the ECM with an analog signal.
There are two IAT sensors incorporated into the MAF sensor, the LH bank IAT sensor is not monitored by the ECM.

**Fuel Rail Pressure (FRP) Sensor**
The FRP sensor measures the instantaneous fuel pressure in the fuel rail very precisely within a very short time and supplies a voltage signal according to the pressure. The FRP is located on the the fuel diverter rail and must not be removed from the diverter rail.
For additional information, refer to: [Fuel Charging and Controls](303-04C Fuel Charging and Controls - 2.7L V6 - TdV6, Description and Operation).

**Fuel Temperature Sensor**
The fuel temperature sensor measures the temperature of the fuel in the low-pressure system. Air and excessive heat in the fuel system can have an adverse effect on the operation of the sensor.
The fuel temperature sensor is located in the low-pressure side return line behind the throttle body housing.

**EOP Sensor**
The engine oil pressure (EOP) sensor is located in the left-hand cylinder head. The EOP is connected to the instrument cluster and is not directly part of the electronic engine control system.
Electronic Engine Controls - 2.7L V6 - TdV6 - Electronic Engine Controls

Diagnosis and Testing

Principle of operation

Common rail diesel

The 2.7L fuel injection system is a common-rail design, running at the high pressures (up to 1,650 bar or 23,931 lb/in²) typical of such systems.

The fuel is drawn from the fuel tank by an electric lift pump and delivered to the transfer pump side of a high pressure fuel pump (HPFP) driven by the engine. For additional information on the HPFP, REFER to: Fuel Charging and Controls (303-04C Fuel Charging and Controls - 2.7L V6 - TdV6, Description and Operation).

The fuel volume control valve (FVCV) regulates the amount of fuel supplied to the high pressure side of the HPFP, while the fuel pressure control valve (FPCV) regulates the pressure. Both valves are controlled by the engine control module (ECM) using inputs from the engine management sensors covered in this section.

The high pressure fuel is delivered to the fuel rail where it is stored, ready for use by the injectors.

The fuel injectors are Piezo type, and are controlled by the ECM using inputs from the engine management sensors covered in this section.

The injectors operate in stages, giving a pilot injection before the main injection to reduce detonation noise and help improve the efficiency of the engine. For additional information on the fuel injectors, REFER to: Fuel Charging and Controls (303-04C Fuel Charging and Controls - 2.7L V6 - TdV6, Description and Operation).

For additional information on the description and operation of the system, REFER to: Electronic Engine Controls (303-14C Electronic Engine Controls - 2.7L V6 - TdV6, Description and Operation).

Inspection and verification

• WARNINGS:

⚠️ Do NOT carry out any work on the fuel system with the engine running. The fuel pressure within the system can be as high as 1,650 bar (23,931 lb/in²). Failure to follow this instruction may result in personal injury.

⚠️ Before performing any work on the fuel system, allow a minimum of 30 seconds to elapse after stopping the engine to allow the fuel system pressure to drop. Failure to follow this instruction may result in personal injury.

⚠️ Eye protection must be worn at all times when working on or near any fuel related components. Failure to follow this instruction may result in personal injury.

⚠️ This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow this instruction may result in personal injury.

⚠️ After carrying out repairs, the fuel system must be checked visually for leaks. This should be done after the engine has been run, but with the engine switched OFF. Failure to follow this instruction may result in personal injury.

⚠️ If fuel is taken internally, DO NOT induce vomiting. Seek immediate medical attention. Failure to follow this instruction may result in personal injury.

⚠️ If fuel contacts the eyes, flush the eyes with cold water or eyewash solution and seek medical attention. Failure to follow this instruction may result in personal injury.

⚠️ Wash hands thoroughly after handling, as prolonged contact may cause irritation. Should irritation develop, seek medical attention. Failure to follow this instruction may result in personal injury.

• CAUTIONS:

⚠️ Before disconnecting any part of the system, it is imperative that all dust, dirt and debris is removed from around components to prevent ingress of foreign matter into the fuel system. Failure to follow this instruction may result in damage to the vehicle.

⚠️ The fuel pipes between the injectors and the rail must be discarded after each use, and new pipes installed. Failure to follow this instruction may result in damage to the vehicle.

⚠️ It is essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in damage to the vehicle.

⚠️ Make sure that the workshop area in which the vehicle is being worked on is as clean and dust-free as possible. Areas in which work on clutches, brakes or where welding or machining are carried out are not suitable in view of the risk of contamination to the fuel system. Failure to follow this instruction may result in damage to the vehicle.

⚠️ Make sure that any protective clothing worn is clean and made from lint-free non-flocking material. Failure to follow this instruction may result in damage to the vehicle.

⚠️ Make sure that any protective gloves worn are new and are of the non-powdered latex type. Failure to follow this instruction may result in damage to the vehicle.

<td>3. Increase the engine speed to 2,000 rpm and monitor the ECT reading until the engine is at full operating temperature.</td>
<td></td>
</tr>
<tr>
<td>Did the ECT reading rise smoothly to a value of between 80 and 95 degrees C (176 and 203 degrees F)?</td>
<td></td>
</tr>
<tr>
<td><strong>Yes</strong></td>
<td><strong>GO to A4.</strong></td>
</tr>
<tr>
<td><strong>No</strong></td>
<td><strong>GO to A4.</strong></td>
</tr>
</tbody>
</table>

**A3: CHECK FOR AN INTERMITTENT FAULT CONDITIONS**
Were there any sudden or unexpected changes in the PID readings?
Yes
KEY OFF. GO to A4.

No
GO to A5.

A4: CHECK THE ECT PID VALUE

1 Key on, engine off.
2 Access the OBDII-engine coolant temperature PID using a scan tool.
3 Check the ECT harness wiring and connectors for loose connections and water ingress. Monitoring the temperature readings for sudden changes while handling the harness and connectors, may help in isolation of these types of fault.

Did you identify any loose connections or water ingress in the ECT harness wiring and connectors?
Yes
REPAIR the fault as necessary.

No
GO to A5.

A5: CHECK THE ECT SENSOR RETURN LINE CONTINUITY

1 Key off.
2 ECT sensor connector disconnected.
3 Key on, engine off.
4 Measure the resistance between:

| Engine coolant temperature sensor - return - Pin 02 | Negative post |

Is the resistance less than 10 ohms?
Yes
GO to A8.

No
GO to A6.

A6: CHECK THE ECT SENSOR RETURN LINE FOR SHORT CIRCUIT TO POWER

1 Measure the resistance between:

| Engine coolant temperature sensor - return - Pin 02 | Positive post |

Is the resistance greater than 100 Kohms?
Yes
GO to A7.

No
GO to A14.

A7: CHECK THE ECT SENSOR RETURN LINE FOR OPEN CIRCUIT

1 Key off.
2 ECM connector disconnected.
3 Measure the resistance between:

| Engine coolant temperature sensor - return - Pin 02 | Engine coolant temperature sensor - return - Pin C-E2 |

Is the resistance less than 10 ohms?
Yes
Suspect: ECM connector - ECM
REPAIR the open circuit. For additional information, refer to the wiring diagrams.

No
GO to A11.

A8: CHECK THE ECT SIGNAL LINE FOR SHORT CIRCUIT TO GROUND

1 Measure the resistance between:

| Engine coolant temperature sensor - signal - Pin 01 | Negative post |

Is the resistance greater than 100 Kohms?
Yes
GO to A9.

No
GO to A12.

A9: CHECK THE ECT SIGNAL LINE FOR SHORT CIRCUIT TO POWER

1 Measure the resistance between:

| Engine coolant temperature sensor - signal - Pin 01 | Positive post |

Is the resistance greater than 100 Kohms?
Yes
GO to A10.

No
GO to A15.

A10: CHECK THE ECT SIGNAL LINE FOR OPEN CIRCUIT

1 Key off.
2 ECM connector disconnected.
3 Measure the resistance between:

| Engine coolant temperature sensor - signal - Pin 01 | Engine coolant temperature sensor - signal - Pin C-C2 |

Is the resistance less than 10 ohms?
Yes
GO to A11.

No
REPAIR the open circuit. For additional information, refer to the wiring diagrams.

A11: CHECK THE COMPONENT RESISTANCE

1 Measure the resistance between:

| Engine coolant temperature sensor - signal - Pin 01 | Engine coolant temperature sensor - return - Pin 02 |

Is the resistance between 1 Kohms - 500 Kohms?
Yes
An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s): ECM connector - ECM
INSTALL a new ECT sensor.

No

A12: CHECK THE ECT CIRCUIT(S) FOR SIGNAL AND RETURN LINES SHORTED TOGETHER

1 Key off.
2 ECM connector disconnected.
3 Key on, engine off.
Measure the resistance between:
Engine coolant temperature sensor - signal - Pin 01
Engine coolant temperature sensor - return - Pin 02

Is the resistance greater than 100 Kohms?
Yes
   GO to A13.
No
   REPAIR the short circuit. For additional information, refer to the wiring diagrams.

**A13: CHECK WHETHER THE SHORT CIRCUIT TO GROUND IS IN THE ECT HARNESS OR ECU**

Measure the resistance between:
Engine coolant temperature sensor - signal - Pin 01

Is the resistance greater than 100 Kohms?
Yes
   Suspect:- ECM
   REPAIR the short circuit. For additional information, refer to the wiring diagrams.
No

**A14: CHECK WHETHER THE SHORT CIRCUIT TO POWER IS IN THE ECT HARNESS OR ECU**

Key off.
2   ECM connector disconnected.
3   Key on, engine off.
4   Measure the resistance between:
Engine coolant temperature sensor - return - Pin 02

Is the resistance greater than 100 Kohms?
Yes
   Suspect:- ECM
   REPAIR the short circuit. For additional information, refer to the wiring diagrams.
No

**A15: CHECK WHETHER THE SHORT CIRCUIT TO POWER IS IN THE ECT HARNESS OR ECU**

Key off.
2   ECM connector disconnected.
3   Key on, engine off.
4   Measure the resistance between:
Engine coolant temperature sensor - signal - Pin 01

Is the resistance greater than 100 Kohms?
Yes
   Suspect:- ECM
   REPAIR the short circuit. For additional information, refer to the wiring diagrams.
No

**Inspection and Verification**

**Note**

This pinpoint test is intended to diagnose the following:
- Short circuit to GROUND in the fuel rail temperature (FRT) sensor circuit
- Short circuit to POWER in the fuel rail temperature (FRT) sensor circuit
- Open circuit in the fuel rail temperature (FRT) sensor circuit
- Fuel rail temperature (FRT) sensor
- ECM

Fuel rail temperature (FRT) Sensor Connector

| 1 | Key off. |
| 2 | FRT Sensor connector disconnected. |
| 3 | Key on, engine off. |
| 4 | Measure the resistance between: |
| Fuel rail temperature sensor - return - Pin 02 | Negative post |
| Is the resistance less than 10 ohms? |
| Yes | GO to B8. |
| No | GO to B6. |

| B6: CHECK THE FRT SENSOR RETURN LINE FOR SHORT CIRCUIT TO POWER |
| 1 | Measure the resistance between: |
| Fuel rail temperature sensor - return - Pin 02 | Positive post |
Is the resistance greater than 100 Kohms?
Yes
   GO to B7.
No
   GO to B15.

B7: CHECK THE FRT SENSOR RETURN LINE FOR OPEN CIRCUIT

1. Key off.
2. ECM connector disconnected.
3. Measure the resistance between:
   Fuel rail temperature sensor - return - Pin 02
   Fuel rail temperature sensor - return - Pin C-G3

Is the resistance less than 10 ohms?
Yes
   Suspect: - ECM connector- ECM
No
   REPAIR the open circuit. For additional information, refer to the wiring diagrams.

B8: CHECK FOR THE EXPECTED VOLTAGE DIFFERENTIAL BETWEEN SIGNAL AND RETURN LINES

1. Measure the voltage between:
   Fuel rail temperature sensor - signal - Pin 01
   Fuel rail temperature sensor - return - Pin 02

Is the voltage between 4.8 volts - 5.2 volts?
Yes
   GO to B12.
No
   GO to B9.

B9: CHECK THE FRT SIGNAL LINE FOR SHORT CIRCUIT TO GROUND

1. Measure the resistance between:
   Fuel rail temperature sensor - signal - Pin 01
   Negative post

Is the resistance greater than 100 Kohms?
Yes
   GO to B10.
No
   GO to B13.

B10: CHECK THE FRT SIGNAL LINE FOR SHORT CIRCUIT TO POWER

1. Measure the resistance between:
   Fuel rail temperature sensor - signal - Pin 01
   Positive post

Is the resistance greater than 100 Kohms?
Yes
   GO to B11.
No
   GO to B16.

B11: CHECK THE FRT SIGNAL LINE FOR OPEN CIRCUIT

1. Key off.
2. ECM connector disconnected.
3. Measure the resistance between:
   Fuel rail temperature sensor - signal - Pin 01
   Fuel rail temperature sensor - signal - Pin C-B2

Is the resistance less than 10 ohms?
Yes
   Suspect: - ECM connector- ECM
No
   REPAIR the open circuit. For additional information, refer to the wiring diagrams.

B12: CHECK THE COMPONENT RESISTANCE

1. Measure the resistance between:
   Fuel rail temperature sensor - signal - Pin 01
   Fuel rail temperature sensor - return - Pin 02

Is the resistance between 1 Kohms - 500 Kohms?
Yes
   An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage
to the harness. If no fault is found in the circuit, suspect the following component(s):- FRT connector- FRT sensor- ECM connector- ECM
No
   INSTALL a new FRT sensor.
   REFER TO: Fuel Temperature Sensor (303-14C Electronic Engine Controls - 2.7L V6 - TdV6, Removal and Installation).

B13: CHECK THE FRT CIRCUIT(S) FOR SIGNAL AND RETURN LINES SHORTED TOGETHER

1. Key off.
2. ECM connector disconnected.
3. Key on, engine off.
4. Measure the resistance between:
   Fuel rail temperature sensor - signal - Pin 01
   Fuel rail temperature sensor - return - Pin 02

Is the resistance greater than 100 Kohms?
Yes
   GO to B14.
No
   REPAIR the short circuit. For additional information, refer to the wiring diagrams.

B14: CHECK WHETHER THE SHORT CIRCUIT TO GROUND IS IN THE FRT HARNESS OR ECU

1. Measure the resistance between:
   Fuel rail temperature sensor - signal - Pin 01
   Negative post

Is the resistance greater than 100 Kohms?
Yes
   Suspect: - ECM
No
   REPAIR the short circuit. For additional information, refer to the wiring diagrams.

B15: CHECK WHETHER THE SHORT CIRCUIT TO POWER IS IN THE FRT HARNESS OR ECU

1. Key off.
2. ECM connector disconnected.
3. Key on, engine off.
4. Measure the resistance between:
   Fuel rail temperature sensor - return - Pin 02
   Positive post
Is the resistance greater than 100 Kohms?
Yes
Suspect: ECM
No
REPAIR the short circuit. For additional information, refer to the wiring diagrams.

B16: CHECK WHETHER THE SHORT CIRCUIT TO POWER IS IN THE FRT HARNESS OR ECU

1. Key off.
2. ECM connector disconnected.
3. Key on, engine off.
4. Measure the resistance between:
   Fuel rail temperature sensor - signal - Pin 01 Positive post

Is the resistance greater than 100 Kohms?
Yes
Suspect: ECM
No
REPAIR the short circuit. For additional information, refer to the wiring diagrams.

Inspection and Verification

This pinpoint test is intended to diagnose the following:
- Short circuit to GROUND in the engine oil temperature, level, and quality sensor (EOTLQ) circuit
- Short circuit to POWER in the engine oil temperature, level, and quality sensor (EOTLQ) circuit
- Open circuit in the engine oil temperature, level, and quality sensor (EOTLQ) circuit
- Engine oil temperature, level, and quality sensor (EOTLQ)
- ECM

Engine oil temperature, level, and quality sensor. (EOTLQ) Connector

Pinpoint Tests

PINPOINT TEST C : ENGINE OIL TEMPERATURE (EOT) SENSOR

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>C1: CHECK THE EOTLQ PID VALUE</td>
<td></td>
</tr>
<tr>
<td>1. Please ensure the engine is cold.</td>
<td></td>
</tr>
<tr>
<td>2. Key on, engine off.</td>
<td></td>
</tr>
<tr>
<td>3. Access the ECM-Engine oil temperature PID using a scan tool.</td>
<td></td>
</tr>
<tr>
<td>Is the EOTLQ reading as expected for the current environmental and engine conditions?</td>
<td></td>
</tr>
<tr>
<td>Yes</td>
<td>GO to C2.</td>
</tr>
<tr>
<td>No</td>
<td>GO to C5.</td>
</tr>
</tbody>
</table>

C2: CHECK THE EOTLQ PID VALUE

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Key on, engine run.</td>
<td></td>
</tr>
<tr>
<td>2. Access the ECM-Engine oil temperature and OBDII-Engine coolant temperature PIDs using a scan tool.</td>
<td></td>
</tr>
</tbody>
</table>
Increase the engine speed to 2000RPM and monitor the EOT reading, until the engine is at full operating temperature.

Did the EOTLQ reading rise smoothly and by more than 20 degrees C (68 degrees F)?

Yes
   No fault found.

GO to C3.

C3: CHECK THE EOTLQ PID VALUE

1 Key off.

Were there any sudden or unexpected changes in the EOT readings?

Yes
   No
   GO to C4.

No
   GO to C5.

C4: CHECK THE EOTLQ PID VALUE

1 Key on, engine off.
2 Access the ECM-Engine oil temperature PID using a scan tool.
3 Check the EOTLQ harness wiring and connectors for loose connections and water ingress. Monitoring the temperature readings for sudden changes, while handling the harness and connectors, may help in isolation of these types of fault.

Did you identify any loose connections or water ingress in EOTLQ harness wiring and connectors?

Yes
   REPAIR the fault as necessary.

No
   GO to C5.

C5: CHECK THE EOTLQ SENSOR RETURN LINE

1 Key off.
2 EOTLQ connector disconnected.
3 Key on, engine off.
4 Measure the resistance between:
   Engine oil temperature, level, and quality sensor - return - Pin 02 Negative post

Is the resistance less than 10 ohms?

Yes
   GO to C6.

No
   GO to C18.

C6: CHECK THE EOTLQ VOLTAGE

1 Measure the voltage between:
   Engine oil temperature, level, and quality sensor - power - Pin 03 Negative post

Is the voltage between 4.8 volts - 5.2 volts?

Yes
   GO to C7.

No
   GO to C15.

C7: CHECK THE EOTLQ SIGNAL LINE FOR SHORT CIRCUIT TO GROUND

1 Measure the resistance between:
   Engine oil temperature, level, and quality sensor - signal - Pin 01 Negative post

Is the resistance greater than 100 Kohms?

Yes
   GO to C8.

No
   GO to C11.

C8: CHECK THE EOTLQ SIGNAL LINE FOR SHORT CIRCUIT TO POWER

1 Measure the resistance between:
   Engine oil temperature, level, and quality sensor - signal - Pin 01 Positive post

Is the resistance greater than 100 Kohms?

Yes
   GO to C9.

No
   GO to C13.

C9: CHECK THE EOTLQ SIGNAL LINE FOR SHORT CIRCUIT TO SENSOR POWER

1 Measure the resistance between:
   Engine oil temperature, level, and quality sensor - signal - Pin 01
   Engine oil temperature, level, and quality sensor - power - Pin 03

Is the resistance greater than 100 Kohms?

Yes
   GO to C10.

No
   GO to C14.

C10: CHECK THE EOTLQ SIGNAL LINE FOR OPEN CIRCUIT

1 Key off.
2 ECM connector disconnected.
3 Measure the resistance between:
   Engine oil temperature, level, and quality sensor - signal - Pin 01
   Engine oil temperature, level, and quality sensor - signal - Pin C-E1

Is the resistance less than 10 ohms?

Yes
   An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s): - EOTLQ connector - ECM connector - EOTLQ sensor - ECM
   REPAIR the open circuit. For additional information, refer to the wiring diagrams.

No
   GO to C11.

C11: CHECK THE EOTLQ CIRCUIT(S) FOR SIGNAL AND RETURN LINES SHORTED TOGETHER

1 Key off.
2 ECM connector disconnected.
3 Key on, engine off.
Measure the resistance between:
Engine oil temperature, level, and quality sensor - signal - Pin 01
Engine oil temperature, level, and quality sensor - return - Pin 02

Is the resistance greater than 100 Kohms?
Yes  **GO to C12.**
No  REPAIR the short circuit. For additional information, refer to the wiring diagrams.

**C12: CHECK WHETHER THE SHORT CIRCUIT TO GROUND IS IN THE EOTLQ HARNESS OR ECU**

1. Measure the resistance between:
   Engine oil temperature, level, and quality sensor - signal - Pin 01
   Engine oil temperature, level, and quality sensor - return - Pin 02

2. Is the resistance greater than 100 Kohms?
   Yes  Suspect: - ECM
   No  REPAIR the short circuit. For additional information, refer to the wiring diagrams.

**C13: CHECK WHETHER THE SHORT CIRCUIT TO POWER IS IN THE EOTLQ HARNESS OR ECU**

1. Key off.
2. ECM connector disconnected.
3. Key on, engine off.
4. Measure the resistance between:
   Engine oil temperature, level, and quality sensor - signal - Pin 01
   Engine oil temperature, level, and quality sensor - power - Pin 03

2. Is the resistance greater than 100 Kohms?
   Yes  Suspect: - ECM
   No  REPAIR the short circuit. For additional information, refer to the wiring diagrams.

**C14: CHECK WHETHER THE SHORT CIRCUIT IS IN THE EOTLQ HARNESS OR CONTROL UNIT**

1. Key off.
2. ECM connector disconnected.
3. Key on, engine off.
4. Measure the resistance between:
   Engine oil temperature, level, and quality sensor - signal - Pin 01
   Engine oil temperature, level, and quality sensor - power - Pin 03

2. Is the resistance greater than 100 Kohms?
   Yes  Suspect: - ECM
   No  REPAIR the short circuit. For additional information, refer to the wiring diagrams.

**C15: CHECK THE 5 VOLT SUPPLY LINE FOR SHORT CIRCUIT TO GROUND**

1. Measure the resistance between:
   Engine oil temperature, level, and quality sensor - power - Pin 03
   Engine oil temperature, level, and quality sensor - signal - Pin 01

2. Is the resistance greater than 100 Kohms?
   Yes  **GO to C16.**
   No  **GO to C21.**

**C16: CHECK THE 5 VOLT SUPPLY LINE FOR SHORT CIRCUIT TO POWER**

1. Measure the resistance between:
   Engine oil temperature, level, and quality sensor - power - Pin 03
   Engine oil temperature, level, and quality sensor - return - Pin 02

2. Is the resistance greater than 100 Kohms?
   Yes  **GO to C17.**
   No  **GO to C23.**

**C17: CHECK THE EOTLQ 5 VOLT SUPPLY LINE FOR OPEN CIRCUIT**

1. Key off.
2. ECM connector disconnected.
3. Measure the resistance between:
   Engine oil temperature, level, and quality sensor - power - Pin 03
   Engine oil temperature, level, and quality sensor - signal - Pin 01

2. Is the resistance less than 10 ohms?
   Yes  Suspect: - ECM
   No  REPAIR the open circuit. For additional information, refer to the wiring diagrams.

**C18: CHECK THE EOTLQ SENSOR RETURN LINE FOR SHORT CIRCUIT TO POWER**

1. Measure the resistance between:
   Engine oil temperature, level, and quality sensor - return - Pin 02
   Engine oil temperature, level, and quality sensor - power - Pin 03

2. Is the resistance greater than 100 Kohms?
   Yes  **GO to C19.**
   No  **GO to C24.**

**C19: CHECK WHETHER THE 5 VOLT SUPPLY AND SIGNAL RETURN LINES ARE SHORTED TOGETHER**

1. Key off.
2. ECM connector disconnected.
3. Key on, engine off.
4. Measure the resistance between:
   Engine oil temperature, level, and quality sensor - power - Pin 03
   Engine oil temperature, level, and quality sensor - return - Pin 02
Is the resistance greater than 100 Kohms?
Yes  GO to C20.
No  REPAIR the short circuit. For additional information, refer to the wiring diagrams.

C20: CHECK THE EOTLQ SENSOR RETURN LINE FOR OPEN CIRCUIT
1 Measure the resistance between:
Engine oil temperature, level, and quality sensor - return - Pin 02
Engine oil temperature, level, and quality sensor - return - Pin C-D2

Is the resistance less than 10 ohm?
Yes  Suspect :- ECM connector.- ECM
No  REPAIR the open circuit. For additional information, refer to the wiring diagrams.

C21: CHECK WHETHER THE 5 VOLT SUPPLY AND SIGNAL RETURN LINES ARE SHORTED TOGETHER
1 Key off.
2 ECM connector disconnected.
3 Key on, engine off.
4 Measure the resistance between:
Engine oil temperature, level, and quality sensor - power - Pin 03
Engine oil temperature, level, and quality sensor - return - Pin 02

Is the resistance greater than 100 Kohms?
Yes  GO to C22.
No  REPAIR the short circuit. For additional information, refer to the wiring diagrams.

C22: CHECK WHETHER THE SHORT CIRCUIT TO GROUND IS IN THE EOTLQ HARNESS OR ECU
1 Measure the resistance between:
Engine oil temperature, level, and quality sensor - power - Pin 03
Negative post

Is the resistance greater than 100 Kohms?
Yes  Suspect:- ECM
No  REPAIR the short circuit. For additional information, refer to the wiring diagrams.

C23: CHECK WHETHER THE SHORT CIRCUIT TO POWER IS IN THE EOTLQ HARNESS OR ECU
1 Key off.
2 ECM connector disconnected.
3 Key on, engine off.
4 Measure the resistance between:
Engine oil temperature, level, and quality sensor - return - Pin 02 Positive post

Is the resistance greater than 100 Kohms?
Yes  Suspect:- ECM
No  REPAIR the short circuit. For additional information, refer to the wiring diagrams.

C24: CHECK WHETHER THE SHORT CIRCUIT TO POWER IS IN THE EOTLQ HARNESS OR ECU
1 Key off.
2 ECM connector disconnected.
3 Key on, engine off.
4 Measure the resistance between:
Engine oil temperature, level, and quality sensor - return - Pin 02 Positive post

Is the resistance greater than 100 Kohms?
Yes  Suspect:- ECM
No  REPAIR the short circuit. For additional information, refer to the wiring diagrams.

Inspection and Verification

This pinpoint test is intended to diagnose the following:
- Short circuit to GROUND in the accelerator pedal position (APP) sensor 1 circuit
- Short circuit to POWER in the accelerator pedal position (APP) sensor 1 circuit
- Open circuit in the accelerator pedal position (APP) sensor 1 circuit
- Accelerator pedal position sensor 1
- ECM

Accelerator pedal position (APP) sensor connector
**Pinpoint Tests**

**PINPOINT TEST D : ACCELERATOR PEDAL POSITION (APP) SENSOR 1**

</tbody>
</table>
Is the resistance greater than 100 Kohms?

Yes
GO to D8.

No
GO to D12.

D8: CHECK THE APP1 SIGNAL LINE FOR OPEN CIRCUIT

1 Key off.
2 ECM connector disconnected.
3 Measure the resistance between:
   Accelerator pedal position sensor 1 - signal - Pin 04
   Accelerator pedal position sensor 1 - signal - Pin A-D1

Is the resistance less than 10 ohms?

Yes
   An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s):
   APP connector
   APP sensor
   ECM connector
   ECM

No
REPAIR the open circuit. For additional information, refer to the wiring diagrams.

D9: CHECK THE APP1 CIRCUIT(S) FOR SIGNAL AND RETURN LINES SHORTED TOGETHER

1 Key off.
2 ECM connector disconnected.
3 Key on, engine off.
4 Measure the resistance between:
   Accelerator pedal position sensor 1 - signal - Pin 04
   Accelerator pedal position sensor 1 - return - Pin 03

Is the resistance greater than 100 Kohms?

Yes
GO to D10.

No
REPAIR the short circuit. For additional information, refer to the wiring diagrams.

D10: CHECK WHETHER THE SHORT CIRCUIT TO GROUND IS IN THE APP1 HARNESS OR ECU

1 Measure the resistance between:
   Accelerator pedal position sensor 1 - signal - Pin 04
   Negative post

Is the resistance greater than 100 Kohms?

Yes
Suspect: ECM

No
REPAIR the short circuit. For additional information, refer to the wiring diagrams.

D11: CHECK WHETHER THE SHORT CIRCUIT TO POWER IS IN THE APP1 HARNESS OR ECU

1 Key off.
2 ECM connector disconnected.
3 Key on, engine off.
4 Measure the resistance between:
   Accelerator pedal position sensor 1 - signal - Pin 04
   Positive post

Is the resistance greater than 100 Kohms?

Yes
Suspect: ECM

No
REPAIR the short circuit. For additional information, refer to the wiring diagrams.

D12: CHECK WHETHER SHORT CIRCUIT IS IN APP1 HARNESS OR CONTROL UNIT

1 Key off.
2 ECM connector disconnected.
3 Key on, engine off.
4 Measure the resistance between:
   Accelerator pedal position sensor 1 - signal - Pin 04
   Accelerator pedal position sensor 1 - power - Pin 05
   Accelerator pedal position sensor 1 - signal - Pin 04
   Accelerator pedal position sensor 1 - return - Pin 03

Are the resistances greater than 100 Kohms?

Yes
Suspect: ECM

No
REPAIR the short circuit. For additional information, refer to the wiring diagrams.

D13: CHECK THE 5 VOLT SUPPLY LINE FOR SHORT CIRCUIT TO GROUND

1 Measure the resistance between:
   Accelerator pedal position sensor 1 - power - Pin 05
   Negative post

Is the resistance greater than 100 Kohms?

Yes
GO to D14.

No
GO to D18.

D14: CHECK THE 5 VOLT SUPPLY LINE FOR SHORT CIRCUIT TO POWER

1 Measure the resistance between:
   Accelerator pedal position sensor 1 - power - Pin 05
   Positive post

Is the resistance greater than 100 Kohms?

Yes
GO to D15.

No
GO to D20.

D15: CHECK THE APP1 5 VOLT SUPPLY LINE FOR OPEN CIRCUIT

1 Key off.
2 ECM connector disconnected.
3 Measure the resistance between:
   Accelerator pedal position sensor 1 - power - Pin 05
   Accelerator pedal position sensor 1 - power - Pin A-E1

Is the resistance less than 10 ohms?

Yes
Suspect: ECM

No
D16: CHECK WHETHER THE 5 VOLT SUPPLY AND SIGNAL RETURN LINES ARE SHORTED TOGETHER

1. Key off.
2. ECM connector disconnected.
3. Key on, engine off.
4. Measure the resistance between:
   - Accelerator pedal position sensor 1 - power - Pin 05
   - Accelerator pedal position sensor 1 - return - Pin 03

   Is the resistance greater than 100 Kohms?
   - Yes
     - GO to D17.
   - No
     - REPAIR the short circuit. For additional information, refer to the wiring diagrams.

D17: CHECK THE APP1 SENSOR RETURN LINE FOR OPEN CIRCUIT

1. Measure the resistance between:
   - Accelerator pedal position sensor 1 - return - Pin 03
   - Accelerator pedal position sensor 1 - return - Pin A-C1

   Is the resistance less than 10 ohms?
   - Yes
     - Suspect: ECM
   - No
     - REPAIR the open circuit. For additional information, refer to the wiring diagrams.

D18: CHECK WHETHER THE 5 VOLT SUPPLY AND SIGNAL RETURN LINES ARE SHORTED TOGETHER

1. Key off.
2. ECM connector disconnected.
3. Key on, engine off.
4. Measure the resistance between:
   - Accelerator pedal position sensor 1 - power - Pin 05
   - Accelerator pedal position sensor 1 - return - Pin 03

   Is the resistance greater than 100 Kohms?
   - Yes
     - GO to D19.
   - No
     - REPAIR the short circuit. For additional information, refer to the wiring diagrams.

D19: CHECK WHETHER THE SHORT CIRCUIT TO GROUND IS IN THE APP1 HARNESS OR ECU

1. Measure the resistance between:
   - Accelerator pedal position sensor 1 - power - Pin 05
   - Negative post

   Is the resistance greater than 100 Kohms?
   - Yes
     - Suspect: ECM
   - No
     - REPAIR the short circuit. For additional information, refer to the wiring diagrams.

D20: CHECK WHETHER THE SHORT CIRCUIT TO POWER IS IN THE APP1 HARNESS OR ECU

1. Key off.
2. ECM connector disconnected.
3. Key on, engine off.
4. Measure the resistance between:
   - Accelerator pedal position sensor 1 - power - Pin 05
   - Positive post

   Is the resistance greater than 100 Kohms?
   - Yes
     - Suspect: ECM
   - No
     - REPAIR the short circuit. For additional information, refer to the wiring diagrams.

D21: CHECK THE APP1 SENSOR RETURN LINE FOR SHORT CIRCUIT TO POWER

1. Measure the resistance between:
   - Accelerator pedal position sensor 1 - return - Pin 03
   - Positive post

   Is the resistance greater than 100 Kohms?
   - Yes
     - GO to D16.
   - No
     - GO to D22.

D22: CHECK WHETHER THE SHORT CIRCUIT TO POWER IS IN THE APP1 HARNESS OR ECU

1. Key off.
2. ECM connector disconnected.
3. Key on, engine off.
4. Measure the resistance between:
   - Accelerator pedal position sensor 1 - return - Pin 03
   - Positive post

   Is the resistance greater than 100 Kohms?
   - Yes
     - Suspect: ECM
   - No
     - REPAIR the short circuit. For additional information, refer to the wiring diagrams.

Inspection and Verification

This pinpoint test is intended to diagnose the following:

- Short circuit to GROUND in the accelerometer pedal position (APP) sensor 2 circuit
- Short circuit to POWER in the accelerometer pedal position (APP) sensor 2 circuit
- Open circuit in the accelerometer pedal position (APP) sensor 2 circuit
- Accelerator pedal position sensor 2
- ECM

Is the resistance greater than 100 Kohms?

Yes
GO to E6.

No
GO to E9.

E6: CHECK THE APP2 SIGNAL LINE FOR SHORT CIRCUIT TO POWER

1 Measure the resistance between:
Accelerator pedal position sensor 2 - signal - Pin 01
Is the resistance greater than 100 Kohms?

Yes
GO to E7.

No
GO to E11.

E7: CHECK FOR SHORT CIRCUIT BETWEEN THE APP2 SIGNAL AND THE POWER LINE

1 Measure the resistance between:
Accelerator pedal position sensor 2 - signal - Pin 01 Accelerator pedal position sensor 2 - power - Pin 02
Is the resistance greater than 100 Kohms?

Yes
GO to E8.

No
GO to E12.

E8: CHECK THE APP2 SIGNAL LINE FOR OPEN CIRCUIT

1 Key off.
2 ECM connector disconnected.
3 Measure the resistance between:
Accelerator pedal position sensor 2 - signal - Pin 01 Accelerator pedal position sensor 2 - signal - Pin A-C2
Is the resistance less than 10 ohms?

Yes
An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s): - APP connector - APP sensor - ECM connector - ECM

No
REPAIR the open circuit. For additional information, refer to the wiring diagrams.

E9: CHECK THE APP2 CIRCUIT(S) FOR SIGNAL AND RETURN LINES SHORTED TOGETHER

1 Key off.
2 ECM connector disconnected.
3 Key on, engine off.
4 Measure the resistance between:
Accelerator pedal position sensor 2 - signal - Pin 01 Accelerator pedal position sensor 2 - return - Pin 06
Is the resistance greater than 100 Kohms?

Yes
GO to E10.

No
REPAIR the short circuit. For additional information, refer to the wiring diagrams.

E10: CHECK WHETHER THE SHORT CIRCUIT TO GROUND IS IN THE APP2 HARNESS OR ECU

1 Measure the resistance between:
Accelerator pedal position sensor 2 - signal - Pin 01 Accelerator pedal position sensor 2 - signal - Pin A-C2
Is the resistance greater than 100 Kohms?

Yes
Suspect: - ECM

No
REPAIR the short circuit. For additional information, refer to the wiring diagrams.

E11: CHECK WHETHER THE SHORT CIRCUIT TO POWER IS IN THE APP2 HARNESS OR ECU

1 Key off.
2 ECM connector disconnected.
3 Key on, engine off.
4 Measure the resistance between:
Accelerator pedal position sensor 2 - signal - Pin 01 Accelerator pedal position sensor 2 - power - Pin 02
Is the resistance greater than 100 Kohms?

Yes
Suspect: - ECM

No
REPAIR the short circuit. For additional information, refer to the wiring diagrams.

E12: CHECK WHETHER THE SHORT CIRCUIT IS IN THE APP2 HARNESS OR CONTROL UNIT

1 Key off.
2 ECM connector disconnected.
3 Measure the resistance between:
Accelerator pedal position sensor 2 - signal - Pin 01 Accelerator pedal position sensor 2 - power - Pin 02
Is the resistance greater than 100 Kohms?

Yes
Suspect: - ECM

No
REPAIR the short circuit. For additional information, refer to the wiring diagrams.

E13: CHECK THE 5 VOLT SUPPLY LINE FOR SHORT CIRCUIT TO GROUND

1 Measure the resistance between:
Accelerator pedal position sensor 2 - power - Pin 02 Accelerator pedal position sensor 2 - return - Pin 06
Is the resistance greater than 100 Kohms?

Yes
GO to E14.

No
GO to E19.

E14: CHECK THE 5 VOLT SUPPLY LINE FOR SHORT CIRCUIT TO POWER

1 Measure the resistance between:
Accelerator pedal position sensor 2 - power - Pin 02 Accelerator pedal position sensor 2 - signal - Pin 01
Is the resistance greater than 100 Kohms?

Yes
GO to E6.

No
GO to E9.
Is the resistance greater than 100 Kohms?
Yes  GO to E15.
No  GO to E21.

E15: CHECK THE APP2 5 VOLT SUPPLY LINE FOR OPEN CIRCUIT
1 Key off.
2 ECM connector disconnected.
3 Measure the resistance between:
   Accelerator pedal position sensor 2 - power - Pin 02 
   Accelerator pedal position sensor 2 - power - Pin A-D2
Is the resistance less than 10 ohms?
Yes  REPAIR the open circuit. For additional information, refer to the wiring diagrams.
No  GO to E16.

E16: CHECK THE APP2 SENSOR RETURN LINE FOR SHORT CIRCUIT TO POWER
1 Measure the resistance between:
   Accelerator pedal position sensor 2 - return - Pin 06 
   Positive post
Is the resistance greater than 100 Kohms?
Yes  GO to E17.
No  GO to E22.

E17: CHECK WHETHER THE 5 VOLT SUPPLY AND SIGNAL RETURN LINES ARE SHORTED TOGETHER
1 Key off.
2 ECM connector disconnected.
3 Key on, engine off.
4 Measure the resistance between:
   Accelerator pedal position sensor 2 - power - Pin 02 
   Accelerator pedal position sensor 2 - return - Pin 06
Is the resistance greater than 100 Kohms?
Yes  GO to E18.
No  REPAIR the short circuit. For additional information, refer to the wiring diagrams.

E18: CHECK THE APP2 SENSOR RETURN LINE FOR OPEN CIRCUIT
1 Measure the resistance between:
   Accelerator pedal position sensor 2 - return - Pin 06 
   Accelerator pedal position sensor 2 - return - Pin A-B2
Is the resistance less than 10 ohms?
Yes  REPAIR the open circuit. For additional information, refer to the wiring diagrams.
No  GO to E19.

E19: CHECK WHETHER THE 5 VOLT SUPPLY AND SIGNAL RETURN LINES ARE SHORTED TOGETHER
1 Key off.
2 ECM connector disconnected.
3 Measure the resistance between:
   Accelerator pedal position sensor 2 - power - Pin 02 
   Accelerator pedal position sensor 2 - return - Pin 06
Is the resistance greater than 100 Kohms?
Yes  GO to E20.
No  REPAIR the short circuit. For additional information, refer to the wiring diagrams.

E20: CHECK WHETHER THE SHORT CIRCUIT TO GROUND IS IN THE APP2 HARNESS OR ECU
1 Measure the resistance between:
   Accelerator pedal position sensor 2 - power - Pin 02 
   Negative post
Is the resistance greater than 100 Kohms?
Yes  REPAIR the short circuit. For additional information, refer to the wiring diagrams.
No  Suspect: - ECM

E21: CHECK WHETHER THE SHORT CIRCUIT TO POWER IS IN THE APP2 HARNESS OR ECU
1 Key off.
2 ECM connector disconnected.
3 Key on, engine off.
4 Measure the resistance between:
   Accelerator pedal position sensor 2 - power - Pin 02 
   Positive post
Is the resistance greater than 100 Kohms?
Yes  REPAIR the short circuit. For additional information, refer to the wiring diagrams.
No  Suspect: - ECM

E22: CHECK WHETHER THE SHORT CIRCUIT TO POWER IS IN THE APP2 HARNESS OR ECU
1 Key off.
2 ECM connector disconnected.
3 Key on, engine off.
4 Measure the resistance between:
   Accelerator pedal position sensor 2 - return - Pin 06 
   Positive post
Is the resistance greater than 100 Kohms?
Yes  REPAIR the short circuit. For additional information, refer to the wiring diagrams.
No  Suspect: - ECM

Inspection and Verification
This pinpoint test is intended to diagnose the following:

- Short circuit to GROUND in the air charge temperature (ACT) sensor circuit
- Short circuit to POWER in the air charge temperature (ACT) sensor circuit
- Open circuit in the air charge temperature (ACT) sensor circuit
- Air charge temperature (ACT) sensor
- ECM

Air charge temperature (ACT) sensor connector

<tr>
<td>F2: CHECK THE ACT SENSOR RETURN LINE FOR SHORT CIRCUIT TO POWER</td>
<td></td>
</tr>
</tbody>
</table>
1. Measure the resistance between: Air charge temperature sensor - return - Pin 02 Positive post

Is the resistance greater than 100 Kohms?
Yes
  GO to F3.
No
  GO to F11.

F3: CHECK THE ACT SENSOR RETURN LINE FOR OPEN CIRCUIT

1. Key off.
2. ECM connector disconnected.
3. Measure the resistance between:
   Air charge temperature sensor - return - Pin 02  Air charge temperature sensor - return - Pin C-G3

Is the resistance less than 10 ohms?
Yes
  Suspect: - ECM connector - ECM
  REPAIR the open circuit. For additional information, refer to the wiring diagrams.
No

F4: CHECK THE ACT VOLTAGE

1. Measure the voltage between:
   Air charge temperature sensor - signal - Pin 01 Negative post

Is the voltage between 4.8 volts - 5.2 volts?
Yes
  GO to F8.
No
  GO to F5.

F5: CHECK THE ACT SIGNAL LINE FOR SHORT CIRCUIT TO GROUND

1. Measure the resistance between:
   Air charge temperature sensor - signal - Pin 01 Negative post

Is the resistance greater than 100 Kohms?
Yes
  GO to F6.
No
  GO to F9.

F6: CHECK THE ACT SIGNAL LINE FOR SHORT CIRCUIT TO POWER

1. Measure the resistance between:
   Air charge temperature sensor - signal - Pin 01 Positive post

Is the resistance greater than 100 Kohms?
Yes
  GO to F7.
No
  GO to F12.

F7: CHECK THE ACT SIGNAL LINE FOR OPEN CIRCUIT

1. Key off.
2. ECM connector disconnected.
3. Measure the resistance between:
   Air charge temperature sensor - signal - Pin 01  Air charge temperature sensor - signal - Pin C-B1

Is the resistance less than 10 ohms?
Yes
  An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s): - ACT connector - ACT sensor - ECM connector - ECM
  REPAIR the open circuit. For additional information, refer to the wiring diagrams.
No
  INSTALL a new ACT.

F8: CHECK THE COMPONENT RESISTANCE

1. Measure the resistance between:
   Air charge temperature sensor - signal - Pin 01  Air charge temperature sensor - return - Pin 02

Is the resistance between 578 ohms - 71 Kohms?
Yes
  An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s): - ACT connector - ACT sensor - ECM connector - ECM
No
  INSTALL a new ACT.

F9: CHECK THE ACT CIRCUIT(S) FOR SIGNAL AND RETURN LINES SHORTED TOGETHER

1. Key off.
2. ECM connector disconnected.
3. Measure the resistance between:
   Air charge temperature sensor - signal - Pin 01  Air charge temperature sensor - return - Pin 02

Is the resistance greater than 100 Kohms?
Yes
  GO to F10.
No
  REPAIR the short circuit. For additional information, refer to the wiring diagrams.

F10: CHECK WHETHER THE SHORT CIRCUIT TO GROUND IS IN THE ACT HARNESS OR ECU

1. Key on, engine off.
2. Measure the resistance between:
   Air charge temperature sensor - signal - Pin 01 Negative post

Is the resistance greater than 100 Kohms?
Yes
  Suspect: - ECM
No
  REPAIR the short circuit. For additional information, refer to the wiring diagrams.

F11: CHECK WHETHER THE SHORT CIRCUIT TO POWER IS IN THE ACT HARNESS OR ECU

1. Key off.
2. ECM connector disconnected.
3. Key on, engine off.
Measure the resistance between:
Air charge temperature sensor - return - Pin 02  Positive post

Is the resistance greater than 100 Kohms?
Yes
Suspect: - ECM
No
REPAIR the short circuit. For additional information, refer to the wiring diagrams.

F12: CHECK WHETHER THE SHORT CIRCUIT TO POWER IS IN THE ACT HARNESS OR ECU

1
Key off.
2
ECM connector disconnected.
3
Key on, engine off.
4
Measure the resistance between:
Air charge temperature sensor - signal - Pin 01  Positive post

Is the resistance greater than 100 Kohms?
Yes
Suspect: - ECM
No
REPAIR the short circuit. For additional information, refer to the wiring diagrams.

Inspection and Verification

This pinpoint test is intended to diagnose the following:
- Short circuit to GROUND in the knock sensor 1 (KS1) circuit
- Short circuit to POWER in the knock sensor 1 (KS1) circuit
- Open circuit in the knock sensor 1 (KS1) circuit
- Knock sensor 1 (KS1)
- ECM

Knock sensor 1 (KS1) connector

Pinpoint Tests

PINPOINT TEST G: KNOCK SENSOR (KS) 1

TEST CONDITIONS DETAILS/RESULTS/ACTIONS
G1: CHECK THE KS1 CIRCUIT(S) FOR SHORT CIRCUIT TO GROUND IN HARNESS
1
Key off.
2
KS1 connector disconnected.
3
ECM connector disconnected.
4
Measure the resistance between:
Knock sensor 1 - positive - Pin 01  Negative post
Knock sensor 1 - negative - Pin 02  Negative post

Are the resistances greater than 100 Kohms?
Yes
GO to G2.
No
REPAIR the short circuit. For additional information, refer to the wiring diagrams.

G2: CHECK THE KS1 CIRCUIT(S) FOR SHORT CIRCUIT TO POWER
1] Key on, engine off.
2] Measure the resistance between:
Knock sensor 1 - positive - Pin 01  Positive post
Knock sensor 1 - negative - Pin 02  Positive post
Are the resistances greater than 100 Kohms?
Yes  GO to G3.
No  REPAIR the short circuit. For additional information, refer to the wiring diagrams.

G3: CHECK WHETHER THE KS1 CIRCUIT(S) SIGNAL AND RETURN LINES ARE SHORTED TOGETHER
1] Measure the resistance between:
Knock sensor 1 - positive - Pin 1  Knock sensor 1 - negative - Pin 2
Is the resistance greater than 100 Kohms?
Yes  GO to G4.
No  REPAIR the short circuit. For additional information, refer to the wiring diagrams.

G4: CHECK THE KS1 CIRCUIT(S) FOR OPEN CIRCUIT IN HARNESS
1] Measure the resistance between:
Knock sensor 1 - positive - Pin 01  Knock sensor 1 - positive - Pin B-E4
Knock sensor 1 - negative - Pin 02  Knock sensor 1 - negative - Pin B-D4
Are the resistances less than 10 ohms?
Yes  An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s):
- KS1 connector
- KS1 sensor
- ECM connector
- ECM
No  REPAIR the open circuit. For additional information, refer to the wiring diagrams.

Inspection and Verification
This pinpoint test is intended to diagnose the following:
- Short circuit to GROUND in the knock sensor 2 (KS2) circuit
- Short circuit to POWER in the knock sensor 2 (KS2) circuit
- Open circuit in the knock sensor 2 (KS2) circuit
- Knock sensor 2 (KS2)
- ECM

Knock sensor 2 (KS2) Connector

Engine control module. (ECM) Connector

Pinpoint Tests

PINPOINT TEST H : KNOCK SENSOR (KS) 2

TEST CONDITIONS  DETAILS/RESULTS/ACTIONS

E54264
Knock sensor 2 - negative  02
Knock sensor 2 - positive  01

E54251
Knock sensor 2 - negative  B-C4
Knock sensor 2 - positive  B-D3
H1: CHECK THE KS2 CIRCUIT(S) FOR SHORT CIRCUIT TO GROUND IN HARNESS
1. Key off.
2. KS1 connector disconnected.
3. ECM connector disconnected.
4. Measure the resistance between:
   Knock sensor 2 - positive - Pin 01
   Knock sensor 2 - negative - Pin 02
   Negative post
   Are the resistances greater than 100 Kohms?
   Yes
   No
   REPAIR the short circuit. For additional information, refer to the wiring diagrams.

H2: CHECK THE KS2 CIRCUIT(S) FOR SHORT CIRCUIT TO POWER
1. Key on, engine off.
2. Measure the resistance between:
   Knock sensor 2 - positive - Pin 01
   Knock sensor 2 - negative - Pin 02
   Positive post
   Are the resistances greater than 100 Kohms?
   Yes
   No
   REPAIR the short circuit. For additional information, refer to the wiring diagrams.

H3: CHECK WHETHER THE KS2 CIRCUIT(S) SIGNAL AND RETURN LINES ARE SHORTED TOGETHER
1. Measure the resistance between:
   Knock sensor 2 - positive - Pin 01
   Knock sensor 2 - negative - Pin 02
   Is the resistance greater than 100 Kohms?
   Yes
   No
   REPAIR the short circuit. For additional information, refer to the wiring diagrams.

H4: CHECK THE KS2 CIRCUIT(S) FOR OPEN IN HARNESS
1. Measure the resistance between:
   Knock sensor 2 - positive - Pin 01
   Knock sensor 2 - positive - Pin B-D3
   Knock sensor 2 - negative - Pin 02
   Knock sensor 2 - negative - Pin B-C4
   Are the resistances less than 10 ohms?
   Yes
   An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s):
   - KS2 connector. - KS2 sensor.
   - ECM connector. - ECM
   No
   REPAIR the open circuit. For additional information, refer to the wiring diagrams.

Inspection and Verification

Note
This pinpoint test is intended to diagnose the following:
- Short circuit to GROUND in the intake air temperature (IAT) sensor circuit
- Short circuit to POWER in the intake air temperature (IAT) sensor circuit
- Open circuit in the intake air temperature (IAT) sensor circuit
- Mass air flow sensor 1 (MAF1)
- ECM

</table>
Measure the resistance between:
Intake air temperature bank 1 - return - Pin 03 Negative post

Is the resistance less than 10 ohms?
Yes
GO to 18.
No
GO to 16.

**I6: CHECK THE IAT SENSOR RETURN LINE FOR SHORT CIRCUIT TO POWER**

1. Measure the resistance between:
   Intake air temperature bank 1 - return - Pin 03 Positive post

Is the resistance greater than 100 Kohms?
Yes
GO to 17.
No
GO to 115.

**I7: CHECK THE IAT SENSOR RETURN LINE FOR OPEN CIRCUIT**

1. Key off.
2. ECM connector disconnected.
3. Measure the resistance between:
   Intake air temperature bank 1 - return - Pin 03 Mass air flow sensor - return - Pin A1-L4

Is the resistance less than 10 ohms?
Yes
Suspect:- ECM connector- ECM
No
REPAIR the open circuit. For additional information, refer to the wiring diagrams.

**I8: CHECK THE IAT VOLTAGE**

1. Measure the voltage between:
   Intake air temperature bank 1 - signal - Pin 02 Negative post

Is the voltage between 4.8 volts - 5.2 volts?
Yes
GO to I12.
No
GO to I19.

**I9: CHECK THE IAT SIGNAL LINE FOR SHORT CIRCUIT TO GROUND**

1. Measure the resistance between:
   Intake air temperature bank 1 - signal - Pin 02 Negative post

Is the resistance greater than 100 Kohms?
Yes
GO to I10.
No
GO to I13.

**I10: CHECK THE IAT SIGNAL LINE FOR SHORT CIRCUIT TO POWER**

1. Key on, engine off.
2. Measure the resistance between:
   Intake air temperature bank 1 - signal - Pin 02 Positive post

Is the resistance greater than 100 Kohms?
Yes
GO to I11.
No
GO to I16.

**I11: CHECK THE IAT SIGNAL LINE FOR OPEN CIRCUIT**

1. Measure the resistance between:
   Intake air temperature bank 1 - signal - Pin 02 Intake air temperature bank 1 - signal - Pin C1-F1

Is the resistance less than 10 ohms?
Yes
Suspect:- ECM connector- ECM
No
REPAIR the open circuit. For additional information, refer to the wiring diagrams.

**I12: CHECK THE COMPONENT RESISTANCE**

1. Measure the resistance between:
   Intake air temperature bank 1 - signal - Pin 02 Intake air temperature bank 1 - return - Pin 03

Is the resistance between 150 ohms - 15 Kohms?
Yes
An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage
to the harness. If no fault is found in the circuit, suspect the following component(s):- MAF1 connector- MAF1 sensor- ECM connector- ECM
No
INSTALL a new MAF1.
REFER to: Mass Air Flow (MAF) Sensor (303-14C Electronic Engine Controls - 2.7L V6 - TdV6, Removal and Installation).

**I13: CHECK WHETHER THE IAT CIRCUIT(S) SIGNAL AND RETURN LINES ARE SHORTED TOGETHER**

1. Key off.
2. ECM connector disconnected.
3. Key on, engine off.
4. Measure the resistance between:
   Intake air temperature bank 1 - signal - Pin 02 Intake air temperature bank 1 - return - Pin 03

Is the resistance greater than 100 Kohms?
Yes
GO to I14.
No
REPAIR the short circuit. For additional information, refer to the wiring diagrams.

**I14: CHECK WHETHER THE SHORT CIRCUIT TO GROUND IS IN THE IAT HARNESS OR ECU**

1. Measure the resistance between:
   Intake air temperature bank 1 - signal - Pin 02 Negative post
Is the resistance greater than 100 Kohms?
Yes
Suspect: ECM
No
REPAIR the short circuit. For additional information, refer to the wiring diagrams.

**I15: CHECK WHETHER THE SHORT TO POWER IS IN THE IAT HARNESS OR ECU**

1. Key off.
2. ECM connector disconnected.
3. Key on, engine off.
4. Measure the resistance between:
   Intake air temperature bank 1 - return - Pin 03 [Positive post]
Is the resistance greater than 100 Kohms?
Yes
Suspect: ECM
No
REPAIR the short circuit. For additional information, refer to the wiring diagrams.

**I16: CHECK WHETHER THE SHORT CIRCUIT TO POWER IS IN THE IAT HARNESS OR ECU**

1. Key off.
2. ECM connector disconnected.
3. Key on, engine off.
4. Measure the resistance between:
   Intake air temperature bank 1 - signal - Pin 02 [Positive post]
Is the resistance greater than 100 Kohms?
Yes
Suspect: ECM
No
REPAIR the short circuit. For additional information, refer to the wiring diagrams.

**Inspection and Verification**

Note
This pinpoint test is intended to diagnose the following:
- Short circuit to GROUND in the mass air flow sensor 1 (MAF1) circuit
- Short circuit to POWER in the mass air flow sensor 1 (MAF1) circuit
- Open circuit in the mass air flow sensor 1 (MAF1) circuit
- Mass air flow sensor 1 (MAF1)
- ECM

![ECM relay controlled 12 volt supply](image)
1: CHECK THE MAF1 PID VALUE
   1 Key on, engine run.
   2 Access the ECM-Mass air flow sensor A signal frequency PID using a scan tool.
   Is the Hot$MAF between 4 g/sec - 18 g/sec?
     Yes
       No fault found.
       GO to 12.
     No

2: CHECK THE MAF1 PID VALUE
   1 Access the ECM-Mass air flow sensor A signal frequency PID using a scan tool.
   Is the Hot$MAF less than 4 g/sec?
     Yes
       GO to 14.
     No
       GO to 13.

3: CHECK FOR SECONDARY AIR LEAKS
   1 Key off.
   2 Please check for air leaks between the turbo and the MAF1.
     REFER to: Intake Air Distribution and Filtering (303-12C Intake Air Distribution and Filtering - 2.7L V6 - TdV6, Diagnosis and Testing).
   Are there any air leaks?
     Yes
       REPAIR the fault as necessary
       GO to 15.
     No

4: CHECK FOR OIL INGESTION
   1 Key off.
   2 Please check for oil ingestion through the engine manifold.
   Is there any oil ingestion?
     Yes
       Repair / replace the MAF1. Check/rectify any external oil leaks.
       GO to 15.
     No

5: CHECK THE COMPONENT RESISTANCE
   1 MAF1 connector disconnected.
   2 Measure the resistance between:
      ECM relay controlled 12 volt supply - Pin 04
      Mass air flow sensor - return - Pin 03
   Is the resistance between 120 Kohms - 130 Kohms?
     Yes
       GO to 16.
     No
       INSTALL a new MAF sensor.
       REFER to: Mass Air Flow (MAF) Sensor (303-14C Electronic Engine Controls - 2.7L V6 - TdV6, Removal and Installation).

6: CHECK THE MAF1 CIRCUIT VOLTAGE
   1 Key on, engine off.
   2 Measure the voltage between:
      ECM relay controlled 12 volt supply - Pin 04
      Negative post
   Is the voltage between 9 volts - 15 volts?
     Yes
       GO to 17.
     No
       No power to the MAF circuit. Check and repair the circuit as necessary.

7: CHECK THE MAF1 CIRCUIT FOR SHORT CIRCUIT TO GROUND IN THE HARNESS
   1 Key off.
   2 ECM connector disconnected.
   3 Key on, engine off.
   4 Measure the resistance between:
      Mass air flow sensor - return - Pin 03
      Negative post
      Mass air flow sensor - signal - Pin 01
      Negative post
   Are the resistances greater than 100 Kohms?
     Yes
       GO to 18.
     No
       REPAIR the short circuit. For additional information, refer to the wiring diagrams.

8: CHECK THE MAF1 CIRCUIT FOR SHORT CIRCUIT TO POWER IN HARNESS
   1 Measure the resistance between:
      Mass air flow sensor - return - Pin 03
      Positive post
      Mass air flow sensor - signal - Pin 01
      Positive post
   Are the resistances greater than 100 Kohms?
     Yes
       GO to 19.
     No
       REPAIR the short circuit. For additional information, refer to the wiring diagrams.

9: CHECK FOR SHORT CIRCUIT BETWEEN SENSOR LINES
   1 Measure the resistance between:
      Mass air flow sensor - signal - Pin 01
      Mass air flow sensor - return - Pin 03
   Is the resistance greater than 100 Kohms?
     Yes
       GO to 20.
     No
       REPAIR the short circuit. For additional information, refer to the wiring diagrams.

10: CHECK MAF1 CIRCUIT FOR AN OPEN CIRCUIT IN THE HARNESS
    1 Key off.
    2 ECM connector disconnected.
Measure the resistance between:

| Mass air flow sensor - return - Pin 03 | Mass air flow sensor - return - Pin A1-L4 |
| Mass air flow sensor - signal - Pin 01 | Mass air flow sensor - signal - Pin A1-F4 |

Are the resistances less than 10 ohms?

Yes
- An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s):
  - MAF connector
  - ECM connector
  - MAF - ECM connector

No
- REPAIR the open circuit. For additional information, refer to the wiring diagrams.

**Inspection and Verification**

This pinpoint test is intended to diagnose the following:
- Short circuit to GROUND in the mass air flow sensor 2 (MAF2) circuit
- Short circuit to POWER in the mass air flow sensor 2 (MAF2) circuit
- Open circuit in the mass air flow sensor 2 (MAF2) circuit
- Mass air flow sensor 2 (MAF2)
- ECM

Mass air flow sensor 2 (MAF2) connector

**Pinpoint Tests**

### PINPOINT TEST K : MASS AIR FLOW METER (MAF) 2

<table>
<thead>

</tr>
</tbody>
</table>
Are there any air leaks?
Yes
REPAIR the fault as necessary.
No
GO to K5.

K4: CHECK FOR OIL INGESTION

1. Key off.
2. Please check for oil ingestion via the engine manifold.

Is there any oil ingestion?
Yes
Repair / replace the MAF2. Check/rectify any external oil leaks.
No
GO to K5.

K5: CHECK THE COMPONENT RESISTANCE

1. MAF2 connector disconnected.
2. Measure the resistance between:
   ECM relay controlled 12 volt supply - Pin 04
   Mass air flow sensor 2 - return - Pin 03

   Is the resistance between 120 Kohms - 130 Kohms?
   Yes
   GO to K6.
   No
   INSTALL a new MAF sensor.
   REFER to: Mass Air Flow (MAF) Sensor (303-14C Electronic Engine Controls - 2.7L V6 - TdV6, Removal and Installation).

K6: CHECK THE MAF2 CIRCUIT VOLTAGE

1. Key on, engine off.
2. Measure the voltage between:
   ECM relay controlled 12 volt supply - Pin 04
   Negative post

   Is the voltage between 9 volts - 15 volts?
   Yes
   GO to K7.
   No
   No power to the MAF circuit. Check and repair the circuit as necessary.

K7: CHECK THE MAF2 CIRCUIT FOR SHORT CIRCUIT TO GROUND IN THE HARNESS

1. Key off.
2. ECM connector disconnected.
3. Key on, engine off.
4. Measure the resistance between:
   Mass air flow sensor 2 - return - Pin 03
   Negative post
   Mass air flow sensor 2 - signal - Pin 01
   Negative post

   Are the resistances greater than 100 Kohms?
   Yes
   GO to K8.
   No
   REPAIR the short circuit. For additional information, refer to the wiring diagrams.

K8: CHECK THE MAF2 CIRCUIT FOR SHORT CIRCUIT TO POWER IN THE HARNESS

1. Measure the resistance between:
   Mass air flow sensor 2 - return - Pin 03
   Positive post
   Mass air flow sensor 2 - signal - Pin 01
   Positive post

   Are the resistances greater than 100 Kohms?
   Yes
   GO to K9.
   No
   REPAIR the short circuit. For additional information, refer to the wiring diagrams.

K9: CHECK FOR SHORT CIRCUIT BETWEEN SENSOR LINES

1. Measure the resistance between:
   Mass air flow sensor 2 - signal - Pin 01
   Mass air flow sensor 2 - return - Pin 03
   Mass air flow sensor 2 - signal - Pin A1-G4
   Mass air flow sensor 2 - signal - Pin A1-G4

   Is the resistance greater than 100 Kohms?
   Yes
   GO to K10.
   No
   REPAIR the short circuit. For additional information, refer to the wiring diagrams.

K10: CHECK MAF2 CIRCUIT FOR AN OPEN CIRCUIT IN THE HARNESS

1. Key off.
2. ECM connector disconnected.
3. Measure the resistance between:
   Mass air flow sensor 2 - return - Pin 03
   Mass air flow sensor 2 - signal - Pin A1-G4
   Mass air flow sensor 2 - signal - Pin 01
   Mass air flow sensor 2 - signal - Pin A1-G4

   Are the resistances less than 10 ohms?
   Yes
   An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s): - MAF connector. - ECM connector. - MAF- ECM
   No
   REPAIR the open circuit. For additional information, refer to the wiring diagrams.

Inspection and Verification

This pinpoint test is intended to diagnose the following:

- Short circuit to GROUND in the manifold absolute pressure (MAP) sensor circuit
- Short circuit to POWER in the manifold absolute pressure (MAP) sensor circuit
- Open circuit in the manifold absolute pressure (MAP) sensor circuit
- Manifold absolute pressure (MAP) sensor
- ECM

**L5: CHECK THE MAP SIGNAL LINE FOR SHORT CIRCUIT TO SIGNAL RETURN AND SENSOR POWER**
**L6: CHECK THE MAP SIGNAL LINE FOR OPEN CIRCUIT**

1. Key off.
2. ECM connector disconnected.
3. Measure the resistance between:
   - Manifold absolute pressure sensor - signal - Pin 02
   - Manifold absolute pressure sensor - signal - Pin C-C1

   Are the resistances greater than 100 Kohms?
   - Yes
     - An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s):
       - MAP connector
       - ECM
     - REPAIR the open circuit. For additional information, refer to the wiring diagrams.
   - No

**L7: CHECK WHETHER THE SHORT CIRCUIT TO GROUND IS IN THE MAP HARNESS OR ECU**

1. Key off.
2. ECM connector disconnected.
3. Key on, engine off.
4. Measure the resistance between:
   - Manifold absolute pressure sensor - signal - Pin 02
   - Negative post

   Is the resistance greater than 100 Kohms?
   - Yes
     - Suspect: ECM
     - REPAIR the short circuit. For additional information, refer to the wiring diagrams.
   - No

**L8: CHECK WHETHER THE SHORT CIRCUIT TO POWER IS IN THE MAP HARNESS OR ECU**

1. Key off.
2. ECM connector disconnected.
3. Key on, engine off.
4. Measure the resistance between:
   - Manifold absolute pressure sensor - signal - Pin 02
   - Positive post

   Is the resistance greater than 100 Kohms?
   - Yes
     - Suspect: ECM
     - REPAIR the short circuit. For additional information, refer to the wiring diagrams.
   - No

**L9: CHECK WHETHER THE SHORT CIRCUIT IS IN THE MAP HARNESS OR CONTROL UNIT**

1. Key off.
2. ECM connector disconnected.
3. Measure the resistance between:
   - Manifold absolute pressure sensor - signal - Pin 02
   - Manifold absolute pressure sensor - power - Pin 01
   - Manifold absolute pressure sensor - signal - Pin 02
   - Manifold absolute pressure sensor - return - Pin 03

   Are the resistances greater than 100 Kohms?
   - Yes
     - Suspect: ECM
     - REPAIR the short circuit. For additional information, refer to the wiring diagrams.
   - No

**L10: CHECK THE 5 VOLT SUPPLY LINE FOR SHORT CIRCUIT TO GROUND**

1. Measure the resistance between:
   - Manifold absolute pressure sensor - power - Pin 01
   - Negative post

   Is the resistance greater than 100 Kohms?
   - Yes
     - GO to L11.
   - No
     - GO to L16.

**L11: CHECK THE 5 VOLT SUPPLY LINE FOR SHORT CIRCUIT TO POWER**

1. Measure the resistance between:
   - Manifold absolute pressure sensor - power - Pin 01
   - Positive post

   Is the resistance greater than 100 Kohms?
   - Yes
     - GO to L12.
   - No
     - GO to L17.

**L12: CHECK THE MAP 5 VOLT SUPPLY LINE FOR OPEN CIRCUIT**

1. Key off.
2. ECM connector disconnected.
3. Measure the resistance between:
   - Manifold absolute pressure sensor - power - Pin 01
   - Manifold absolute pressure sensor - power - Pin C-D1

   Is the resistance less than 10 ohms?
   - Yes
     - Suspect: ECM
     - REPAIR the open circuit. For additional information, refer to the wiring diagrams.
   - No

**L13: CHECK THE MAP SENSOR RETURN LINE FOR SHORT CIRCUIT TO POWER**

1. Measure the resistance between:
   - Manifold absolute pressure sensor - return - Pin 03
   - Positive post
Is the resistance greater than 100 Kohms?
Yes
GO to L14.
No
GO to L18.

L14: CHECK WHETHER THE 5 VOLT SUPPLY AND SIGNAL RETURN LINES ARE SHORTED TOGETHER
1 Measure the resistance between:
   Manifold absolute pressure sensor - power - Pin 01   Manifold absolute pressure sensor - return - Pin 03
   Manifold absolute pressure sensor - power - Pin 05   Manifold absolute pressure sensor - return - Pin 03
   Manifold absolute pressure sensor - power - Pin 05   Manifold absolute pressure sensor - return - Pin C-E2
   Manifold absolute pressure sensor - power - Pin 01   Manifold absolute pressure sensor - return - Pin C-E2
   Manifold absolute pressure sensor - power - Pin 05   Manifold absolute pressure sensor - return - Pin C-E2

Is the resistance greater than 100 Kohms?
Yes
GO to L15.
No
GO to L19.

L15: CHECK THE MAP SENSOR RETURN LINE FOR OPEN CIRCUIT
1 Key off.
2 ECM connector disconnected.
3 Key on, engine off.
4 Measure the resistance between:
   Manifold absolute pressure sensor - return - Pin 03   Manifold absolute pressure sensor - return - Pin C-E2
   Manifold absolute pressure sensor - return - Pin 03   Manifold absolute pressure sensor - return - Pin 01
   Manifold absolute pressure sensor - return - Pin 03   Manifold absolute pressure sensor - return - Pin C-E2
   Manifold absolute pressure sensor - return - Pin 03   Manifold absolute pressure sensor - return - Pin 01

Is the resistance less than 10 ohms?
Yes
   Suspect: - MAP connector- ECM connector- MAP- ECM
   Pin 03 - Pin 03 - Pin 03 - Pin C-E2
No
   REPAIR the open circuit. For additional information, refer to the wiring diagrams.

L16: CHECK WHETHER THE SHORT CIRCUIT TO GROUND IS IN THE MAP HARNESS OR ECU
1 Key off.
2 ECM connector disconnected.
3 Key on, engine off.
4 Measure the resistance between:
   Manifold absolute pressure sensor - power - Pin 01   Negative post
   Manifold absolute pressure sensor - power - Pin 01   Negative post
   Manifold absolute pressure sensor - power - Pin 01   Negative post
   Manifold absolute pressure sensor - power - Pin 01   Negative post

Is the resistance greater than 100 Kohms?
Yes
   Suspect: - ECM
No
   REPAIR the short circuit. For additional information, refer to the wiring diagrams.

L17: CHECK WHETHER THE SHORT CIRCUIT TO POWER IS IN THE MAP HARNESS OR ECU
1 Key off.
2 ECM connector disconnected.
3 Key on, engine off.
4 Measure the resistance between:
   Manifold absolute pressure sensor - power - Pin 01   Positive post
   Manifold absolute pressure sensor - power - Pin 01   Positive post
   Manifold absolute pressure sensor - power - Pin 01   Positive post
   Manifold absolute pressure sensor - power - Pin 01   Positive post

Is the resistance greater than 100 Kohms?
Yes
   Suspect: - ECM
No
   REPAIR the short circuit. For additional information, refer to the wiring diagrams.

L18: CHECK WHETHER THE SHORT CIRCUIT TO POWER IS IN THE MAP HARNESS OR ECU
1 Key off.
2 ECM connector disconnected.
3 Key on, engine off.
4 Measure the resistance between:
   Manifold absolute pressure sensor - return - Pin 03   Positive post
   Manifold absolute pressure sensor - return - Pin 03   Positive post
   Manifold absolute pressure sensor - return - Pin 03   Positive post
   Manifold absolute pressure sensor - return - Pin 03   Positive post

Is the resistance greater than 100 Kohms?
Yes
   Suspect: - ECM
No
   REPAIR the short circuit. For additional information, refer to the wiring diagrams.

L19: CHECK WHETHER THE SHORT CIRCUIT IS IN THE MAP HARNESS OR CONTROL UNIT
1 Key off.
2 ECM connector disconnected.
3 Measure the resistance between:
   Manifold absolute pressure sensor - power - Pin 01   Manifold absolute pressure sensor - return - Pin 03
   Manifold absolute pressure sensor - power - Pin 01   Manifold absolute pressure sensor - return - Pin C-E2
   Manifold absolute pressure sensor - power - Pin 01   Manifold absolute pressure sensor - return - Pin C-E2
   Manifold absolute pressure sensor - power - Pin 03   Manifold absolute pressure sensor - return - Pin C-E2

Is the resistance greater than 100 Kohms?
Yes
   Suspect: - ECM
No
   REPAIR the short circuit. For additional information, refer to the wiring diagrams.

Inspection and Verification

Note
This pinpoint test is intended to diagnose the following:
- Short circuit to GROUND in the air charge temperature (ACT) sensor circuit
- Short circuit to POWER in the air charge temperature (ACT) sensor circuit
- Open circuit in the air charge temperature (ACT) sensor circuit
- Air charge temperature (ACT) sensor
- ECM

Air charge temperature (ACT) connector

</table>
Measure the resistance between:
Air charge temperature sensor - return - Pin 02
Is the resistance less than 10 ohms?
Yes
GO to M8.
No
GO to M6.

M6: CHECK THE ACT SENSOR RETURN LINE FOR SHORT CIRCUIT TO POWER
1 Measure the resistance between:
Air charge temperature sensor - return - Pin 02
Positive post
Is the resistance greater than 100 Kohms?
Yes
GO to M7.
No
GO to M15.

M7: CHECK THE ACT SENSOR RETURN LINE FOR OPEN CIRCUIT
1 Key off.
2 ACT connector disconnected.
3 Measure the resistance between:
Air charge temperature sensor - return - Pin 02
Air charge temperature sensor - return - Pin C-G3
Is the resistance less than 10 ohms?
Yes
Suspect:- ECM connector- ECM
No
REPAIR the open circuit. For additional information, refer to the wiring diagrams.

M8: CHECK THE ACT VOLTAGE
1 Measure the voltage between:
Air charge temperature sensor - signal - Pin 01
Negative post
Is the voltage between 4.8 volts - 5.2 volts?
Yes
GO to M12.
No
GO to M9.

M9: CHECK THE ACT SIGNAL LINE FOR SHORT CIRCUIT TO GROUND
1 Measure the resistance between:
Air charge temperature sensor - signal - Pin 01
Negative post
Is the resistance greater than 100 Kohms?
Yes
GO to M10.
No
GO to M13.

M10: CHECK THE ACT SIGNAL LINE FOR SHORT CIRCUIT TO POWER
1 Key on, engine off.
2 Measure the resistance between:
Air charge temperature sensor - signal - Pin 01
Positive post
Is the resistance greater than 100 Kohms?
Yes
GO to M11.
No
GO to M16.

M11: CHECK THE ACT SIGNAL LINE FOR OPEN CIRCUIT
1 Measure the resistance between:
Air charge temperature sensor - signal - Pin 01
Air charge temperature sensor - signal - Pin C-B1
Is the resistance less than 10 ohms?
Yes
Suspect:- ECM connector- ECM
No
REPAIR the open circuit. For additional information, refer to the wiring diagrams.

M12: CHECK THE COMPONENT RESISTANCE
1 Measure the resistance between:
Air charge temperature sensor - signal - Pin 01
Air charge temperature sensor - return - Pin 02
Is the resistance between 1 Kohms - 100 Kohms?
Yes
An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s):- ACT connector- ECM connector- ECM
No
INSTALL a new ACT sensor.

M13: CHECK THE ACT CIRCUIT(S) FOR SIGNAL AND RETURN LINES SHORTED TOGETHER
1 Key off.
2 ECM connector disconnected.
3 Key on, engine off.
4 Measure the resistance between:
Air charge temperature sensor - signal - Pin 01
Air charge temperature sensor - return - Pin 02
Is the resistance greater than 100 Kohms?
Yes
GO to M14.
No
REPAIR the short circuit. For additional information, refer to the wiring diagrams.

M14: CHECK WHETHER THE SHORT CIRCUIT TO GROUND IS IN THE ACT HARNESS OR ECU
1 Measure the resistance between:
Air charge temperature sensor - signal - Pin 01
Negative post.
**Is the resistance greater than 100 Kohms?**

Yes

Suspect: ECM

No

REPAIR the short circuit. For additional information, refer to the wiring diagrams.

---

**M15: CHECK WHETHER THE SHORT CIRCUIT TO POWER IS IN THE ACT HARNESS OR ECU**

1. Key off.
2. ECM connector disconnected.
3. Key on, engine off.
4. Measure the resistance between:
   Air charge temperature sensor - return - Pin 02  Positive post

**Is the resistance greater than 100 Kohms?**

Yes

Suspect: ECM

No

REPAIR the short circuit. For additional information, refer to the wiring diagrams.

---

**M16: CHECK WHETHER THE SHORT CIRCUIT TO POWER IS IN THE ACT HARNESS OR ECU**

1. Key off.
2. ECM connector disconnected.
3. Key on, engine off.
4. Measure the resistance between:
   Air charge temperature sensor - signal - Pin 01  Positive post

**Is the resistance greater than 100 Kohms?**

Yes

Suspect: ECM

No

REPAIR the short circuit. For additional information, refer to the wiring diagrams.

---

**Inspection and Verification**

This pinpoint test is intended to diagnose the following:

- Short circuit to GROUND in the crankshaft position (CKP) sensor circuit
- Short circuit to POWER in the crankshaft position (CKP) sensor circuit
- Open circuit in the crankshaft position (CKP) sensor circuit
- Crankshaft position (CKP) sensor
- ECM

Crankshaft position (CKP) sensor connector

**Pinpoint Tests**

**PINPOINT TEST N : CRANKSHAFT POSITION (CKP) SENSOR**

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>N1: CHECK THE CKP FOR SHORT CIRCUIT TO GROUND</strong></td>
<td></td>
</tr>
</tbody>
</table>
1. Key off.
2. ECM connector disconnected.
3. Key on, engine off.
4. Measure the resistance between:
   - Crankshaft position sensor - negative - Pin C-G2
   - Crankshaft position sensor - positive - Pin C-G1
   - Crankshaft position sensor - signal - Pin C-F1

   Are the resistances greater than 100 Kohms?
   Yes: GO to N2.
   No: REPAIR the short circuit to GROUND in the CKP harness or component.

**N2: CHECK THE CKP CIRCUIT FOR SHORT CIRCUIT TO POWER**

1. Measure the resistance between:
   - Crankshaft position sensor - negative - Pin C-G2
   - Crankshaft position sensor - positive - Pin C-G1
   - Crankshaft position sensor - signal - Pin C-F1

   Are the resistances greater than 100 Kohms?
   Yes: GO to N3.
   No: REPAIR the short circuit to POWER in the CKP harness or component.

**N3: CHECK THE CKP CIRCUIT RESISTANCE**

1. Measure the resistance between:
   - Crankshaft position sensor - negative - Pin C-G2
   - Crankshaft position sensor - signal - Pin C-F1

   Is the resistance between 100 Kohms - 120 Kohms?
   Yes: GO to N4.
   No: REPAIR the out of limits resistance in the CKP harness or component. This may be due to a short or open circuit, depending on the result of the last measurement.

**N4: CHECK THE CKP CIRCUIT RESISTANCE**

1. Measure the resistance between:
   - Crankshaft position sensor - positive - Pin C-G1
   - Crankshaft position sensor - signal - Pin C-F1
   - Crankshaft position sensor - positive - Pin C-G1
   - Crankshaft position sensor - negative - Pin C-G2

   Are the resistances greater than 100 Kohms?
   Yes: No fault found in the tests. However the following may be suspect: Open circuit in sensor power line- CKP connector- CKP sensor- Crank target wheel- ECM connector- ECM
   No: REPAIR the out of limits resistance in the CKP harness or component. This may be due to a short or open circuit, depending on the result of the last measurement.

**Inspection and Verification**

This pinpoint test is intended to diagnose the following:

- Short circuit to GROUND in the camshaft position (CMP) sensor circuit
- Short circuit to POWER in the camshaft position (CMP) sensor circuit
- Open circuit in the camshaft position (CMP) sensor circuit
- Camshaft position sensor
- ECM

Engine control module (ECM) connector

| **O2: CHECK THE CMP CIRCUIT FOR SHORT CIRCUIT TO POWER** | |
| 1 Measure the resistance between: | |
| Camshaft position sensor - signal - Pin C-G4 Positive post | |
| Camshaft position sensor - power - Pin C-H4 Positive post | |
| Camshaft position sensor - return - Pin C-H3 Positive post | |
| Are the resistances greater than 100 Kohms? | |
| Yes | GO to O3. |
| No | REPAIR the short circuit to POWER in the CMP harness or component. |

| **O3: CHECK THE CMP CIRCUIT RESISTANCE** | |
| 1 Measure the resistance between: | |
| Camshaft position sensor - signal - Pin C-G4 Camshaft position sensor - return - Pin C-H3 | |
| Is the resistance between 100 Kohms - 120 Kohms? | |
| Yes | GO to O4. |
| No | REPAIR the out of limits resistance in the CMP harness or component. This may be due to a short or open circuit, depending on the result of the last measurement. |

| **O4: CHECK THE CMP CIRCUIT RESISTANCE** | |
| 1 Measure the resistance between: | |
| Camshaft position sensor - power - Pin C-H4 Camshaft position sensor - signal - Pin C-G4 Camshaft position sensor - power - Pin C-H4 Camshaft position sensor 2 - return | |
| Are the resistances greater than 100 Kohms? | |
| Yes | No fault found in the tests. However the following may be suspect:— Open circuit in sensor power line— CMP connector— CMP sensor— ECM connector— ECM |
| No | REPAIR the out of limits resistance in the CMP harness or component. This may be due to a short or open circuit, depending on the result of the last measurement. |

**Inspection and Verification**

This pinpoint test is intended to diagnose the following:

- Short circuit to GROUND in the Crankshaft position (CKP) sensor circuit
- Short circuit to GROUND in the camshaft position (CMP) sensor circuit
- Short circuit to POWER in the crankshaft position (CKP) sensor circuit
- Short circuit to POWER in the camshaft position (CMP) sensor circuit
- Open circuit in the crankshaft position (CKP) sensor circuit
- Open circuit in the camshaft position (CMP) sensor circuit
- Crankshaft position sensor
- Camshaft position sensor
- ECM

Crankshaft position (CKP) sensor connector

</table>
Measure the resistance between:
- Crankshaft position sensor - negative - Pin C-G2  Positive post
- Crankshaft position sensor - positive - Pin C-G1  Positive post
- Crankshaft position sensor - signal - Pin C-F1  Positive post

Are the resistances greater than 100 Kohms?
Yes  **GO to P3.**
No  REPAIR the short circuit to GROUND in the CKP harness or component.

### P3: CHECK THE CKP CIRCUIT RESISTANCE

Measure the resistance between:
- Crankshaft position sensor - signal - Pin C-F1  Crankshaft position sensor - negative - Pin C-G2

Is the resistance between 100 Kohms - 120 Kohms?
Yes  **GO to P4.**
No  REPAIR the out of limits resistance in the CKP harness or component. This may be due to a short or open circuit, depending on the result of the last measurement.

### P4: CHECK THE CKP CIRCUIT RESISTANCE

Measure the resistance between:
- Crankshaft position sensor - positive - Pin C-G1  Crankshaft position sensor - signal - Pin C-F1
- Crankshaft position sensor - positive - Pin C-G1  Crankshaft position sensor - negative - Pin C-G2

Are the resistances greater than 100 Kohms?
Yes  **GO to P5.**
No  REPAIR the out of limits resistance in the CKP harness or component. This may be due to a short or open circuit, depending on the result of the last measurement.

### P5: CHECK THE CMP FOR SHORT CIRCUIT TO GROUND

Measure the resistance between:
- Camshaft position sensor - power - Pin C-H4  Negative post
- Camshaft position sensor - return - Pin C-H3  Negative post
- Camshaft position sensor - signal - Pin C-G4  Negative post

Are the resistances greater than 100 Kohms?
Yes  **GO to P6.**
No  REPAIR the short circuit to GROUND in the CMP harness or component.

### P6: CHECK CMP CIRCUIT FOR SHORT CIRCUIT TO POWER

Measure the resistance between:
- Camshaft position sensor - power - Pin C-H4  Positive post
- Camshaft position sensor - return - Pin C-H3  Positive post
- Camshaft position sensor - signal - Pin C-G4  Positive post

Are the resistances greater than 100 Kohms?
Yes  **GO to P7.**
No  REPAIR the short circuit to POWER in the CMP harness or component.

### P7: CHECK THE CMP CIRCUIT RESISTANCE

Measure the resistance between:
- Camshaft position sensor - return - Pin C-H3  Camshaft position sensor - signal - Pin C-G4

Is the resistance between 100 Kohms - 120 Kohms?
Yes  **GO to P8.**
No  REPAIR the out of limits resistance in the CMP harness or component. This may be due to a short or open circuit, depending on the result of the last measurement.

### P8: CHECK THE CMP CIRCUIT RESISTANCE

Measure the resistance between:
- Camshaft position sensor - power - Pin C-H4  Camshaft position sensor - signal - Pin C-G4
- Camshaft position sensor - power - Pin C-H4  Camshaft position sensor 2 - return

Are the resistances greater than 100 Kohms?
Yes  No fault found in the tests. However the following may be suspect: - Open circuit in sensor power line -> CMP connector -> CKP connector -> CMP sensor -> CKP sensor -> Crank target wheel -> ECM connector -> ECM
No  REPAIR the out of limits resistance in the CMP harness or component. This may be due to a short or open circuit, depending on the result of the last measurement.

**Inspection and Verification**

This pinpoint test is intended to diagnose the following:
- Short circuit to GROUND in the accelerator pedal position (APP1) sensor circuit
- Short circuit to GROUND in the accelerator pedal position (APP2) sensor circuit
- Short circuit to POWER in the accelerator pedal position (APP1) sensor circuit
- Short circuit to POWER in the accelerator pedal position (APP2) sensor circuit
- Open circuit in the accelerator pedal position (APP1) sensor circuit
- Open circuit in the accelerator pedal position (APP2) sensor circuit
- Accelerator pedal position sensor 1
- Accelerator pedal position sensor 2
- ECM

**Accelerator pedal position (APP) sensor connector**

</tbody>
</table>
Key off.

APP Sensor connector disconnected.

Key on, engine off.

 Measure the resistance between:
Accelerator pedal position sensor 1 - return - Pin 03 Negative post

Is the resistance less than 10 ohms?

Yes

GO to Q6.

No

GO to Q23.

Q6: CHECK THE APP1 VOLTAGE

Measure the voltage between:
Accelerator pedal position sensor 1 - power - Pin 05 Negative post

Is the voltage between 4.8 volts - 5.2 volts?

Yes

GO to Q7.

No

GO to Q15.

Q7: CHECK THE APP1 SIGNAL LINE FOR SHORT CIRCUIT TO GROUND

Measure the resistance between:
Accelerator pedal position sensor 1 - signal - Pin 04 Negative post

Is the resistance greater than 100 Kohms?

Yes

GO to Q8.

No

GO to Q11.

Q8: CHECK THE APP1 SIGNAL LINE FOR SHORT CIRCUIT TO POWER

Measure the resistance between:
Accelerator pedal position sensor 1 - signal - Pin 04 Positive post

Is the resistance greater than 100 Kohms?

Yes

GO to Q9.

No

GO to Q13.

Q9: CHECK FOR SHORT CIRCUIT BETWEEN THE APP1 SIGNAL AND POWER LINES

Measure the resistance between:
Accelerator pedal position sensor 1 - signal - Pin 04 Accelerator pedal position sensor 1 - return - Pin 03

Are the resistances greater than 100 Kohms?

Yes

GO to Q10.

No

GO to Q14.

Q10: CHECK THE APP1 SIGNAL LINE FOR OPEN CIRCUIT

Key off.

ECM connector disconnected.

Measure the resistance between:
Accelerator pedal position sensor 1 - signal - Pin 04 Accelerator pedal position sensor 1 - signal - Pin A-D1

Is the resistance less than 10 ohms?

Yes

An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s):
- APP connector
- APP sensor
- ECM connector
- ECM

No

REPAIR the open circuit. For additional information, refer to the wiring diagrams.

Q11: CHECK THE APP1 CIRCUIT(S) FOR SIGNAL AND RETURN LINES SHORTED TOGETHER

Key off.

ECM connector disconnected.

Key on, engine off.

Measure the resistance between:
Accelerator pedal position sensor 1 - signal - Pin 04 Accelerator pedal position sensor 1 - return - Pin 03

Is the resistance greater than 100 Kohms?

Yes

GO to Q12.

No

REPAIR the short circuit. For additional information, refer to the wiring diagrams.

Q12: CHECK WHETHER THE SHORT CIRCUIT TO GROUND IS IN THE APP1 HARNESS OR ECU

Measure the resistance between:
Accelerator pedal position sensor 1 - signal - Pin 04 Negative post

Is the resistance greater than 100 Kohms?

Yes

Suspect: ECM

No

REPAIR the short circuit. For additional information, refer to the wiring diagrams.

Q13: CHECK WHETHER THE SHORT CIRCUIT TO POWER IS IN THE APP1 HARNESS OR ECU

Key off.

ECM connector disconnected.

Key on, engine off.

Measure the resistance between:
Accelerator pedal position sensor 1 - signal - Pin 04 Positive post

Is the resistance greater than 100 Kohms?

Yes

Suspect: ECM

No
Q14: CHECK WHETHER THE SHORT CIRCUIT IS IN THE APP1 HARNESS OR CONTROL UNIT

1. Key off.
2. ECM connector disconnected.
3. Key on, engine off.
4. Measure the resistance between:
   Accelerator pedal position sensor 1 - signal - Pin 04  Accelerator pedal position sensor 1 - power - Pin 05
   Accelerator pedal position sensor 1 - signal - Pin 04  Accelerator pedal position sensor 1 - return - Pin 03

Are the resistances greater than 100 Kohms?
- Yes
  - Suspect: ECM
- No
  - REPAIR the short circuit. For additional information, refer to the wiring diagrams.

Q15: CHECK THE 5 VOLT SUPPLY LINE FOR SHORT CIRCUIT TO GROUND

1. Key off.
2. ECM connector disconnected.
3. Key on, engine off.
4. Measure the resistance between:
   Accelerator pedal position sensor 1 - power - Pin 05  Negative post

Is the resistance greater than 100 Kohms?
- Yes
  - GO to Q16.
- No
  - GO to Q20.

Q16: CHECK THE 5 VOLT SUPPLY LINE FOR SHORT CIRCUIT TO POWER

1. Measure the resistance between:
   Accelerator pedal position sensor 1 - power - Pin 05  Positive post

Is the resistance greater than 100 Kohms?
- Yes
  - GO to Q17.
- No
  - GO to Q22.

Q17: CHECK THE APP1 5 VOLT SUPPLY LINE FOR OPEN CIRCUIT

1. Key off.
2. ECM connector disconnected.
3. Measure the resistance between:
   Accelerator pedal position sensor 1 - power - Pin 05  Accelerator pedal position sensor 1 - power - Pin A-E1

Is the resistance less than 10 ohms?
- Yes
  - Suspect: ECM connector. ECM
- No
  - REPAIR the open circuit. For additional information, refer to the wiring diagrams.

Q18: CHECK WHETHER THE 5 VOLT SUPPLY AND SIGNAL RETURN LINES ARE SHORTED TOGETHER

1. Key off.
2. ECM connector disconnected.
3. Key on, engine off.
4. Measure the resistance between:
   Accelerator pedal position sensor 1 - power - Pin 05  Accelerator pedal position sensor 1 - return - Pin 03

Is the resistance greater than 100 Kohms?
- Yes
  - GO to Q19.
- No
  - REPAIR the short circuit. For additional information, refer to the wiring diagrams.

Q19: CHECK THE APP1 SENSOR RETURN LINE FOR OPEN CIRCUIT

1. Measure the resistance between:
   Accelerator pedal position sensor 1 - return - Pin 03  Accelerator pedal position sensor 1 - return - Pin A-C1

Is the resistance less than 10 ohms?
- Yes
  - Suspect: ECM connector. ECM
- No
  - REPAIR the open circuit. For additional information, refer to the wiring diagrams.

Q20: CHECK WHETHER THE 5 VOLT SUPPLY AND SIGNAL RETURN LINES ARE SHORTED TOGETHER

1. Key off.
2. ECM connector disconnected.
3. Key on, engine off.
4. Measure the resistance between:
   Accelerator pedal position sensor 1 - power - Pin 05  Accelerator pedal position sensor 1 - return - Pin 03

Is the resistance greater than 100 Kohms?
- Yes
  - GO to Q21.
- No
  - REPAIR the short circuit. For additional information, refer to the wiring diagrams.

Q21: CHECK WHETHER THE SHORT CIRCUIT TO GROUND IS IN THE APP1 HARNESS OR ECU

1. Measure the resistance between:
   Accelerator pedal position sensor 1 - power - Pin 05  Negative post

Is the resistance greater than 100 Kohms?
- Yes
  - Suspect: ECM
- No
  - REPAIR the short circuit. For additional information, refer to the wiring diagrams.

Q22: CHECK WHETHER THE SHORT CIRCUIT TO POWER IS IN THE APP1 HARNESS OR ECU

1. Key off.
2. ECM connector disconnected.
3. Key on, engine off.
4. Measure the resistance between:
   Accelerator pedal position sensor 1 - power - Pin 05  Positive post
Q23: CHECK THE APP1 SENSOR RETURN LINE FOR SHORT CIRCUIT TO POWER

1. Measure the resistance between:
   Accelerator pedal position sensor 1 - return - Pin 03  Positive post
2. Is the resistance greater than 100 Kohms?
   Yes
   No

   REPAIR the short circuit. For additional information, refer to the wiring diagrams.

Q24: CHECK WHETHER THE SHORT CIRCUIT TO POWER IS IN THE APP1 HARNESS OR ECU

1. Key off.
2. ECM connector disconnected.
3. Key on, engine off.
4. Measure the resistance between:
   Accelerator pedal position sensor 1 - return - Pin 03  Positive post
2. Is the resistance greater than 100 Kohms?
   Yes
   No

   REPAIR the short circuit. For additional information, refer to the wiring diagrams.

Q25: CHECK THE APP2 SENSOR RETURN LINE

1. Key off.
2. APP Sensor connector disconnected.
3. Key on, engine off.
4. Measure the resistance between:
   Accelerator pedal position sensor 2 - return - Pin 06  Negative post
2. Is the resistance less than 10 ohms?
   Yes
   No

   GO to Q26.

Q26: CHECK THE APP2 VOLTAGE

1. Measure the voltage between:
   Accelerator pedal position sensor 2 - power - Pin 02  Negative post
2. Is the voltage between 4.8 volts - 5.2 volts?
   Yes
   No

   GO to Q27.

Q27: CHECK THE APP2 SIGNAL LINE FOR SHORT CIRCUIT TO GROUND

1. Measure the resistance between:
   Accelerator pedal position sensor 2 - signal- Pin 01  Negative post
2. Is the resistance greater than 100 Kohms?
   Yes
   No

   GO to Q28.

Q28: CHECK THE APP2 SIGNAL LINE FOR SHORT CIRCUIT TO POWER

1. Measure the resistance between:
   Accelerator pedal position sensor 2 - signal - Pin 01  Positive post
2. Is the resistance greater than 100 Kohms?
   Yes
   No

   GO to Q29.

Q29: CHECK FOR SHORT CIRCUIT BETWEEN THE APP2 SIGNAL AND THE POWER LINE

1. Measure the resistance between:
   Accelerator pedal position sensor 2 - signal - Pin 01  Accelerator pedal position sensor 2 - power - Pin 02
   Accelerator pedal position sensor 2 - signal - Pin 01  Accelerator pedal position sensor 2 - return - Pin 06
   Are the resistances greater than 100 Kohms?
   Yes
   No

   GO to Q30.

Q30: CHECK THE APP2 SIGNAL LINE FOR OPEN CIRCUIT

1. Key off.
2. ECM connector disconnected.
3. Measure the resistance between:
   Accelerator pedal position sensor 2 - signal - Pin 01  Accelerator pedal position sensor 2 - signal - Pin A-C2
2. Is the resistance less than 10 ohms?
   Yes
   An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s): ECM connector ECM
   No

   REPAIR the open circuit. For additional information, refer to the wiring diagrams.

Q31: CHECK THE APP2 CIRCUIT(S) FOR SIGNAL AND RETURN LINES SHORTED TOGETHER

1. Key off.
2. ECM connector disconnected.
3. Key on, engine off.
Measure the resistance between:
Accelerator pedal position sensor 2 - signal - Pin 01
Accelerator pedal position sensor 2 - return - Pin 06
Is the resistance greater than 100 Kohms?
Yes
GO to Q32.
No
REPAIR the short circuit. For additional information, refer to the wiring diagrams.

Q32: CHECK WHETHER THE SHORT CIRCUIT TO GROUND IS IN THE APP2 HARNESS OR ECU

Measure the resistance between:
Accelerator pedal position sensor 2 - signal - Pin 01
Negative post
Is the resistance greater than 100 Kohms?
Yes
Suspect: ECM
No
REPAIR the short circuit. For additional information, refer to the wiring diagrams.

Q33: CHECK WHETHER THE SHORT CIRCUIT TO POWER IS IN THE APP2 HARNESS OR ECU

Key off.
1. ECM connector disconnected.
2. Key on, engine off.
3. Measure the resistance between:
Accelerator pedal position sensor 2 - signal - Pin 01
Positive post
Is the resistance greater than 100 Kohms?
Yes
Suspect: ECM
No
REPAIR the short circuit. For additional information, refer to the wiring diagrams.

Q34: CHECK WHETHER THE SHORT CIRCUIT IS IN THE APP2 HARNESS OR CONTROL UNIT

Key off.
1. ECM connector disconnected.
2. Key on, engine off.
3. Measure the resistance between:
Accelerator pedal position sensor 2 - signal - Pin 01
Accelerator pedal position sensor 2 - power - Pin 02
Accelerator pedal position sensor 2 - signal - Pin 01
Accelerator pedal position sensor 2 - return - Pin 06
Are the resistances greater than 100 Kohms?
Yes
Suspect: ECM
No
REPAIR the short circuit. For additional information, refer to the wiring diagrams.

Q35: CHECK THE 5 VOLT SUPPLY LINE FOR SHORT CIRCUIT TO GROUND

Measure the resistance between:
Accelerator pedal position sensor 2 - power - Pin 02
Negative post
Is the resistance greater than 100 Kohms?
Yes
GO to Q36.
No
GO to Q41.

Q36: CHECK THE 5 VOLT SUPPLY LINE FOR SHORT CIRCUIT TO POWER

Measure the resistance between:
Accelerator pedal position sensor 2 - power - Pin 02
Positive post
Is the resistance greater than 100 Kohms?
Yes
GO to Q37.
No
GO to Q43.

Q37: CHECK THE APP2 5 VOLT SUPPLY LINE FOR OPEN CIRCUIT

Key off.
1. ECM connector disconnected.
2. Measure the resistance between:
Accelerator pedal position sensor 2 - power - Pin 02
Accelerator pedal position sensor 2 - power - Pin A-D2
Is the resistance less than 10 ohms?
Yes
Suspect: ECM connector ECM
No
REPAIR the open circuit. For additional information, refer to the wiring diagrams.

Q38: CHECK THE APP2 SENSOR RETURN LINE FOR SHORT CIRCUIT TO POWER

Measure the resistance between:
Accelerator pedal position sensor 2 - return - Pin 06
Positive post
Is the resistance greater than 100 Kohms?
Yes
GO to Q39.
No
GO to Q44.

Q39: CHECK WHETHER THE 5 VOLT SUPPLY AND SIGNAL RETURN LINES ARE SHORTED TOGETHER

Key off.
1. ECM connector disconnected.
2. Key on, engine off.
3. Measure the resistance between:
Accelerator pedal position sensor 2 - return - Pin 06
Accelerator pedal position sensor 2 - power - Pin 02
Is the resistance greater than 100 Kohms?
Yes
GO to Q40.
No
REPAIR the short circuit. For additional information, refer to the wiring diagrams.

Q40: CHECK THE APP2 SENSOR RETURN LINE FOR OPEN CIRCUIT
Measure the resistance between:
Accelerator pedal position sensor 2 - return - Pin 06  Accelerator pedal position sensor 2 - return - Pin A-B2

Is the resistance less than 10 ohms?
Yes
No

Suspect :- ECM connector= ECM

REPAIR the open circuit. For additional information, refer to the wiring diagrams.

Q41: CHECK WHETHER THE 5 VOLT SUPPLY AND SIGNAL RETURN LINES ARE SHORTED TOGETHER

1 Key off.
2 ECM connector disconnected.
3 Measure the resistance between:
Accelerator pedal position sensor 2 - power - Pin 02  Accelerator pedal position sensor 2 - return - Pin 06

Is the resistance greater than 100 Kohms?
Yes
No

GO to Q42.

REPAIR the short circuit. For additional information, refer to the wiring diagrams.

Q42: CHECK WHETHER THE SHORT CIRCUIT TO GROUND IS IN THE APP2 HARNESS OR ECU

1 Measure the resistance between:
Accelerator pedal position sensor 2 - power - Pin 02  Negative post

Is the resistance greater than 100 Kohms?
Yes
No

Suspect:- ECM

REPAIR the short circuit. For additional information, refer to the wiring diagrams.

Q43: CHECK WHETHER THE SHORT CIRCUIT TO POWER IS IN THE APP2 HARNESS OR ECU

1 Key off.
2 ECM connector disconnected.
3 Key on, engine off.
4 Measure the resistance between:
Accelerator pedal position sensor 2 - power - Pin 02  Positive post

Is the resistance greater than 100 Kohms?
Yes
No

Suspect:- ECM

REPAIR the short circuit. For additional information, refer to the wiring diagrams.

Q44: CHECK WHETHER THE SHORT CIRCUIT TO POWER IS IN THE APP2 HARNESS OR ECU

1 Key off.
2 ECM connector disconnected.
3 Key on, engine off.
4 Measure the resistance between:
Accelerator pedal position sensor 2 - return - Pin 06  Positive post

Is the resistance greater than 100 Kohms?
Yes
No

Suspect:- ECM

REPAIR the short circuit. For additional information, refer to the wiring diagrams.

**Inspection and Verification**

This pinpoint test is intended to diagnose the following:
- Short circuit to GROUND in the manifold absolute pressure (MAP) sensor circuit
- Short circuit to POWER in the manifold absolute pressure (MAP) sensor circuit
- Open circuit in the manifold absolute pressure (MAP) sensor circuit
- Manifold absolute pressure sensor
- ECM

Manifold absolute pressure (MAP) sensor connector

Pinpoint Tests

**PINPOINT TEST R : MANIFOLD ABSOLUTE PRESSURE (MAP) SENSOR**

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
</table>
| R1: CHECK THE MAP SENSOR CONNECTOR FOR PHYSICAL DAMAGE OR CORROSION | 1 Inspect the sensor for damage, correct fitment, connection, etc.  
Yes  
GO to R2.  
No  
CHECK and rectify as necessary. REFER to: Manifold Absolute Pressure (MAP) Sensor (303-14C Electronic Engine Controls - 2.7L V6 - TdV6, Removal and Installation). |
| R2: CHECK THE MAP PID VALUE | 1 Key on, engine run.  
2 Access the OBDII-Intake Manifold Absolute Pressure PID using a scan tool.  
3 Slowly increase the engine speed to 1,500 rpm while monitoring the PID.  
Did the pressure increase smoothly as the engine speed was increased?  
Yes  
No fault found.  
No  
GO to R3. |
| R3: CHECK THE MAP SENSOR RETURN LINE | 1 Key off.  
2 MAP Sensor connector disconnected.  
3 Measure the resistance between:  
Manifold absolute pressure sensor - return - Pin 03 Negative post  
Is the resistance less than 10 ohms?  
Yes  
GO to R4.  
No  
GO to R15. |
| R4: CHECK THE MAP VOLTAGE | 1 Key on, engine off.  
2 Measure the voltage between:  
Manifold absolute pressure sensor - power - Pin 01 Negative post  
Is the voltage between 4.8 volts - 5.2 volts?  
Yes  
GO to R5.  
No  
GO to R12. |
| R5: CHECK THE MAP SIGNAL LINE FOR SHORT CIRCUIT TO GROUND | 1 Measure the resistance between:  
Manifold absolute pressure sensor - signal - Pin 02 Negative post  
Is the resistance greater than 100 Kohms?  
Yes  
GO to R6.  
No  
GO to R9. |
| R6: CHECK THE MAP SIGNAL LINE FOR SHORT CIRCUIT TO POWER | 1 Key on, engine off.  
2 Measure the resistance between:  
Manifold absolute pressure sensor - signal - Pin 02 Positive post  
Is the resistance greater than 100 Kohms?  
Yes  
GO to R7.  
No  
GO to R10. |
| R7: CHECK THE MAP SIGNAL LINE FOR SHORT CIRCUIT TO SIGNAL RETURN AND SENSOR POWER | 1 Measure the resistance between:  
Manifold absolute pressure sensor - signal - Pin 02 Manifold absolute pressure sensor - power - Pin 01  
Manifold absolute pressure sensor - signal - Pin 02 Manifold absolute pressure sensor - return - Pin 03 |
Are the resistances greater than 100 Kohms?
Yes
   GO to R8.
No
   GO to R11.

R8: CHECK THE MAP SIGNAL LINE FOR OPEN CIRCUIT
1. Key off.
2. ECM connector disconnected.
3. Measure the resistance between:
   Manifold absolute pressure sensor - signal - Pin 02
   Manifold absolute pressure sensor - signal - Pin C-C1

   Is the resistance less than 10 ohms?
   Yes
      An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s): MAP connector, ECM connector, ECM.
   No
      REPAIR the open circuit. For additional information, refer to the wiring diagrams.

R9: CHECK WHETHER THE SHORT CIRCUIT TO GROUND IS IN THE MAP HARNESS OR ECU
1. Key off.
2. ECM connector disconnected.
3. Key on, engine off.
4. Measure the resistance between:
   Manifold absolute pressure sensor - signal - Pin 02
   Negative post

   Is the resistance greater than 100 Kohms?
   Yes
      Suspect: ECM
   No
      REPAIR the short circuit. For additional information, refer to the wiring diagrams.

R10: CHECK WHETHER THE SHORT CIRCUIT TO POWER IS IN THE MAP HARNESS OR ECU
1. Key off.
2. ECM connector disconnected.
3. Key on, engine off.
4. Measure the resistance between:
   Manifold absolute pressure sensor - signal - Pin 02
   Positive post

   Is the resistance greater than 100 Kohms?
   Yes
      Suspect: ECM
   No
      REPAIR the short circuit. For additional information, refer to the wiring diagrams.

R11: CHECK WHETHER THE SHORT CIRCUIT IS IN THE MAP HARNESS OR CONTROL UNIT
1. Key off.
2. ECM connector disconnected.
3. Measure the resistance between:
   Manifold absolute pressure sensor - signal - Pin 02
   Manifold absolute pressure sensor - power - Pin 01
   Manifold absolute pressure sensor - signal - Pin 02
   Manifold absolute pressure sensor - return - Pin 03

   Are the resistances greater than 100 Kohms?
   Yes
      Suspect: ECM
   No
      REPAIR the short circuit. For additional information, refer to the wiring diagrams.

R12: CHECK THE 5 VOLT SUPPLY LINE FOR SHORT CIRCUIT TO GROUND
1. Measure the resistance between:
   Manifold absolute pressure sensor - power - Pin 01
   Negative post

   Is the resistance greater than 100 Kohms?
   Yes
      GO to R13.
   No
      GO to R18.

R13: CHECK THE 5 VOLT SUPPLY LINE FOR SHORT CIRCUIT TO POWER
1. Measure the resistance between:
   Manifold absolute pressure sensor - power - Pin 01
   Positive post

   Is the resistance greater than 100 Kohms?
   Yes
      GO to R14.
   No
      GO to R19.

R14: CHECK THE MAP 5 VOLT SUPPLY LINE FOR OPEN CIRCUIT
1. Key off.
2. ECM connector disconnected.
3. Key on, engine off.
4. Measure the resistance between:
   Manifold absolute pressure sensor - power - Pin 01
   Manifold absolute pressure sensor - power - Pin C-D1

   Is the resistance less than 10 ohms?
   Yes
      Suspect: ECM connector, ECM
   No
      REPAIR the open circuit. For additional information, refer to the wiring diagrams.

R15: CHECK THE MAP SENSOR RETURN LINE FOR SHORT CIRCUIT TO POWER
1. Measure the resistance between:
   Manifold absolute pressure sensor - return - Pin 03
   Positive post

   Is the resistance greater than 100 Kohms?
   Yes
      GO to R16.
   No
R16: CHECK WHETHER THE 5 VOLT SUPPLY AND SIGNAL RETURN LINES ARE SHORTED TOGETHER

1. Measure the resistance between:
   - Manifold absolute pressure sensor - power - Pin 01
   - Manifold absolute pressure sensor - return - Pin 03

   Is the resistance greater than 100 Kohms?
   - Yes: GO to R20.
   - No: GO to R17.

R17: CHECK THE MAP SENSOR RETURN LINE FOR OPEN CIRCUIT

1. Key off.
2. ECM connector disconnected.
3. Key on, engine off.
4. Measure the resistance between:
   - Manifold absolute pressure sensor - return - Pin 03
   - Manifold absolute pressure sensor - return - Pin C-E2

   Is the resistance less than 10 ohms?
   - Yes: Suspect: MAP connector - ECM connector - MAP - ECM
   - No: REPAIR the open circuit. For additional information, refer to the wiring diagrams.

R18: CHECK WHETHER THE SHORT CIRCUIT TO GROUND IS IN THE MAP HARNESS OR ECU

1. Key off.
2. ECM connector disconnected.
3. Key on, engine off.
4. Measure the resistance between:
   - Manifold absolute pressure sensor - power - Pin 01
   - Negative post

   Is the resistance greater than 100 Kohms?
   - Yes: Suspect: ECM
   - No: REPAIR the short circuit. For additional information, refer to the wiring diagrams.

R19: CHECK WHETHER THE SHORT CIRCUIT TO POWER IS IN THE MAP HARNESS OR ECU

1. Key off.
2. ECM connector disconnected.
3. Key on, engine off.
4. Measure the resistance between:
   - Manifold absolute pressure sensor - power - Pin 01
   - Positive post

   Is the resistance greater than 100 Kohms?
   - Yes: Suspect: ECM
   - No: REPAIR the short circuit. For additional information, refer to the wiring diagrams.

R20: CHECK WHETHER THE SHORT CIRCUIT TO POWER IS IN THE MAP HARNESS OR ECU

1. Key off.
2. ECM connector disconnected.
3. Key on, engine off.
4. Measure the resistance between:
   - Manifold absolute pressure sensor - return - Pin 03
   - Positive post

   Is the resistance greater than 100 Kohms?
   - Yes: Suspect: ECM
   - No: REPAIR the short circuit. For additional information, refer to the wiring diagrams.

R21: CHECK WHETHER THE SHORT CIRCUIT IS IN THE MAP HARNESS OR CONTROL UNIT

1. Key off.
2. ECM connector disconnected.
3. Measure the resistance between:
   - Manifold absolute pressure sensor - power - Pin 01
   - Manifold absolute pressure sensor - return - Pin 03

   Is the resistance greater than 100 Kohms?
   - Yes: Suspect: ECM
   - No: REPAIR the short circuit. For additional information, refer to the wiring diagrams.
Removal

1. Switch the ignition on.
2. Position the front seat fully rearwards.
3. Switch the ignition off.
4. Remove the driver's side footwell trim panel.
   - Release the 3 clips.

5. Release the brake pedal position (BPP) switch.
   - Rotate the BPP switch 45 degrees counter-clockwise.

6. Remove the BPP switch.
   - Disconnect the electrical connector.

Installation

1. CAUTIONS:
Make sure that the brake pedal remains in the rest position during this procedure.

The bracket is keyed to avoid incorrect orientation. Failure to correctly align the switch may result in damage to the vehicle.

Make sure that the pedal box, booster-to-brake pedal assembly and switch bracket are all installed correctly before installing the switch.

Install the BPP switch.
- Locate the BPP switch in the bracket.
- Rotate the BPP switch 45 degrees clockwise.

2. Connect the electrical connector.
3. Install the driver's side footwell trim panel.
   - Align the trim panel with the guide.
   - Install the 3 clips.
Removal

1. Remove the left-hand exhaust gas recirculation (EGR) valve. For additional information, refer to: Exhaust Gas Recirculation (EGR) Valve LH (303-08B Engine Emission Control - 2.7L V6 - TdV6, Removal and Installation).

2. Disconnect the camshaft position (CMP) sensor electrical connector (engine shown removed for clarity).

3. Remove the CMP sensor (engine shown removed for clarity).
   - Remove and discard the CMP sensor.

Installation

1. NOTE: Only turn the engine in the normal direction of rotation.
   Turn the engine until one of the three webs on the back of the camshaft pulley is visible through the CMP sensor housing (timing belt upper cover shown removed for clarity).

2. **CAUTION:** The CMP sensor tip must rest on one of the three webs on the back of the camshaft pulley. Incorrect installation may result in the CMP sensor being damaged.
   Install the CMP sensor until the tip of the sensor touches the back of the camshaft pulley (timing belt upper cover shown removed for clarity).
3. Install the CMP sensor retaining bolt.
   - Tighten to 10 Nm

4. Connect the CMP sensor electrical connector.

5. Install the left-hand EGR valve.
   For additional information, refer to: Exhaust Gas Recirculation (EGR) Valve LH (303-08B Engine Emission Control - 2.7L V6 - TdV6, Removal and Installation).
Removal

All vehicles

1. Disconnect the battery ground cable.
   For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

2. Remove the air deflector.
   For additional information, refer to: Air Deflector (501-02 Front End Body Panels, Removal and Installation).

Left-hand drive vehicles

3. Lower the vehicle.

4. Center the steering wheel.
   - Lock in position, remove the ignition key.

5. Raise the vehicle.

6. Detach the lower steering column
   - Remove the steering gear shaft pinch bolt.

7. Detach the steering gear.

8. Using suitable tie strap(s), secure the steering gear.
9. Disconnect the crankshaft position (CKP) sensor electrical connector.

10. Remove the CKP sensor blanking cover.

11. NOTE: The CKP sensor retaining bolt should not be removed from the CKP sensor.
    Fully loosen the CKP sensor retaining bolt.

12. Remove the CKP sensor.

Installation
1. **CAUTION:** Install the CKP sensor correctly into the housing. Failure to follow this instruction may result in damage to the CKP sensor.

To install, reverse the removal procedure.

2. Tighten to 5 Nm.

3. Tighten to 100 Nm.

4. Tighten to 35 Nm.
Removal

Vehicles with manual transmission

1. Remove the flywheel.
   For additional information, refer to: Flywheel (303-01C Engine - 2.7L V6 - TdV6, In-vehicle Repair).

Vehicles with automatic transmission

2. Remove the flexplate.
   For additional information, refer to: Flexplate (303-01C Engine - 2.7L V6 - TdV6, In-vehicle Repair).

All vehicles

3. Remove the crankshaft position (CKP) sensor.

4. Remove the CKP sensor ring.
   • Discard the CKP ring.

Installation

• NOTE: Install a new CKP ring.

All vehicles
1. Install the alignment special tool to the crankshaft.
   - Align the special tool alignment peg to the timing hole on the crankshaft.

2. NOTE: Make sure that the CKP sensor ring is aligned correctly with the special tool pip and that both mating surfaces are fully seated.
   Install the CKP sensor ring to the installation special tool.

3. NOTE: Assemble the installation special tool to the alignment special tool.
   Using the special tool, install the CKP sensor ring.
   - Tighten the special tool nut.

4. Remove the installation special tool.

5. Remove the special tool retaining bolts and reposition into the threaded holes on the special tool and tighten to remove the alignment special tool from the crankshaft.
6. **CAUTION:** Install the CKP sensor correctly into the housing. Failure to follow this instruction may result in damage to the CKP sensor.

Install the crankshaft position (CKP) sensor.

- Tighten to 5 Nm.

Vehicles with automatic transmission

7. Install the flexplate.
   For additional information, refer to: [Flexplate](303-01C Engine - 2.7L V6 - TdV6, In-vehicle Repair).

Vehicles with manual transmission

8. Install the flywheel.
   For additional information, refer to: [Flywheel](303-01C Engine - 2.7L V6 - TdV6, In-vehicle Repair).
Removal

1. Disconnect the battery ground cable. For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

2. Remove the cabin air filter. For additional information, refer to: Cabin Air Filter (412-01 Air Distribution and Filtering, Removal and Installation).

3. Remove the engine compartment support.

4. Remove the cabin air filter housing retaining nut.

5. Remove the cabin air filter housing.

6. Remove the engine compartment panel.
7. Disconnect the engine control module (ECM) electrical connectors.

8. Remove the ECM bracket retaining nuts.

9. Remove the glove compartment.
   For additional information, refer to: Glove Compartment (501-12 Instrument Panel and Console, Removal and Installation).

10. Remove the ECM.
    - Remove the ECM bracket bolt.

**Installation**

1. To install, reverse the removal procedure.
   - Tighten to 6 Nm.
2. Tighten to 3 Nm.

3. Tighten to 25 Nm.
**Electronic Engine Controls - 2.7L V6 - TdV6 - Engine Coolant Temperature (ECT) Sensor**

**Removal**

1. **WARNINGS:**

   - Never remove the coolant expansion tank pressure cap under any circumstances while the engine is operating. Failure to follow this instruction may result in personal injury.

   - To avoid hot coolant or steam blowing out of the cooling system, use extreme care when removing the coolant expansion tank pressure cap. Wait until the engine has cooled down, then insulate the coolant pressure cap with a suitable cloth and slowly loosen the coolant expansion tank pressure cap until the cooling system pressure is released. Do not remove the coolant expansion tank pressure cap. Step back while the pressure is released from the system. When all of the pressure has been released slowly remove the coolant expansion tank pressure cap (still with the suitable cloth in position) from the coolant expansion tank. Failure to follow this instruction may result in personal injury.

   Release the cooling system pressure.

   - Remove the coolant expansion tank pressure cap.

2. Remove the oil filler cap.

3. Remove the engine cover.

4. Disconnect the engine coolant temperature (ECT) sensor electrical connector.
5. Remove the ECT sensor.
   1. Lift the locking tang.
   2. Rotate the ECT sensor counterclockwise to remove.

**Installation**

1. To install, reverse the removal procedure.
   - Fill the cooling system up to the MAX mark on the coolant expansion tank.
Electronic Engine Controls - 2.7L V6 - TdV6 - Engine Oil Pressure (EOP) Sensor
Removal and Installation

Removal

1. Remove the oil filler cap.

2. Remove the engine cover.

3. Disconnect the engine oil pressure (EOP) sensor electrical connector.

4. Remove the EOP sensor.

Installation
1. To install, reverse the removal procedure.
   - Tighten to 15 Nm.
Electronic Engine Controls - 2.7L V6 - TdV6 - Fuel Rail Pressure (FRP) Sensor

Removal and Installation

**General Equipment**

| Pneumatic vacuum gun |

**Removal**

**WARNINGS:**

⚠ Wait at least 30 seconds after the engine stops before commencing any repair to the high pressure fuel injection system. Failure to follow this instruction may result in personal injury.

⚠ Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable mixtures are always present and may ignite. Failure to follow these instructions may result in personal injury.

⚠ This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

⚠ Do not carry out any repairs to the fuel system with the engine running. The fuel pressure within the high-pressure system can be as high as 1650 bar. Failure to follow this instruction may result in personal injury.

**CAUTIONS:**

⚠ Make sure the workshop area in which the vehicle is being worked on is as clean and as dust free as possible. Foreign matter from work on clutches, brakes or from machining or welding operations can contaminate the fuel system and may result in later malfunction.

⚠ Always carry out the cleaning process before carrying out any repairs to the fuel injection system components. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

⚠ Diesel fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines.

⚠ Do not remove the fuel rail pressure sensor from the fuel injection diverter rail.

**NOTE:** If a new fuel rail pressure sensor is to be installed, a new fuel injection diverter rail and fuel rail pressure sensor must be installed as an assembly.

1. Remove the oil filler cap.

2. Remove the engine cover.

3. Remove the fuel injector soundproofing.
4. Remove the engine compartment support.

5. Remove the engine compartment access panel.

6. Remove the engine harness retaining bolts.

7. Detach the wiring harness retaining nut.

8. Clean around the low pressure fuel inlet and return lines, high-pressure fuel supply lines and surrounding areas. For additional information, refer to: Fuel Injection Component Cleaning (303-04C Fuel Charging and Controls - 2.7L V6 - TdV6, General Procedures).
9. Disconnect the low pressure fuel inlet and return lines. For additional information, refer to: Quick Release Coupling - Push Connect (310-00 Fuel System - General Information, General Procedures).
   • Install suitable blanking caps to the fuel lines and unions.

10. NOTE: Left-hand shown, right-hand similar.
    Detach the high pressure fuel supply line clamps.

11. CAUTION: Make sure that the high-pressure fuel supply line remains in contact with the fuel injection supply manifold and fuel injection diverter rail until both unions have been detached and cleaned. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.
    • NOTE: Left-hand shown, right-hand similar.
    Loosen the high pressure fuel supply lines.

12. Using the pneumatic vacuum gun, vacuum foreign material from the high-pressure fuel supply lines, the fuel injection diverter rail and the fuel injection supply manifolds.

13. NOTE: Left-hand shown, right-hand similar.
    Remove and discard the high pressure fuel supply lines.
    • Install suitable blanking caps to the open threaded ports on the fuel injection diverter rail and fuel injection supply manifold.
14. CAUTIONS:

⚠️ Make sure that the high-pressure fuel supply line remains in contact with the fuel injection pump and fuel injection diverter rail until both unions have been detached and cleaned. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

⚠️ Make sure the tool used to loosen the high-pressure fuel supply line unions is used at the top of the unions as this is where there is most material. Failure to follow this instruction may result in damage to the unions.

Loosen the high pressure fuel supply line.

15. Using the pneumatic vacuum gun, vacuum foreign material from the high-pressure fuel supply lines, the fuel injection diverter rail and the fuel injection pump.

16. Remove and discard the high pressure fuel supply line.
   - Install suitable blanking caps to the open threaded ports on the fuel injection diverter rail and fuel injection pump.

17. Remove the fuel line retaining nut.

18. Disconnect the electrical connector.
19. Disconnect the fuel line.
   • Install suitable blanking caps to the fuel line and union.

20. Detach the fuel line.
   • Install suitable blanking caps to the fuel line and union.

21. **CAUTION:** Do not remove the fuel rail pressure sensor from the fuel injection diverter rail.
   • **NOTE:** If a new fuel rail pressure sensor is to be installed, a new fuel injection diverter rail and fuel rail pressure sensor must be installed as an assembly.

   Remove the fuel injection diverter rail.

**Installation**

1. **WARNINGS:**
   
   - Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable mixtures are always present and may ignite. Failure to follow these instructions may result in personal injury.
   
   - This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.
   
   - Do not carry out any repairs to the fuel injection system with the engine running. The fuel pressure within the system can be as high as 1650 bar. Failure to follow this instruction may result in personal injury.

   - **CAUTIONS:**
     
     - Make sure the workshop area in which the vehicle is being worked on is as clean and as dust free as possible. Foreign matter from work on clutches, brakes or from machining or welding operations can contaminate the fuel system and may result in later malfunction.
     
     - Always carry out the cleaning process before carrying out any repairs to the fuel injection system components. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.
     
     - Diesel fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute
cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines.

⚠️ Do not remove the fuel rail pressure sensor from the fuel injection diverter rail.

• NOTE: If a new fuel rail pressure sensor is to be installed, a new fuel injection diverter rail and fuel rail pressure sensor must be installed as an assembly.

Install the fuel injection diverter rail.

• Do not fully tighten the fuel injection diverter rail retaining bolts at this stage.

2. Attach the fuel line.

• Remove and discard the blanking caps.

3. Connect the fuel line.

4. Connect the electrical connector.

5. Attach the fuel line retaining nut.

• Tighten to 7 Nm.
6. Install a new high pressure fuel supply line.
   • Remove and discard the blanking caps.
   • Install but do not tighten the high pressure fuel supply line.
   • Tighten the fuel injection diverter rail retaining bolts to 23 Nm.
   • Tighten the high-pressure fuel supply line in the sequence shown in four stages:
     1. Stage 1: Tighten the high-pressure fuel supply line union 1 to 15 Nm.
     2. Stage 2: Tighten the high-pressure fuel supply line union 2 to 15 Nm.
     3. Stage 3: Tighten the high-pressure fuel supply line union 1 to 30 Nm.
     4. Stage 4: Tighten the high-pressure fuel supply line union 2 to 30 Nm.

7. NOTE: Left-hand shown, right-hand similar.

   Install new high pressure fuel supply lines.
   • Remove and discard the blanking caps.
   • Tighten the high-pressure fuel supply line in the sequence shown in four stages:
     1. Stage 1: Tighten the high-pressure fuel supply line union 1 to 15 Nm.
     2. Stage 2: Tighten the high-pressure fuel supply line union 2 to 15 Nm.
     3. Stage 3: Tighten the high-pressure fuel supply line union 1 to 30 Nm.
     4. Stage 4: Tighten the high-pressure fuel supply line union 2 to 30 Nm.

8. NOTE: Left-hand shown, right-hand similar.

   Attach the high pressure fuel supply line clamps.
   • Tighten to 10 Nm.

9. Connect the low pressure fuel inlet and return lines.
   For additional information, refer to: Quick Release Coupling - Push Connect (310-00 Fuel System - General Information, General Procedures).
   • Remove and discard the blanking caps.
10. Attach the wiring harness retaining nut.
   - Tighten to 7 Nm.

11. Install the engine harness retaining bolts.
   - Tighten to 4 Nm.

12. Install the engine compartment access panel.

13. Install the engine compartment support.

14. Install the fuel injector soundproofing.

15. Install the engine cover.
16. Install the oil filler cap.
WARNING: Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable mixtures are always present and may ignite. Failure to follow these instructions may result in personal injury.

This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

Do not carry out any repairs to the fuel injection system with the engine running. The fuel pressure within the system can be as high as 1600 bar. Failure to follow this instruction may result in personal injury.

Do not carry out any repairs to the fuel injection system without checking that the fuel pressure has dropped to zero. Failure to follow this instruction may result in personal injury.

Wait at least one minute after the engine stops before commencing any repair to the fuel injection system. Failure to follow this instruction may result in personal injury. CAUTIONS:

CAUTION: Make sure the workshop area in which the vehicle is being worked on is as clean and as dust free as possible. Foreign matter from work on clutches, brakes or from machining or welding operations can contaminate the fuel system and may result in later malfunction.

Always carry out the cleaning process before carrying out any repairs to the fuel injection system components. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

Diesel fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines.

1. Remove the oil filler cap.

2. Remove the engine cover.

3. Disconnect the fuel temperature sensor electrical connector.
4. **CAUTION:** Do not use excessive force when detaching the fuel return line from the retaining bracket. Failure to follow this instruction may result in damage to the fuel return line.

To gain access to the locking tangs, detach the fuel return line from the retaining bracket and position it one side.

5. **CAUTION:** Do not use excessive force when releasing the fuel temperature sensor locking tangs. Failure to follow this instruction may result in damage to the fuel temperature sensor.

Remove the fuel temperature sensor.

1. Release the locking tangs.

2. Remove the fuel temperature sensor from the fuel return line.

   - Install a clean blanking plug to the fuel return line.
   - Discard the O-ring seal.

---

**Installation**

**WARNING:** Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable mixtures are always present and may ignite. Failure to follow these instructions may result in personal injury.

This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

Do not carry out any repairs to the fuel injection system with the engine running. The fuel pressure within the system can be as high as 1600 bar. Failure to follow this instruction may result in personal injury.

Do not carry out any repairs to the fuel injection system without checking that the fuel pressure has dropped to zero. Failure to follow this instruction may result in personal injury.

Wait at least one minute after the engine stops before commencing any repair to the fuel injection system. Failure to follow this instruction may result in personal injury. **CAUTIONS:**

**CAUTION:** Make sure the workshop area in which the vehicle is being worked on is as clean and as dust free as possible. Foreign matter from work on clutches, brakes or from machining or welding operations can contaminate the fuel system and may result in later malfunction.

Always carry out the cleaning process before carrying out any repairs to the fuel injection system components. Failure to follow this instruction may result in foreign matter ingressing to the fuel injection system.

Diesel fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines.

- **NOTE:** Install a new O-ring seal and fuel temperature sensor.

1. **NOTE:** Remove and discard the blanking plug from the fuel return line.

   To install, reverse the removal procedure.
1. Remove the oil filler cap.

2. Remove the engine cover.

3. Remove the cowl panel grille.
   For additional information, refer to: Cowl Panel Grille (501-02 Front End Body Panels, Removal and Installation).

4. Remove the engine compartment support.

5. Remove the engine compartment access panel.
6. Remove the engine wiring harness retaining bolts and position the wiring harness to one side.

7. Remove the oil filter housing.
   - Clean any oil spillage from the oil filter housing area.

8. Disconnect the knock sensor (KS) electrical connector.
   - Release the KS wiring harness from the retaining clips.

9. Disconnect the left-hand glow plugs electrical connector and position it to one side.

10. NOTE: Make a note of the orientation of the KS and make sure it is positioned in the same position when installed.

    Remove the KS.
Installation

1. **NOTE:** Prior to installing the KS, clean the cylinder head and KS mating surfaces.

   • **NOTE:** Make sure the KS is installed in the same position as removed.

   To install, reverse the removal procedure.
   
   1. Tighten to 20 Nm.

2. Tighten to 25 Nm.
Removal

1. Remove the oil filler cap.

2. Remove the engine cover.

3. Remove the oil filter housing.
   - Clean any oil spillage from the oil filter housing area.

4. Disconnect the knock sensor (KS) electrical connector.
   - Release the KS wiring harness from the retaining clips.

5. NOTE: Make a note of the routing of the KS wiring harness and make sure it is routed in the same position when installed.
   Manoeuvre the KS wiring harness under the intake air shutoff throttle.
6. Disconnect the right-hand glow plugs electrical connector and position it to one side.

7. **NOTE:** Make a note of the orientation of the KS and make sure it is positioned in the same position when installed.

Remove the KS.

---

**Installation**

1. **NOTE:** Prior to installing the KS, clean the cylinder head and KS mating surfaces.

   • **NOTE:** Make sure the KS is installed in the same position as removed.

   To install, reverse the removal procedure.

   • Tighten to 20 Nm.

2. Tighten to 25 Nm.
Removal

1. Remove the oil filler cap.

2. Remove the engine cover.

3. Disconnect the manifold absolute pressure (MAP) sensor electrical connector.

4. Remove the MAP sensor.

Installation
1. To install, reverse the removal procedure.
   - Tighten to 3 Nm.
Electronic Engine Controls - 2.7L V6 - TdV6 - Mass Air Flow (MAF) Sensor

Removal

• NOTE: This procedure is showing the lower mass air flow (MAF) sensor removal and installation. The upper MAF sensor removal and installation is similar.

1. Remove the air cleaner. For additional information, refer to: Air Cleaner (303-12C Intake Air Distribution and Filtering - 2.7L V6 - TdV6, Removal and Installation).

2. Remove the MAF sensor.

Installation

1. To install, reverse the removal procedure.
   • Tighten MAF sensor retaining screws to 2 Nm.
CAUTION: Use only Shell M1375.4 Automatic transmission fluid. Use of any other fluids may result in a transmission malfunction or failure.

A = refer to the procedure for correct torque sequence
The ZF 6HP26 automatic transmission has been developed for vehicles with an engine torque of up to 600 Newton-metres (Nm). This transmission uses planetary gears with hydraulic-electronic control. The transmission control module (TCM) and the main control valve body units form a composite element that is installed as a single unit inside the automatic transmission.

The 6HP26 has the following features:

- six forward speeds.
- a torque converter with an integral converter lock up clutch.
- electronic shift and pressure controls.
- a single planetary gear set.
- a double planetary gear set.
- two fixed multi-disc brakes.
- three multi-plate clutches.

All hydraulic functions are directed by electronic solenoids to control:

- engagement feel.
- shift feel.
- shift scheduling.
- modulated torque converter clutch (TCC) applications.
- engine braking utilizing the coast clutch.

Engine power reaches the transmission by a torque converter with integral converter lock up clutch. The 6 forward gears and 1 reverse gear are obtained from a single planetary set followed by a double planetary set also known as lepelletier-type gear sets, these gear sets make it possible to obtain 6 forward gears.

The 6HP26 Automatic Transmission is a six speed electronically controlled transmission comprising the basic elements of a TCM and main control valve body unit, a torque converter, one solenoid valve and six pressure regulators. Gear selection is achieved by the control of Automatic Transmission Fluid (ATF) flow to operate various internal clutches. The TCM operates the electrical components and provides for the control of gear selection shift pressure which increases refinement and torque converter slip control.

In the event of a system fault the TCM also provides for Failure Mode Effect Management (FMEM) to maintain maximum functional operation of the transmission with a minimum reduction in driver, passenger or vehicle safety. In the event of a total loss of control or electrical power the basic transmission functions Park, Reverse, Neutral and Drive are retained. Also 3rd or 5th gear is retained by the hydraulic system, the gear retained is dependant upon the gear selected at time of the failure.
The transmission also contains turbine and output shaft speed sensors, an internal P, R, N, D selector shaft position sensor, and a transmission fluid temperature sensor. The TCM also requires information from the J-Gate to determine when the driver has initiated manual gear selection. The TCM communicates with other electronic control modules by the controller area network (CAN).

The TCM also provides for legislated transmission diagnostics, which meet the requirements of CARB OBDII legislation, monitoring all components, which may effect vehicle emissions. Additional diagnostic functions are also supported to ensure fast repairs of all failures in the service environment.

Upshifts
Transmission upshifting is controlled by the TCM. The TCM receives inputs from various engine or vehicle sensors and driver demands to control shift scheduling, shift feel and torque converter clutch (TCC) operation.

The TCM has an adaptive learn strategy to electronically control the transmission which will automatically adjust the shift feel.

Downshifts
Under certain conditions the transmission will downshift automatically to a lower gear range (without moving the gearshift lever). There are three categories of automatic downshifts, coastdown, torque demand and forced or kickdown shifts.

Coastdown
The coastdown downshift occurs when the vehicle is coasting down to a stop.

Torque Demand
The torque demand downshift occurs (automatically) during part throttle acceleration when the demand for torque is greater than the engine can provide at that gear ratio. If applied, the transmission will disengage the TCC to provide added acceleration.

Kickdown
For maximum acceleration, the driver can force a downshift by pressing the accelerator pedal to the floor. A forced downshift into a lower gear is possible below calibrated speeds. Specifications for downshift speeds are subject to variations due to tire size and engine and transmission calibration requirements.

Range Selection
Depending on the vehicle options selected the transmission range selector may have different range positions.

The standard range selector has eight positions: P, R, N, D, 5, 4, 3 and 2.

J-Gate Range Selection

P

In the PARK position:
- there is no power flow through the transmission.
- the parking pawl locks the output shaft to the case.
- the engine may be started.
- the ignition key may be removed.

R

In the REVERSE position:
- the vehicle may be operated in a rearward direction, at a reduced gear ratio.
- backup lamps are illuminated.

N

In the NEUTRAL position:
- there is no power flow through the transmission.
- the output shaft is not held and is free to turn.
- the engine may be started.

D

DRIVE is the normal position for most forward driving.

The D position provides:
automatic shift 1-6 and 6-1. 
apply and release of the torque converter clutch. 
maximum fuel economy during normal operation. 
engine braking in 6th gear.

"5"
The 5 position provides:
- automatic shift 1-5 and 5-1. 
- apply and release of the torque converter clutch. 
- engine braking in 5th gear.

"4"
The 4 position provides:
- automatic shift 1-4 and 4-1. 
- apply and release of the torque converter clutch. 
- engine braking in 4th gear.

"3"
The 3 position provides:
- automatic shift 1-3 and 3-1. 
- engine braking in 3rd gear.

"2"
The 2 position provides:
- automatic shift 1-2 and 2-1. 
- engine braking in 2nd gear.

"S"
The sport mode switch:
- allows the driver to select or de-select the automatic transmission sport mode. 
- allows the automatic transmission to operate normally when the sport mode is selected, but under acceleration the gear shift points are extended to make full use of the engine's power reserves. 
- allows the driver to drive the vehicle in the "D" position with the full automatic transmission shift or manually shift gears in the "second, third, fourth and fifth" positions. 
- is illuminated when Sport mode is selected. 
- communicates with the TCM through the CAN network to show the sport mode switch status.

Torque converter
The torque converter is a three element unit containing a single plate lock up clutch. The lock up clutch can be controlled and engaged in any gear 1 to 6. The clutch is applied by removing transmission fluid pressure from one side of the plate. The torque converter transmits and multiplies torque. The torque converter is a three-element device:
- impeller assembly
- turbine assembly
- reactor assembly
The standard torque converter components operate as follows:
- The impeller, which is driven by the engine, imparts a circular flow to the transmission fluid in the converter. 
- This transmission fluid strikes the turbine wheel, which causes the flow to change its direction. 
- The transmission fluid flows out of the turbine wheel close to the hub and strikes the stator, where its direction is changed again to a direction suitable for re-entering the impeller. 
- The change in direction at the stator generates a torque reaction that increases the torque reaching the turbine. 
- The ratio between turbine and impeller torque is referred to as torque multiplication or conversion. 
- The greater the difference in speeds of rotation at the impeller and turbine, the greater the increase in torque; The maximum increase is obtained when the turbine wheel is stationary. As turbine wheel speed increases, the amount of torque multiplication gradually drops. 
- When the turbine wheel is rotating at about 85 % of the impeller speed, torque conversion reverts to 1, that is to say torque at the turbine wheel is no higher than the torque at the impeller. 
- The stator, which is prevented from rotating backwards by a freewheel and the shaft in the transmission housing, runs freely in the transmission fluid flow and overruns the freewheel. From this point on, the converter acts only as a fluid coupling. During the torque conversion process, the stator ceases to rotate and bears against the housing by the freewheel.
## Torque Converter Lock-up Clutch

The torque converter lock-up clutch is a device that eliminates slip in the torque converter and therefore helps to keep fuel consumption to a minimum.

The torque converter lock-up clutch is engaged and released by the control system. During the actuating phase, a slight difference is selected between the impeller and turbine wheels.

Pressure at the torque converter lock-up clutch piston is determined by an electronic pressure control valve.

The torque converter lock-up clutch can be controlled and engaged in any gear from 1 to 6. When decoupling takes place the actuating clutch A in the transmission is dependent on load and output speed.

When the torque converter lock-up clutch is released, transmission fluid pressures behind the lock-up clutch piston turbine area are equalized. The direction of flow is through the turbine shaft and the area behind the piston into the turbine area.

To engage the torque converter lock-up clutch the direction of transmission fluid flow is changed and reversed by a valve in the hydraulic control unit. At the same time the space behind the torque converter lock-up clutch piston is vented.

Oil pressure extends from the turbine area to the torque converter lock-up clutch piston and presses it against the cover outer shell of the torque converter. This locks the turbine wheel by way of the lined disc between the piston and the cover and enables the drive to pass with limited slip to the planetary gear train in normal operating conditions.

## Geartrain

Power is transmitted from the torque converter to the planetary gearsets through the input shaft. Clutches are used to hold and drive certain combinations of gearsets. This results in six forward ratios and one reverse ratio, which are transmitted to the output shaft and differential.

Double Planetary Gearset

The double planetary gearset is splined to the output shaft.

The double planetary gear set consists of:

- 2 sunwheels of different sizes
- 3 short planetary gears meshing with the sunwheels
- 3 long planetary gears meshing with the sunwheels
- 1 planetary gear carrier
- 1 ring gear

Double Planetary Gearset
Apply Components

### Shift Elements

The other shift elements in addition to the torque converter lock-up clutch are:

- three rotating multi-plate clutches A, B and E.
- two fixed multi-disc brakes C and D.

All gear shifts from 1st to 6th or from 6th to 1st are power-on overlapping shifts, that is to say during the shift one of the clutches must continue to transmit the drive at lower main pressure until the other clutch is able to accept the input torque.

The shift elements, clutches or brakes are engaged hydraulically. The transmission fluid pressure is built up between the cylinder and the piston, this presses the clutch plates together.

When the transmission fluid pressure drops, the cup spring pressing against the piston moves it back to its original position.

The purpose of these shift elements is to perform in-load shifts with no interruption to traction.

Multi-plate clutches A, B and E supply power from the engine to the planetary gear train; multi-disc brakes C and D bear against the transmission housing in order to achieve a torque reaction effect.
Multi Plate Clutch

Clutch E is equalized in terms of dynamic pressure, that is to say its piston is exposed to the transmission fluid flow on both sides, in order to prevent pressure build up in the clutch as the speed increases. This equalization process is achieved by a baffle plate and pressure-free transmission fluid supply by a lubricating passage, through which the space between piston and baffle plate is filled with transmission fluid.

The advantages of this dynamic pressure equalization are:

- reliable clutch engagement and release in all speed ranges.
- improved shift refinement.

Multi Plate Clutch
Shift overlap control

When overlap gearshift takes place, freewheels (one-way clutches) are not used but are replaced by suitable actuation of the relevant clutches. This both enables weight and space to be saved.

The electronic-hydraulic shift action is obtained by means of various valves in the transmission control module (TCM) and main control valve body, actuated by pressure regulators. They engage or disengage the relevant clutches or brakes at the correct moments.

Output is always by the ring gear of the second, downstream planetary gear set.

Hydraulic System

Fluid Pump

The fluid pump is of a "half-moon" pattern and delivers approximately 16 square cm of transmission fluid per revolution.

It is located between the torque converter and the transmission housing.

The torque converter is supported in the fluid pump by a needle roller bearing. The fluid pump is driven directly from the engine by the torque converter shell and supplies transmission fluid to the transmission and the hydraulic control unit.

The fluid pump draws in transmission fluid through a filter and delivers it at high pressure to the main pressure valve in TCM and main control valve body unit. This valve adjusts the pressure and returns excess transmission fluid to the fluid pan.

Fluid Pump
Fluid Pan, Gasket and Filter

The transmission fluid pan, gasket and filter is a one piece assembly, all transmission fluid is drawn from the transmission fluid pan by the fluid pump and passes through the fluid filter.

Transmission Control Module (TCM) and Main Control Valve Body

Electrostatic Discharge (ESD)

![Diagram of electrostatic discharge]

**CAUTION:** When working with the transmission control module (TCM) and main control valve body, all suitable safety precautions must be taken to protect the component against electrostatic discharge (ESD). Failure to follow these instructions may result in component damage.

Make sure all possible safety precautions are taken to protect the TCM and main control valve body unit against ESD.

Personal Wrist-Band Earthing

Earthing (grounding) by means of a wrist band or strap is the most reliable method of diverting electrostatic charges away from working personnel, and should therefore be used wherever possible, particularly if the person concerned is working while seated. The wrist band earthing (grounding) device consists of a bracelet closely attached to the wrist and a spiral earthing (grounding) cable connecting it to the earthing (grounding) contact point. This system must include a quick-release device so that the wrist can be released in the event of danger.

Shoes and Foot Earthing Straps

Electrically conductive shoes should be worn by persons who mainly work standing up or either standing or sitting in ESD protection zones, particularly if wrist band earthing (grounding) is impracticable. The standard calls for ESD shoes to record values between 0 and 35 Mega-ohms (MOhm) resistance. However, for antistatic working shoes resistance values between 0.1 and 1000 MOhm are called for, and a through-conducting resistance for protective shoes of 0.1 to 100 MOhm. A lower limit value of not less than 0.1 MOhm must be maintained on account of the contact voltage risk. For this reason the minimum value has been set contrary to the standard at the higher figure of 0.75 MOhm.

Transmission Control Module (TCM) and Main Control Valve Body

The transmission control module (TCM) and main control valve body is a combination of hydraulic and electronic control units. Both these modules are installed in the transmission, in the fluid pan.

This technical principle has the following advantages:

- Minimum tolerances (TCM is mated to solenoids)
- Better coordination of gear shifts
- Increased refinement
- Optimized shift quality
- Good reliability, since the number of plug connections and interfaces is reduced.

Transmission Control Module (TCM) and Main Control Valve Body
### Transmission Electronic System

The transmission control module (TCM) and its input/output network control the following transmission operations:

- Shift timing.
- Line pressure (shift feel).
- Torque converter clutch.

In addition, the TCM receives input signals from certain transmission-related sensors and switches. The TCM also uses these signals when determining transmission operating strategy.

Using all of these input signals, the TCM can determine when the time and conditions are right for a shift, or when to apply or release the torque converter clutch. It will also determine the pressure needed to optimize shift feel. To accomplish this the TCM uses six pressure control solenoids and one shift solenoid to control transmission operation.

The following provides a brief description of each of the sensors and actuators used to control transmission operation.

### TCM
The TCM for the transmission is mounted on top of the main control valve body. The control module for the transmission has been designed to operate correctly in the environment in which the TCM is located.

The transmission control module is activated and deactivated by the ignition supply and is connected to the transmission link harness by a 16-way connector.

The TCM controls the operation of the transmission. The TCM processes information received in both analogue and digital form such as:

- Transmission input speed
- Output speed
- Throttle pedal position
- Gear selector position
- Engine torque
- Engine speed
- Transmission fluid temperature
- Brake pedal status
- Engine oil temperature
- Coolant temperature
- ABS wheel speed

This information is then used by the TCM to decide which shift pattern to select and for shift energy management. Electro-hydraulic solenoid valves and pressure regulators control the transmission gear changes.

Five pressure regulators and one solenoid valve are used to control direct transmission fluid flow to select internal clutches and control the fluid pressure at the clutch. A separate pressure regulator is used exclusively for torque converter clutch control.

The TCM monitors all TCM inputs and outputs to confirm correct system operation. If a fault occurs the TCM is able to perform default action and inform the driver of the problem, this is by the instrument cluster message centre.

Solenoids

The hydraulic module contains one solenoid valve. The solenoid valve is actuated by the TCM and has two positions of open or closed, it is used to switch the position valve.

There are six electronic pressure control valves, these convert an electric current into a proportional hydraulic pressure. They are energized by the TCM and actuate the valves belonging to the relevant switching elements.

Controller Area Network (CAN) Interface

For the TCM to be able to perform shift point and shift quality management a number of external signals are required. For shift point management alone the TCM requires output speed sensor, throttle pedal position, brake pedal status and gear selector position. The controller area network (CAN) bus is used to share information between control modules. The TCM obtains most of its required data over the CAN bus from the electronic engine controls, J-Gate and ABS, Instruments pack and diagnostic tools.

Brake Pedal Position (BPP) Switch

The brake pedal position (BPP) switch tells the TCM when the brakes are applied, and disengages torque converter clutch. The BPP switch closes when the brakes are applied and opens when they are released. The BPP is also used to disengage the brake shift interlock and stops gradient calculations.

Engine Coolant Temperature (ECT) Sensor

The engine coolant temperature (ECT) sensor detects engine coolant temperature and supplies the information to the TCM. The ECT sensor is used to control the torque converter clutch (TCC) operation.

Accelerator Pedal Position (APP) Sensor

The accelerator pedal position (APP) sensor is a potentiometer mounted on the accelerator pedal. The APP sensor detects the position of the accelerator pedal and sends this information to the electronic control module (ECM). The APP sensor is used for shift scheduling and TCC lock-up.

Input Shaft Speed (ISS) Sensor

The input shaft speed (ISS) sensor is a Hall effect type sensor. The ISS sensor is mounted internally on the transmission and is located on the TCM and main control valve body unit.

Output Shaft Speed (OSS) Sensor

The output shaft speed (OSS) sensor is a Hall effect type sensor. The OSS sensor is mounted internally on the transmission and is located on the TCM and main control valve body unit and is used for shift scheduling.

Transmission Fluid Temperature (TFT) Sensor

The TCM utilizes one transmission fluid temperature sensor located on the main control valve body. The TCM uses the sensor input to activate various shift strategies. The sensor is in the form of a temperature dependent resistor.

The temperature sensor performs plausibility checks on each sensor reading. Obviously, the transmission oil temperature should not jump in value excessively between sensor readings. If the inputs from the temperature sensor are outside the working range it possible that the sensor is short or open circuit.

Position sensor

The TCM uses the position of this switch housed on the TCM and main control valve body, to determine the selected gear range on the Automatic side of the selector lever.

The selector lever is connected to the transmission by a cable, which operates the transmission selector shaft between positions Park, Reverse, Neutral and Drive. The TCM detects the driver's choice of manual range selection (5,4,3,2) by means of a 3-bit code generated by the J-gate. This 3-bit code is then transformed in to a CAN message by the J-Gate module and transmitted on to the CAN bus where it is detected by the TCM.
The sport mode switch:

- Allows the driver to select or de-select the automatic transmission sport mode.
- Allows the automatic transmission to operate normally when the sport mode is selected, but under acceleration the gear shift points are extended to make full use of the engine's power reserves.
- Allows the driver to drive the vehicle in the “D” position with the full automatic transmission shift or manually shift gears in the “second, third, fourth and fifth” positions.
- Is illuminated when Sport mode is selected.
- Communicates with the TCM through the CAN network to show the sport mode switch status.

**TCM Monitoring Functions**

As explained above the TCM monitors all input and outputs to identify possible failures. If a fault is detected the TCM takes the appropriate action to ensure the transmission enters a safe mode of operation, without sacrificing transmission durability or driver safety.

**Supply Monitoring**

If the battery voltage is either too great or too low, the TCM will detect a fault condition. For the TCM to be able to identify this fault, the engine must be running and the transmission fluid temperature sensor must be functioning correctly.

**Solenoid Supply Monitoring**

While the solenoid operating transistors are being activated, checks are run for open circuits, shorts circuits to ground and short circuits to supply. The monitoring function evaluates the voltage characteristics during the switch on process checking for the above faults.

All solenoid outputs are fully protected. The processor and the appropriate fail-safe action taken can quickly identify open and short circuit faults.

**Sensor Supply Monitoring**

The sensor supply voltage is a stabilized supply. This supply is monitored by the micro-processor by an Analogue to Digital Converter (ADC). If the voltage is out of the valid tolerance a raise a diagnostic trouble code (DTC) is set and the appropriate fail-safe action is performed.

**Electronically Erasable Program Read Only Memory (EEPROM) Monitoring**

To diagnose errors with the electronically erasable program read only memory (EEPROM) the TCM calculates 4 checksums continuously: If the processor identifies discrepancies in any of the four checksums the TCM will engage mechanical limp-home mode.

The TCM can diagnose errors within the EEPROM. Diagnosis is only performed during TCM initialization. There is no fail-safe mechanism associated with this function as the EEPROM is mainly used for the storage of fault codes and transmission calibration adaptations. If a fault occurs the TCM is able to perform default action and inform the driver of the problem, this is by the instrument cluster message centre.

**Watchdog Monitoring**

The watchdog monitoring function has two functions. Firstly it checks that it is possible to inhibit output control by the activation of the solenoid supply transistor. Secondly the watchdog checks that the safety circuit is functioning correctly.

During initialization the watchdog checks that it is possible to inhibit control of the pressure regulator and solenoid valves by switching the solenoid supply transistor. There is a fault if activation of the solenoids cannot be inhibited by the watchdog (NB. The supply to the solenoids can still be inhibited by the high side switch responsible for control of each solenoid i.e. One safety path is lost).

**Monitoring the Substrate Temperature Sensor**

The TCM is situated within the transmission on the valve body. As the TCM controls a number of high power solenoids and is surrounded by ATF, the TCM can obviously get very hot. If the temperature of the hardware rises above a pre-determined level the TCM will be shut down. Prior to the TCM shutting down the TCM will log a fault code, during shutdown the transmission will enter mechanical limp-home mode.

Monitoring of the substrate temperature is performed by a temperature dependent resistor mounted on the processor.

**Plausibility Checking**

The TCM detects a fault if an excessive voltage jump is identified between any two consecutive measurements. Also, with the engine started from cold the transmission fluid temperature will start to rise. Therefore the substrate or fluid temperature will also start to rise because the TCM is surrounded by transmission fluid. If the engine and output shaft speed is higher than a set threshold for a predetermined length of time without the substrate temperature rising above a set threshold a fault will be detected.

**Pressure Regulator/Solenoid Monitoring**

Each pressure regulator and solenoid is monitored for open circuits and short circuits. The TCM also checks that the current being delivered to each solenoid valve or pressure regulator is within valid limits. When each solenoid is being driven with minimum current the TCM checks that the current is not below a valid threshold. If either of these two errors occurs a plausibility error is logged and the appropriate fail-safe action is performed.

**Output Speed Monitor**

It is possible for the TCM to diagnose electrical errors associated with the output speed sensor while the vehicle is stationary as well as...
Input Speed Monitor

It is possible for the TCM to diagnose electrical errors associated with the input shaft speed sensor while the vehicle is stationary as well as moving. Plausibility monitoring is performed on the sensor output when the vehicle is moving.

Transmission Fluid Temperature Sensor Monitoring

The TCM monitors for faults associated with the transmission fluid temperature sensor in the following ways:

1. Open and short circuit fault detection.
2. The temperature cannot alter by more than a predefined differential between any two consecutive measurements.
3. The transmission fluid temperature must rise after the engine has been started provided that the fluid temperature was low enough to begin with (The vehicle must be driven and the diagnostic test condition met).

Position Sensor Monitoring

The TCM can identify errors with the position switch located within the transmission. If an unrecognized position code is read by the TCM a plausibility fault will be logged. (A code is checked between positions).

Transmission Fluid Temperature Sensor Monitoring

The TCM monitors for faults associated with the transmission fluid temperature sensor in the following ways:

1. Open and short circuit fault detection.
2. The temperature cannot alter by more than a predefined differential between any two consecutive measurements.
3. The transmission fluid temperature must rise after the engine has been started provided that the fluid temperature was low enough to begin with (The vehicle must be driven and the diagnostic test condition met).

Position Sensor Monitoring

The TCM can identify errors with the position switch located within the transmission. If an unrecognized position code is read by the TCM a plausibility fault will be logged. (A code is checked between positions).

The position switch outputs a 4-bit code to the TCM, the bits being labelled L1-L4. For the transmission, the following codes are used to identify the selector position.

Only for the automatic side of the J-GATE P,R,N,D

Gear Ratio Monitoring

The gear ratio diagnostic checks that each gear ratio is correctly engaged. Also, following a gear shift the diagnostic checks that the transmission has engaged the target gear within the allowed time.

Torque Converter Monitoring

The TCM checks that the torque converter can be locked correctly. If torque converter lock-up does not occur correctly the TCM performs the appropriate fail-safe action of opening the Torque converter clutch.

Torque Converter Lock-up Control

The TCM controls how the torque converter clutch is engaged as a function of the accelerator pedal position, output speed, transmission fluid temperature, gear selected and shift program. Lock-up is possible in all forward gears, but usually it is restricted to fourth, fifth and sixth gears. To make use of the comfort enhancing effect of the torque converter, the converter clutch can be disengaged prior to a downshift or up-shift. The torque converter lock up clutch is always modulated to allow for controlled slip, to further improve the shift quality.

Shift Energy Management

This function involves reducing or increasing the engine output torque during shifting. The aim when up-shifting is to reduce the energy that is dissipated in the friction elements of the transmission. This is done by reducing the engine torque during synchronization without interrupting the tractive drive. This function may be used for:

- Increasing the transmission service life by shortening the slipping time.
- Improving the shift comfort by reducing the step change in torque caused by the gearshift.
- Transferring a higher engine power, this is allowed by the mechanical in-gear strength of the transmission.

Real-time control of engine torque is required to maintain maximum shift quality and transmission durability. The TCM has the ability to control the engine output torque during the gearshift to synchronize with the operation of the transmission clutches.

Pressure Modulation

To provide a high level of shift comfort and durability, the hydraulic pressure in the shift related friction elements of the transmission must be matched very accurately to the transmission input torque. This hydraulic pressure is composed of a hydraulically pre-set basic pressure and a controlling pressure that is set by one of the electro-hydraulic pressure regulators.

The transmission input torque can be directly calculated from the following operating parameters: engine torque signals, engine speed or any signals transmitted from the ECM by CAN, and converter slip. Separate pressure characteristics for each gear change make it possible to adapt precisely to the particular shift operation. A further improvement in shift comfort is achieved by individual treatment of special cases, such as manual shifts.

Shift Quality Adapts

The shift quality adapts are used to obtain a high quality and consistent shift feel. This is achieved through monitoring shift quality and then adapting the shift pressures and shift energy management to overcome hardware variability and "in service wear".

It will typically take a new transmission approximately 161 kilometers (100 miles) of use to fully adapt.

Shift Point Selection

The gearshift points are selected by the TCM, as a function of the output speed, accelerator pedal position, selector position and shift program selected. The driver has control over the shift points by the selector lever, accelerator pedal movement and mode switch.

Transmission Shift selection

Shift Map Selection
The transmission control system utilizes a number of driver selectable operating modes and also a number of adaptive/automatically selectable modes. Sport, Normal and Cruise Control mode are all driver selectable. Hot mode, traction control mode and trailer towing mode are all adaptive modes i.e. the transmission will automatically select this mode dependent upon the current driving conditions.

**Normal Mode**

Normal mode can be selected by activation of the transmission mode switch located on the J-Gate. Once activated this mode will remain engaged until the driver deselects the mode or engages the cruise control system. If the driver engages cruise control when Normal mode is active upon deactivation of the cruise system the transmission will automatically re-engage Normal mode. This mode can be overridden by a number of adaptive modes.

The mode switch is of the momentary type.

**Cruise Mode**

When the driver engages the cruise control system the TCM receives a CAN message transmitted by the Adaptive Cruise Control (ACC) or engine electronic controls which informs the TCM that cruise control is currently active. Upon receipt of this message the TCM selects a new transmission shift map. This map has been developed to reduce busy gearshift during cruise mode. It has also been developed to increase fuel economy.

**Hot Mode**

This is one of the adaptive modes the transmission can enter when conditions are correct. When the transmission fluid temperature, chip temp, engine oil temp or coolant temperature becomes hot enough to reach threshold values, the TCM will cause the transmission to enter Hot mode. This mode will automatically engage new shift and lock-up maps to reduce heat generated within the transmission. The shift map will enable the transmission to change to higher gears at lower vehicle speeds and the lock-up map will engage the lock-up clutch at lower vehicle speeds and in lower gears. The effect of this is that less heat will be generated within the transmission due to the effects of lock-up clutch slip and churning effects. There will be forced upshift strategy used in hot mode. To exit hot mode the selector lever must be moved or the brake pedal applied or the accelerator pedal applied 100%, during all of these methods of exiting from hot mode the fluid temperature must be lower than the threshold values.

**Traction Control Mode**

Traction Control Mode is an adaptive mode, which is automatically engaged when a traction event occurs. When driving on slippery surfaces (i.e. sand, ice) it is possible for the driven wheels to begin to spin. The TCM believes the vehicle speed is increasing and therefore it may begin to upshift. These upshifts reduce the torque at the wheel and so tend to reduce wheel slip. The downshift lines are forced downwards to prevent unwanted shifts. To reduce the effects of this, if a traction event occurs a signal is transmitted by the ABS module to the TCM over the CAN network, the TCM uses this signal to change the currently selected shift map. The new shift map will have gearshift lines further apart, thus inhibiting the transmission shifting to a lower gear.

**Hill/Trailer Towing Mode**

This is an adaptive mode. When the TCM detects reduced vehicle acceleration for a certain percentage of throttle opening then this mode is automatically engaged by the TCM. When this mode is engaged a new shift map and torque converter lock-up map is selected. This new shift map is designed to reduce the number of gearshifts when towing a trailer or with the car climbing a steep hill. The shift map will cause the transmission to hold on to gears for longer this increases acceleration and reduces the number of gearshifts. This mode can also give an advantage when driving at high altitudes, where the torque produced by an engine is greatly reduced by the effects of reduced ambient pressure and airflow.

**Driving Mode Priority**

Each of the above modes has an associated priority i.e. Normal mode cannot over-ride cruise mode etc.

**Adaptive Shift Strategies**

The TCM of the six speed ZF automatic transmission incorporates adaptive strategies which improve the accessibility of the vehicle’s performance in driving conditions while maintaining a relaxed driving experience when cruising.

In “Sport” mode, accelerator pedal usage and cornering behaviour are monitored to assess driving style and road conditions. When an enthusiastic driving style or a demanding road is detected, 6th gear is inhibited and the lower gears are made slightly more accessible in order to prevent unwanted “hunting” between gears. Conversely, when cruising conditions are detected, 6th gear is once again made available to maximise driving refinement and economy.

Under conditions of heavy braking, the transmission will perform one or more downshifts to improve response to a subsequent accelerator pedal application. Similarly if the accelerator pedal is released rapidly following hard acceleration, one or more upshifts are inhibited to increase engine braking and also improve subsequent response.

To complement these features, when a corner is detected transmission upshifts are inhibited. This inhibition is also maintained for a short distance after the corner allowing the driver to achieve a smooth balance through the bend without unwanted shifting mid-corner.

**Safety features**

The safety functions are designed to safeguard against mis-operation by the driver as well as against system malfunctions. The mis-operation system prevents reverse gear from being engaged at high forward speeds (Above 5 kph) and prevents manual downshifting at excessive engine speeds.

Great attention has been paid to safeguarding against, and detecting, malfunctions in the electronic control system. The design of the electrical and diagnostic system is such that system integrity is protected at all times.

The hydraulic system has "fail-safe" characteristics regarding its electrical energisation, i.e. as a result of the power supply being lost to the electro-hydraulic actuators the transmission engages a reliable emergency gear ratio to facilitate a basic limp-home mode.

Recognition of critical shift operation by monitoring the last element in the signal path, i.e. the solenoid valve, and checking by means of redundant measured variables, i.e. engine speed, input speed and output speed.

Measures are in place which guarantee a high degree of availability of safeguard functions, i.e. monitoring of safety circuits. For this purpose each time the vehicle is started there is a check on the entire safety hardware, this is during TCM initialization and the associated program parts and signal paths used during the TCM operation status. A malfunction in this part of the system, or triggering of the safety circuit, will be communicated to the driver by the instrument cluster message centre.

Automatic Transmission/Transaxle - Diagnostic Strategy
VIN Range: M45255->N52047

Diagnosis and Testing

The complexity of the electronics involved with the automatic transmission preclude the use of workshop general electrical test equipment. Therefore, reference should be made to the Jaguar approved diagnostic system for detailed instructions on testing the automatic transmission.

Where a fault involving the automatic transmission is indicated by the Jaguar approved diagnostic system, some basic diagnostic methods may be necessary to confirm that connections are good and that the wiring is not damaged, before installing new components.

1. Verify the customer concern by operating the vehicle. Refer to the automatic transmission diagnostic drive cycle in the DTC summary section.
2. Check the fluid levels and condition of the fluid.
3. Check for non-factory fitted items.
4. Check the selector lever cable for correct adjustment. Refer to Section 307-05 Automatic Transmission/Transaxle External Controls.
5. Visually inspect for obvious signs of mechanical, electrical or hydraulic damage:

Basic diagnosis

Check Fluid Level and Condition

⚠️ CAUTION: The vehicle should not be driven if the fluid level is low as internal failure can result.

• NOTE: The transmission oil temperature must not be allowed to exceed 50 °C (122 °F) whilst checking level. Should the temperature rise above this figure, abort the check and allow the transmission oil to cool to below 30°C (86°F).

This vehicle is not equipped with a fluid level indicator. An incorrect level may affect the transmission operation and could result in transmission damage. To correctly check and add fluid to the transmission, refer to Transmission Fluid Level Check in this section.

High Fluid Level

A fluid level that is too high may cause the fluid to become aerated due to the churning action of the rotating internal parts. This will cause erratic control pressure, foaming, loss of fluid from the vent tube and possible transmission damage. If an overfill reading is indicated, refer to Transmission Fluid Drain and Refill in this section.

Low Fluid Level

A low fluid level could result in poor transmission engagement, slipping, or damage. This could also indicate a leak in one of the transmission seals or gaskets. Refer to Transmission Fluid Level Check in this section.

Adding Fluid

⚠️ CAUTION: The use of any other type of transmission fluid than specified can result in transmission damage.

If fluid needs to be added, add fluid in 0.50 liter increments through the fill hole opening. Do not overfill the fluid. For fluid type, refer to the General Specification chart in this section. Refer to Transmission Fluid Level Check in this section.

Fluid Condition Check

1. Check the fluid level. For additional information, refer to Transmission Fluid Drain and Refill in this section.
2. Observe the color and the odor. The color under normal circumstances should be reddish, not brown or black.
3. Allow the fluid to drip onto a facial tissue and examine the stain.
4. If evidence of solid material is found, the transmission fluid pan should be removed for further inspection.

NOTE: In the event of a transmission unit replacement for internal failure, the oil cooler and pipes must also be replaced.

Shift Linkage Check

Hydraulic leakage at the manual control valve can cause delay in engagements and/or slipping while operating if the linkage is not correctly adjusted; for selector lever cable adjustment, refer to Section 307-05 Automatic Transmission/Transaxle External Controls.

**Transmission Link Harness Electrical Connector Layout**

**Electrostatic Discharge**

⚠️ **CAUTION:** When working with the transmission control module (TCM) and main control valve body, all suitable safety precautions must be taken to protect the component against electrostatic discharge. Failure to follow these instructions may result in component damage.

Make sure all possible safety precautions are taken to protect the TCM and main control valve body unit against electrostatic discharge.

**Personal Wrist-Band Earthing**

Earthing (grounding) by means of a wrist band or strap is the most reliable method of diverting electrostatic charges away from working personnel, and should therefore be used wherever possible, particularly if the person concerned is working while seated. The wrist band earthing (grounding) device consists of a bracelet closely attached to the wrist and a spiral earthing (grounding) cable connecting it to the earthing (grounding) contact point. This system must include a quick-release device so that the wrist can be released in the event of danger.

**Shoes and Foot Earthing Straps**

Electrically conductive shoes should be worn by persons who mainly work standing up or either standing or sitting in ESD protection zones, particularly if wrist band earthing (grounding) is impracticable. The standard calls for ESD shoes to record values between 0 and 35 Megga-ohms (MOhm) resistance. However, for antistatic working shoes resistance values between 0.1 and 1000 MOhm are called for, and a through-conducting resistance for protective shoes of 0.1 to 100 MOhm. A lower limit value of not less than 0.1 MOhm must be maintained on account of the contact voltage risk. For this reason the minimum value has been set contrary to the standard at the higher figure of 0.75 MOhm.

**Transmission Link Harness Electrical Connector Layout**

- **CAUTIONS:**
  - When working with the transmission control module (TCM) and main control valve body, all suitable safety precautions must be taken to protect the component against electrostatic discharge.
  - Do not carry out any electrical tests on the TCM and main control valve body. Failure to follow these instructions may result in component damage.
  - Make sure all suitable safety precautions are taken to protect the transmission control module (TCM) and main control valve body electrical connector pins against electrostatic discharge.

Solenoids

- **CAUTIONS:**

  - When working with the transmission control module (TCM) and main control valve body, all suitable safety precautions must be taken to protect the component against electrostatic discharge.
  - Do not carry out any electrical tests on the TCM and main control valve body. Failure to follow these instructions may result in component damage.

The hydraulic module contains one solenoid valve. The solenoid valve is actuated by the TCM and has two positions (open or closed), it is used to switch the position valve. There are six electronic pressure control valves, these convert an electric current into a proportional hydraulic pressure. They are energised by the TCM and actuate the valves belonging to the relevant switching elements.

Two types of electronic pressure regulator are installed:

1. **Pressure regulator with a rising characteristic (1,3,6 green cap) i.e. as current increases pressure increases (0mA = 0 bar / 700mA = 4.6 bar)**
2. **Pressure regulator with a falling characteristic (2,4,5 black cap) i.e. as current increases the pressure drops (0 mA = 4.6 bar / 700 mA = 0 bar)**

Both types of regulator have a resistance value of approximately 5 Ohms at 20°C.

System inputs and outputs

System inputs

The TCM uses the permanent voltages supply to support and to maintain data in the random access memory (RAM).

The Term.15 input is used to wake up the TCM. Once awake the TCM commences its initialization sequence. This input is not a power supply input to the TCM. For initialization to commence the ignition must be switched to the "II2" position and Vbat above 7V but below 16V (30ms after term.15 signal on, the initialization of the TCM starts). Initialization time is 500ms max. When initialization is finished, the Drive Program is started and TCM has full functionality.

The TCM has one internal solenoid ground for all internal solenoids (SV and PR).

This internal input acts as the ground for position switch. The TCM requires two vehicle ground supplies. (Term.31). Both ground wires are linked to one grounding point on the vehicle. The TCM incorporates polarity reversal protection.

System outputs

The P/N signal (from the internal position sensor) is used to ensure that the engine is only started with the transmission gear selector in either the Park or Neutral position. When the selector is in either Park or Neutral this output is activated. This in turn closes a relay that allows the starter to be engaged if allowed by the Engine management system. If this output fails the electronic engine controls system uses a CAN bus signal supplied by the TCM to allow the engine to start.

Transmission control

The selector lever can be used to engage Park through to drive (D) mechanically. The link between the lever and the transmission is by a cable.

The manual side of the shifter, 5 through to position 2 are selected electronically by the CAN bus. Integrated with this are functions for gear selected illumination, brake shift interlock and keylock interlock system. For additional information, REFER to Section 307-05 Automatic Transmission/Transaxle External Controls.
Automatic Transmission/Transaxle - Diagnostic Strategy
VIN Range: N52048->N99999

Diagnosis and Testing

The complexity of the electronics involved with the automatic transmission preclude the use of workshop general electrical test equipment. Therefore, reference should be made to the Jaguar approved diagnostic system for detailed instructions on testing the automatic transmission.

Where a fault involving the automatic transmission is indicated by the Jaguar approved diagnostic system, some basic diagnostic methods may be necessary to confirm that connections are good and that the wiring is not damaged, before installing new components.

1. Verify the customer concern by operating the vehicle. Refer to the automatic transmission diagnostic drive cycle in the DTC summary section.
2. Check the fluid levels and condition of the fluid.
3. Check for non-factory fitted items.
4. Check the selector lever cable for correct adjustment as per workshop manual section 307-05 selector lever cable adjustment procedure.
5. Visually inspect for obvious signs of mechanical, electrical or hydraulic damage:

Basic diagnosis

Check Fluid Level and Condition

**CAUTION:** The vehicle should not be driven if the fluid level is low as internal failure can result.

- NOTE: The transmission oil temperature must not be allowed to exceed 50 °C (122 °F) whilst checking level. Should the temperature rise above this figure, abort the check and allow the transmission oil to cool to below 30°C (86°F).

This vehicle is not equipped with a fluid level indicator. An incorrect level may affect the transmission operation and could result in transmission damage. To correctly check and add fluid to the transmission follow the procedures outlined in the workshop manual section 307-01 under General Procedures.

High Fluid Level

A fluid level that is too high may cause the fluid to become aerated due to the churning action of the rotating internal parts. This will cause erratic control pressure, foaming, loss of fluid from the vent tube and possible transmission damage. If an overfill reading is indicated, refer to the workshop manual section 307-01 - General Procedures - drain and refill.

Low Fluid Level

A low fluid level could result in poor transmission engagement, slipping, or damage. This could also indicate a leak in one of the transmission seals or gaskets. To correctly check and add fluid to the transmission follow the procedures outlined in the workshop manual section 307-01 under General Procedures.

Adding Fluid

**CAUTION:** The use of any other type of transmission fluid than specified can result in transmission damage.

If fluid needs to be added, add fluid in 0.50 liter increments through the fill hole opening. Do not overfill the fluid. For fluid type, refer to the General Specification chart in section 307-01 of the workshop manual.

Fluid Condition Check

1. Check the fluid level. For additional information refer to the workshop manual section 307-01.
2. Observe the color and the odour. The color under normal circumstances should be like honey, not dark brown or black.
3. Allow the fluid to drip onto a facial tissue and examine the stain.
4. If evidence of solid material is found, the transmission fluid pan should be removed for further inspection.

NOTE: In the event of a transmission unit replacement for internal failure, the oil cooler and pipes must also be replaced.

Shift Linkage Check

Hydraulic leakage at the manual control valve can cause delay in engagements and/or slipping while operating if the linkage is not correctly adjusted; for selector lever cable adjustment refer to the workshop manual section 307-05.

Earthing (grounding) by means of a wrist band or strap is the most reliable method of diverting electrostatic charges away from working personnel, and should therefore be used wherever possible, particularly if the person concerned is working while seated. The wrist band consists of a bracelet closely attached to the wrist and a spiral earthing (grounding) cable connecting it to the person's body. Earthing (grounding) devices should be used wherever possible, particularly if the person concerned is working while seated.

**Personal Wrist-Band Earthing**

Make sure all possible safety precautions are taken to protect the TCM and main control valve body unit against electrostatic discharge. Failure to follow these instructions may result in component damage.

**Electrostatic Discharge**

**Transmission Link Harness Electrical Connector Layout**

**Electrostatic Discharge**

**CAUTION:** When working with the transmission control module (TCM) and main control valve body, all suitable safety precautions must be taken to protect the component against electrostatic discharge. Failure to follow these instructions may result in component damage.

Make sure all possible safety precautions are taken to protect the TCM and main control valve body unit against electrostatic discharge.

**Personal Wrist-Band Earthing**

Earthing (grounding) by means of a wrist band or strap is the most reliable method of diverting electrostatic charges away from working personnel, and should therefore be used wherever possible, particularly if the person concerned is working while seated. The wrist band consists of a bracelet closely attached to the wrist and a spiral earthing (grounding) cable connecting it to the earthing (grounding) contact point. This system must include a quick-release device so that the wrist can be released in the event of a fault.
Shoes and Foot Earthing Straps

Electrically conductive shoes should be worn by persons who mainly work standing up or either standing or sitting in ESD protection zones, particularly if wrist band earthing (grounding) is impracticable. The standard calls for ESD shoes to record values between 0 and 35 Mega-ohm (MOhm) resistance. However, for antistatic working shoes resistance values between 0.1 and 1000 MOhm are called for, and a through-conducting resistance for protective shoes of 0.1 to 100 MOhm. A lower limit value of not less than 0.1 MOhm must be maintained on account of the contact voltage risk. For this reason the minimum value has been set contrary to the standard at the higher figure of 0.75 MOhm.

Transmission Link Harness Electrical Connector Layout

- **CAUTIONS:**

  - When working with the transmission control module (TCM) and main control valve body, all suitable safety precautions must be taken to protect the component against electrostatic discharge.

  - Do not carry out any electrical tests on the TCM and main control valve body. Failure to follow these instructions may result in component damage.

  - Make sure all suitable safety precautions are taken to protect the transmission control module (TCM) and main control valve body electrical connector pins against electrostatic discharge.

Solenoids

- **CAUTIONS:**

  - When working with the transmission control module (TCM) and main control valve body, all suitable safety precautions must be taken to protect the component against electrostatic discharge.

  - Do not carry out any electrical tests on the TCM and main control valve body. Failure to follow these instructions may result in component damage.

The hydraulic module contains one solenoid valve. The solenoid valve is actuated by the TCM and has two positions (open or closed), it is
used to switch the position valve.

There are six electronic pressure control valves, these convert an electric current into a proportional hydraulic pressure. They are energized by the TCM and actuate the valves belonging to the relevant switching elements.

Two types of electronic pressure regulator are installed:

1. **Pressure regulator with a rising characteristic (1,3,6 green cap)** i.e. as current increases pressure increases (0mA = 0 bar / 700mA = 4.6 bar)

2. **Pressure regulator with a falling characteristic (2,4,5 black cap)** i.e. as current increases the pressure drops (0 mA = 4.6 bar / 700 mA = 0 bar)

Both types of regulator have a resistance value of approximately 5 Ohms at 20°C.

- **PR5**: System Pressure
- **PR6**: Torque Converter Clutch

### System inputs and outputs

#### System inputs

The TCM uses the permanent voltages supply to support and to maintain data in the random access memory (RAM).

The Term.15 input is used to wake up the TCM. Once awake the TCM commences its initialization sequence. This input is not a power supply input to the TCM. For initialization to commence the ignition must be switched to the "II2" position and Vbat above 7V but below 16V (30ms after term.15 signal on, the initialization of the TCM starts). Initialization time is 500ms max. When initialization is finished, the Drive Program is started and TCM has full functionality.

The TCM has one internal solenoid ground for all internal solenoids (SV and PR).

This internal input acts as the ground for position switch. The TCM requires two vehicle ground supplies. (Term.31). Both ground wires are linked to one grounding point on the vehicle. The TCM incorporates polarity reversal protection.

#### System outputs

The P/N signal (from the internal position sensor) is used to ensure that the engine is only started with the transmission gear selector in either the Park or Neutral position. When the selector is in either Park or Neutral this output is activated. This in turn closes a relay that allows the starter to be engaged if allowed by the Engine management system. If this output fails the electronic engine controls system uses a CAN bus signal supplied by the TCM to allow the engine to start.

#### Transmission control

The selector lever can be used to engage Park through to drive (D) mechanically. The link between the lever and the transmission is by a cable.

The manual side of the shifter, 5 through to position 2 are selected electronically by the CAN bus. Integrated with this are functions for gear selected illumination, brake shift interlock and keylock interlock system. For additional information refer to the workshop manual section 307-05.
Automatic Transmission/Transaxle - Transmission Fluid Drain and Refill

General Procedures

Drain

**Vehicles with diesel engine**

1. Remove the transmission undertray.

**All vehicles**

2. Raise and support the vehicle.
   For additional information, refer to: [Lifting](100-02 Jacking and Lifting, Description and Operation).

3. Place a suitable container under the transmission.

4. Using the special tool, remove the transmission fluid fill plug.
   - Remove and discard the transmission fluid fill plug.

5. **CAUTION:** If the automatic transmission fluid is very dirty or it contains metallic particles, then along with a new transmission, install a new automatic transmission fluid cooler and lines.
   Remove and discard the transmission fluid drain plug.
6. Install the new transmission fluid drain plug.
   - Tighten to 8 Nm.

All vehicles

1. NOTE: Use transmission fluid meeting Jaguar specification.
   Fill the transmission with 8 liters of transmission fluid through the transmission fluid filler plug hole.

2. Carry out a transmission fluid level check.
   For additional information, refer to: Transmission Fluid Level Check (307-01 Automatic Transmission/Transaxle, General Procedures).
Automatic Transmission/Transaxle - Transmission Fluid Level Check

General Procedures

<table>
<thead>
<tr>
<th>Special Tool(s)</th>
<th>Adaptor 307-452</th>
</tr>
</thead>
</table>

Check

All vehicles

1. The follow steps must be observed before starting the transmission fluid level check.
   1. The vehicle must be on a horizontal ramp.
   2. The parking brake must be applied.
   3. The engine must be running for 2 minutes with the transmission selector lever in the "P" position.

2. Connect the Jaguar Approved Diagnostic System.
3. Make sure the transmission selector lever is in the "P" position.

4. NOTE: Make sure the transmission fluid temperature is below 30 °C (86 °F) on the Jaguar Approved Diagnostic System.

   With the engine running and the foot brake applied, circulate the transmission fluid by:
   1. Moving the transmission selector lever to the "R" position
   2. Waiting for three seconds.
   3. Moving the transmission selector lever to the "D" position
   4. Waiting for three seconds.
   5. Moving the transmission selector lever to the "P" position

5. Raise and support the vehicle.
   For additional information, refer to: Lifting (100-02 Jacking and Lifting, Description and Operation).

Vehicles with diesel engine

6. Remove the transmission undertray.

All vehicles

7. Place a suitable container under the transmission fluid filler plug.
8. **WARNING:** Make sure that care is exercised near rotating parts. Failure to follow this instruction may result in personal injury.

With the engine running, using the special tool remove the transmission fluid fill plug.

- Remove and discard the transmission fluid fill plug.

9. **NOTE:** Use transmission fluid meeting Jaguar specification.

If the transmission fluid does not come out of the transmission fluid filler plug hole the transmission fluid level is insufficient. If this is the case add the transmission fluid in 0.5 liter units into the transmission fluid filler plug hole until fluid comes out.

10. **NOTE:** Make sure the transmission fluid temperature does not exceed 50 °C (122 °F). If the transmission fluid temperature does exceed 50 °C (122 °F) stop the transmission fluid level check and allow the transmission fluid to cool until the temperature is below 30 °C (86°F).

Allow the transmission fluid to drain from the transmission fluid filler plug hole until the flow almost stops.

11. **NOTE:** Install a new sealing washer.

Using the special tool, install the new transmission fluid fill plug.

12. **CAUTION:** Make sure the transmission fluid fill plug is tightened to the correct specification. Failure to follow this instruction may result in damage to the vehicle.

Using the special tool and a torque wrench, tighten the transmission fluid fill plug.

- Tighten the transmission fluid fill plug to the torque given by the calculation
- To make sure the transmission fill plug is torqued to the correct specification. Using the special tool and a torque wrench the following calculation steps must be followed.
  1. **Step 1.** Multiply 35 Nm by the effective length of the torque wrench (1).
  2. **Step 2.** Add the effective length of the special tool (2) to the effective length of the torque wrench (1).
3. Step 3. Divide the total of step 1 by the total of step 2.
4. Step 4. Set the torque wrench to the figure arrived at in step 3.
   - Tighten the transmission fluid fill plug to the torque given by the calculation.

13. Remove the special tool.

14. Remove the container.

15. Install the transmission undertray.

16. Lower the vehicle.
17. Disconnect the Jaguar Approved Diagnostic System.

**Removal**
1. **CAUTIONS:**

⚠️ **Under no circumstances must the flexible coupling (or its fixings) be loosened or removed from the driveshaft.** Failure to follow this instruction may result in damage to the vehicle.

⚠️ **Make sure the front of the driveshaft does not put an excessive load on the center bearing.** Failure to follow this instruction may result in damage to the vehicle.

Detach the driveshaft from the transmission flange.
- Mark the position of the driveshaft in relation to the transmission flange.
- Mark the position of each nut and bolt in relation to the transmission flexible joint.

2. Loosen the heat shield retaining nut.

3. Install suitable cord to the heat shield retaining nut stud.
   - Tighten the retaining nut.

4. Reposition the driveshaft.
5. Using the special tool, remove the transmission support.
   - Lower the transmission to a suitable height.

6. Using the special tools, remove and discard the output shaft flange retaining nut.

7. Using the special tool, remove the output shaft flange.
   - Remove the output shaft flange spacing shim.

8. **CAUTION:** Make sure the transmission housing seal face is not damaged when removing the extension housing seal. Failure to follow this instruction may result in damage to the vehicle.

   Using the special tools, remove the extension housing seal.

9. **NOTE:** Using a suitable metal surface cleaner meeting Jaguar specification, clean the seal face on the housing before installing the new seal.

   Clean and inspect the transmission housing seal face.
**Installation**

1. Using the special tool, install the extension housing seal.

2. Using the special tools install a new output shaft flange retaining nut.
   - Install the output shaft flange spacing shim.
   - Install the output shaft flange.
   - Tighten to 60 Nm.

3. Install the transmission support.
   - Using the special tool, raise the transmission.
   - Tighten to 55 Nm.

4. Tighten to 48 Nm.

5. **CAUTION:** Make sure the front of the driveshaft does not put an excessive load on the center bearing. Failure to follow this instruction may result in damage to the vehicle.
   - Reposition the driveshaft.
   - Undo the cord.
6. Loosen the retaining nut.
   - Remove the cord from the heat shield retaining nut stud.

7. Tighten the retaining nut.

8. CAUTIONS:
   - Make sure the front of the driveshaft does not put an excessive load on the center bearing. Failure to follow this instruction may result in damage to the vehicle.
   - Make sure all components are installed to the position they were removed from. Failure to follow this instruction may result in damage to the vehicle.

   Attach the driveshaft to the transmission flange.
   - Tighten to 88 Nm.

9. Carry out a transmission fluid level check.
   For additional information, refer to: Transmission Fluid Level Check (307-01 Automatic Transmission/Transaxle, General Procedures).
Automatic Transmission/Transaxle - Transmission Fluid Pan, Gasket and Filter

In-vehicle Repair

Removal

All vehicles

1. Disconnect the battery ground cable.
   For additional information, refer to: Battery Disconnect (414-01, General Procedures).

Vehicles with diesel engine

2. Remove the air deflector.
   For additional information, refer to: Air Deflector (501-02, Removal and Installation).

All vehicles

3. Drain the transmission.
   For additional information, refer to: Transmission Fluid Drain and Refill (307-01, General Procedures).

Vehicles with diesel engine

4. Detach the catalytic converter temperature sensor wiring harness from the fluid pan.

All vehicles

5. NOTE: Discard the fluid pan, gasket and filter.

   Remove the fluid pan, gasket and filter.
   
   • Remove the retaining bolts.

Installation

All vehicles

1. Install the new fluid pan, gasket and filter.
   
   • Tighten to 8 Nm.

Vehicles with diesel engine
2. Attach the catalytic converter temperature sensor wiring harness onto the fluid pan.

All vehicles

3. Fill the transmission.
   For additional information, refer to: Transmission Fluid Drain and Refill (307-01, General Procedures).

Vehicles with diesel engine

4. Install the air deflector.
   For additional information, refer to: Air Deflector (501-02, Removal and Installation).

All vehicles

5. Lower the vehicle.

6. Connect the battery ground cable.
   For additional information, refer to: Battery Connect (414-01, General Procedures).
**Automatic Transmission/Transaxle - Transmission Control Module (TCM) and Main Control Valve Body**

**In-vehicle Repair**

**General Equipment**

- Anti-Static Wrist Strap

---

**Removal**

1. Remove the fluid pan, gasket and filter. For additional information, refer to: [Transmission Fluid Pan, Gasket and Filter](#) (307-01 Automatic Transmission/Transaxle, In-vehicle Repair).

2. **CAUTION:** Make sure the transmission control module (TCM) and main control valve body are protected against electrostatic discharge. Failure to follow this instruction may result in component damage. Reposition the locking device.

3. Disconnect the TCM and main control valve body electrical connector.
   1. Reposition the electrical connector retaining ring.
   2. Disconnect the electrical connector.

4. **CAUTION:** Make sure all suitable safety precautions are taken to protect the TCM and main control valve body electrical connector pins against electrostatic discharge. Remove the sealing tube.

5. Remove and discard the seals.
6. Remove the TCM and main control valve body.
   - Remove the retaining bolts.

7. Remove the TCM and main control valve body sealing block.

8. Remove and discard the seals.

9. Remove and discard the seals.

**Installation**

1. Install the new seals.
2. Install the new seals.

3. Install the TCM and main control valve body sealing block.

4. **CAUTION**: Make sure the TCM and main control valve body are protected against electrostatic discharge. Failure to follow this instruction may result in component damage.
   
   Align the transmission selector shaft to the TCM and main control valve body.

5. Install the TCM and main control valve body retaining bolts.
   - Tighten to 8 Nm.

6. Install the new seals.
7. **CAUTION**: Make sure all suitable safety precautions are taken to protect the TCM and main control valve body electrical connector pins against electrostatic discharge.

   Install the sealing tube.

---

8. Reposition the TCM and main control valve body electrical connector retaining ring.
   
   1. Connect the electrical connector.
   
   2. Reposition the electrical connector retaining ring.

---

9. Reposition the locking device.

---

10. Install the fluid pan, gasket and filter.  
    For additional information, refer to: [Transmission Fluid Pan, Gasket and Filter](307-01 Automatic Transmission/Transaxle, In-vehicle Repair).
1. Place the selector lever in the N position.
2. Disconnect the battery ground cable. For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).
3. Remove the exhaust system. For additional information, refer to: Exhaust System - V8 4.2L Petrol/V8 S/C 4.2L Petrol/2.5L NA V6 - AJV6/3.0L NA V6 - AJ27 (309-00 Exhaust System, Removal and Installation).

4. CAUTIONS:
   - Under no circumstances must the flexible coupling (or its fixings) be loosened or removed from the driveshaft.
   - Make sure the front of the driveshaft does not put an excessive load on the center bearing. Failure to follow this instruction may result in damage to the vehicle.

   Detach the driveshaft from the transmission flange.
   - Mark the position of the driveshaft in relation to the transmission flange.
   - Mark the position of each nut and bolt in relation to the transmission flexible joint.

5. CAUTION: Make sure the front of the driveshaft does not put an excessive load on the center bearing. Failure to follow this instruction may result in damage to the vehicle.

   Using a suitable securing strap, reposition and support the driveshaft to the vehicle body.

6. Detach the engine ground cable.
7. **CAUTION:** Make sure the starter motor is supported. Failure to follow this instruction may result in damage to the vehicle.

Detach the starter motor.

8. Remove the rubber access cover.

9. Remove the torque converter retaining bolts.
   - Rotate the torque converter to gain access to the remaining bolts.

10. Detach the transmission fluid cooler tubes from the oil pan.
11. Detach the transmission fluid cooler tubes.
   1. Remove the retaining bolt.
   2. Remove the retaining plate.

11. **CAUTION:** Make sure the transmission fluid cooler tubes are not removed from the automatic transmission by using a pry bar. Failure to follow this instruction may result in damage to the vehicle.
   3. Detach the transmission fluid cooler tubes.
      - Allow the transmission fluid to drain into a suitable container.

12. Remove the torque converter rubber inspection cover.

13. **CAUTION:** Make sure the automatic transmission weight is evenly supported on the special tool. Failure to follow this instruction may result in damage to the vehicle.
    Install the special tool.

14. Install the rubber blocks supplied with special tool HTJ1200-2, between the front subframe and the oil pan.

15. Lower the rear of the transmission.
    - Remove the automatic transmission support retaining bolts.
16. **WARNING:** Secure the automatic transmission to the special tool using the tie down straps. Failure to follow this instruction may result in personal injury.

   Install the tie down strap.

17. Detach the selector lever cable.

18. Reposition the selector lever cable.
   - Remove the retaining bolts.

19. **CAUTION:** Make sure the transmission control module (TCM) and main control valve body is protected against electrostatic discharge. Failure to follow this instruction may result in component damage.

   Disconnect the automatic transmission electrical connector.

20. Remove the automatic transmission retaining bolts.
21. Remove the automatic transmission retaining bolts.

22. **WARNING:** Do not let the torque converter drop out of the automatic transmission. Failure to follow this instruction may result in personal injury.

- **NOTE:** Special tool shown removed for clarity.

Remove the automatic transmission from the vehicle.

- Remove the retaining bolts.
- Lower the automatic transmission from the vehicle.
Automatic Transmission/Transaxle - Transmission 2.7L V6 - TdV6

**Removal**

1. Move the transmission selector lever to the "N" position.
2. Disconnect the battery ground cable.
   For additional information, refer to: Battery Disconnect (414-01, General Procedures).
3. Remove the filler cap.

4. Remove the engine cover.
5. Install the special tool.

6. Install the special tool.
   - Rotate the special tool adjustment bolt a suitable amount of turns to support the engine.

7. Remove both catalytic converters.
   For additional information, refer to: Catalytic Converter - 2.7L Diesel (309-00, Removal and Installation).

8. **CAUTIONS:**
   - Under no circumstances must the flexible coupling (or its fixings) be loosened or removed from the driveshaft. Failure to follow this instruction may result in damage to the vehicle.
   - Make sure the front of the driveshaft does not put an excessive load on the center bearing. Failure to follow this instruction may result in damage to the vehicle.

   Detach the driveshaft from the transmission flange.
   - Mark the position of the driveshaft in relation to the transmission flange.
   - Mark the position of each nut and bolt in relation to the transmission flexible joint.

9. Loosen the retaining nut.
10. Install suitable cord to the heat shield retaining nut stud.
   - Tighten the retaining nut.

11. **CAUTION:** Make sure the front of the driveshaft does not put an excessive load on the center bearing. Failure to follow this instruction may result in damage to the vehicle.
    Reposition and support the driveshaft.

12. Remove the transmission undertray.

13. Remove the rubber access cover.

14. Remove the retaining bolts.
    - Rotate the torque converter to gain access to the remaining bolts.
15. Release the transmission fluid cooler tube bracket.

16. Detach the transmission fluid cooler tubes from the retaining bracket.

17. **CAUTION:** Make sure the transmission fluid cooler tubes are not removed from the automatic transmission by using a pry bar. Failure to follow this instruction may result in damage to the vehicle.

   Detach the transmission fluid cooler tubes from the automatic transmission.
   - Allow the transmission fluid to drain into a suitable container.
   - Remove and discard the O-ring seals.

18. Detach the selector lever cable.

19. Reposition the selector lever cable.
   - Remove the retaining bolts.
20. **CAUTION:** Make sure the transmission weight is evenly supported on the special tool. Failure to follow this instruction may result in damage to the vehicle.

   Install the special tool.

21. Using the special tool, lower the rear of the transmission.
   - Remove the retaining bolts.

22. **WARNING:** Secure the transmission to the special tool using the tie down straps. Failure to follow this instruction may result in personal injury.

   **CAUTION:** Make sure the tie down strap does not trap the transmissions sensors or harness etc. Failure to follow this instruction may result in damage to the vehicle.

   Install the tie down strap.

23. **CAUTION:** Make sure the transmission control module (TCM) and main control valve body is protected against electrostatic discharge. Failure to follow this instruction may result in component damage.

   Disconnect the automatic transmission electrical connector.

24. Remove the retaining bolts.
25. Remove the retaining bolts.

26. Remove the retaining bolts.

27. **WARNING:** Do not allow the torque converter to become disengaged from the automatic transmission. Failure to follow this instruction may result in personal injury.

- **NOTE:** Shown with the powertrain assembly jack removed for clarity.

Remove the automatic transmission from the vehicle.
- Remove the retaining bolts.
- Lower the automatic transmission from the vehicle.
Automatic Transmission/Transaxle - Transmission

Special Tool(s)

| Powertrain Assembly Jack HTJ1200-2 |

Removal

1. Place the selector lever in the N position.
2. Disconnect the battery ground cable. For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).
3. Remove the exhaust system. For additional information, refer to: Exhaust System - V8 4.2L Petrol/V8 S/C 4.2L Petrol/2.5L NA V6 - AJV6/3.0L NA V6 - AJ27 (309-00 Exhaust System, Removal and Installation).
4. CAUTIONS:
   - Under no circumstances must the flexible coupling (or its fixings) be loosened or removed from the driveshaft.
   - Make sure the front of the driveshaft does not put an excessive load on the center bearing. Failure to follow this instruction may result in damage to the vehicle.

   Detach the driveshaft from the transmission flange.
   - Mark the position of the driveshaft in relation to the transmission flange.
   - Mark the position of each nut and bolt in relation to the transmission flexible joint.

5. CAUTION: Make sure the front of the driveshaft does not put an excessive load on the center bearing. Failure to follow this instruction may result in damage to the vehicle.

   Using a suitable securing strap, reposition and support the driveshaft to the vehicle body.

6. Detach the transmission fluid cooler tubes from the oil pan.
7. Detach the transmission fluid cooler tubes.
   1. Remove the retaining bolt.
   2. Remove the retaining plate.

7. **CAUTION:** Make sure the transmission fluid cooler tubes are not removed from the automatic transmission by using a pry bar. Failure to follow this instruction may result in damage to the vehicle.

   3. Detach the transmission fluid cooler tubes.
   
   - Allow the transmission fluid to drain into a suitable container.

8. Remove the torque converter rubber inspection cover.

9. **CAUTION:** Make sure the automatic transmission weight is evenly supported on the special tool. Failure to follow this instruction may result in damage to the vehicle.

   Install the special tool.

10. Install the rubber blocks supplied with special tool HTJ1200-2, between the front subframe and the oil pan.

11. Lower the rear of the transmission.
    
    - Remove the automatic transmission support retaining bolts.
12. **WARNING:** Secure the automatic transmission to the special tool using the tie down straps. Failure to follow this instruction may result in personal injury.

   Install the tie down strap.

13. Detach the selector lever cable.

14. Reposition the selector lever cable.
   
   - Remove the retaining bolts.

15. **CAUTION:** Make sure the transmission control module (TCM) and main control valve body is protected against electrostatic discharge. Failure to follow this instruction may result in component damage.

   Disconnect the automatic transmission electrical connector.

16. Remove the rubber access cover.
17. Remove the torque converter retaining bolts.
   - Rotate the torque converter to gain access to the remaining bolts.

18. Remove the automatic transmission retaining bolts.

19. **WARNING:** Do not let the torque converter drop out of the automatic transmission. Failure to follow this instruction may result in personal injury.
   - **NOTE:** Special tool shown removed for clarity.
   Remove the automatic transmission from the vehicle.
   - Remove the retaining bolts.
   - Lower the automatic transmission from the vehicle.

1. **WARNING:** Do not let the torque converter drop out of the transmission. Failure to follow this instruction may result in personal injury.

   Using the special tools, remove the torque converter.
   - Drain any remaining fluid into a suitable container.

2. **CAUTION:** Make sure the transmission housing seal face is not damaged when removing the torque converter seal. Failure to follow this instruction may result in damage to the vehicle.

   Using the special tools, remove the input shaft seal.
4. **NOTE:** Using a suitable metal surface cleaner meeting Jaguar specification, clean the seal face on the housing before fitting the new seal.

   Clean and inspect the transmission housing seal face.

5. Using the special tool, install a new input shaft seal.

6. **WARNING:** Do not let the torque converter drop out of the transmission. Failure to follow this instruction may result in personal injury.

   • **NOTE:** The torque converter hub must engage fully in the oil pump drive gear.

   Using the special tools, install the torque converter.

7. Install the transmission assembly.

Installation

1. **CAUTION:** If the automatic transmission fluid is very dirty or it contains metallic particles, then along with a new transmission, install a new automatic transmission fluid cooler and lines.

   Flush the transmission oil cooler and fluid tubes.

2. **NOTE:** Use high-temperature grease meeting Jaguar specification.

   Apply a thin layer of high-temperature grease to the centering spigot bore on the torque converter.

3. **WARNING:** Do not let the torque converter drop out of the automatic transmission. Failure to follow this instruction may result in personal injury.

   **CAUTION:** The torque converter hub must engage fully in the oil pump drive gear throughout the whole installation procedure.

   Install the automatic transmission to the vehicle.
   - Raise the automatic transmission to the vehicle.
   - Install the retaining bolts.
   - Tighten to 48 Nm.

4. Install the automatic transmission retaining bolts.
   - Tighten to 48 Nm.

5. Install the automatic transmission retaining bolts.
   - Tighten to 48 Nm.
6. **CAUTION:** Make sure the transmission control module (TCM) and main control valve body is protected against electrostatic discharge. Failure to follow this instruction may result in component damage. 

   Connect the automatic transmission electrical connector.

7. Attach the selector lever cable.
   - Install the retaining bolts.
   - Tighten to 11 Nm.

8. Attach the selector lever cable.

9. Remove the tie down strap.

10. Install the automatic transmission support retaining bolts.
    - Raise the rear of the transmission.
    - Tighten to 50 Nm.
11. Remove the rubber blocks supplied with special tool HTJ1200-2.

12. Remove the special tool.

13. Install the torque converter rubber inspection cover.

14. Attach the transmission fluid cooler tubes.
   1. Attach the transmission fluid cooler tubes.
   2. Install new O-ring seals.
   3. Install the retaining plate.
   4. Install the retaining bolt.
      1. Tighten to 23 Nm.
15. Attach the transmission fluid cooler tubes to the oil pan.
   - Tighten to 10 Nm.

16. Install the torque converter retaining bolts.
   - Rotate the torque converter to gain access to the remaining bolts.
   - Tighten to 55 Nm.

17. Install the rubber access cover.

18. Attach the starter motor.
   - Tighten to 25 Nm.
19. Attach the engine ground cable.

20. **CAUTION:** Make sure the front of the driveshaft does not put an excessive load on the center bearing. Failure to follow this instruction may result in damage to the vehicle.

   Detach the driveshaft.

21. **CAUTIONS:**

   - Make sure the front of the driveshaft does not put an excessive load on the center bearing. Failure to follow this instruction may result in damage to the vehicle.

   - Make sure all components are installed to the position they were removed from. Failure to follow this instruction may result in damage to the vehicle.

   Attach the driveshaft to the transmission flange.
   - Tighten to 108 Nm.

22. Install the exhaust system.
    For additional information, refer to: Exhaust System - V8 4.2L Petrol/V8 S/C 4.2L Petrol/2.5L NA V6 - AJV6/3.0L NA V6 - AJ27 (309-00 Exhaust System, Removal and Installation).

23. Connect the battery ground cable.
    For additional information, refer to: Battery Connect (414-01 Battery, Mounting and Cables, General Procedures).

24. Carry out a transmission fluid level check.
    For additional information, refer to: Transmission Fluid Level Check (307-01 Automatic Transmission/Transaxle, General Procedures).

25. **NOTE:** For NAS vehicles only.

    If required, carry out a long drive cycle.
    For additional information, refer to: Powertrain Control Module (PCM) Long Drive Cycle Self-Test (303-14A Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, General Procedures).
### Special Tool(s)

### Installation

1. **CAUTION:** If the automatic transmission fluid is very dirty or it contains metallic particles, then along with a new transmission, install a new automatic transmission fluid cooler and lines.

   Flush the transmission oil cooler and fluid tubes.

2. **NOTE:** Use high-temperature grease meeting Jaguar specification.

   Apply a thin layer of high-temperature grease to the centering spigot bore on the torque converter.

3. **WARNING:** Do not allow the torque converter to become disengaged from the automatic transmission. Failure to follow this instruction may result in personal injury.

   **CAUTION:** The torque converter hub must engage fully in the oil pump drive gear throughout the whole installation procedure. Failure to follow this instruction may result in damage to the vehicle.

   - **NOTE:** Shown with the powertrain assembly jack removed for clarity.

   Install the automatic transmission to the vehicle.
   - Raise the automatic transmission to the vehicle.
   - Loosely install the retaining bolts.

4. Install the retaining bolts.
   - Tighten to 48 Nm.
5. Install the retaining bolts.
   - Tighten to 48 Nm.

6. Install the retaining bolts.
   - Tighten to 48 Nm.

7. Tighten to 48 Nm.

8. **CAUTION:** Make sure the transmission control module (TCM) and main control valve body is protected against electrostatic discharge. Failure to follow this instruction may result in component damage.

   Connect the automatic transmission electrical connector.

9. Remove the tie down strap.
10. Install the automatic transmission mount retaining bolts.
   - Raise the rear of the transmission.
   - Tighten to 50 Nm.

11. Remove the special tool.

12. Attach the selector lever cable.
   - Install the retaining bolts.
   - Tighten to 11 Nm.

13. Attach the selector lever cable.

14. Attach the transmission fluid cooler tubes to the automatic transmission.
   - Install new O-ring seals.
   - Tighten to 23 Nm.
15. Attach the transmission fluid cooler tubes to the retaining bracket.

16. Attach the transmission fluid cooler tube bracket.

17. Install the retaining bolts.
   - Rotate the torque converter to gain access to the remaining bolts.
   - Tighten to 55 Nm.

18. Install the rubber access cover.

19. **CAUTION:** Make sure the front of the driveshaft does not put an excessive load on the center bearing. Failure to follow this instruction may result in damage to the vehicle.
   
   Reposition the driveshaft.
   - Undo the cord.
20. Loosen the retaining nut.
   • Remove the cord from the heat shield retaining nut stud.

21. Tighten the retaining nut.

22. CAUTIONS:

   ! Make sure the front of the driveshaft does not put an excessive load on the center bearing. Failure to follow this instruction may result in damage to the vehicle.

   ! Make sure all components are installed to the position they were removed from. Failure to follow this instruction may result in damage to the vehicle.

   Attach the driveshaft to the transmission flange.
   • Tighten to 88 Nm.

23. Install both catalytic converters.
   For additional information, refer to: Catalytic Converter - 2.7L Diesel (309-00 Exhaust System, Removal and Installation).

24. Connect the battery ground cable.
   For additional information, refer to: Battery Connect (414-01 Battery, Mounting and Cables, General Procedures).

25. Remove the special tool.
   • Loosen the special tool adjustment bolt.
26. Remove the special tool.

27. Install the engine cover.

28. Install the filler cap.

29. Carry out a transmission fluid level check. For additional information, refer to: Transmission Fluid Level Check (307-01 Automatic Transmission/Transaxle, General Procedures).
Installation

1. **CAUTION:** If the automatic transmission fluid is very dirty or it contains metallic particles, then along with a new transmission, install a new automatic transmission fluid cooler and lines.

   Flush the transmission oil cooler and fluid tubes.

2. **NOTE:** Use high-temperature grease meeting Jaguar specification.

   Apply a thin layer of high-temperature grease to the centering spigot bore on the torque converter.

3. **WARNING:** Do not let the torque converter drop out of the automatic transmission. Failure to follow this instruction may result in personal injury.

   **CAUTION:** The torque converter hub must engage fully in the oil pump drive gear throughout the whole installation procedure.

   Install the automatic transmission to the vehicle.
   - Raise the automatic transmission to the vehicle.
   - Install the retaining bolts.
   - Tighten to 48 Nm.

4. Install the automatic transmission retaining bolts.
   - Tighten to 48 Nm.

5. Install the torque converter retaining bolts.
   - Rotate the torque converter to gain access to the remaining bolts.
   - Tighten to 55 Nm.
6. Install the rubber access cover.

7. **CAUTION:** Make sure the transmission control module (TCM) and main control valve body is protected against electrostatic discharge. Failure to follow this instruction may result in component damage.

Connect the automatic transmission electrical connector.

8. Attach the selector lever cable.
   - Install the retaining bolts.
   - Tighten to 11 Nm.

9. Attach the selector lever cable.

10. Remove the tie down strap.
11. Install the automatic transmission support retaining bolts.
   - Raise the rear of the transmission.
   - Tighten to 50 Nm.

12. Remove the rubber blocks supplied with special tool HTJ1200-2.

13. Remove the special tool.

14. Install the torque converter rubber inspection cover.

15. Attach the transmission fluid cooler tubes.
   1. Attach the transmission fluid cooler tubes.
      1. Install new O-ring seals.
   2. Install the retaining plate.
   3. Install the retaining bolt.
      1. Tighten to 23 Nm.
16. Attach the transmission fluid cooler tubes to the oil pan.
   - Tighten to 10 Nm.

17. **CAUTION:** Make sure the front of the driveshaft does not put an excessive load on the center bearing. Failure to follow this instruction may result in damage to the vehicle.
   
   Detach the driveshaft.

18. **CAUTIONS:**

   - Make sure the front of the driveshaft does not put an excessive load on the center bearing. Failure to follow this instruction may result in damage to the vehicle.

   - Make sure all components are installed to the position they were removed from. Failure to follow this instruction may result in damage to the vehicle.

   Attach the driveshaft to the transmission flange.
   - Tighten to 108 Nm.

19. Install the exhaust system.
   For additional information, refer to: Exhaust System - V8 4.2L Petrol/V8 5/C 4.2L Petrol/2.5L NA V6 - AJV6/3.0L NA V6 - AJ27 (309-00 Exhaust System, Removal and Installation).

20. Connect the battery ground cable.
    For additional information, refer to: Battery Connect (414-01 Battery, Mounting and Cables, General Procedures).

21. Carry out a transmission fluid level check.
    For additional information, refer to: Transmission Fluid Level Check (307-01 Automatic Transmission/Transaxle, General Procedures).

22. **NOTE:** For NAS vehicles only.

   If required, carry out a long drive cycle.
   For additional information, refer to: Powertrain Control Module (PCM) Long Drive Cycle Self-Test (303-14A Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, General Procedures).

Transmission/Transaxle Cooling - Transmission Cooling

Description and Operation

All except vehicles with diesel engine

Fluid Cooler

The fluid cooler is of an aluminium construction consisting of a tube and louvered fin core-type, the tubes are arranged horizontally for the crossflow of the fluid.

It is divided into two sections to provide cooling for both the transmission and the engine, each section is separate within the same unit.

When carrying out any transmission procedures the drained fluid should be checked thoroughly for any metal filings or particles, in the event of this the transmission fault should be located followed by a thorough flushing of the fluid cooler and fluid cooler tubes.

**Fluid Cooler**

The fluid cooler is mounted to the left-hand side of the front subframe via a retaining bracket. The fluid cooler is cooled by the engine coolant system.

When carrying out any transmission procedures the drained fluid should be checked thoroughly for any metal filings or particles, in the event of this the transmission fault should be located followed by a thorough flushing of the fluid cooler and fluid cooler tubes.
Transmission/Transaxle Cooling - Transmission Cooling

Diagnosis and Testing

Inspection and Verification

1. Verify the customer concern by operating the system.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

<table>

### Removal and Installation

<table>
<thead>
<tr>
<th>Special Tool(s)</th>
<th>Remover/Installer, Cooling Hose Clamp 303-397 (24-003)</th>
</tr>
</thead>
</table>

### Removal

1. Remove the air deflector.
   For additional information, refer to: [Air Deflector](501-02 Front End Body Panels, Removal and Installation).

2. Remove the splash shield.

3. Detach the transmission fluid cooler tubes.
   - Allow the transmission fluid to drain into a suitable container.
   - Remove and discard the O-ring seals.

4. **NOTE**: Clamp the coolant hose to minimize coolant loss.

   Using the special tool, detach the transmission fluid cooler coolant hose.
5. **NOTE:** Clamp the coolant hose to minimize coolant loss. Using the special tool, detach the transmission fluid cooler coolant hose.

6. Detach the transmission fluid cooler.

7. Remove the transmission fluid cooler.

**Installation**

1. Install the transmission fluid cooler.
2. Attach the transmission fluid cooler.

3. Using the special tool, attach the transmission fluid cooler coolant hose.

4. Using the special tool, attach the transmission fluid cooler coolant hose.

5. Attach the transmission fluid cooler tubes.
   - Install new O-ring seals.
   - Tighten to 10 Nm.

6. Install the splash shield.

7. Install the air deflector.
   For additional information, refer to: Air Deflector (501-02 Front End Body Panels, Removal and Installation).

8. Carry out a transmission fluid level check.
   For additional information, refer to: Transmission Fluid Level Check (307-01 Automatic Transmission/Transaxle, General Procedures).

Removal

1. Center the steering wheel.
   - Lock in position, remove the ignition key.

2. Remove the air deflector.
   For additional information, refer to: [Air Deflector](501-02 Front End Body Panels, Removal and Installation).

3. Remove the splash shield.

4. Detach the transmission fluid cooler tubes.
   - Allow the transmission fluid to drain into a suitable container.
   - Remove and discard the O-ring seals.
5. Detach the wiring harness.

6. Detach the hose.

7. Make sure the alignment mark on the steering gear pinion seal protection cover is central to the steering gear pinion casting.

8. Detach the lower steering column.
   - Remove the steering gear shaft pinch bolt.
9. Detach the steering gear.

10. Secure the steering gear.

11. Remove the retaining nut.

12. Remove the catalyst heat shield.

13. Remove the catalyst heat shield retaining bracket.
14. Remove the retaining bracket.

15. Remove the retaining nut.

16. Lower the vehicle.
17. Remove the filler cap.

18. Remove the engine cover.

19. Install the special tool.
20. Remove the cowl panel grille.
For additional information, refer to: Cowl Panel Grille (501-02 Front End Body Panels, Removal and Installation).

21. Remove the engine compartment support.

22. Using the special tools, raise the engine to a suitable height.

23. Raise the vehicle.
24. Remove the retaining bracket.

25. Release the transmission fluid cooler tube bracket.
26. Detach the transmission fluid cooler tubes from the retaining bracket.

27. **CAUTION:** Make sure the transmission fluid cooler tubes are not removed from the automatic transmission by using a pry bar. Failure to follow this instruction may result in damage to the vehicle.

- **NOTE:** Catalyst shown removed for clarity.

Remove the transmission fluid cooler tubes from the automatic transmission.

- Allow the transmission fluid to drain into a suitable container.
- Remove and discard the O-ring seals.

**Installation**

1. **NOTE:** Catalyst shown removed for clarity.

   Install transmission fluid cooler tubes.

   - Install new O-ring seals.
   - Tighten to 23 Nm.

2. Attach the transmission fluid cooler tubes to the retaining bracket.
3. Attach the transmission fluid cooler tube bracket.

4. Install the retaining bracket.

5. Lower the vehicle.
6. Remove the special tool.
   - Loosen the special tool adjustment bolt.

7. Install the engine compartment support.

8. Install the cowl panel grille.
   For additional information, refer to: Cowl Panel Grille (501-02 Front End Body Panels, Removal and Installation).
9. Remove the special tool.

10. Install the engine cover.

11. Install the filler cap.

12. Raise the vehicle.
13. Install the retaining nut.
   - Tighten to 63 Nm.

15. Install the catalyst heat shield retaining bracket.

16. Install the catalyst heat shield.

17. Install the retaining nut.

18. Detach the steering gear.

19. Attach the steering gear.
   - Tighten to 100 Nm.
20. Attach the lower steering column.
   • Tighten to 35 Nm.

21. Make sure the alignment mark on the steering gear pinion seal protection cover is central to the steering gear pinion casting.

22. Attach the hose.

23. Attach the transmission fluid cooler tubes.
   • Install new O-ring seals.
   • Tighten to 10 Nm.
24. Install the splash shield.

25. Install the air deflector.
   For additional information, refer to: Air Deflector (501-02 Front End Body Panels, Removal and Installation).

26. Carry out a transmission fluid level check.
   For additional information, refer to: Transmission Fluid Level Check (307-01 Automatic Transmission/Transaxle, General Procedures).

<td>Selector cable and bracket.</td>
</tr>
</tbody>
</table>

**Transmission selector lever**

The transmission selector lever:
- Has eight positions: Park, Reverse, Neutral, Drive, Fifth, Fourth, Third and Second.
- Operates the transmission selector shaft in the Park, Reverse, Neutral, Drive positions by means of a cable.
- Communicates the transmission selector lever position to the transmission control module (TCM) using electronic code through the Controlled Area Network (CAN) bus.
- Uses "Hall Effect" switches and a micro controller inside the transmission selector lever to generate the electronic code.
- When moved to the left-hand side of the transmission selector lever, allows manual electronic selection of Fifth, Fourth, Third and Second gears.

**The transmission selector illumination:**
- Is provided by the TCM by using electronic code.
- Is possible by decoding the electronic code received by the transmission selector lever from the TCM and illuminating the relevant transmission selector lever position.
- Provides a red transmission lever position illumination to indicate the selected gear.
- Provides a green background for the transmission selector lever module and is hard-wired to the front electronics module (FEM).

**The eight transmission selector positions are:**
- P: The transmission is mechanically locked (starting available).
- R: Reverse gear.
- N: No power to the rear wheels (starting available).
- D: All six forward gears available.
- 5: Upshift to fifth gear only.
- 4: Upshift to fourth gear only.
- 3: Upshift to third gear only.
- 2: Upshift to second gear only.

**Sport mode switch**

The sport mode switch:
- Allows the driver to select or de-select the automatic transmission sport mode.
- Allows the automatic transmission to operate normally when the sport mode is selected, but under acceleration the gear shift points are extended to make full use of the engine’s power reserves.
- Allows the driver to drive the vehicle in the “D” position with the full automatic transmission shift or manually shift gears in the “second, third, fourth and fifth” positions.
- Is illuminated when Sport mode is selected.
- Communicates with the TCM through the CAN network to show the sport mode switch status.

**Transmission unit gear selector**

The gear selector at the transmission unit:
Transmission selector lever interlock solenoid

Transmission selector lever interlock solenoid:

- Prevents the transmission selector lever from being moved from the Park position, unless the ignition switch is in the "ON" position and the brake pedal is applied.
- Is controlled by an input from the brake pedal switch through the CAN bus.

Transmission selector lever interlock solenoid operation

When the driver first enters the vehicle and turns the ignition switch to the "ON" position, the transmission selector lever position indicator "P" will flash. If the driver then applies the brake pedal while the transmission selector lever position indicator "P" is flashing, the driver will then be able to move the transmission selector lever out of the "P" position.

Once the transmission selector lever has been moved out of the "P" position, the transmission selector lever interlock solenoid will de-energise after 5 seconds. If the transmission selector lever is moved back into the "P" position before the 5 seconds have elapsed, the transmission selector lever interlock solenoid will de-energise as soon as the transmission selector lever detects it is in the "P" position.

If the transmission selector lever is moved into a gear selection position for longer than 5 seconds and then returned to the "P" position whilst the brake pedal is applied. The transmission selector lever interlock solenoid will remain de-energised and the transmission selector lever position indicator "P" will flash. The driver must release and re-apply the brake pedal to allow the transmission selector lever to be moved from the "P" position.

If the driver runs the vehicle for a short period of time, with the brake pedal applied and then turns the vehicle off without moving the transmission selector lever out of the "P" position. The driver will not be able to remove the key from the ignition switch, until the brake pedal has been released.
Automatic Transmission/Transaxle External Controls - External Controls
Diagnosis and Testing

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

**WARNING:** Danger of accident. Apply the parking brake. Shift the gear selector lever to "P". Failure to follow these instructions may result in personal injury.

<table>
<thead>
<tr>

Automatic Transmission/Transaxle External Controls - Selector Lever Cable Adjustment

General Procedures

1. Remove the floor console. For additional information, refer to Section 501-12 Instrument Panel and Console.
2. Move the transmission selector lever to the “R” position.
3. Loosen the selector lever cable retaining nuts.

4. Detach the selector lever cable.

5. NOTE: Fully extend the selector cable, then retract the selector cable one detent. Make sure the selector lever cable is in the "R" position.

6. Make sure the transmission selector lever is in the "R" position.
7. Connect the selector lever cable.

8. Adjust the selector lever cable retaining nuts to lock against the retaining bracket without moving the set position of either the shift lever or the selector lever cable.
9. NOTE: Make sure all transmission selector lever positions select the relevant automatic transmission states.

Move the transmission selector lever to all positions.

10. NOTE: When tightening the selector lever cable retaining nuts, make sure both retaining nuts are tightened to the specified torque simultaneously.

Tighten the selector lever cable retaining nuts.

- Tighten to 20 Nm.

11. Install the floor console.
For additional information, refer to Section 501-12 Instrument Panel and Console.
Automatic Transmission/Transaxle External Controls - Selector Lever Cable and Bracket
Removal and Installation

Removal

All vehicles

1. Remove the floor console. For additional information, refer to: Floor Console (501-12 Instrument Panel and Console, Removal and Installation).

2. Move the transmission selector lever to the "R" position.

3. Detach the selector lever cable.
   - Loosen the selector lever cable retaining nuts.

4. Detach the selector lever cable.

5. Detach the selector lever cable.

6. Raise and support the vehicle. For additional information, refer to: Lifting (100-02 Jacking and Lifting, Description and Operation).

Vehicles with diesel engine
7. Remove the transmission undertray.

8. Detach the selector lever cable.

9. Detach the selector lever cable.

10. Remove the selector lever cable.
    - Remove the retaining bolts.

**Installation**

All vehicles
1. Install the selector lever cable.
   • Tighten to 11 Nm.

2. NOTE: Make sure the selector lever cable is fully seated to the transmission unit gear selector pivot ball.
   Attach the selector lever cable.

3. Attach the selector lever cable.

Vehicles with diesel engine

4. Install the transmission undertray.

All vehicles

5. Lower the vehicle.
6. **NOTE:** Make sure the selector lever cable grommet is seated correctly.
   Attach the selector lever cable.

7. **NOTE:** Fully extend the selector cable, then retract the selector cable one detent.
   Make sure the selector lever cable is in the “R” position.

8. Make sure the transmission selector lever is in the “R” position.
9. Attach the selector lever cable.
   - Do not tighten the selector lever cable retaining nuts.

10. Connect the selector lever cable.

11. Adjust the selector lever cable retaining nuts to lock against the retaining bracket without moving the set position of either the shift lever or the selector lever cable.
    - Do not tighten the selector lever cable retaining nuts.

12. **NOTE:** Make sure all transmission selector lever positions are illuminated to indicate the selected gear and the automatic transmission selects the relevant transmission state.
    - **NOTE:** Repeat the adjustment of the selector lever cable retaining nuts if the transmission selector lever does not illuminate the indicated selected gear and the automatic transmission does not select the relevant transmission state.
    Move the transmission selector lever to all positions.
13. NOTE: When tightening the selector lever cable retaining nuts, make sure both retaining nuts are tightened to the specified torque simultaneously.

Tighten the selector lever cable retaining nuts.
- Tighten to 20 Nm.

14. NOTE: Make sure all transmission selector lever positions are illuminated to indicate the selected gear and the automatic transmission selects the relevant transmission state.

- NOTE: Repeat the adjustment of the selector lever cable retaining nuts if the transmission selector lever does not illuminate the indicated selected gear and the automatic transmission does not select the relevant transmission state.

Move the transmission selector lever to all positions.

15. Install the floor console.
For additional information, refer to: Floor Console (501-12 Instrument Panel and Console, Removal and Installation).
Removal

1. Position the transmission selector lever into NEUTRAL.
2. Remove the floor console cup holder.
3. Remove the floor console stowage compartment.
   - Remove the 2 screws.
   - Disconnect the electrical connector.
4. Remove the gearshift lever selector trim panel.
5. Remove the instrument panel console bezel.
   - Release from the 8 clips.
6. Remove the floor console rear stowage compartment.
   - Release from the 2 clips.

7. Release the floor console.
   - Remove the 2 nuts.

8. Remove the floor console.
   - Slide the floor console rearward.
   - Release from the 4 clips.

9. Release the instrument panel switch pack.
   - Remove the 2 Torx bolts.
   - Position aside.

10. Remove the ashtray retaining screw covers.
11. Remove the ashtray retaining screws.

12. Release the ashtray.
   - Release the ashtray from retaining tangs.
   - Detach the ashtray.

13. Remove the ashtray.
   - Disconnect the electrical connector.

14. Disconnect the selector lever cable.

15. Release the transmission selector lever.
   - Disconnect the electrical connector.
16. Remove the transmission selector lever.
   - Remove the 4 bolts.

Installation

1. To install, reverse the removal procedure.
2. Tighten the Torx bolts to 11 Nm.
<table>

<td>Brake fluid</td>
<td>ITT Super Dot 4</td>
</tr>
</tbody>
</table>
Description and Operation

The clutch system consists of the following components:

- A flywheel
- A clutch disc
- A clutch pressure plate
- A clutch master cylinder
- A clutch slave cylinder
- A clutch release hub and bearing

The clutch master cylinder transmits fluid pressure to the slave cylinder, which in turn moves the clutch release hub and bearing.

The clutch master cylinder uses brake fluid and shares a common reservoir with the brake master cylinder.

The clutch is a single plate, dry-friction disc with a diaphragm-style spring clutch pressure plate. The clutch disc has a hub which is splined to the input shaft. The clutch disc has friction material where it contacts the flywheel and the pressure plate. The clutch pressure plate applies pressure to the clutch disc, holding it tightly against the surface of the flywheel.

In the engaged position, the diaphragm spring holds the clutch pressure plate against the clutch disc, so that engine torque is transmitted to the input shaft. When the clutch pedal is depressed, the clutch release hub and bearing pushes the diaphragm spring center toward the flywheel. The diaphragm spring pivots at the fulcrum, relieving the load on the clutch pressure plate. Steel spring straps riveted to the clutch pressure plate cover pull the clutch pressure plate from the clutch disc, disengaging the engine torque from the transmission and enabling the gears to be changed.
Inspection and Verification - Clutch

As fault diagnosis starts when repairs are taken on, the following procedure is recommended:

1. Verify the customer concern by operating the system.
2. Visually inspect for obvious signs of mechanical damage.

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the concern is not visually evident, verify the symptom and refer to the Symptom Chart.

Inspection and Verification - Manual Transmission

The following checks should be carried out before repairing or installing a new transmission:

Transmission Noise

If transmission noises are reported, check the transmission fluid level. If damage has occurred due to a lack of fluid, install a new transmission.

Oil Leakage

- Check that the leaking fluid is actually transmission fluid and not hydraulic fluid (from the hydraulically operated clutch) or engine oil.
- Check the transmission fluid level and, as necessary, drain off any excess fluid.
- Clean the transmission and the adjacent areas carefully before the road test.

Symptom Chart - Poor gear shifting

<table>

<td></td>
</tr>
</tbody>
</table>
Are there noises when the clutch is operated?
   Yes  GO to G2.
   No  System OK.

G2: TEST CLUTCH PEDAL FREE TRAVEL
   1  Press the clutch down manually until resistance is felt, then release it again.
   2  Measure pedal travel.

Is the measured dimension within 15 mm?
   Yes  GO to G3.
   No  INSTALL a new clutch master cylinder.

G3: TEST CLUTCH SLAVE CYLINDER WITH RELEASE BEARING
   1  Remove the transmission.
   2  Check the clutch slave cylinder bolts.
   3  Check the release bearing for wear and rust.

Are the bolts loose or are there signs of wear or rust?
   Yes  TIGHTEN the bolts or INSTALL a new clutch slave cylinder with the release bearing. TEST the system for normal operation.
   No  GO to G4.

G4: CHECK CLUTCH FRICTION DISC TORSION SPRINGS
   1  Check torsion springs for wear.

Do the torsion springs have signs of wear?
   Yes  INSTALL a new clutch friction disc. TEST the system for normal operation.
   No  Check crankshaft end play.

PINPOINT TEST H : FLUID LEAKAGE

<table>
<thead>

</table>
Manual Transmission/Transaxle and Clutch - General Information - Clutch System
Bleeding

1. **WARNING:** Brake fluid contains polyglycol ethers and polyglycols. Avoid contact with the eyes. Wash hands thoroughly after handling, as prolonged contact may cause irritation and dermatitis. If brake fluid contacts the eyes, flush the eyes with cold water or eyewash solution and seek medical attention. If taken internally do not induce vomiting, seek immediate medical attention. Failure to follow these instructions may result in personal injury.

2. **CAUTION:** If brake fluid comes into contact with the paintwork, the affected area must be immediately washed down with cold water. Failure to follow this instruction may result in damage to the vehicle.

• **NOTE:** Make sure of absolute cleanliness when filling brake fluid.

• **NOTE:** Do not re-use brake fluid.

Bleed the clutch system.

2. Fill the brake fluid reservoir with brake fluid.

3. Remove the right-hand catalytic converter.
   For additional information, refer to: **Catalytic Converter - 2.7L V6 - TdV6** (309-00 Exhaust System, Removal and Installation).

4. Remove the bleed nipple cover.

5. Bleed the clutch system.
   • Attach a proprietary bleed jar to the bleed nipple and open the bleed nipple one turn.
   • Depress the clutch pedal repeatedly until the emerging fluid is free of bubbles; always make sure that there is sufficient fluid (5 mm above the MAX) in the reservoir.
   • After bleeding, tighten the bleed nipple.
   • Install the bleed nipple cover.
   • Install the dust cover.
   • After bleeding, depress the clutch ten times and check that it is functioning correctly.

6. Install the right-hand catalytic converter.
   For additional information, refer to: **Catalytic Converter - 2.7L V6 - TdV6** (309-00 Exhaust System, Removal and Installation).

7. **NOTE:** Make sure of absolute cleanliness when filling brake fluid.

Check the brake fluid level.

• The fluid level should be between the MIN and MAX marks. If the level drops below the MIN mark, the brake warning indicator will light up.

• As necessary, fill the brake fluid reservoir with brake fluid.
1. Turn the clutch release hub and bearing in both directions and check for any binding or abnormal noise.

2. **CAUTION:** The clutch release hub and bearing is sealed and must not be immersed in any type of cleaning fluid.
   
   Check for worn or damaged clutch release hub and bearing fork contact surfaces.

3. Install the clutch release hub and bearing on the input shaft and check for a smooth sliding condition.

4. Check driveshaft splines for rust, scoring, or damage.
### Torque Specifications

<table>
<thead>
<tr>
<th>Description</th>
<th>Nm</th>
<th>lb-ft</th>
<th>lb-in</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pressure plate retaining bolts</td>
<td>23</td>
<td>17</td>
<td>-</td>
</tr>
</tbody>
</table>
The clutch transfers the engine torque to the transmission.

The clutch consists of a disc and a pressure plate with a diaphragm spring, bolted to the flywheel.

When the clutch pedal is operated the power transmission from the engine to the transmission is interrupted. The clutch is therefore engaged when the pedal is not depressed. Pressing down the pedal disengages the clutch.
For additional information, refer to Section 308-00 Manual Transmission/Transaxle and Clutch - General Information.
Clutch - Clutch Disc and Pressure Plate

Removal and Installation

Special Tool(s)

- Clutch alignment tool/pilot bearing installer
  - 303-1096

Removal

1. Remove the manual transmission. For additional information, refer to:

2. **CAUTION:** Working in a diagonal sequence, progressively loosen the bolts.

   • NOTE: Restrain the flywheel.

   Remove the pressure plate and clutch disc.
   • Remove the 6 bolts.

Installation

Vehicles with diesel engine

1. **NOTE:** The clutch cover is self adjusting. It is recommended that a clutch disc and clutch cover is replaced as an assembly. If a used clutch cover is assembled with a new clutch disc, the clutch cover adjustment must be reset prior to assembly. With the clutch cover supported under its outside edge, press down evenly on the diaphragm fingers as shown, until the clutch cover adjustment ring can be rotated fully counterclockwise. With the adjustment ring held in this position, release the pressure on the diaphragm fingers. The adjustment ring will be held in this position until self adjustment on the application of the clutch pedal.

   Check, and if necessary, reset the clutch pressure plate.

All vehicles

2. **CAUTIONS:**
Examine the flywheel for signs of scoring or overheating. Renew if worn or damaged.

Examine the clutch release bearing for signs of wear or damage. Renew if necessary.

Examine the spigot bearing for signs of wear or damage. Renew if necessary.

Clean the component mating faces.

3. CAUTIONS:

⚠️ Install the clutch disc with 'TRANSMISSION SIDE' marking against the clutch cover.

⚠️ Use the special tool to align the components.

⚠️ Working in a diagonal sequence, progressively tighten the bolts.

• NOTE: Restrain the flywheel.

Install the clutch disc and pressure plate.

• Tighten the bolts to 25 Nm (18 lb.ft).

4. NOTE: Make sure that the input shaft of the transmission is moved squarely into the hub of the clutch disc. Do not bend in any direction.

Install the manual transmission. For additional information, refer to:

The vehicle has a hydraulically operated clutch. The brake master cylinder reservoir has a separate chamber and is used to supply the hydraulic clutch system with fluid.

Applying the clutch pedal builds up pressure in the clutch master cylinder and operates the release bearing integrated in the clutch slave cylinder.

The hydraulic clutch system has the following advantages:

- Automatic adjustment.
- Low operating effort.
- Minimal wear.

Reservoir

The brake fluid reservoir supplies both the hydraulic clutch system and the brake system with brake fluid.

The hydraulic clutch system and the brake system are separate inside the brake fluid reservoir. In the event of any leaks in the hydraulic clutch system the brake system remains fully operative.

Clutch Master Cylinder

The pressure required to operate the clutch system is produced in the clutch master cylinder.
When the clutch pedal is applied the piston rod moves the piston in the clutch master cylinder. This displaces the hydraulic fluid in the clutch master cylinder, which in turn displaces the hydraulic fluid in the clutch slave cylinder via the high-pressure line.

**Clutch Slave Cylinder**

The central slave cylinder is fixed to the clutch housing with three bolts, together with an integrated release bearing. The release bearing is a press-fit on the clutch slave cylinder.

The hydraulic fluid which is displaced by the master cylinder piston moves the piston in the clutch slave cylinder, which in turn moves the release bearing in an axial direction. The release bearing presses against the tongues of the diaphragm spring with the inner bearing ring. This breaks the friction contact between the clutch disc and the flywheel.

When the clutch pedal is released the diaphragm spring returns the piston in the clutch slave cylinder to its original position. This restores the friction contact between the clutch disc and the flywheel.

**Hydraulic Restricter**

The hydraulic restricter is fitted through the transmission housing and connects to the clutch slave cylinder to the clutch slave cylinder supply tube. The hydraulic restricter reduces clutch snatch, should the clutch pedal be released too quickly.

The clutch bleed tube is located on the hydraulic restricter.
Clutch Controls - Clutch Controls
Diagnosis and Testing

For additional information, refer to Section 308-00 Manual Transmission/Transaxle and Clutch - General Information
Removal

WARNING: Brake fluid contains polyglycol ethers and polyglycols. Avoid contact with the eyes. Wash hands thoroughly after handling, as prolonged contact may cause irritation and dermatitis. If brake fluid contacts the eyes, flush the eyes with cold water or eyewash solution and seek medical attention. If taken internally do not induce vomiting, seek immediate medical attention. Failure to follow these instructions may result in personal injury.

• CAUTIONS:

If brake fluid comes into contact with the paintwork, the affected area must be immediately washed down with cold water.

Brake fluid will escape when the pipes are disconnected.

Vehicles with diesel engine

1. Remove the cowl panel grille.
   For additional information, refer to: Cowl Panel Grille (501-02 Front End Body Panels, Removal and Installation).

2. Remove the engine compartment support.

All vehicles

3. Using a suitable suction device drain the brake fluid reservoir.

4. Detach the clutch master cylinder supply hose.
5. Disconnect the slave cylinder supply hose.
   1. Remove the slave cylinder supply hose retaining clip.
   2. Disconnect the slave cylinder supply hose.

6. Remove clutch master cylinder retaining clip.

7. Disconnect the clutch master cylinder electrical connector.

8. Detach the clutch master cylinder.
   • Remove the clutch master cylinder retaining bolts.

9. Detach the clutch master cylinder.
   1. Detach the clutch master cylinder from the clutch pedal.
   2. Detach the clutch master cylinder.
10. Remove the clutch master cylinder.
   - Remove the clutch master cylinder supply pipe.

**Installation**

1. To install, reverse the removal procedure.
2. Carry out the clutch system bleeding procedure.
   For additional information, refer to: Clutch System Bleeding (308-00 Manual Transmission/Transaxle and Clutch - General Information, General Procedures).
Removal

2. Remove the hydraulic restricter retaining bracket.

3. Reposition the clutch slave cylinder supply tube mount rubber.

4. Detach the clutch slave cylinder supply tube.

5. Remove the retaining clip.
6. Remove the hydraulic restricter.

7. Remove the clutch slave cylinder.

**Installation**

- NOTE: Apply suitable tape to the input shaft to protect the slave cylinder seal from damage. Remove the tape when the slave cylinder is installed.

1. To install, reverse the removal procedure.
   - Tighten to 9 Nm.

2. Tighten to 24 Nm.

3. Install the transmission.

Manual Transmission/Transaxle - Vehicles With: 5-Speed Manual Transmission -
GETRAG 221 - Manual Transmission

Description and Operation

The transmission consists of the following:

- A 2 part die cast aluminum housing.
- Bevel cut gears that rotate on needle roller bearings.
- An input shaft and output shaft that rotate on ball bearings.
- A layshaft that rotates on roller bearings.
- Selector shaft assemblies.

The engine rotational torque is transmitted from the crankshaft through the clutch to the transmission input shaft, which then transmits drive to a layshaft and then the output shaft by utilizing an arrangement of gears. When reverse gear is selected, the direction of the output shaft is changed by an idler gear assembly.

In neutral, none of the gears are connected to the input or output shaft through the relevant synchronizer unit. No torque is transmitted to the driveline.

Diagnosis and Testing

For additional information, refer to Section 308-00 Manual Transmission/Transaxle and Clutch - General Information
General Procedures

1. Raise and support the vehicle. For additional information, refer to Section 100-02 Jacking and Lifting.
2. Remove the transmission fill plug.

3. Remove the transmission drain plug and drain the fluid into a suitable container.

4. Install the transmission drain plug.
   1. Tighten to 50 Nm.
Manual Transmission/Transaxle - Vehicles With: 5-Speed Manual Transmission -
GETRAG 221 - Fill Procedure

General Procedures

1. Raise and support the vehicle. For additional information, refer to
   For additional information, refer to Section 100-02 Jacking and Lifting.
2. Remove the transmission fill plug.

3. Fill the transmission to 0.5 mm (0.02 in) below the lower edge of the
   fill plug bore.

4. Install the transmission fill plug.
   1. Tighten to 50 Nm.

5. Lower the vehicle.

In-vehicle Repair

Removal

1. Remove the driveshaft. For additional information, refer to Section 205-01 Driveshaft.
2. Detach the gearshift control shaft.
   - Remove the gearshift control shaft locating pin.
3. Detach the stabilizer rod.
   - Remove the stabilizer rod locating pin.
4. Remove and discard the gearshift control shaft seal.

Installation

1. NOTE: Apply a light film of transmission oil to the gearshift control shaft seal.
   - Install a new gearshift control shaft seal.
2. Attach the stabilizer rod.
   - Install the stabilizer rod locating pin.

3. Attach the gearshift control shaft.
   - Install the gearshift control shaft locating pin.

4. Install the driveshaft.
   For additional information, refer to Section 205-01 Driveshaft.

**Removal**

1. Remove the driveshaft.
   For additional information, refer to Section [205-01 Driveshaft](#).
2. Remove and discard the output shaft flange nut.
3. Remove the output shaft flange.

4. Remove the output shaft seal.

**Installation**

1. NOTE: Clean any existing thread locking material from the output shaft and output flange.

   • NOTE: Apply a light film of transmission oil to the output shaft oil seal.

   Install the output shaft seal.

   • Install new the retaining nut.

2. Install the output shaft flange.
3. NOTE: Apply Loctite 243 to the retaining nut.
   Install the output shaft nut.
   • Tighten to 120 Nm.

4. Install the driveshaft.
   For additional information, refer to Section 205-01 Driveshaft.
1. Raise and support the vehicle. For additional information, refer to Section 100-00 General Information.
2. Position the transmission jack and install holding strap around transmission.

3. Detach the support insulator.

4. Remove the support insulator.

Installation
1. To install, reverse the removal procedure.
   - Tighten to 40 Nm.

2. Tighten to 40 Nm.
Special Tool(s)
Powertrain Assembly Jack
HTJ1200-2

Removal

1. Disconnect the battery ground cable.
   For additional information, refer to: \textit{Battery Disconnect and Connect}
   (414-01 Battery, Mounting and Cables, General Procedures).

2. Remove the exhaust system.
   For additional information, refer to: \textit{Exhaust System - V8 4.2L Petrol/V8
   S/C 4.2L Petrol/2.5L NA V6 - AJV6/3.0L NA V6 - AJ27}
   (309-00 Exhaust System, Removal and Installation).

3. \textbf{CAUTIONS:}

   \begin{itemize}
   \item Under no circumstances must the flexible coupling (or its fixings) be
   loosened or removed from the driveshaft.
   \item Make sure the front of the driveshaft does not put an excessive load
   on the center bearing. Failure to follow this instruction may result in
damage to the vehicle.
   \end{itemize}

   Detach the driveshaft from the transmission flange.
   \begin{itemize}
   \item Mark the position of the driveshaft in relation to the transmission
   flange.
   \item Mark the position of each nut and bolt in relation to the
   transmission flexible joint.
   \end{itemize}

4. \textbf{CAUTION:} Make sure the front of the driveshaft does not put an
   excessive load on the center bearing. Failure to follow this instruction may
   result in damage to the vehicle.

   Using a suitable securing strap, reposition and support the driveshaft to
   the vehicle body.

5. \textbf{CAUTION:} Make sure the weight of the transmission is evenly
   supported by the special tool. Failure to follow this instruction may result
   in damage to the vehicle.

   Install the special tool.
6. Install the rubber blocks supplied with special tool HTJ1200-2, between the front subframe and the oil pan.

7. Detach the transmission support.

8. Using the special tool, lower the transmission to gain access to the transmission upper retaining bolts.

9. **WARNING:** Secure the transmission to the special tool, using a tie down strap. Failure to follow this instruction may result in personal injury. Install the tie down strap.

10. Detach the gearshift control shaft.
    - Remove the gearshift control shaft locating pin.
11. Detach the stabilizer rod.
   - Remove the stabilizer rod locating pin.

12. CAUTION: If brake fluid comes into contact with the paintwork, the affected area must be washed down immediately with cold water. Failure to follow this instruction may result in damage to the vehicle.
   Detach the clutch slave cylinder supply tube.
   - Clamp the hose to prevent loss of fluid.

13. Disconnect the manual transmission electrical connector.

14. Detach the engine ground cable.

15. CAUTION: Make sure the starter motor is supported. Failure to follow this instruction may result in damage to the vehicle.
   Detach the starter motor.
16. Remove the transmission retaining bolts.

17. **NOTE:** Special tool shown removed for clarity. Remove the transmission retaining bolts.

18. **NOTE:** Special tool shown removed for clarity. Remove the transmission.
   - Remove the transmission retaining bolts.
   - Lower the transmission from the vehicle.
Installation

1. Install the transmission.
   - Raise the transmission to the vehicle.
   - Install the retaining bolts.
   - Tighten to 47 Nm.

2. Install the transmission retaining bolts.
   - Tighten to 47 Nm.

3. Install the transmission retaining bolts.
   - Tighten to 47 Nm.

Special Tool(s)

| Powertrain Assembly Jack HTJ1200-2 | HTJ12002 |

4. Attach the starter motor.
   - Tighten to 25 Nm.

5. Attach the engine ground cable.

6. Connect the manual transmission electrical connector.

7. **CAUTION:** If brake fluid comes into contact with the paintwork, the affected area must be washed down immediately with cold water. Failure to follow this instruction may result in damage to the vehicle.
   - **NOTE:** Install a new O-ring seal.
   - Attach the clutch slave cylinder supply tube.
     - Remove the clamp from the hose.

8. Attach the stabilizer rod.
   - Install the stabilizer rod locating pin.
9. Attach the gearshift control shaft.
   • Install the gearshift control shaft locating pin.

10. Remove the tie down strap.

11. Using the special tool, raise the transmission.

12. Remove the rubber blocks supplied with special tool HTJ1200-2.

13. Install the transmission support retaining bolts.
   • Tighten to 55 Nm.

14. Remove the special tool.
15. **CAUTION:** Make sure the front of the driveshaft does not put an excessive load on the center bearing. Failure to follow this instruction may result in damage to the vehicle.

   Detach the driveshaft.

16. **CAUTIONS:**

   - Make sure the front of the driveshaft does not put an excessive load on the center bearing. Failure to follow this instruction may result in damage to the vehicle.
   
   - Make sure all components are installed to the position they were removed from. Failure to follow this instruction may result in damage to the vehicle.

   Attach the driveshaft to the transmission flange.
   - Tighten to 108 Nm.

17. Install the exhaust system.  
   For additional information, refer to: Exhaust System - V8 4.2L Petrol/V8 S/C 4.2L Petrol/2.5L NA V6 - AJV6/3.0L NA V6 - AJ27 (309-00 Exhaust System, Removal and Installation).

18. Carry out the clutch system bleeding procedure.  
   For additional information, refer to: Clutch System Bleeding (308-00 Manual Transmission/Transaxle and Clutch - General Information, General Procedures).

19. Connect the battery ground cable.  
   For additional information, refer to: Battery Connect (414-01 Battery, Mounting and Cables, General Procedures).

A = refer to the procedure for correct torque sequence

- Manual Transmission

Description and Operation

Transmission Components

The transmission consists of the following:

Housing

The housing is a two piece die cast aluminium unit with an integral bell housing.

Shafts

The layshaft and main shaft are designed to reduce weight and are a hollow shaft construction.

Gears

Helical cut gears with a high-contact area are used. They are machined by grinding and honing to optimise noise levels.

Bearing

The input shaft and main shaft rotate on ball bearings. The layshaft rotates on a roller bearing at the rear and a double ball bearing at the front, with the idler gears rotating on needle roller bearings.

Internal shifting system

The six-speed transmission utilises aluminium die cast swing forks for the internal shift mechanism to achieve the axial motion needed in the sliding sleeve for changing gear, in contrast to the traditional fixed gear change rod structures used in most manually shifted transmissions. This has the benefit of reduced friction in the internal shifting mechanism.

The interlock prevents simultaneous engagement actions of several gears.

Position sensor

The Diagnostic Trouble Codes for the position sensor are retained in the electronic park brake module.

The position sensor located on the top of the transmission is a permanent magnetic linear contact-less sensor. The sensor consists of a soft magnetic core surrounded by a coil system, on each side of the sensor is a second short coil. A permanent magnet attached to the gearbox selector shaft guided close to the sensor causes localised saturation of the core.

The position of the saturated section along the sensor axis can be determined by the coil system, and transformed into a proportional voltage value.

The position switch will output a voltage to the electronic park brake module of approximately 4 volts when the transmission is in reverse, 1st, 3rd and 5th gears and will output a voltage of approximately 1 volt, when the transmission is in 2nd, 4th and 6th gears and when in neutral will output a voltage of approximately 2.5 volts.

Synchronisation

Fast and easy shift engagement of the transmission is ensured by the use of single, double and triple cone synchronisers. The lock-synchroniser mechanism lives up to the following requirements:

- Reduction of synchroniser forces
- Reduction of forces at the central selector shaft

1st gear is equipped with a triple synchroniser unit where 2nd, 3rd, 4th and reverse have dual cone synchroniser and 5th and 6th gears have single cone synchronisers.
- Manual Transmission

Diagnosis and Testing

For additional information, refer to Section 308-00 Manual Transmission/Transaxle and Clutch - General Information

**General Procedures**

1. Raise and support the vehicle. For additional information, refer to: [Lifting](#) (100-02 Jacking and Lifting, Description and Operation).

2. Remove the transmission undertray.

3. Remove the transmission fluid filler plug.

4. Remove the transmission fluid drain plug.
   - Drain the transmission fluid into a suitable container.

5. Install the transmission fluid drain plug.
   - Tighten to 35 Nm.

- Fill Procedure

General Procedures

1. Drain the transmission.

2. **CAUTION:** When filling the transmission with fluid, make sure the transmission contains the specified quantity only. Failure to follow this instruction may result in damage to the vehicle.
   - NOTE: Use transmission fluid meeting Jaguar specification.
   - NOTE: The transmission fluid filler plug hole is not a level indicator.
   Fill the transmission with transmission fluid through the transmission fluid filler plug hole.

3. Install the transmission fluid filler plug.
   - Tighten to 35 Nm.

4. Install the transmission undertray.

5. Lower the vehicle.

## In-vehicle Repair

### Removal

1. **Drain the transmission.**
   For additional information, refer to: [Drain Procedure](#) (308-03B Manual Transmission/Transaxle - Vehicles With: S6-53 6-Speed Manual Transmission, General Procedures).

3. **CAUTION:** Make sure the special tool stop is set 5 mm from the drill tip. Failure to follow this instruction may result in damage to the vehicle.

   Adjust special tool stop to 5 mm from the drill tip if required.
   1. Make sure the special tool stop is set 5 mm from the drill tip.
   2. Adjust special tool stop to 5 mm from the drill tip if required.
4. **CAUTION:** Make sure the countershaft seal is drilled in the area shown. Failure to follow this instruction may result in damage to the vehicle.
   Drill the countershaft seal in the area shown.

5. **CAUTION:** Make sure the countershaft seal is drilled in the area shown. Failure to follow this instruction may result in damage to the vehicle.
   Using the special tool, drill the countershaft seal.

6. Install the special tool to the countershaft seal.

7. **NOTE:** Repeat steps 3-6 if required to the remove countershaft seal.
   Using the special tool, remove the countershaft seal.

**Installation**
1. Using the special tool, install the countershaft seal.

3. Fill the transmission.
- Gearshift Control Shaft Seal

**Removal**

1. Drain the transmission. For additional information, refer to: [Drain Procedure](#) (308-03B Manual Transmission/Transaxle - Vehicles With: S6-53 6-Speed Manual Transmission, General Procedures).

2. **CAUTIONS:**

   - Under no circumstances must the flexible coupling (or its fixings) be loosened or removed from the driveshaft. Failure to follow this instruction may result in damage to the vehicle.
   - Make sure the front of the driveshaft does not put an excessive load on the center bearing. Failure to follow this instruction may result in damage to the vehicle.

   Detach the driveshaft from the transmission flange.
   - Mark the position of the driveshaft in relation to the transmission flange.
   - Mark the position of each nut and bolt in relation to the transmission flexible joint.

3. Loosen the heat shield retaining nut.

4. Install suitable cord to the heat shield retaining nut stud.
   - Tighten the retaining nut.
5. Reposition the driveshaft.

6. Detach the gear shift linkage selector rod.
   - Remove the gear shift linkage selector rod retaining clip.

7. Install the special tool.

8. Using the special tool, remove the gearshift control shaft seal.

Installation
1. Using the special tool, install the gearshift control shaft seal.

2. Make sure the seal is correctly installed.

3. Attach the gear shift linkage selector rod.
   - Install the gear shift linkage selector rod retaining clip.

4. **CAUTION:** Make sure the front of the driveshaft does not put an excessive load on the center bearing. Failure to follow this instruction may result in damage to the vehicle.
   - Reposition the driveshaft.
   - Undo the cord.

5. Loosen the retaining nut.
   - Remove the cord from the heat shield retaining nut stud.
6. Tighten the retaining nut.

7. CAUTIONS:

⚠️ Make sure the front of the driveshaft does not put an excessive load on the center bearing. Failure to follow this instruction may result in damage to the vehicle.

⚠️ Make sure all components are installed to the position they were removed from. Failure to follow this instruction may result in damage to the vehicle.

Attach the driveshaft to the transmission flange.
- Tighten to 88 Nm.

8. Fill the transmission.
- Input Shaft Seal
In-vehicle Repair

Removal

2. CAUTIONS:

⚠️ Under no circumstances must the flexible coupling (or its fixings) be loosened or removed from the driveshaft. Failure to follow this instruction may result in damage to the vehicle.

⚠️ Make sure the front of the driveshaft does not put an excessive load on the center bearing. Failure to follow this instruction may result in damage to the vehicle.

Detach the driveshaft from the transmission flange.

- Mark the position of the driveshaft in relation to the transmission flange.
- Mark the position of each nut and bolt in relation to the transmission flexible joint.

3. Loosen the heat shield retaining nut.
4. Install suitable cord to the heat shield retaining nut stud.
   - Tighten the retaining nut.

5. Reposition the driveshaft.

6. Using the special tool, remove the transmission support.
   - Lower the transmission to a suitable height.

7. Using the special tools, remove and discard the output shaft flange retaining nut.

8. Using the special tools, remove the output shaft flange.
9. Using the special tools, remove the output shaft seal.

Installation

1. Using the special tool, install the output shaft seal.

2. Install the special tool to the output shaft.

3. Install the special tools to the output shaft flange.
4. **CAUTION:** Make sure when installing the output shaft flange, the output shaft flange is heated to a temperature between 100 °C and 120 °C. Failure to follow this instruction, may result in damage to the vehicle.

   Using suitable equipment, heat the output shaft flange to a temperature between 100 °C and 120 °C.

5. **CAUTION:** Make sure when installing the output shaft flange, the output shaft flange is heated to a temperature between 100 °C and 120 °C. Failure to follow this instruction, may result in damage to the vehicle.

   Align the output shaft flange to the output shaft.

6. **CAUTIONs:**

   - **⚠️** Make sure when installing the output shaft flange, the output shaft flange is heated to a temperature between 100 °C and 120 °C. Failure to follow this instruction, may result in damage to the vehicle.

   - **⚠️** Make sure the output shaft flange is fully installed to the output shaft. Failure to follow this instruction, may result in damage to the vehicle.

   Using the special tool install the output shaft flange to the output shaft.

7. Remove the special tools.

8. Remove the special tools.
9. Using the special tools, install a new output shaft flange retaining nut.
   • Tighten to 145 Nm.

10. Install the transmission support.
    • Using the special tool, raise the transmission.
    • Tighten to 55 Nm.

11. Tighten to 48 Nm.

12. **CAUTION:** Make sure the front of the driveshaft does not put an excessive load on the center bearing. Failure to follow this instruction may result in damage to the vehicle.
    Reposition the driveshaft.
    • Undo the cord.

13. Loosen the retaining nut.
    • Remove the cord from the heat shield retaining nut stud.
14. Tighten the retaining nut.

15. **CAUTIONS:**

⚠️ Make sure the front of the driveshaft does not put an excessive load on the center bearing. Failure to follow this instruction may result in damage to the vehicle.

⚠️ Make sure all components are installed to the position they were removed from. Failure to follow this instruction may result in damage to the vehicle.

Attach the driveshaft to the transmission flange.
- Tighten to 88 Nm.

16. Fill the transmission.
- Support Insulator

In-vehicle Repair

<table>
<thead>
<tr>
<th>Special Tool(s)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Powertrain Assembly Jack</td>
</tr>
<tr>
<td>HTJ1200-2</td>
</tr>
</tbody>
</table>

Removal

1. Raise and support the vehicle.
   For additional information, refer to: Lifting (100-02 Jacking and Lifting, Description and Operation).

2. Using the special tool, remove the transmission support.

3. Remove the support insulator.

Installation

1. To install, reverse the removal procedure.
   - Tighten to 55 Nm.
2. Tighten to 48 Nm.

3. Tighten to 55 Nm.

Removal

1. Remove the filler cap.

2. Remove the engine cover.
3. Install the special tool.

4. Install the special tool.
   - Rotate the special tool adjustment bolt a suitable amount of turns to support the engine.

5. Disconnect the battery ground cable.
   For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

6. Remove both catalytic converters.
   For additional information, refer to: Catalytic Converter - 2.7L V6 - TdV6 (309-00 Exhaust System, Removal and Installation).

7. CAUTIONS:
   - Under no circumstances must the flexible coupling (or its fixings) be loosened or removed from the driveshaft. Failure to follow this instruction may result in damage to the vehicle.
   - Make sure the front of the driveshaft does not put an excessive load on the center bearing. Failure to follow this instruction may result in damage to the vehicle.

   Detach the driveshaft from the transmission flange.
   - Mark the position of the driveshaft in relation to the transmission flange.
   - Mark the position of each nut and bolt in relation to the transmission flexible joint.

8. Loosen the heat shield retaining nut.
9. Install suitable cord to the heat shield retaining nut stud.
   - Tighten the retaining nut.

10. Reposition the driveshaft.

11. Remove the transmission undertray.

12. Detach the gear shift linkage selector rod.
    - Remove the gear shift linkage selector rod retaining clip.

13. Detach the gear shift linkage stabilizer rod.
    - Remove the clevis pins.
14. Disconnect the reverse lamp switch electrical connector.

15. Detach the reverse lamp switch electrical harness.

16. Detach the clutch slave cylinder supply tube.
   - Clamp the hose to prevent loss of fluid.

17. **CAUTION:** Make sure the transmission weight is evenly supported on the special tool. Failure to follow this instruction may result in damage to the vehicle.

   - Install the special tool.

18. Using the special tool, lower the rear of the transmission.
   - Remove the retaining bolts.
19. **WARNING:** Secure the transmission to the special tool using the tie down straps. Failure to follow this instruction may result in personal injury.

**CAUTION:** Make sure the tie down strap does not trap the transmissions sensors or harness etc. Failure to follow this instruction may result in damage to the vehicle.

Install the tie down strap.

20. Disconnect the electrical connector.

21. Remove the retaining bolts.

22. Remove the retaining bolts.

23. **CAUTION:** Make sure the input shaft fully disengages from the clutch disc when removing manual transmission. Failure to follow this instruction may result in damage to the vehicle.

Remove the manual transmission.
- Lower the manual transmission from the vehicle.

Installation

1. **CAUTIONS:**

   - Make sure the input shaft correctly engages with the clutch disc when installing manual transmission. Failure to follow this instruction may result in damage to the vehicle.

   - Make sure the location dowels are fitted correctly to the engine block. Failure to follow this instruction may result in damage to the vehicle.

   - Make sure the manual transmission correctly locates to the location dowels on the engine block. Failure to follow this instruction may result in damage to the vehicle.

   - **NOTE:** Position the transmission to the engine using the transmission jack.

   - Install the manual transmission to the vehicle.
     - Raise the manual transmission to the vehicle.
     - Install the retaining bolts.
     - Tighten to 40 Nm.

2. Install the retaining bolts.

   - Tighten to 40 Nm.
3. Install the retaining bolts.
   • Tighten to 40 Nm.

4. Connect the electrical connector.

5. Remove the tie down strap.

6. Install the manual transmission mount retaining bolts.
   • Raise the rear of the manual transmission.
   • Tighten to 50 Nm.

7. Remove the special tool.
8. **NOTE:** Install a new O-ring seal.
   - Attach the clutch slave cylinder supply tube.
   - Clamp the hose to prevent loss of fluid.
   - Unclamp the hose.

9. Attach the reverse lamp switch electrical harness.

10. Connect the reverse lamp switch electrical connector.

11. Attach the gear shift linkage stabilizer rod.
    - Install the clevis pins.

12. Attach the gear shift linkage selector rod.
    - Install the gear shift linkage selector rod retaining clip.
13. Install the transmission undertray.

14. **CAUTION:** Make sure the front of the driveshaft does not put an excessive load on the center bearing. Failure to follow this instruction may result in damage to the vehicle.

   Reposition the driveshaft.
   - Undo the cord.

15. Loosen the retaining nut.

   - Remove the cord from the heat shield retaining nut stud.

16. Tighten the retaining nut.

17. **CAUTIONS:**

   - Make sure the front of the driveshaft does not put an excessive load on the center bearing. Failure to follow this instruction may result in damage to the vehicle.

   - Make sure all components are installed to the position they were removed from. Failure to follow this instruction may result in damage to the vehicle.

   Attach the driveshaft to the transmission flange.
   - Tighten to 88 Nm.
18. Carry out the clutch system bleeding procedure. For additional information, refer to: Clutch System Bleeding (308-00 Manual Transmission/Transaxle and Clutch - General Information, General Procedures).

19. Install both catalytic converters. For additional information, refer to: Catalytic Converter - 2.7L V6 - TdV6 (309-00 Exhaust System, Removal and Installation).

20. Connect the battery ground cable. For additional information, refer to: Battery Connect (414-01 Battery, Mounting and Cables, General Procedures).

21. Remove the special tool.
   - Loosen the special tool adjustment bolt.

22. Remove the special tool.

23. Install the engine cover.

24. Install the filler cap.

The manual transmission is equipped with a selector rod gearshift mechanism. In order to isolate the outer gearshift mechanism from the bodywork, the gearshift housing is located in the gearshift mounting. This mounting accommodates lengthways and rotational movement to allow the movements of the engine/transmission relative to the vehicle body. The gearshift housing is rigidly joined to the transmission by the gearshift stabilizer.
Manual Transmission/Transaxle External Controls - External Controls

Diagnosis and Testing

1. **1.** Verify the customer concern by operating the system.
2. **2.** Visually inspect for obvious signs of mechanical damage.

### Visual Inspection Chart

<table>
<thead>
<tr>
<th></th>
<th>Mechanical</th>
<th>Electrical</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Visibly damaged or worn</td>
<td></td>
<td>•</td>
</tr>
<tr>
<td>• Loose or missing screws or nuts</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** If the concern is not visually evident, verify the symptom and refer to the

Removal

1. Remove the shift linkage assembly. For additional information, refer to Shift Linkage

2. Detach the shift linkage gaiter.

3. Remove the selector rod retaining clip.

4. Remove the selector rod.

5. Release the nylon insert retaining tangs.
6. Remove the gearshift lever assembly.

7. Remove the nylon insert.

**Installation**

1. **NOTE:** Make sure the gear lever is upright in 3-4 neutral before reconnecting the lever to the selector rod.

- **NOTE:** Make sure the arrow on the gear lever gaiter is pointing forward before installing.

To install, reverse the removal procedure.

- Apply polyglup SSD-M1C244-A or equivalent.
Removal

1. Remove the selector lever handle.

2. Remove the selector lever finish panel.

3. Remove the selector lever boot.

4. Remove the exhaust system.
   For additional information, refer to Section 309-00 Exhaust System.

5. Remove the driveshaft.
   For additional information, refer to Section 205-01 Driveshaft.

6. Detack the gear shift linkage selector rod.
   - Remove the gear shift linkage selector rod retaining clip.
7. Detach the gear shift linkage stabilizer rod.
   - Remove the clevis pin.

8. Remove the gear shift linkage.

**Installation**

1. To install, reverse the removal procedure.
Removal

1. Remove the selector lever handle.
   - Pull the selector lever handle upwards.

2. Remove the selector lever finish panel.

3. Remove the insulation foam.

4. Detach the selector lever boot.
5. **CAUTIONS:**

⚠️ Under no circumstances must the flexible coupling (or its fixings) be loosened or removed from the driveshaft. Failure to follow this instruction may result in damage to the vehicle.

⚠️ Make sure the front of the driveshaft does not put an excessive load on the center bearing. Failure to follow this instruction may result in damage to the vehicle.

Detach the driveshaft from the transmission flange.

- Mark the position of the driveshaft in relation to the transmission flange.

- Mark the position of each nut and bolt in relation to the transmission flexible joint.

6. Loosen the heat shield retaining nut.

7. Install suitable cord to the heat shield retaining nut stud.

- Tighten the retaining nut.

8. **CAUTION:** Make sure the front of the driveshaft does not put an excessive load on the center bearing. Failure to follow this instruction may result in damage to the vehicle.

Reposition and support the driveshaft.
9. Detach the gear shift linkage selector rod.
   - Remove the gear shift linkage selector rod retaining clip.

10. Detach the gear shift linkage stabilizer rod.
    - Remove the clevis pins.

11. Remove the gear shift linkage.

**Installation**

1. To install, reverse the removal procedure.

The exhaust system for various engines are of similar design but utilize different internal elements to achieve a distinct exhaust note for each variant.
Catalytic Converters

Three Way Catalytic Converters - Except Vehicles with Diesel Engine

The three way catalytic converters consist of palladium / rhodium coated elements. These elements are utilized to control the emissions of hydrocarbons (HC), carbon monoxide (CO) and oxides of nitrogen (NOx) from the engine.

The catalytic converters are connected to the exhaust manifold by a two bolt self-sealing flange. Exhaust jointing compound must not be applied to these self-sealing joints due to the possibility of catalytic converter contamination. Avoid allowing any foreign particles of debris into the catalytic downpipe as this can result in damage to the catalytic converter.

Oxidation Catalytic Converter - Vehicles with Diesel Engine

The oxidation catalytic converters consist of a element coated with platinum. This element is utilized to control the emissions of hydrocarbons (HC), carbon monoxide (CO) and particles of matter (soot) from the engine.

The catalytic converters are connected to the turbocharger by a three bolt flange and decoupler assembly, sealed by a gasket. Exhaust jointing compound must not be applied to these joints due to the possibility of catalytic converter contamination. Avoid allowing any foreign particles of debris into the catalytic downpipe as this can result in damage to the catalytic converter.

Inspection and Verification

1. 1. Verify the customer concern.
2. 2. Visually inspect for obvious signs of mechanical damage.

### Visual inspection
- Inspect the exhaust system components for damage
- Check the condition and security of the system fittings
- Check the condition and security of the system mountings
- Check the system for evidence of leakage
- Check the alignment of the system

3. 3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. 4. If the concern is not visually evident, verify the symptom and refer to the Symptom Chart.

### Symptom Chart

<table>
<thead>
<tr>
<th>Symptom</th>
<th>Possible cause</th>
<th>Action</th>
</tr>
</thead>
</table>
| Excessive fuel consumption/poor performance | • Damaged/Blocked exhaust pipe and/or mufflers  
• Damaged/Blocked catalytic converter | Inspect the exhaust system for damage. Disconnect the exhaust system from the catalytic converters and check for restricted flow. Remove the catalytic converters and inspect internally for damage. Install new components as necessary. REFER to: Exhaust System - VIN Range: N52048->N99999 (309-00 Exhaust System, Description and Operation). |
| Knocks/Rattles from underside        | • Exhaust system components insecure/damaged  
• Catalytic converters damaged | Inspect the exhaust system for damage. Check the security of the exhaust system fittings. Tap the sides of the catalytic converters with a soft-faced hammer and listen for movement inside the converter. Install new components as necessary. REFER to: Exhaust System - VIN Range: N52048->N99999 (309-00 Exhaust System, Description and Operation). |
| Noise/Fumes inside vehicle           | • Exhaust system components insecure/damaged  
• Leakage from joints               | Inspect the exhaust system for damage. Check the security of the exhaust system fittings. In a well-ventilated area, close off the tailpipes and check for evidence of leakage. Seal any leaks as necessary. |
Removal

1. Raise and support the vehicle. For additional information, refer to: Jacking (100-02 Jacking and Lifting, Description and Operation).

2. Remove the heated oxygen sensor (HO2S).
   1. Disconnect the heated oxygen sensor electrical connector.
   2. Remove the HO2S.

3. Remove the catalyst monitor sensor.
   1. Disconnect the catalyst monitor sensor electrical connector.
   2. Remove the catalyst monitor sensor.

4. Loosen the catalytic converter retaining clamp.

5. Detach the catalytic converter.
6. Remove the catalytic converter.

**Installation**

1. **CAUTION:** Never use jointing compound forward of the catalytic converter.
   
   To install reverse, the removal procedure.
   
   - Tighten to 40 Nm.

2. Tighten to 55 Nm.

3. Tighten to 40 Nm.
4. Tighten to 40 Nm.

5. **NOTE:** For NAS vehicles only.
   If required, carry out a long drive cycle.
   For additional information, refer to: Powertrain Control Module (PCM)
   Long Drive Cycle Self-Test (303-14A Electronic Engine Controls - 2.5L NA
   V6 - AJV6/3.0L NA V6 - AJ27, General Procedures).
Removal

All vehicles

1. Remove the air deflector. For additional information, refer to: Air Deflector (501-02 Front End Body Panels, Removal and Installation).

Vehicles with diesel particulate filter (DPF)

2. NOTE: Right-hand shown, left-hand similar.
   Loosen the catalytic converter to particulate filter retaining clamp.

3. NOTE: Right-hand shown, left-hand similar.
   Disconnect the catalytic converter temperature sensor electrical connectors.

Vehicles without diesel particulate filter (DPF)

5. Remove the front muffler. For additional information, refer to: Front Muffler (309-00 Exhaust System, Removal and Installation).

All vehicles
6. **CAUTION:** Make sure the catalytic converter is fully supported during removal. Failure to follow this instruction will result in damage to the catalytic converter decoupler joint.
   • **NOTE:** Right-hand shown, left-hand similar.
   Detach the catalytic converter.
   • Remove and discard the retaining nuts.

7. **NOTE:** Right-hand shown, left-hand similar.
   Remove the catalytic converter.
   • Remove and discard the gasket.

---

**Installation**

**Vehicles without diesel particulate filter (DPF)**

1. **CAUTIONS:**

   - **CAUTION:** Make sure the catalytic converter is fully supported during installation. Failure to follow this instruction will result in damage to the catalytic converter decoupler joint.
   - **CAUTION:** Never use jointing compound forward of the catalytic converter.
   • **NOTE:** Right-hand shown, left-hand similar.
   Install the catalytic converter.
   • Install a new gasket.
   • Install new retaining nuts.
   • Tighten to 22 Nm.

2. **NOTE:** Right-hand shown, left-hand similar.
   Tighten to 22 Nm.

3. Install the front muffler.
   For additional information, refer to: Front Muffler (309-00 Exhaust System, Removal and Installation).

**Vehicles with diesel particulate filter (DPF)**
4. CAUTIONS:

⚠️ Make sure the catalytic converter is fully supported during installation. Failure to follow this instruction will result in damage to the catalytic converter decoupler joint.

⚠️ Never use jointing compound forward of the catalytic converter.

• NOTE: Right-hand shown, left-hand similar.

Loosely install the catalytic converter.
  - Install a new gasket.
  - Install the retaining bolts.

5. NOTE: Right-hand shown, left-hand similar.

Install new retaining nuts.
  - Tighten to 22 Nm.

6. NOTE: Right-hand shown, left-hand similar.

Install the catalytic converter to particulate filter retaining clamp.
  - Tighten to 11 Nm.

7. NOTE: Right-hand shown, left-hand similar.

Fully tighten the catalytic converter bracket retaining bolts.
  - Tighten to 25 Nm.

• NOTE: For vehicles prior to VIN N85983, refit old fixings and tighten to 22 Nm.

8. NOTE: Right-hand shown, left-hand similar.

Attach the catalytic converter temperature sensor wiring harness to the transmission.
9. NOTE: Right-hand shown, left-hand similar.
   Connect the catalytic converter temperature sensor electrical connectors.

All vehicles

10. Install the air deflector.
    For additional information, refer to: Air Deflector (501-02 Front End Body Panels, Removal and Installation).
Exhaust System - Diesel Particulate Filter (DPF)

Removal

1. Raise the vehicle. For additional information, refer to Lifting (100-02 Jacking and Lifting, Description and Operation).

2. Disconnect the diesel particulate filter temperature sensor electrical connector.

3. NOTE: Note the orientation of the diesel particulate filter high-pressure and low-pressure hoses and make sure they are installed in the same position. There is a paint mark to identify the high-pressure hose.

   Detach the diesel particulate filter high-pressure and low-pressure hoses.

4. Loosen the diesel particulate filter to center muffler retaining clamps.

5. Remove the diesel particulate filter to right-hand catalytic convertor retaining bracket.
   - Remove and discard the gasket.
6. Remove the diesel particulate filter to left-hand catalytic convertor retaining bracket.
   - Remove and discard the gasket.

7. **CAUTION:** Make sure that the diesel particulate filter is supported at all times. Failure to follow this instruction may result in damage to the vehicle.
   - Remove the diesel particulate filter mount bracket.
   - Remove and discard the diesel particulate filter mount bracket retaining nuts.

8. Using an assistant, remove the diesel particulate filter.

**Installation**

1. To install, reverse the removal procedure.
   - Tighten to 9 Nm.
2. NOTE: Install a new gasket.
   Tighten to 11 Nm.

3. NOTE: Install a new gasket.
   Tighten to 11 Nm.

4. Tighten to 55 Nm.
Removal

1. Disconnect the diesel particulate filter differential pressure sensor electrical connector.

2. **CAUTION:** Make a note of the connection orientation of the high-pressure and low-pressure hoses to the sensor ports. Make sure that the hoses are located to the correct sensor port when installed. Failure to follow these instructions may result in damage to the vehicle.

   Detach the diesel particulate filter differential pressure sensor high-pressure and low-pressure hoses.

3. Remove the diesel particulate filter differential pressure sensor.

Installation

1. **CAUTION:** Make sure that the high-pressure and low-pressure hoses are fully installed and the retaining clips are positioned in their original position.

   To install, reverse the removal procedure.
   - Tighten to 5 Nm.
Removal

1. Raise and support the vehicle. For additional information, refer to Section 100-02 Jacking and Lifting.
2. Remove the support bracket.

3. Support the exhaust system with suitable stands.
4. NOTE: Left-hand shown, right-hand similar.
   Disconnect the heated oxygen sensor (HO2S) electrical connector.

5. NOTE: Left-hand shown, right-hand similar.
   Disconnect the catalyst monitor sensor electrical connector.

6. NOTE: Right-hand shown, left-hand similar.
   Detach the catalytic converter.
7. **NOTE:** Right-hand shown, left-hand similar.
   Detach the muffler and tailpipe hanger insulators.

8. **Remove the exhaust system.**
   1. Detach both front muffler hanger insulators.
   2. Remove the exhaust system.

**Installation**

1. **NOTE:** Right-hand shown, left-hand similar.
   To install, reverse the removal procedure.
   - Tighten to 40 Nm.

2. Tighten to 6 Nm.
Exhaust System - Front Muffler
Removal and Installation

Removal

1. Remove both muffler and tailpipes.
   For additional information, refer to Muffler and Tailpipe in this section.
2. Remove the support bracket.

3. Support the exhaust system using suitable stands.
4. NOTE: Left-hand shown, right-hand similar.
   Loosen both catalytic converter retaining clamps.

5. NOTE: Detach both front muffler hanger insulators.
   Remove the front muffler.

Installation

1. CAUTION: The hanger insulators are constructed of a special material. Use only the correct specification insulators.
   • NOTE: Check the hanger insulators for damage or fatigue. Install new hangers if required.
   To install, reverse the removal procedure.
   • Tighten to 55 Nm.
2. Tighten to 6 Nm.
Exhaust System - Muffler and Tailpipe
Removal and Installation

**Removal**

1. Raise and support the vehicle. For additional information, refer to Section [100-02 Jacking and Lifting].
2. Loosen the muffler and tailpipe retaining clamp.

3. Detach the muffler and tailpipe hanger insulator.

4. Remove the muffler and tailpipe.

**Installation**

1. **CAUTION:** The hanger insulators are constructed of a special material. Use only the correct specification insulators.

   - **NOTE:** Check the hanger insulators for damage or fatigue. Install new hangers if required.
   - **NOTE:** Make sure the muffler and tailpipe is central in the bumper aperture.

   To install, reverse the removal procedure.
   - Tighten to 55 Nm.

### Fuel System - Except Vehicles with Diesel Engine

The electronic returnless fuel system utilized has the following advantages:

- reduced fuel tank vapor.
- requires less electrical power.
- does not require a fuel return line.

The intelligence of this system is contained within the engine control module (ECM).

The ECM determines the required fuel flow and communicates this information to the rear electronic module (REM). The REM has the fuel pump driver functions fully integrated into the microprocessor. The fuel pump relay is activated by the ECM power relay and provides a fused power supply to the REM. The ECM and the REM calculates the frequency and determines the current required by the fuel pump to maintain the correct fuel pressure at the fuel injectors.

The fuel tank is of a saddle design which incorporates a pump/sender unit in both sides of the tank on vehicles with superchargers. On vehicles without superchargers, the right-hand side houses the fuel pump module and the left-hand side houses the fuel transfer pump. The fuel pump cross over lines are internal to the fuel tank to reduce potential leak paths.

Fuel is supplied at high pressure to the injectors via a fuel rail which incorporates a fuel pressure and a fuel temperature sensor. The ECM increases the fuel pressure to minimise fuel vapor formation to maintain fuel flow across the injectors. An inertia type fuel shutoff switch will cut power to the fuel pump in the event of an accident.

Vehicles with Diesel Engine
Fuel System - Vehicles with Diesel Engine

The diesel fuel is drawn from the fuel tank by an internal electric lift pump which is supplied with battery voltage from the fuel pump relay located in the rear power distribution box. The fuel pump relay is controlled by the ECM. The fuel pump provides a low pressure diesel fuel supply to the transfer pump incorporated in to the fuel injection pump. The fuel metering valve (FMV) governs the amount of fuel supplied to the fuel injection pump. The fuel injection pump has a fuel return circuit to the fuel filter, which is independent of the injector return pipes.

The fuel tank is of a saddle design which incorporates a fuel pump module and fuel level sensor in the right-hand side and a fuel level sensor module in the left-hand side of the tank. The fuel pump cross over lines are internal to the fuel tank to reduce potential leak paths. The signals from the fuel level sensors are used both for the fuel gauge and the run dry prevention strategy within the ECM.

The driver will always be aware of the risk of running out of fuel as the fuel gauge will show empty and the fuel warning lamp will be illuminated. In order to protect the fuel lift pump and fuel injection pump and to prevent the need for fuel priming after the vehicle has run...
out of fuel, the ECM will instigate the run dry prevention strategy prior to the fuel tank becoming completely empty. In order to recognize the fuel tank becoming empty, a low level switch is incorporated into the fuel tank swirl pot. The signal from this switch, together with the signal from two fuel level sensors is relayed to the ECM, via the controller area network (CAN) bus.

Before a run dry event occurs the ECM will take a series of actions to inform the driver of the low fuel level in the fuel tank.

* Dependant on average fuel consumption

If, when the ignition key is turned to the ON position, the run dry event is still detected, this would indicate that either no, or insufficient, fuel has been added to the fuel tank, or that the vehicle may be parked on a slope. In this instance the fuel pump will run to fill the swirl pot and cover the low fuel level switch. The ECM will not prevent the engine from cranking, but it will inhibit fuel injection. If, after a delay, a run dry event is still detected, the fuel pump will be inhibited for the rest of the ignition cycle. As soon as a run dry event is no longer detected normal starting can resume.

1. Verify the customer concern by operating the system.
2. Visually inspect for obvious signs of mechanical or electrical damage.
3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the concern is not visually evident, refer to the Symptom Chart.

### Symptom Chart

<table>

<tr>
<td>Yes</td>
</tr>
<tr>
<td>No</td>
</tr>
</tbody>
</table>

#### A3: CHECK THE GROUND SUPPLY TO THE FUEL PUMP

<table>
<thead>
<tr>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Switch the ignition to the OFF position.</td>
</tr>
<tr>
<td>2. Measure the resistance between the fuel pump electrical connector FP4 pin 3, (BR) and ground.</td>
</tr>
</tbody>
</table>
Is the resistance less than 0.5 Ohms?
Yes
INSTALL a new fuel pump. CLEAR DTC. TEST the system for normal operation.
No
GO to A11.

A4: CHECK THE POSITIVE SUPPLY TO THE FUEL PUMP RELAY

1. REMOVE the fuel pump relay at the rear power distribution box.
2. Switch the ignition to the RUN position.
3. Measure the voltage at the fuel pump relay electrical connector pin 1.

Is the voltage less than 10.5 Volts?
Yes
GO to A5.
No
GO to A13.

A5: CHECK THE POSITIVE SUPPLY TO THE FUEL PUMP DIODE

1. Switch the ignition to the OFF position.
2. REMOVE the fuel pump diode at the rear distribution box.
3. Switch the ignition to the RUN position.
4. Measure the voltage between the fuel pump diode electrical connector CA61 pin G2, (GW) and GROUND.

Is the voltage less than 10.5 Volts?
Yes
GO to A6.
No
INSTALL a new fuel pump diode. CLEAR DTC. TEST the system for normal operation.

A6: CHECK THE POSITIVE SUPPLY TO FUSE 4 AT THE PRIMARY JUNCTION BOX

1. Measure the voltage at the positive supply side of fuse 4 at the primary junction box.

Is the voltage less than 10.5 Volts?
Yes
TEST the voltage supply to the primary junction box from ignition switch.
No
GO to A7.

A7: CHECK THE VOLTAGE SUPPLY BETWEEN THE INPUT SIDE OF INERTIA SWITCH AND OUTPUT SIDE OF FUSE 4 AT THE PRIMARY JUNCTION BOX

1. Switch the ignition to the OFF position.
2. Measure the resistance between fuse 4 at the primary junction box and the fuel shut-off inertia switch electrical connector CA4 pin X2, (GO).

Is the resistance less than 0.5 Ohms?
Yes
GO to A8.
No
REPAIR the inertia fuel shut-off switch supply circuit. CLEAR DTC. TEST the system for normal operation.

A8: CHECK THE CONTINUITY BETWEEN THE OUTPUT SIDE OF INERTIA SWITCH AND THE POSITIVE SUPPLY TO FUEL PUMP DIODE

1. Measure the resistance between the inertia fuel shut-off switch electrical connector CA4 pin X3, (GW) the fuel pump diode electrical connector CA61 pin G2, (GW).

Is the resistance less than 0.5 Ohms?
Yes
INSTALL a new fuel inertia shut-off switch.
No
REPAIR the circuit between the inertia fuel shut-off switch electrical connector CA4 pin X3, (GW) and the fuel pump diode electrical connector CA61 pin G2, (GW). CLEAR DTC. TEST the system for normal operation.

A9: CHECK THE SWITCHABLE VOLTAGE SUPPLY TO THE FUEL PUMP RELAY

1. Switch the ignition to the OFF position.
2. REMOVE the fuel pump relay at the rear power distribution box.
3. Switch the ignition to the RUN position.
4. Measure the voltage at the fuel pump relay electrical connector pin 3 (R).

Is the voltage less than 10.5 Volts?
Yes
GO to A10.
No
GO to A14.

A10: CHECK THE FUEL PUMP RELAY SWITCHABLE VOLTAGE SUPPLY FUSE

1. Measure the voltage at the fuel pump relay switchable voltage supply fuse.

Is the voltage less than 10.5 Volts?
Yes
TEST the rear power distribution box power supply. CLEAR DTC. TEST the system for normal operation.
No
REPAIR the circuit between the rear power distribution box electrical connector CA61 pin X34, (R) and the fuel pump relay electrical connector pin 3, (R). CLEAR DTC. TEST the system for normal operation.

1. Measure the resistance between the fuel pump electrical connector FP4 pin 3, (BR) and the rear electronic module CA101 pin 12, (BR).

Is the resistance less than 0.5 Ohms?
Yes
GO to A12.
No
REPAIR the circuit between the fuel pump electrical connector FP4 pin 3, (BR) and rear electronic module electrical connector CA101 pin 12, (BR). CLEAR DTC. TEST the system for normal operation.

A12: CHECK THE CONTINUITY BETWEEN THE REAR ELECTRONIC MODULE AND GROUND

1. Measure the resistance between the rear electronic module electrical connector CA101 pin 02, (B) and GROUND CA156, (B).

Is the resistance less than 0.5 Ohms?
Yes
GO to A16.
No
REPAIR the circuit between the rear electronic module CA101 pin 02, (B) and GROUND CA156, (B). CLEAR DTC. TEST the system for normal operation.
A13: CHECK THE GROUND SUPPLY TO THE FUEL PUMP RELAY  
1. Switch the ignition to the OFF position.  
2. Measure the resistance between the fuel pump relay pin 2 (B) and GROUND CA116 (B).  
   - Is the resistance less than 0.5 Ohms?  
     - Yes: INSTALL a new fuel pump relay. CLEAR DTC. TEST the system for normal operation.  
     - No: REPAIR the circuit between the fuel pump relay pin 2 (B) and GROUND CA116 (B). CLEAR DTC. TEST the system for normal operation.

A14: CHECK THE VOLTAGE OUTPUT AT THE FUEL PUMP RELAY  
1. Switch the ignition to the OFF position.  
2. INSTALL the fuel pump relay at the rear power distribution box.  
3. Switch the ignition to the RUN position.  
4. Measure the output voltage from the fuel pump relay electrical connector pin 5 at the rear electronic module electrical connector CA101 pin 01, (GO).  
   - Is the voltage greater than 10.5 Volts?  
     - Yes: GO to A15.  
     - No: INSTALL a new fuel pump relay. CLEAR DTC. TEST the system for normal operation.

A15: CHECK THE CONTINUITY BETWEEN THE REAR ELECTRONIC MODULE AND THE FUEL PUMP  
1. Measure the resistance between the rear electronic module electrical connector CA101 pin 11, (GO) and fuel pump electrical connector FP4 pin 1, (GO).  
   - Is the resistance less than 0.5 Ohms?  
     - Yes: INSTALL a new rear electronics module. CLEAR DTC. TEST the system for normal operation.  
     - No: REPAIR the circuit between the rear electronic module electrical connector CA101 pin 11, (GO) and fuel pump electrical connector FP4 pin 1, (GO). CLEAR DTC. TEST the system for normal operation.

A16: CHECK THE CONTINUITY OF THE REAR ELECTRONIC MODULE SIGNAL SUPPLY CIRCUIT  
1. Disconnect the engine control module (ECM) electrical connector FH1.  
2. Disconnect the rear electronic module electrical connector CA103.  
3. Measure the resistance between the ECM electrical connector FH1 pin 58, (WP) and the rear electronic module electrical connector CA103 pin 19, (WP).  
   - Is the resistance less than 0.5 Ohms?  
     - Yes: REPAIR the circuit between the ECM electrical connector FH1 pin 58, (WP) and the rear electronic module electrical connector CA103 pin 19, (WP). CLEAR DTC. TEST the system for normal operation.  
     - No: INSTALL a new rear electronics module. CLEAR DTC. TEST the system for normal operation.

PINPOINT TEST B : B1201, P0460—FUEL SENDER CIRCUIT FAILURE  

B1: CHECK THE VOLTAGE SUPPLY TO THE FUEL LEVEL SENSORS  
1. Switch the ignition to the RUN position.  
2. Measure the voltage at the fuel level sensor electrical connector between:  
   - FP3 pin 4, (NR) and GROUND  
   - FP4 pin 4, (NR) and GROUND  
   - Is the voltage greater than 10.5 Volts?  
     - No: GO to B4.

B2: CHECK THE GROUND SUPPLY TO THE FUEL LEVEL SENSORS  
1. Switch the ignition to the OFF position.  
2. Measure the resistance at the fuel level sensor electrical connector between:  
   - FP3 pin 2, (WU) and GROUND  
   - FP4 pin 2, (WR) and GROUND  
   - Is the resistance less than 0.5 Ohms?  
     - Yes: GO to B3.  
     - No: REPAIR the relevant circuit. CLEAR DTC. TEST system for normal operation.

B3: CHECK THE RESISTANCE AT THE RIGHT-HAND SIDE FUEL LEVEL SENSOR  
1. REMOVE the right-hand side fuel level sensor. For additional information, refer to Section 310-01 Fuel Tank and Lines  
2. Measure the resistance between the sensor electrical connectors FP4 pin 4 and FP4 pin 2.  
   - Is the resistance between 16 and 160 Ohms?  
     - Yes: INSTALL a new left-hand side fuel level sensor. CLEAR DTC. TEST the system for normal operation.  
     - No: INSTALL a new right-hand side fuel level sensor. CLEAR DTC. TEST the system for normal operation.

B4: CHECK THE CONTINUITY BETWEEN THE FUEL LEVEL SENSOR ELECTRICAL CONNECTOR FP3-4, FP4-4 AND CA103-23 AT THE REAR ELECTRONICS MODULE  
1. Switch the ignition to the OFF position.  
2. Measure the fuel level sensor positive supply circuit resistance between:  
   - FP3 pin 4, (NU) and CA103 pin 23, (NR)  
   - FP4 pin 4, (NR) and CA103 pin 23, (NR)  
   - Is the resistance less than 0.5 Ohms?  
     - Yes: INSTALL a new rear electronic module. CLEAR DTC. TEST the system for normal operation.  
     - No:
REPAIR the relevant circuit. CLEAR DTC. TEST the system for normal operation.
Fuel System - General Information - Fuel System Pressure Check

General Procedures

All vehicles

• NOTE: This procedure is for the installation of the adaptor into the fuel line due to the removal of the schraeder valve from the fuel line.

1. WARNINGS:

⚠️ Place the vehicle in a quarantined area and arrange "No Smoking/Petrol Fumes" signs about the vehicle.

⚠️ Before any work is carried out on the fuel system, ground the vehicle to earth and maintain the ground connection until the work is complete.

⚠️ Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

⚠️ Do not carry or operate cellular phones when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

⚠️ The fuel system remains pressurized for a long time after the ignition is switched off. The fuel pressure must be relieved before attempting any repairs. Failure to follow these instructions may result in personal injury.

⚠️ This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

⚠️ After carrying out repairs, the fuel system must be checked visually for leaks. Failure to follow these instructions may result in personal injury.

Disconnect the battery ground cable.

For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

2. Remove the engine cover.

Vehicles with 2.5L or 3.0L engine

3. Remove the air cleaner outlet pipe.

For additional information, refer to: Air Cleaner Outlet Pipe - VIN Range: N52048->N99999 (303-12A Intake Air Distribution and Filtering - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation).

4. Detach the power steering fluid reservoir and reposition.

Vehicles with supercharger
5. Disconnect the electrical connector.

6. Disconnect the fuel rail feed pipe.
   For additional information, refer to: Spring Lock Couplings (310-00 Fuel System - General Information, General Procedures).

Vehicles with 2.5L or 3.0L engine

7. NOTE: Make sure the special tool is fully seated to the fuel pipe connections.
   Install the special tool.

Vehicles with supercharger

8. NOTE: Make sure the special tool is fully seated to the fuel pipe connections.
   Install the special tool.

Vehicles with 4.0L or 4.2L engine without supercharger

9. NOTE: Make sure the special tool is fully seated to the fuel pipe connections.
   Install the special tool.

All vehicles
10. NOTE: Vehicles with supercharger shown, others vehicles similar.

Install the fuel pressure gauge.

Vehicles with 2.5L or 3.0L engine

11. Install the air cleaner outlet pipe.

For additional information, refer to: Air Cleaner Outlet Pipe - VIN Range: N52048->N99999 (303-12A Intake Air Distribution and Filtering - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation).

All vehicles

12. Connect the battery ground cable.

For additional information, refer to: Battery Connect (414-01 Battery, Mounting and Cables, General Procedures).

13. Carry out the fuel system pressure check.

1. WARNINGS:

⚠️ Place the vehicle in a quarantined area and arrange "No Smoking/Petrol Fumes" signs about the vehicle.

⚠️ Before any work is carried out on the fuel system, ground the vehicle to earth and maintain the ground connection until the work is complete.

⚠️ Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

⚠️ The fuel system remains pressurized for a long time after the ignition is switched off. The fuel pressure must be relieved before attempting any repairs. Failure to follow these instructions may result in personal injury.

⚠️ After carrying out repairs, the fuel system must be checked visually for leaks. Failure to follow these instructions may result in personal injury.

⚠️ This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

⚠️ If taken internally do not induce vomiting, seek immediate medical attention. Failure to follow these instructions may result in personal injury.

⚠️ If fuel contacts the eyes, flush the eyes with cold water or eyewash solution and seek medical attention.

⚠️ Wash hands thoroughly after handling, as prolonged contact may cause irritation. Should irritation develop, seek medical attention.

Disconnect the battery ground cable.

2. Remove the fuel system pressure relief valve cap.
3. **WARNING:** Make sure the tap of the special tool is rotated fully clockwise before installing the special tool to the fuel system pressure relief valve. Failure to follow these instructions may result in personal injury.

   Install the special tool to the fuel system pressure relief valve.

4. **NOTE:** When relieving the fuel system pressure, catch any displaced fuel in a suitable container.

   Relieve the fuel system pressure.
   - Rotate the tap of the special tool fully counterclockwise.

5. Remove the special tool from the fuel system pressure relief valve.

6. Install the fuel system pressure relief valve cap.

7. Connect the battery ground cable.

**1. WARNINGS:**

- Place the vehicle in a quarantined area and arrange "No Smoking/Petrol Fumes" signs about the vehicle.

- Before any work is carried out on the fuel system, ground the vehicle to earth and maintain the ground connection until the work is complete.

- Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

- The fuel system remains pressurized for a long time after the ignition is switched off. The fuel pressure must be relieved before attempting any repairs. Failure to follow these instructions may result in personal injury.

- After carrying out repairs, the fuel system must be checked visually for leaks. Failure to follow these instructions may result in personal injury.

- This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

- If taken internally do not induce vomiting, seek immediate medical attention. Failure to follow these instructions may result in personal injury.

- If fuel contacts the eyes, flush the eyes with cold water or eyewash solution and seek medical attention.

- Wash hands thoroughly after handling, as prolonged contact may cause irritation. Should irritation develop, seek medical attention.

Release the pressure in the fuel system. For additional information, refer to Fuel System Pressure Release in this section.

2. Open the fuel tank filler pipe flap.

3. Disconnect the battery ground cable.

4. Detach the fuel tank filler pipe cap.

5. Remove the rear seat cushion. For additional information, refer to Section 501-10 Seating.

6. Detach and reposition the door opening weatherstrip.
7. Remove the scuff plate trim panel.

8. Detach and reposition the floor covering.

9. Detach and reposition the rear seat cushion insulation.

10. Remove the floor aperture cover.

11. Disconnect the fuel pump module quick release coupling.
12. Detach the fuel pump module electrical connector from the retaining bracket.

13. Disconnect the fuel pump module electrical connector.

14. Using the special tool, remove the fuel pump module locking ring.

15. Detach and reposition the upper part of the fuel pump module.

16. Detach and reposition the left-hand rear door opening weatherstrip.
17. Remove the scuff plate trim panel.

18. Detach and reposition the floor covering.

19. Detach and reposition the rear seat cushion insulation.

20. Remove the floor aperture cover.

21. Detach the fuel transfer pump module electrical connector from the retaining bracket.
22. Disconnect the fuel transfer pump electrical connector.
   1.

23. Using the special tool, remove the fuel transfer pump locking ring.

24. Detach and reposition the upper part of the fuel transfer pump.

25. **CAUTION**: Make sure no damage occurs to the fuel level float.
    Remove the fuel transfer pump.
    - Disconnect the fuel cross over lines.

26. Remove and discard the fuel transfer pump O-ring seal.
27. Remove the fuel pump module.
    - Remove and discard the fuel pump module gasket.

28. Using the fuel pump module hole in the fuel tank to gain access to the fuel, remove the fuel from the fuel tank using the fuel tank draining equipment. Follow the manufactures operating instructions.
29. Using the fuel transfer pump hole in the fuel tank to gain access to the fuel, remove the fuel from the fuel tank using the fuel tank draining equipment. Follow the manufactures operating instructions.
30. **CAUTIONS:**

- **On vehicles with supercharger make sure the arrow on the fuel pump module and the 'SC' marker on the fuel tank are aligned.**

- **On vehicles without supercharger make sure the arrow on the fuel transfer module and the 'NA' marker on the fuel tank are aligned.**

- **Make sure no damage occurs to the fuel level float.**
- **NOTE:** Install a new gasket to the fuel pump module flange.
- **NOTE:** Take care not to stretch the gasket.

Install the fuel pump module.

1. Feed the fuel cross-over lines through the fuel pump module hole and across the front of the fuel tank saddle.

31. Using the special tool, install the fuel pump module locking ring.
- Tighten to 60 Nm.

32. Connect the fuel pump module electrical connector.

33. Attach the fuel pump module electrical connector to the retaining bracket.
34. Connect the fuel pump module quick release coupling.
   • Make sure the quick release coupling has latched onto the fuel pump module fuel pipe by pulling the pipe after the connection has been made.

35. Install the floor aperture cover.

36. Attach the rear seat cushion insulation.

37. Attach the floor covering.

38. Install the scuff plate trim panel.
39. Attach the door opening weatherstrip.

40. CAUTIONS:

⚠️ Vehciles with supercharger - make sure the arrow on the left-hand fuel pump module lines up with the ‘SC’ marker on the fuel tank.

⚠️ Vehicles without supercharger - make sure the arrow on the fuel transfer pump lines up with the ‘NA’ marker on the fuel tank.

Make sure no damage occurs to the fuel level float.
- NOTE: Install a new gasket to the fuel transfer pump flange.
- NOTE: Take care not to stretch the gasket.

Install the fuel transfer pump.

41. Using the special tool, install the fuel transfer pump locking ring.
   - Tighten to 60 Nm.

42. Connect the fuel transfer pump electrical connector.

43. Attach the fuel transfer pump module electrical connector to the retaining bracket.
44. Install the floor aperture cover.

45. Attach the rear seat cushion insulation.

46. Attach the floor covering.

47. Install the scuff plate trim panel.

48. Attach the door opening weatherstrip.
49. Install the rear seat cushion. For additional information, refer to Section 501-10 Seating.
50. Attach the fuel tank filler pipe cap.
51. Connect the battery ground cable.
52. Close the fuel tank filler pipe flap.
Fuel System - General Information - Fuel Tank Draining
2.7L V6 - TdV6, VIN Range: M45255->N52047

General Procedures

### Special Tool(s)
- Remover/Installer, Fuel Pump Module/Fuel Transfer Pump Locking Ring
- 310-072A

1. **WARNINGS:**

   - Place the vehicle in a quarantined area and arrange "No Smoking/Fuel Fumes" signs about the vehicle.

   - Before any work is carried out on the fuel system, ground the vehicle to earth and maintain the ground connection until the work is complete.

   - Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

   - After carrying out repairs, the fuel system must be checked visually for leaks. Failure to follow these instructions may result in personal injury.

   - This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

   - If taken internally do not induce vomiting, seek immediate medical attention. Failure to follow these instructions may result in personal injury.

   - If fuel contacts the eyes, flush the eyes with cold water or eyewash solution and seek medical attention.

   - Wash hands thoroughly after handling, as prolonged contact may cause irritation. Should irritation develop, seek medical attention.

   Remove the fuel level sensor.
   For additional information, refer to: Fuel Transfer Unit - 2.7L V6 - TdV6 (310-01 Fuel Tank and Lines, Removal and Installation).

2. Detach and reposition the door opening weatherstrip.
3. Remove the scuff plate trim panel.

4. Detach and reposition the floor covering.

5. Detach and reposition the rear seat cushion insulation.

6. Remove the floor aperture cover.

7. Detach the fuel pump module electrical connector from the retaining bracket.
8. Disconnect the fuel pump module electrical connector.

9. Disconnect the auxiliary heater fuel supply line quick release coupling. For additional information, refer to: Quick Release Coupling - Push Connect (310-00 Fuel System - General Information, General Procedures).

10. Disconnect the fuel supply line quick release coupling. For additional information, refer to: Quick Release Coupling - Push Connect (310-00 Fuel System - General Information, General Procedures).

11. **CAUTION:** Make sure no damage occurs to the fuel pump module when removing the locking ring.

   Using the special tool, remove the fuel pump module locking ring.

12. Detach and reposition the upper part of the fuel pump module.
13. Using the fuel pump module hole in the fuel tank to gain access to the fuel, remove the fuel from the fuel tank using the fuel tank draining equipment. Follow the manufacturers operating instructions.

14. Using the fuel transfer pump hole in the fuel tank to gain access to the fuel, remove the fuel from the fuel tank using the fuel tank draining equipment. Follow the manufacturers operating instructions.

15. NOTE: Install a new gasket to the fuel pump module flange.

  • NOTE: Take care not to stretch the gasket.

  Reposition the upper part of the fuel pump module.

16. Align the arrow on the fuel pump module with the alignment marks on the fuel tank.

17. CAUTION: Make sure no damage occurs to the fuel pump module when installing the locking ring.

  Using the special tool, install the fuel pump module locking ring.

  • Tighten to 60 Nm.

18. Connect the fuel pump module quick release coupling. For additional information, refer to: Quick Release Coupling - Push Connect (310-00 Fuel System - General Information, General Procedures).
19. Connect the auxiliary heater fuel supply line quick release coupling. For additional information, refer to: Quick Release Coupling - Push Connect (310-00 Fuel System - General Information, General Procedures).

20. Connect the fuel pump module electrical connector.

21. Attach the fuel pump module electrical connector to the retaining bracket.

22. Install the floor aperture cover.

23. Attach the rear seat cushion insulation.
24. Attach the floor covering.

25. Install the scuff plate trim panel.

26. Attach the door opening weatherstrip.

27. Install the fuel level sensor.
   For additional information, refer to: Fuel Transfer Unit - 2.7L V6 - TdV6
   (310-01 Fuel Tank and Lines, Removal and Installation).
Fuel System - General Information - Fuel Tank Draining

- **WARNINGS:**

⚠️ Place the vehicle in a quarantined area and arrange "No Smoking/Petrol Fumes" signs about the vehicle.

⚠️ Before any work is carried out on the fuel system, ground the vehicle to earth and maintain the ground connection until the work is complete.

⚠️ Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

⚠️ The fuel system remains pressurized for a long time after the ignition is switched off. The fuel pressure must be relieved before attempting any repairs. Failure to follow these instructions may result in personal injury.

⚠️ After carrying out repairs, the fuel system must be checked visually for leaks. Failure to follow these instructions may result in personal injury.

⚠️ This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

⚠️ If taken internally do not induce vomiting, seek immediate medical attention. Failure to follow these instructions may result in personal injury.

⚠️ If fuel contacts the eyes, flush the eyes with cold water or eyewash solution and seek medical attention.

⚠️ Wash hands thoroughly after handling, as prolonged contact may cause irritation. Should irritation develop, seek medical attention.

1. Release the pressure in the fuel system.
   For additional information, refer to: Fuel System Pressure Release (310-00 Fuel System - General Information, General Procedures).

2. Remove the rear seat cushion.
   For additional information, refer to: Rear Seat Cushion (501-10 Seating, Removal and Installation).

3. Detach and reposition the door opening weatherstrip.
4. Remove the scuff plate trim panel.

5. Detach and reposition the floor covering.

6. Detach and reposition the rear seat cushion insulation.

7. Remove the floor aperture cover.

8. **CAUTION:** The correct measurement must be used to remove the fuel tank drain port top. Failure to follow this instruction may result in damage to the vehicle.

   - **NOTE:** The fuel tank drain port is marked with **DRAIN**.

   - **NOTE:** Vehicles without Diesel engine shown, vehicles with Diesel engine similar.

     Using a suitable tool, remove the top of the fuel tank drain port.
9. NOTE: Vehicles without Diesel engine shown, vehicles with Diesel engine similar.
Using the special tool, drain the right-hand side of the fuel tank.

10. NOTE: Vehicles without Diesel engine shown, vehicles with Diesel engine similar.
Remove the special tool.

11. **CAUTION:** Make sure the new fuel tank drain port sealing cap is correctly installed. Failure to follow this instruction may result in damage to the vehicle.
• NOTE: Vehicles without Diesel engine shown, vehicles with Diesel engine similar.
Install a new fuel tank drain port sealing cap.

12. Install the floor aperture cover.

13. Attach the rear seat cushion insulation.
14. Attach the floor covering.

15. Install the scuff plate trim panel.

16. Attach the door opening weatherstrip.

17. Detach and reposition the door opening weatherstrip.

18. Remove the scuff plate trim panel.
19. Detach and reposition the floor covering.

20. Detach and reposition the rear seat cushion insulation.

21. Remove the floor aperture cover.

22. **CAUTION:** The correct measurement must be used to remove the fuel tank drain port top. Failure to follow this instruction may result in damage to the vehicle.

- NOTE: The fuel tank drain port is marked with **DRAIN**.
- NOTE: Vehicles without Diesel engine shown, vehicles with Diesel engine similar.

Using a suitable tool, remove the top of the fuel tank drain port.

23. **NOTE:** Vehicles without Diesel engine shown, vehicles with Diesel engine similar.

Using the special tool, drain the left-hand side of the fuel tank.
24. **NOTE:** Vehicles without Diesel engine shown, vehicles with Diesel engine similar.
   Remove the special tool.

25. **CAUTION:** Make sure the new fuel tank drain port sealing cap is correctly installed. Failure to follow this instruction may result in damage to the vehicle.
   • **NOTE:** Vehicles without Diesel engine shown, vehicles with Diesel engine similar.
   Install a new fuel tank drain port sealing cap.

26. Attach the rear seat cushion insulation.

27. Attach the floor covering.

28. Install the scuff plate trim panel.
29. Attach the door opening weatherstrip.

30. Install the rear seat cushion. For additional information, refer to: Rear Seat Cushion (501-10 Seating, Removal and Installation).
**General Procedures**

*General Equipment*

**Pneumatic vacuum gun**

*WARNINGS:*

⚠️ Wait at least 30 seconds after the engine stops before commencing any repair to the high-pressure fuel injection system. Failure to follow this instruction may result in personal injury.

⚠️ Place the vehicle in a well ventilated, quarantined, area and arrange "No Smoking/Fuel Fumes" signs about the vehicle.

⚠️ Before any work is carried out on the fuel system, ground the vehicle to earth and maintain the ground connection until the work is complete.

⚠️ Do not carry out any repairs to the fuel injection system with the engine running. The fuel pressure within the system can be as high as 1650 bar. Failure to follow this instruction may result in personal injury.

⚠️ Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

⚠️ After carrying out repairs, the fuel system must be checked visually for leaks. Failure to follow these instructions may result in personal injury.

⚠️ If taken internally do not induce vomiting, seek immediate medical attention. Failure to follow these instructions may result in personal injury.

⚠️ If fuel contacts the eyes, flush the eyes with cold water or eyewash solution and seek medical attention.

⚠️ Wash hands thoroughly after handling fuel, as prolonged contact may cause irritation. Should irritation develop, seek medical attention.

⚠️ This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

*CAUTIONS:*

⚠️ Diesel fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always fit blanking plugs to any open orifices or lines.

⚠️ Always carry out the cleaning process before carrying out any repairs to the fuel injection system components. Failure to follow these instructions may result in foreign matter ingress to the fuel injection system.

⚠️ The low pressure fuel system bleeding procedure must be carried out before this procedure is carried out, or the engine is attempted to be started, following removal or replacement of any low pressure fuel system component. Failure to follow this instruction may result in damage to the fuel injection pump.

For additional information, refer to: [Low-Pressure Fuel System Bleeding](310-00 Fuel System - General Information, General Procedures).

⚠️ The engine must not be cranked using the starter motor for more than 30 seconds. The starter motor must be allowed to cool for at least 5 minutes after cranking for 30 seconds. Failure to follow these instructions will result in damage to the starter motor.

- **NOTE:** If a new fuel filter is to be installed, make sure the fuel filter is installed **AFTER** the high-pressure fuel system has been bled.

- **NOTE:** This procedure is necessary if the fuel injection pump, or the fuel line between the fuel filter and the fuel injection pump is removed, drained of fuel or replaced.

1. **Bleed the low pressure fuel system.**
   
   For additional information, refer to: [Low-Pressure Fuel System Bleeding](310-00 Fuel System - General Information, General Procedures).
2. Remove the oil filler cap.

3. Remove the engine cover.

4. Detach the high-pressure fuel supply line clamp.

5. Clean around the high-pressure fuel supply lines, the fuel injection diverter rail and the fuel injection supply manifolds. For additional information, refer to: Fuel Injection Component Cleaning (303-04C Fuel Charging and Controls - 2.7L V6 - TdV6, General Procedures).

6. CAUTIONS:

⚠️ Make sure that the high-pressure fuel supply line remains in contact with the fuel injection supply manifold and fuel injection diverter rail until both unions have been detached and cleaned. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

⚠️ Make sure the tool used to loosen the high-pressure fuel supply line unions is used at the top of the unions as this is where there is most material. Failure to follow this instruction may result in damage to the unions.

Loosen the high-pressure fuel supply lines.

7. Using the pneumatic vacuum gun, vacuum foreign material from the high-pressure fuel supply lines, the fuel injection diverter rail and the fuel injection supply manifolds.
8. Remove and discard the high-pressure fuel supply line.

9. Install a new high-pressure fuel supply line, but do not fully tighten the unions at this stage.

10. Position suitable lint free material under the left-hand high-pressure fuel line unions to catch escaping fuel.

11. Turn the ignition switch to the **RUN** position for 20 seconds.

12. If fuel does not appear at the fuel line unions after 20 seconds, allow the starter motor to cool for five minutes.

13. Repeat steps 11 and 12 until fuel appears at the fuel line unions.

14. **CAUTION:** Make sure the tool used to tighten the high-pressure fuel supply line unions is used at the top of the unions as this is where there is most material. Failure to follow this instruction may result in damage to the unions.

   Tighten the high-pressure fuel supply line unions.

   - Tighten the high-pressure fuel supply line in the sequence shown in four stages:
     1. Stage 1: Tighten the high-pressure fuel supply line union 1 to 15 Nm.
     2. Stage 2: Tighten the high-pressure fuel supply line union 2 to 15 Nm.
     3. Stage 3: Tighten the high-pressure fuel supply line union 1 to 30 Nm.
     4. Stage 4: Tighten the high-pressure fuel supply line union 2 to 30 Nm.

15. Attach the high-pressure fuel supply line clamp.

   - Tighten to 10 Nm.

16. **WARNING:** Do not carry out any repairs to the fuel system with the engine running. The fuel pressure within the high-pressure system can be as high as 1650 bar. Failure to follow this instruction may result in personal injury.

   Start the engine and check visually for fuel leaks.
17. Install the engine cover.

18. Install the oil filler cap.
Fuel System - General Information - Low-Pressure Fuel System Bleeding

General Procedures

• WARNINGS:

⚠️ Wait at least 30 seconds after the engine stops before commencing any repair to the high-pressure fuel injection system. Failure to follow this instruction may result in personal injury.

⚠️ Before any work is carried out on the fuel system, ground the vehicle to earth and maintain the ground connection until the work is complete.

⚠️ Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

⚠️ After carrying out repairs, the fuel system must be checked visually for leaks. Failure to follow these instructions may result in personal injury.

⚠️ If taken internally do not induce vomiting, seek immediate medical attention. Failure to follow these instructions may result in personal injury.

⚠️ If fuel contacts the eyes, flush the eyes with cold water or eyewash solution and seek medical attention.

⚠️ Wash hands thoroughly after handling, as prolonged contact may cause irritation. Should irritation develop, seek medical attention.

⚠️ This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

• CAUTIONS:

⚠️ Diesel fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always fit blanking plugs to any open orifices or lines.

⚠️ This procedure must be carried out before the engine is attempted to be started, following removal or replacement of any low pressure fuel system component. Failure to follow this instruction will result in damage to the fuel injection pump.

⚠️ The engine must not be cranked using the starter motor for more than 30 seconds. The starter motor must be allowed to cool for at least 5 minutes after cranking for 30 seconds. Failure to follow these instructions will result in damage to the starter motor.

• NOTE: This procedure is necessary if any low-pressure fuel system components are removed or replaced. These include the fuel filter, fuel lines, fuel tank or fuel cooler.

1. Disconnect the fuel filter to fuel pump supply line from the fuel filter. For additional information, refer to: Quick Release Coupling - Push Connect (310-00 Fuel System - General Information, General Procedures).

2. ⚠️ CAUTION: The tube used to bleed the low pressure fuel system must be absolutely clean. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

   Connect a suitable clean, clear tube to the fuel pump supply outlet.

3. Place a suitable container under the tube to catch any escaping fuel.

4. Turn the ignition switch to the ON position for 10 seconds. The fuel pump in the fuel tank will be audible.

5. Turn the ignition switch to the OFF position.

6. Repeat steps 2 and 3 until air-free fuel escapes from the tube.

7. Disconnect and discard the tube from the fuel filter outlet line.
8. Connect the fuel filter to fuel pump supply line to the fuel filter. For additional information, refer to: Quick Release Coupling - Push Connect (310-00 Fuel System - General Information, General Procedures).

9. **CAUTION:** If any high pressure fuel system components have been removed or replaced, the high pressure fuel system bleeding procedure must be carried out before the engine is started. Failure to follow this instruction may result in damage to the fuel injection pump.

   If necessary, bleed the high pressure fuel system. For additional information, refer to: High-Pressure Fuel System Bleeding (310-00 Fuel System - General Information, General Procedures).

10. Start the engine and allow to idle.
**Fuel System - General Information - Quick Release Coupling - Push Connect**

**General Procedures**

**Disconnect**

1. **WARNINGS:**

   - Place the vehicle in a quarantined area and arrange "No Smoking/Petrol Fumes" signs about the vehicle.

   - Before any work is carried out on the fuel system, ground the vehicle to earth and maintain the ground connection until the work is complete.

   - Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

   - The fuel system remains pressurized for a long time after the ignition is switched off. The fuel pressure must be relieved before attempting any repairs. Failure to follow these instructions may result in personal injury.

   - After carrying out repairs, the fuel system must be checked visually for leaks. Failure to follow these instructions may result in personal injury.

   - This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

   - If taken internally do not induce vomiting, seek immediate medical attention. Failure to follow these instructions may result in personal injury.

   - If fuel contacts the eyes, flush the eyes with cold water or eyewash solution and seek medical attention.

   - Wash hands thoroughly after handling, as prolonged contact may cause irritation. Should irritation develop, seek medical attention.

   Relieve the fuel system pressure. For additional information, refer to the procedure in this section:
   For additional information, refer to: [Fuel System Pressure Release](310-00 Fuel System - General Information, General Procedures).

2. Disconnect the push connect fitting.

   1. Press the tang.
   2. Disconnect the push connect fitting.

**Connect**
1. To connect.
   - Support the male stub.
   - Push the connector fitting onto the stub until an audible click can be heard.
   - Check the connection by a gentle tug test.
Fuel System - General Information - Quick Release Coupling

General Procedures

Disconnect

1. WARNINGS:

⚠️ Place the vehicle in a quarantined area and arrange "No Smoking/Petrol Fumes" signs about the vehicle.

⚠️ Before any work is carried out on the fuel system, ground the vehicle to earth and maintain the ground connection until the work is complete.

⚠️ Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

⚠️ The fuel system remains pressurized for a long time after the ignition is switched off. The fuel pressure must be relieved before attempting any repairs. Failure to follow these instructions may result in personal injury.

⚠️ After carrying out repairs, the fuel system must be checked visually for leaks. Failure to follow these instructions may result in personal injury.

⚠️ This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

⚠️ If taken internally do not induce vomiting, seek immediate medical attention. Failure to follow these instructions may result in personal injury.

⚠️ If fuel contacts the eyes, flush the eyes with cold water or eyewash solution and seek medical attention.

⚠️ Wash hands thoroughly after handling, as prolonged contact may cause irritation. Should irritation develop, seek medical attention.

Relieve the fuel system pressure. For additional information, refer to the procedure in this section: Pressure Relief.

2. Disconnect the quick release fitting.

   1. Release the retaining clip.

   2. Disconnect the quick release fitting.

Connect

1. To connect, reverse the disconnect procedure.

**Disconnect**

1. **WARNINGS:**

   - Place the vehicle in a quarantined area and arrange "No Smoking/Petrol Fumes" signs about the vehicle.
   - Before any work is carried out on the fuel system, ground the vehicle to earth and maintain the ground connection until the work is complete.
   - Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.
   - The fuel system remains pressurized for a long time after the ignition is switched off. The fuel pressure must be relieved before attempting any repairs. Failure to follow these instructions may result in personal injury.
   - After carrying out repairs, the fuel system must be checked visually for leaks. Failure to follow these instructions may result in personal injury.
   - This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.
   - If taken internally do not induce vomiting, seek immediate medical attention. Failure to follow these instructions may result in personal injury.
   - If fuel contacts the eyes, flush the eyes with cold water or eyewash solution and seek medical attention.
   - Wash hands thoroughly after handling, as prolonged contact may cause irritation. Should irritation develop, seek medical attention.

2. Remove the safety clip from the spring lock coupling.

Relieve the fuel system pressure. For additional information, refer to the procedure in this section: Pressure Relief.
3. Install the special tool.

4. Close the special tool and push it into the female end of the spring lock coupling.

5. Disconnect the spring lock coupling.

6. Remove the special tool.

**Connect**

1. NOTE: Install new O-ring seals.
2. NOTE: Install a new garter spring.

   Clean and inspect the male and female ends of the spring lock coupling.
2. **WARNING:** Make sure the garter spring snaps over the male end of the spring lock coupling.

   Connect the spring lock coupling.

3. Check the spring lock coupling to make sure it is correctly connected.

4. Install the safety clip to the spring lock coupling.

**Fuel Tank**

All Except Vehicles with Diesel Engine

The fuel tank is of a plastic construction and is retained to the vehicle by means of two steel support straps. The fuel tank support straps are mounted onto the underside of the vehicle chassis towards the front of the fuel tank and bolt to the vehicle towards the rear of the fuel tank. Fuel tank ventilation is achieved through a fuel tank roll-over valve into an evaporative emission canister which absorbs fuel tank vapor. The fuel tank roll-over valve is integral to the fuel tank and will prevent fuel loss from the fuel tank if the vehicle becomes inverted.

Vehicles with Diesel Engine

The fuel tank is of a plastic construction and is retained to the vehicle by means of two steel support straps. The fuel tank support straps are mounted onto the underside of the vehicle chassis towards the front of the fuel tank and bolt to the vehicle towards the rear of the fuel tank. Fuel tank ventilation is achieved through a fuel tank roll-over valve into a ventilation filter. The fuel tank roll-over valve is integral to the fuel tank and will prevent fuel loss from the fuel tank if the vehicle becomes inverted.

**Fuel Filter**

All Except Vehicles with Diesel Engine

The fuel filter is of a conventional construction being that of a paper element sealed within a steel canister. The fuel filter is located behind the left-hand front fender splash shield.

Vehicles with Diesel Engine

The diesel fuel filter is located in the engine compartment. Incorporated into the fuel filter housing is a bimetallic valve which will start to close at 30°C (86°F) and will fully close at 50°C (122°F).

When the bimetallic valve is open, fuel is only allowed to pass through the fuel cooler in the engine vee, which aids warm up of the fuel at low temperatures. When the fuel temperature increases, the bimetallic valve closes, diverting fuel through the under-floor fuel cooler which then lowers the fuel temperature before returning the fuel back to the fuel filter.

The fuel filter has an air bleed return to the fuel tank which returns excess air and fuel back to the fuel tank.

**Fuel Tank Filler Pipe**

Vehicles built up to 01/2004

The fuel tank filler pipe is of steel construction and is retained to the vehicle by means of one lower retaining bolt and three upper retaining bolts. The fuel tank filler pipe is fitted with a twist-fit filler cap, which seals the system.

Vehicles built 02/2004 onwards

The fuel tank filler pipe is of stainless steel construction and is retained to the vehicle by means of one lower retaining bolt, one lower retaining nut and one upper retaining nut. The fuel tank filler pipe is fitted with a twist-fit filler cap, which seals the system.

**Inertia Fuel Shutoff (IFS) Switch**

All vehicles
The inertia fuel shutoff (IFS) switch is designed to cut power to the fuel pump in the event of an accident. It is located behind the left-hand cowl side trim panel.

**Fuel Pumps**

**All Except Vehicles with Diesel Engine**

The fuel pumps are electric turbine type pumps and are located inside the fuel tank, one on the left-hand side and one on the right-hand side on supercharged vehicles. They both feature an integral fuel tank sender unit and each is retained to the fuel tank by means of a locking ring.

As the fuel tank is of a saddle design, a fuel pump module and a fuel transfer pump are incorporated. The fuel pump module located in the right-hand side of the fuel tank transfers fuel to the left-hand side of the fuel tank. The fuel transfer pump located in the left-hand side of the fuel tank transfers fuel to the fuel pump module and then the engine.

**Vehicles with Diesel Engine**

The fuel pump is an electric turbine type and is located in the right-hand side of the fuel tank. The fuel pump supplies fuel to the fuel injection pump and also circulates fuel from the left-hand side of the fuel tank by means of fuel transfer pipes incorporated in the fuel pump module.

The fuel tank incorporates two fuel level sensors, one in the right hand fuel pump module and one in the left-hand fuel tank level sensor. Both the fuel pump and fuel tank level sensor modules are retained to the fuel tank by means of a locking ring.

**Fuel cooler**

**Vehicles with Diesel Engine**

Two fuel coolers are fitted to the vehicle. One is located in the vee of the engine block, which has a coolant connection to aid heat transfer. The second cooler is located in the fuel return line and is located under the vehicle on the left-hand side. Fuel flow through the under-floor cooler is controlled by the fuel filter.

Diagnosis and Testing

Overview

There are changes to the engine management system (EMS) for 2006 my, the most obvious of which will be the change to 7-digit diagnostic trouble codes (DTCs) from the familiar 5-digit, and the change from two fuel pumps for vehicles with supercharger to a single pump.

For additional information on the description and operation of the fuel system, REFER to: Fuel Tank and Lines - VIN Range: N52048->N99999 (310-01 Fuel Tank and Lines, Description and Operation).

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

### Pinpoint tests

**CAUTION:** When probing connectors to take measurements in the course of the pinpoint tests, use the adaptor kit, part number 3548-1358-00.

- **NOTE:** When performing electrical voltage or resistance tests, always use a digital multimeter (DMM) accurate to 3 decimal places, and with an up-to-date calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.

- **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

Is the resistance 15 ohms?
Yes
   **GO to B8.**
No
   INSTALL a new level sensor,
   CLEAR the DTC, test the system for normal operation.

**B8: CHECK THE SENSOR A RESISTANCE FULL**

1. Move the sensor float to it's highest position.
2. Measure the resistance between:
   - Fuel module connector FP16, component side
   - Fuel module connector FP16, component side
   - Pin 02 Pin 01
Is the resistance 160 ohms?
Yes
   **GO to B9.**
No
   INSTALL a new level sensor,
   CLEAR the DTC, test the system for normal operation.

**B9: CHECK THE SENSOR B RESISTANCE EMPTY**

1. Remove the left-hand fuel pump module.
2. Move the sensor float to it's lowest position.
3. Measure the resistance between:
   - Fuel module connector FP16, component side
   - Fuel module connector FP16, component side
   - Pin 06 Pin 05
Is the resistance 15 ohms?
Yes
   **GO to B10.**
No
   INSTALL a new level sensor,
   CLEAR the DTC, test the system for normal operation.

**B10: CHECK THE SENSOR B RESISTANCE FULL**

1. Move the sensor float to it's highest position.
2. Measure the resistance between:
   - Fuel module connector FP16, component side
   - Fuel module connector FP16, component side
   - Pin 06 Pin 05
Is the resistance 160 ohms?
Yes
   **GO to B11.**
No
   INSTALL a new level sensor,
   CLEAR the DTC, test the system for normal operation.

**B11: CHECK THE SENSOR B RESISTANCE EMPTY**

1. Remove the left-hand fuel pump module.
2. Move the sensor float to it's lowest position.
3. Measure the resistance between:
   - Fuel module connector FP16, component side
   - Fuel module connector FP16, component side
   - Pin 06 Pin 05
Is the resistance 15 ohms?
Yes
   **GO to B12.**
No
   INSTALL a new level sensor,
   CLEAR the DTC, test the system for normal operation.

**B12: CHECK THE SENSOR B RESISTANCE FULL**

1. Move the sensor float to it's highest position.
2. Measure the resistance between:
   - Fuel module connector FP16, component side
   - Fuel module connector FP16, component side
   - Pin 06 Pin 05
Is the resistance 160 ohms?
Yes
   **GO to B13.**
No
   INSTALL a new level sensor,
   CLEAR the DTC, test the system for normal operation.

**B13: CHECK THE SIGNAL CIRCUIT BETWEEN THE REM AND LEVEL SENSOR A FOR HIGH RESISTANCE**

1. Disconnect the REM electrical connector, CA101.
2. Measure the resistance between:
   - REM connector CA101, harness side
   - Fuel module connector FP16, harness side
   - Pin 15 Pin 02
Is the resistance greater than 5 ohms?
Yes
  REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC, test the system for normal operation.
No
  GO to B14.

**B14: CHECK THE SIGNAL CIRCUIT BETWEEN THE REM AND LEVEL SENSOR B FOR HIGH RESISTANCE**

<table>
<thead>
<tr>
<th>1</th>
<th>Measure the resistance between:</th>

Pin 16  Pin 06

Is the resistance greater than 5 ohms?
Yes
  REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC, test the system for normal operation.
No
  GO to B15.

**B15: CHECK THE LEVEL SENSOR GROUND CIRCUIT BETWEEN THE REM AND LEVEL SENSORS FOR HIGH RESISTANCE**

| 1 | Disconnect the REM electrical connector, CA103. |
| 2 | Measure the resistance between: |
| REM connector CA103, harness side | Fuel module connector FP16, harness side |

Pin 23  Pin 01

| 3 | Measure the resistance between: |
| REM connector CA103, harness side | Fuel module connector FP16, harness side |

Pin 23  Pin 05

Is either resistance greater than 5 ohms?
Yes
  REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC, test the system for normal operation.
No
  CHECK for DTCs. REFER to the DTC index.

**PINPOINT TEST C : ECM TO REM DRIVE CIRCUIT**

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>C1: CHECK THE ECM TO REM DRIVE CIRCUIT FOR SHORT CIRCUIT TO GROUND</strong></td>

</tbody>
</table>

Pin 19  Negative terminal

Is the resistance less than 10,000 ohms?
Yes
  REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC, test the system for normal operation.
No
  GO to C2.

**C2: CHECK THE ECM TO REM DRIVE CIRCUIT FOR SHORT CIRCUIT TO POWER**

| 1 | Measure the resistance between: |
| REM connector CA103, harness side | Battery |

Pin 19  Positive terminal

Is the resistance less than 10,000 ohms?
Yes
  REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC, test the system for normal operation.
No
  GO to C3.

**C3: CHECK THE ECM TO REM DRIVE CIRCUIT FOR HIGH RESISTANCE**

| 1 | Disconnect the ECM electrical connector, FH300. |
| 2 | Measure the resistance between: |
| REM connector CA103, harness side | ECM connector FH300, harness side |

Pin 19  Pin 20

Is the resistance greater than 5 ohms?
Yes
  REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC, test the system for normal operation.
No
  CHECK for DTCs indicating a REM or ECM fault. REFER to the DTC index.
  For vehicles with 3.0L engines and
  REFER to: Electronic Engine Controls - VIN Range: N80181->R99999  (303-14B Electronic Engine Controls - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Diagnosis and Testing).
  For vehicles with 3.5L and 4.2L engines.

</table>

Pin 05  Negative terminal

Is the voltage greater than 5 volts?
Yes
  REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC, test the system for normal operation.
No
  CHECK for DTCs indicating a REM or ECM fault. REFER to the DTC index.
  For vehicles with 3.0L engines and
  REFER to: Electronic Engine Controls - VIN Range: N80181->R99999  (303-14B Electronic Engine Controls - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Diagnosis and Testing).
  For vehicles with 3.5L and 4.2L engines.
Is the voltage less than 10 volts?
Yes
REPAIR the circuit between the battery and the FPDM. This circuit includes fuse 49 of the rear power distribution box. For additional information, refer to the wiring diagrams. CLEAR the DTC, test the system for normal operation.
No
Go to D2.

D2: CHECK THE GROUND TO THE FPDM
1. Key off.
2. Measure the resistance between:

<table>
<thead>
<tr>
<th>FPDM connector FP15, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>pin 06</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?
Yes
REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC, test the system for normal operation.
No
Go to D3.

D3: CHECK THE FPDM TO FUEL PUMP NEGATIVE CIRCUIT FOR SHORT CIRCUIT TO GROUND
1. Measure the resistance between:

<table>
<thead>
<tr>
<th>Fuel pump module connector FP15, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>pin 02</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance less than 10,000 ohms?
Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC, test the system for normal operation.
No
Go to D4.

D4: CHECK THE FPDM TO FUEL PUMP NEGATIVE CIRCUIT FOR SHORT CIRCUIT TO POWER
1. Measure the resistance between:

<table>
<thead>
<tr>
<th>Fuel pump module connector FP15, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>pin 02</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance less than 10,000 ohms?
Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC, test the system for normal operation.
No
Go to D5.

D5: CHECK THE FPDM TO FUEL PUMP POSITIVE CIRCUIT FOR SHORT CIRCUIT TO GROUND
1. Measure the resistance between:

<table>
<thead>
<tr>
<th>Fuel pump module connector FP15, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>pin 01</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance less than 10,000 ohms?
Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC, test the system for normal operation.
No
Go to D6.

D6: CHECK THE FPDM TO FUEL PUMP POSITIVE CIRCUIT FOR SHORT CIRCUIT TO POWER
1. Measure the resistance between:

<table>
<thead>
<tr>
<th>Fuel pump module connector FP15, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>pin 01</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance less than 10,000 ohms?
Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC, test the system for normal operation.
No
Go to D7.

D7: CHECK THE FPDM TO FUEL PUMP NEGATIVE CIRCUIT FOR HIGH RESISTANCE
1. Disconnect the fuel pump module electrical connector, FP16.
2. Measure the resistance between:

<table>
<thead>
<tr>
<th>FPDM connector FP15, harness side</th>
<th>Fuel module connector FP16, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>pin 02</td>
<td>pin 03</td>
</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?
Yes
REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC, test the system for normal operation.
No
Go to D8.

D8: CHECK THE FPDM TO FUEL PUMP POSITIVE CIRCUIT FOR HIGH RESISTANCE
1. Measure the resistance between:

<table>
<thead>
<tr>
<th>FPDM connector FP15, harness side</th>
<th>Fuel module connector FP16, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>pin 01</td>
<td>pin 04</td>
</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?
Yes
REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC, test the system for normal operation.
No
CHECK for DTCs indicating a module fault. REFER to the DTC index.
For vehicles with 3.0L engines and
REFER to: Electronic Engine Controls - VIN Range: N80181->R99999 (303-14B Electronic Engine Controls - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Diagnosis and Testing).
For vehicles with 3.5L and 4.2L engines.

PINPOINT TEST E: CHECK THE FUEL SYSTEM PRESSURE
E1: CHECK THE PUMP ACTIVITY

1. Remove the rear seat cushion. REFER to: Rear Seat Cushion (501-10 Seating, Removal and Installation).
2. Key on, engine off.
3. Make sure the fuel pump relay is energized.
4. Listen for pump noise.

Can the fuel pump be heard running?

Yes

GO to E2.

No

CHECK for DTCs. REFER to the DTC index.

E2: CHECK THE FUEL SYSTEM PRESSURE

- WARNING: This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.
- NOTE: The fuel pressure can be tested using the Jaguar approved diagnostic system datalogger facility, or by the use of a suitable gauge from the schraeder connector on the special tool fitted to the fuel rail. REFER to: Fuel System Pressure Check (310-00 Fuel System - General Information, General Procedures).

1. Apply the parking brake.
2. Make sure the gear selector is in the NEUTRAL position for vehicles fitted with manual transmission, PARK position for vehicles fitted with automatic transmission.
3. Connect a suitable gauge to the fuel Schraeder valve.
4. Disconnect and plug the vacuum hose from the pressure regulator.
5. Key on, engine off.
   - Make sure there are no leaks from the gauge connections
6. Record the fuel pressure reading.

Is the fuel pressure between 4 and 5 bar (58.01 and 72.51 lb/in²)?

Yes

GO to E3.

No

CHECK for DTCs. REFER to the DTC index.

E3: CHECK THE FUEL SYSTEM PRESSURE WITH THE ENGINE CRANKING

1. Key in start position.
2. Record the fuel pressure reading.

Is the fuel pressure between 4 and 5 bar (58.01 and 72.51 lb/in²)?

Yes

GO to E4.

No

CHECK for DTCs. REFER to the DTC index.

E4: CHECK THE FUEL SYSTEM PRESSURE WITH THE ENGINE IDLING (WHERE POSSIBLE)

1. Key on, engine running.

Is the fuel pressure between 4 and 5 bar (58.01 and 72.51 lb/in²)?

Yes

CHECK for DTCs and symptoms indicating another cause of the problem.

No

CHECK for DTCs. If there are no codes, suspect pump module failure. REFER to: Fuel Pump Module - V8 4.2L Petrol/V8 S/C 4.2L Petrol/2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, VIN Range: N52048->N99999 (310-01 Fuel Tank and Lines, Removal and Installation).

PINPOINT TEST F: CHECK THE FUEL LINES

F1: CHECK THE FUEL LINES FOR RESTRICTIONS

- WARNING: This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

1. Detach the fuel line from the fuel rail and from the fuel pump module.
2. Using an air line gently blow through the line checking for blockages or restrictions.

Is a blockage or restriction evident?

Yes

CLEAR/REPAIR the blocked or restricted fuel line and test the system for normal operation.

No

GO to F2.

F2: CHECK THE FUEL TANK LINES FOR RESTRICTIONS

1. Remove the fuel and transfer pump module locking rings. REFER to: Fuel Pump Module - V8 4.2L Petrol/V8 S/C 4.2L Petrol/2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, VIN Range: N52048->N99999 (310-01 Fuel Tank and Lines, Removal and Installation).
2. Detach the fuel lines from the transfer and fuel pump modules.
3. Using an air line gently blow through the line checking for blockages or restrictions.

Is a blockage or restriction evident?

Yes

CLEAR/REPAIR the blocked or restricted fuel line and test the system for normal operation.

No

CHECK for DTCs and symptoms indicating another cause of the problem.
Fuel Tank and Lines - Fuel Tank and Lines
V8 4.2L Petrol/V8 S/C 4.2L Petrol/2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, VIN Range: N80181->R99999

Overview

There are changes to the engine management system (EMS) for 2006 my, the most obvious of which will be the change to 7-digit diagnostic trouble codes (DTCs) from the familiar 5-digit, and the change from two fuel pumps for vehicles with supercharger to a single pump.

For additional information on the description and operation of the fuel system, REFER to: Fuel Tank and Lines - VIN Range: N52048->N99999 (310-01 Fuel Tank and Lines, Description and Operation).

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect for obvious signs of mechanical or electrical damage.

<table>
<thead>
<tr>
<th>Visual Inspection Chart</th>
<th>Mechanical</th>
<th>Electrical</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fuel leaks</td>
<td>Fuel leaks</td>
<td>Fuses</td>

</tr>
<tr>
<td></td>
<td>Fuel</td>
<td>Fuel pump relay</td>
</tr>
<tr>
<td></td>
<td>Engine control module (ECM)</td>
<td></td>
</tr>
</tbody>
</table>

3. If an obvious cause for an observed or reported symptom is found, correct the cause (if possible) before proceeding to the next step.

4. If the cause is not visually evident use the Jaguar approved diagnostic system or a scan tool to retrieve the fault codes before proceeding to the diagnostic trouble code (DTC) Index.

</tbody>
</table>

**DTC index**

- **NOTE:** Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

- **NOTE:** For a full list of DTCs, REFER to: Electronic Engine Controls - VIN Range: N80181->R99999 (303-14A Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Diagnosis and Testing). or REFER to: Electronic Engine Controls - VIN Range: N80181->R99999 (303-14B Electronic Engine Controls - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Diagnosis and Testing).

### DTC Description Table

<table>
<thead>
<tr>
<th>DTC</th>
<th>Description</th>
<th>Possible source</th>
<th>Action</th>
</tr>
</thead>
</table>
| P008700 | Fuel rail/system pressure - too low | • Fuel rail pressure (FRP) sensor disconnected  
• FRP sensor to ECM sensing circuit: short circuit to ground  
• FRP sensor supply circuit: high resistance  
• FRP sensor failure  
• Fuel pump failure  
• Fuel line leak  
| P008800 | Fuel rail/system pressure - too high | • FRP sensor to ECM wiring (supply/sense): short circuit to other  
• FRP sensor to ECM sense circuit: short circuit to power  
• FRP sensor ground circuit: high resistance  
• FRP sensor failure  
• Restricted fuel line  
| P017100 | System too lean (right hand bank) | • Air intake leak between MAF sensor and cylinder head  
• Fuel filter/system restriction  
• Fuel injector restriction  
• MAF sensor fault (low intake air flow)  
• Exhaust leak (before catalyst) | Intake system information, REFER to: Intake Air Distribution and Filtering - VIN Range: N52048->N99999 (303-12A Intake Air Distribution and Filtering - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Diagnosis and Testing). or REFER to: Intake Air Distribution and Filtering - VIN Range: N52048->N99999 (303-12B Intake Air Distribution and Filtering - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Diagnosis and Testing). | |

| P046129   | Fuel level sensor A circuit range/performance - signal invalid               | • Fuel level sensor to rear electronic module (REM) circuits; intermittent short circuit, high resistance  
• Fuel level sensor failure  
• REM fault (incorrect fuel level data) | For fuel level sensor tests, GO to Pinpoint Test B. |
| P04612F   | Fuel level sensor A circuit range/performance - signal erratic               | • Fuel level sensor to rear electronic module (REM) circuits; intermittent short circuit, high resistance  
• Fuel level sensor failure  
• REM fault (incorrect fuel level data) | For fuel level sensor tests, GO to Pinpoint Test B. |
| P046200   | Fuel level sensor A circuit low input                                       | • Fuel level sensor to rear electronic module (REM) circuits; intermittent short circuit to ground or high resistance  
• Fuel level sensor failure  
• REM fault (incorrect fuel level data) | For fuel level sensor tests, GO to Pinpoint Test B. |
| P046300   | Fuel level sensor A circuit high input                                      | • Fuel level sensor to rear electronic module (REM) circuits; intermittent short circuit to power  
• Fuel level sensor failure  
• REM fault (incorrect fuel level data) | For fuel level sensor tests, GO to Pinpoint Test B. |
| P062700   | Fuel pump A control circuit/open                                             | • Invalid fuel pump duty requested by ECM | Refer to the warranty policy and procedures manual if an ECM is suspect. |
| P062A00   | Fuel pump driver module (FPDM) control circuit range/performance (vehicles with supercharger only) | • ECM to FPDM control drive circuits; intermittent short circuit, high resistance  
• FPDM failure  
• Rear electronic module (REM) failure | For REM power and ground tests, GO to Pinpoint Test A. For ECM to FPDM circuit tests, GO to Pinpoint Test D. |
| P263500   | Fuel pump A low flow/performance (fuel pump not activated when requested by ECM) | • ECM to rear electronic module (REM) drive circuit: short circuit, high resistance  
• Fuel pump failure  
• REM failure | For REM power and ground tests, GO to Pinpoint Test A. For ECM to REM circuit tests, GO to Pinpoint Test C. Check the fuel pressure. GO to Pinpoint Test E. |

**Pinpoint tests**

**CAUTION:** When probing connectors to take measurements in the course of the pinpoint tests, use the adaptor kit, part number 3548-1358-00.

• **NOTE:** When performing electrical voltage or resistance tests, always use a digital multimeter (DMM) accurate to 3 decimal places, and with an up-to-date calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

**PINPOINT TEST A : REM POWER AND GROUND CIRCUITS**

<table>

Is the voltage less than 10 volts?

Yes  
REPAIR the circuit between the battery and the REM. This circuit includes splice CAS31, the inertia switch and fuse 4 of the primary junction box. For additional information, refer to the wiring diagrams. CLEAR the DTC, test the system for normal operation.

No  
GO to A2.

| **A2: CHECK THE POWER SUPPLY VOLTAGE TO THE REM** | |
| 1 Key off. |                         |
| 2 Disconnect the REM electrical connector, CA100. |                         |

</table>

| **B2: CHECK THE SIGNAL CIRCUIT BETWEEN THE REM AND LEVEL SENSOR A FOR SHORT CIRCUIT TO POWER** |
| **1** Measure the resistance between: |
| Fuel module connector FP16, harness side | Battery |
| Pin 02 | Positive terminal |
| Is the resistance less than 10,000 ohms? |
| Yes | REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC, test the system for normal operation. |
| No | GO to B3. |

| **B3: CHECK THE SIGNAL CIRCUIT BETWEEN THE REM AND LEVEL SENSOR B FOR SHORT CIRCUIT TO GROUND** |
| **1** Measure the resistance between: |
| Fuel module connector FP16, harness side | Battery |
| Pin 06 | Negative terminal |
| Is the resistance less than 10,000 ohms? |
| Yes | REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC, test the system for normal operation. |
| No | GO to B4. |

| **B4: CHECK THE SIGNAL CIRCUIT BETWEEN THE REM AND LEVEL SENSOR B FOR SHORT CIRCUIT TO POWER** |
| **1** Measure the resistance between: |
| Fuel module connector FP16, harness side | Battery |
| Pin 06 | Positive terminal |
| Is the resistance less than 10,000 ohms? |
| Yes | REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC, test the system for normal operation. |
| No | GO to B5. |

| **B5: CHECK THE LEVEL SENSOR GROUND CIRCUIT BETWEEN THE REM AND LEVEL SENSORS FOR SHORT CIRCUIT TO GROUND** |
| **1** Measure the resistance between: |
| Fuel module connector FP16, harness side | Battery |
| Pin 01 | Negative terminal |
| **2** Measure the resistance between: |
| Fuel module connector FP16, harness side | Battery |
| Pin 05 | Negative terminal |
| Is either resistance less than 10,000 ohms? |
| Yes | REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC, test the system for normal operation. |
| No | GO to B6. |

| **B6: CHECK THE LEVEL SENSOR GROUND CIRCUIT BETWEEN THE REM AND LEVEL SENSORS FOR SHORT CIRCUIT TO POWER** |
| **1** Measure the resistance between: |
| Fuel module connector FP16, harness side | Battery |
| Pin 01 | Positive terminal |
| **2** Measure the resistance between: |
| Fuel module connector FP16, harness side | Battery |
| Pin 05 | Negative terminal |
| Is either resistance less than 10,000 ohms? |
| Yes | REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC, test the system for normal operation. |
| No | GO to B7. |

| **B7: CHECK THE SENSOR A RESISTANCE EMPTY** |
| **1** Remove the right-hand fuel pump module. |
| **2** Move the sensor float to it’s lowest position. |
| **3** Measure the resistance between: |
| Fuel module connector FP16, component side | Fuel module connector FP16, component side |
| Pin 02 | Pin 01 |
Is the resistance 15 ohms?
Yes  
**GO to B8.**
No  
INSTALL a new level sensor,
CLEAR the DTC, test the system for normal operation.

**B8: CHECK THE SENSOR A RESISTANCE FULL**

1. Move the sensor float to it's highest position.
2. Measure the resistance between:
   - Fuel module connector FP16, component side
   - Fuel module connector FP16, component side
   - Pin 02
   - Pin 01

   Is the resistance 160 ohms?
   Yes  
   **GO to B9.**
   No  
   INSTALL a new level sensor,
   CLEAR the DTC, test the system for normal operation.

**B9: CHECK THE SENSOR B RESISTANCE EMPTY**

1. Remove the left-hand fuel pump module.
2. Move the sensor float to it's lowest position.
3. Measure the resistance between:
   - Fuel module connector FP16, component side
   - Fuel module connector FP16, component side
   - Pin 06
   - Pin 05

   Is the resistance 15 ohms?
   Yes  
   **GO to B10.**
   No  
   INSTALL a new level sensor,
   CLEAR the DTC, test the system for normal operation.

**B10: CHECK THE SENSOR B RESISTANCE FULL**

1. Move the sensor float to it's highest position.
2. Measure the resistance between:
   - Fuel module connector FP16, component side
   - Fuel module connector FP16, component side
   - Pin 06
   - Pin 05

   Is the resistance 160 ohms?
   Yes  
   **GO to B11.**
   No  
   INSTALL a new level sensor,
   CLEAR the DTC, test the system for normal operation.

**B11: CHECK THE SENSOR B RESISTANCE EMPTY**

1. Remove the left-hand fuel pump module.
2. Move the sensor float to it's lowest position.
3. Measure the resistance between:
   - Fuel module connector FP16, component side
   - Fuel module connector FP16, component side
   - Pin 06
   - Pin 05

   Is the resistance 15 ohms?
   Yes  
   **GO to B12.**
   No  
   INSTALL a new level sensor,
   CLEAR the DTC, test the system for normal operation.

**B12: CHECK THE SENSOR B RESISTANCE FULL**

1. Move the sensor float to it's highest position.
2. Measure the resistance between:
   - Fuel module connector FP16, component side
   - Fuel module connector FP16, component side
   - Pin 06
   - Pin 05

   Is the resistance 160 ohms?
   Yes  
   **GO to B13.**
   No  
   INSTALL a new level sensor,
   CLEAR the DTC, test the system for normal operation.

**B13: CHECK THE SIGNAL CIRCUIT BETWEEN THE REM AND LEVEL SENSOR A FOR HIGH RESISTANCE**

1. Disconnect the REM electrical connector, CA101.
2. Measure the resistance between:
   - REM connector CA101, harness side
   - Fuel module connector FP16, harness side
   - Pin 15
   - Pin 02

   Is the resistance 15 ohms?
   Yes  
   **GO to B8.**
   No  
   INSTALL a new level sensor,
   CLEAR the DTC, test the system for normal operation.
Is the resistance greater than 5 ohms?
Yes
   REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC, test the system for normal operation.
No
   GO to B14.

B14: CHECK THE SIGNAL CIRCUIT BETWEEN THE REM AND LEVEL SENSOR B FOR HIGH RESISTANCE

1. Measure the resistance between:
   - REM connector CA101, harness side
   - Fuel module connector FP16, harness side
   Pin 16  Pin 06

Is the resistance greater than 5 ohms?
Yes
   REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC, test the system for normal operation.
No
   GO to B15.

B15: CHECK THE LEVEL SENSOR GROUND CIRCUIT BETWEEN THE REM AND LEVEL SENSORS FOR HIGH RESISTANCE

1. Disconnect the REM electrical connector, CA103.
2. Measure the resistance between:
   - REM connector CA103, harness side
   - Fuel module connector FP16, harness side
   Pin 23  Pin 01
3. Measure the resistance between:
   - REM connector CA103, harness side
   - Fuel module connector FP16, harness side
   Pin 23  Pin 05

Is either resistance greater than 5 ohms?
Yes
   REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC, test the system for normal operation.
No
   CHECK for DTCs. REFER to the DTC index.

PINPOINT TEST C : ECM TO REM DRIVE CIRCUIT

TEST CONDITIONS

DETAILS/RESULTS/ACTIONS

C1: CHECK THE ECM TO REM DRIVE CIRCUIT FOR SHORT CIRCUIT TO GROUND

1. Disconnect the REM electrical connector, CA103.
2. Measure the resistance between:
   - REM connector CA103, harness side
   - Battery
   Pin 19  Negative terminal

Is the resistance less than 10,000 ohms?
Yes
   REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC, test the system for normal operation.
No
   GO to C2.

C2: CHECK THE ECM TO REM DRIVE CIRCUIT FOR SHORT CIRCUIT TO POWER

1. Measure the resistance between:
   - REM connector CA103, harness side
   - Battery
   Pin 19  Positive terminal

Is the resistance less than 10,000 ohms?
Yes
   REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC, test the system for normal operation.
No
   GO to C3.

C3: CHECK THE ECM TO REM DRIVE CIRCUIT FOR HIGH RESISTANCE

1. Disconnect the ECM electrical connector, FH300.
2. Measure the resistance between:
   - REM connector CA103, harness side
   - ECM connector FH300, harness side
   Pin 19  Pin 20

Is the resistance greater than 5 ohms?
Yes
   REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC, test the system for normal operation.
No
   CHECK for DTCs indicating a REM or ECM fault. REFER to the DTC index.
   For vehicles with 3.0L engines and
   REFER to: Electronic Engine Controls - VIN Range: N80181->R99999  (303-14B Electronic Engine Controls - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Diagnosis and Testing).
   For vehicles with 3.5L and 4.2L engines.

PINPOINT TEST D : FUEL PUMP DRIVE CIRCUITS (VEHICLES WITH SUPERCHARGER)

TEST CONDITIONS

DETAILS/RESULTS/ACTIONS

D1: CHECK THE IGNITION POWER SUPPLY TO THE FPDM

1. Key off.
2. Disconnect the FPDM electrical connector, FP15.
3. Key on, engine off.
4. Measure the voltage between:
   - FPDM connector FP15, harness side
   - Battery
   Pin 05  Negative terminal
Is the voltage less than 10 volts?
Yes
  REPAIR the circuit between the battery and the FPDM. This circuit includes fuse 49 of the rear power distribution box.
  For additional information, refer to the wiring diagrams. CLEAR the DTC, test the system for normal operation.
No
  GO to D2.

**D2: CHECK THE GROUND TO THE FPDM**

1. Key off.
2. Measure the resistance between:

<table>
<thead>
<tr>
<th>FPDM connector FP15, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>pin 06</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?
Yes
  REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC, test the system for normal operation.
No
  GO to D3.

**D3: CHECK THE FPDM TO FUEL PUMP NEGATIVE CIRCUIT FOR SHORT CIRCUIT TO GROUND**

1. Measure the resistance between:

<table>
<thead>
<tr>
<th>Fuel pump module connector FP15, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>pin 02</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance less than 10,000 ohms?
Yes
  REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC, test the system for normal operation.
No
  GO to D4.

**D4: CHECK THE FPDM TO FUEL PUMP NEGATIVE CIRCUIT FOR SHORT CIRCUIT TO POWER**

1. Measure the resistance between:

<table>
<thead>
<tr>
<th>Fuel pump module connector FP15, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>pin 02</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance less than 10,000 ohms?
Yes
  REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC, test the system for normal operation.
No
  GO to D5.

**D5: CHECK THE FPDM TO FUEL PUMP POSITIVE CIRCUIT FOR SHORT CIRCUIT TO GROUND**

1. Measure the resistance between:

<table>
<thead>
<tr>
<th>Fuel pump module connector FP15, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>pin 01</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance less than 10,000 ohms?
Yes
  REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC, test the system for normal operation.
No
  GO to D6.

**D6: CHECK THE FPDM TO FUEL PUMP POSITIVE CIRCUIT FOR SHORT CIRCUIT TO POWER**

1. Measure the resistance between:

<table>
<thead>
<tr>
<th>Fuel pump module connector FP15, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>pin 01</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance less than 10,000 ohms?
Yes
  REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC, test the system for normal operation.
No
  GO to D7.

**D7: CHECK THE FPDM TO FUEL PUMP NEGATIVE CIRCUIT FOR HIGH RESISTANCE**

1. Disconnect the fuel pump module electrical connector, FP16.
2. Measure the resistance between:

<table>
<thead>
<tr>
<th>FPDM connector FP15, harness side</th>
<th>Fuel module connector FP16, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>pin 02</td>
<td>Pin 03</td>
</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?
Yes
  REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC, test the system for normal operation.
No
  GO to D8.

**D8: CHECK THE FPDM TO FUEL PUMP POSITIVE CIRCUIT FOR HIGH RESISTANCE**

1. Measure the resistance between:

<table>
<thead>
<tr>
<th>FPDM connector FP15, harness side</th>
<th>Fuel module connector FP16, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>pin 01</td>
<td>Pin 04</td>
</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?
Yes
  REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC, test the system for normal operation.
No
  CHECK for DTCs indicating a module fault. REFER to the DTC index.
  For vehicles with 3.0L engines and
  REFER to: Electronic Engine Controls - VIN Range: N80181->R99999 (303-14B Electronic Engine Controls - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Diagnosis and Testing).
  For vehicles with 3.5L and 4.2L engines.

**PINPOINT TEST E : CHECK THE FUEL SYSTEM PRESSURE**
**E1: CHECK THE PUMP ACTIVITY**

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>1</strong> Remove the rear seat cushion.</td>
<td>REFER to: Rear Seat Cushion (501-10 Seating, Removal and Installation).</td>
</tr>
<tr>
<td><strong>2</strong> Key on, engine off.</td>
<td></td>
</tr>
<tr>
<td><strong>3</strong> Make sure the fuel pump relay is energized.</td>
<td></td>
</tr>
<tr>
<td><strong>4</strong> Listen for pump noise.</td>
<td></td>
</tr>
</tbody>
</table>

Can the fuel pump be heard running?

- **Yes** Go to E2.
- **No** CHECK for DTCs. REFER to the DTC index.

**E2: CHECK THE FUEL SYSTEM PRESSURE**

**WARNING:** This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

- **NOTE:** The fuel pressure can be tested using the Jaguar approved diagnostic system datalogger facility, or by the use of a suitable gauge from the schraeder connector on the special tool fitted to the fuel rail.
  
  REFER to: Fuel System Pressure Check (310-00 Fuel System - General Information, General Procedures).

1. Apply the parking brake.
2. Make sure the gear selector is in the **NEUTRAL** position for vehicles fitted with manual transmission, **PARK** position for vehicles fitted with automatic transmission.
3. Connect a suitable gauge to the fuel Schraeder valve.
4. Disconnect and plug the vacuum hose from the pressure regulator.
5. Key on, engine off.
   - Make sure there are no leaks from the gauge connections
6. Record the fuel pressure reading.

Is the fuel pressure between 4 and 5 bar (58.01 and 72.51 lb/in²)?

- **Yes** Go to E3.
- **No** CHECK for DTCs. REFER to the DTC index.

**E3: CHECK THE FUEL SYSTEM PRESSURE WITH THE ENGINE CRANKING**

1. Key in start position.
2. Record the fuel pressure reading.

Is the fuel pressure between 4 and 5 bar (58.01 and 72.51 lb/in²)?

- **Yes** Go to E4.
- **No** CHECK for DTCs. REFER to the DTC index.

**E4: CHECK THE FUEL SYSTEM PRESSURE WITH THE ENGINE IDLING (WHERE POSSIBLE)**

1. Key on, engine running.

Is the fuel pressure between 4 and 5 bar (58.01 and 72.51 lb/in²)?

- **Yes** CHECK for DTCs and symptoms indicating another cause of the problem.
- **No** CHECK for DTCs. If there are no codes, suspect pump module failure.
  

**PINPOINT TEST F : CHECK THE FUEL LINES**

**TEST CONDITIONS**

**DETAILS/RESULTS/ACTIONS**

---

**F1: CHECK THE FUEL LINES FOR RESTRICTIONS**

**WARNING:** This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

1. Detach the fuel line from the fuel rail and from the fuel pump module.
2. Using an air line gently blow through the line checking for blockages or restrictions.

Is a blockage or restriction evident?

- **Yes** CLEAR/REPAIR the blocked or restricted fuel line and test the system for normal operation.
- **No** Go to F2.

---

**F2: CHECK THE FUEL TANK LINES FOR RESTRICTIONS**

1. Remove the fuel and transfer pump module locking rings.
   
2. Detach the fuel lines from the transfer and fuel pump modules.
3. Using an air line gently blow through the line checking for blockages or restrictions.

Is a blockage or restriction evident?

- **Yes** CLEAR/REPAIR the blocked or restricted fuel line and test the system for normal operation.
- **No** CHECK for DTCs and symptoms indicating another cause of the problem.
Fuel Tank and Lines - Fuel Tank and Lines2.7L V6 - TdV6

Diagnosis and Testing

Principles of Operation

The 2.7L engine differs from the 2.0L diesel, in that it has an electric lift pump in the fuel tank, rather than drawing fuel from the tank with the engine-driven pump.

The fuel tank shares many of the features of the petrol variant, being of the same shape to facilitate the driveshaft, and using a jet pump to transfer fuel across the tank.

For additional information, REFER to: Fuel Tank and Lines - VIN Range: N52048->N99999 (310-01 Fuel Tank and Lines, Description and Operation).

Inspection and Verification

• WARNINGS:

⚠️ Do NOT carry out any work on the fuel system with the engine running. The fuel pressure within the system can be as high as 1650 bar (23,930 lb/in²). Failure to follow this instruction may result in personal injury.

⚠️ Eye protection must be worn at all times when working on or near any fuel related components. Failure to follow this instruction may result in personal injury.

⚠️ This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow this instruction may result in personal injury.

⚠️ After carrying out repairs, the fuel system must be checked visually for leaks. This should be done after the engine has been run, but with the engine switched OFF. Failure to follow this instruction may result in personal injury.

⚠️ If taken internally, DO NOT induce vomiting. Seek immediate medical attention. Failure to follow this instruction may result in personal injury.

⚠️ If fuel contacts the eyes, flush the eyes with cold water or eyewash solution and seek medical attention. Failure to follow this instruction may result in personal injury.

⚠️ Wash hands thoroughly after handling, as prolonged contact may cause irritation. Should irritation develop, seek medical attention. Failure to follow this instruction may result in personal injury.

• CAUTIONS:

⚠️ Before disconnecting any part of the system, it is imperative that all dust, dirt and debris is removed from around components to prevent ingress of foreign matter into the fuel system. Failure to follow this instruction may result in damage to the vehicle.

⚠️ The fuel pipes between the injectors and the rail must be discarded after each use, and new pipes installed. Failure to follow this instruction may result in damage to the vehicle.

⚠️ It is essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in damage to the vehicle.

⚠️ Make sure that the workshop area in which the vehicle is being worked on is as clean and dust-free as possible. Areas in which work on clutches, brakes or where welding or machining are carried out are not suitable in view of the risk of contamination to the fuel system. Failure to follow this instruction may result in damage to the vehicle.

⚠️ Make sure that any protective clothing worn is clean and made from lint-free non-flocking material. Failure to follow this instruction may result in damage to the vehicle.

⚠️ Make sure that any protective gloves worn are new and are of the non-powdered latex type. Failure to follow this instruction may result in damage to the vehicle.

⚠️ Make sure that clean, non-plated tools are used. Clean tools using a new brush that will not lose its bristles and fresh cleaning fluid prior to starting work on the vehicle. Failure to follow this instruction may result in damage to the vehicle.

⚠️ Use a steel-topped work bench and cover it with clean, lint-free, non-flocking material. Failure to follow this instruction may result in damage to the vehicle.

⚠️ When probing connectors to take measurements in the course of the pinpoint tests, use the adaptor kit, part number 3548-1358-00. Failure to follow this instruction may result in damage to the vehicle.

• NOTE: This section contains references to Parameter Identifiers (PIDs). Where the Jaguar approved diagnostic system is not available, a scantool may be used to access these PIDs, all of which give information, and some of which can be used to both read information and to activate components. The format of the information may vary, depending on the tool used.
• Check that the inertia switch has not tripped. Check the fuel level/condition, check the lift pump operation, REFER to: Fuel Charging and Controls (303-04C Fuel Charging and Controls - 2.7L V6 - TdV6, Diagnosis and Testing). Check the fuel filter, REFER to: Fuel Filter - 2.7L V6 - TdV6 (310-01 Fuel Tank and Lines, Removal and Installation). Check the low-pressure fuel lines for connection/damage/leaks. Check the FPCV and FVCV, REFER to: Fuel Charging and Controls (303-04C Fuel Charging and Controls - 2.7L V6 - TdV6, Diagnosis and Testing). Check the high-pressure pump, REFER to: Fuel Injection Pump (303-04C Fuel Charging and Controls and - 2.7L V6 - TdV6, Removal and Installation).

Difficult to start

Rough idle

Lack of power when accelerating

Engine stops/stalls

Check the fuel level/condition, REFER to: Fuel Charging and Controls (303-04C Fuel Charging and Controls - 2.7L V6 - TdV6, Diagnosis and Testing). Check the fuel filter, REFER to: Fuel Filter - 2.7L V6 - TdV6 (310-01 Fuel Tank and Lines, Removal and Installation). Check the low-pressure fuel lines for connection/damage/leaks. Check the FVCV.

</table>
### Symptom Possible source Action

- High pressure leak
- and FPCV, REFER to: **Fuel Charging and Controls** (303-04C Fuel Charging and Controls - 2.7L V6 - TdV6, Diagnosis and Testing).
- Check the high-pressure fuel lines for leaks, REFER to: **Fuel Charging and Controls** (303-04C Fuel Charging and Controls - 2.7L V6 - TdV6, Diagnosis and Testing).

### Engine Judders

- Low/contaminated fuel
- Low pressure circuit fault
- FVCV blocked/contaminated
- FPCV blocked/contaminated
- High pressure leak
- Pump fault
- Check the fuel level/condition, REFER to: **Fuel Charging and Controls** (303-04C Fuel Charging and Controls - 2.7L V6 - TdV6, Diagnosis and Testing).
- Check the low-pressure fuel lines for connection/damage/leaks, check the FVCV and FPCV, REFER to: **Fuel Charging and Controls** (303-04C Fuel Charging and Controls - 2.7L V6 - TdV6, Diagnosis and Testing).
- Check the high-pressure fuel lines for leaks, REFER to: **Fuel Charging and Controls** (303-04C Fuel Charging and Controls - 2.7L V6 - TdV6, Diagnosis and Testing).
- Check the high-pressure pump, REFER to: **Fuel Injection Pump** (303-04C Fuel Charging and Controls - 2.7L V6 - TdV6, Removal and Installation).

### Excessive fuel consumption

- Low pressure circuit fault
- Fuel temperature sensor leak
- High pressure leak
- Injector(s) failure
- Check the low-pressure fuel lines for connection/damage/leaks. Check the fuel temperature sensor, REFER to: **Fuel Temperature Sensor** (303-14C Electronic Engine Controls - 2.7L V6 - TdV6, Removal and Installation).
- Check the high-pressure fuel lines for leaks. For injector circuit tests, REFER to: **Fuel Charging and Controls** (303-04C Fuel Charging and Controls - 2.7L V6 - TdV6, Diagnosis and Testing).

Removal

1. WARNINGS:

⚠️ Place the vehicle in a quarantined area and arrange "No Smoking/Petrol Fumes" signs about the vehicle.

⚠️ Before any work is carried out on the fuel system, ground the vehicle to earth and maintain the ground connection until the work is complete.

⚠️ Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

⚠️ The fuel system remains pressurized for a long time after the ignition is switched off. The fuel pressure must be relieved before attempting any repairs. Failure to follow these instructions may result in personal injury.

⚠️ After carrying out repairs, the fuel system must be checked visually for leaks. Failure to follow these instructions may result in personal injury.

⚠️ This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

⚠️ If taken internally do not induce vomiting, seek immediate medical attention. Failure to follow these instructions may result in personal injury.

⚠️ If fuel contacts the eyes, flush the eyes with cold water or eyewash solution and seek medical attention.

⚠️ Wash hands thoroughly after handling, as prolonged contact may cause irritation. Should irritation develop, seek medical attention.

Disconnect the battery ground cable.

De-pressurize the fuel system. For additional information, refer to Section 310-00 Fuel System - General Information.

2. Raise and support the vehicle. For additional information, refer to Section 100-02 Jacking and Lifting.

3. Detach the left-hand front fender splash shield.
4. Disconnect the fuel lines. For additional information, refer to Section 310-00 Fuel System - General Information.

5. Loosen the fuel filter bracket retaining bolt.

6. **NOTE:** Observe the direction of the fuel filter fuel flow arrow. Remove the fuel filter.

**Installation**

1. To install, reverse the removal procedure.
Removal

• WARNINGS:

⚠️ Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable mixtures are always present and can ignite. Failure to follow these instructions may result in personal injury.

⚠️ This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

• CAUTIONS:

⚠️ Diesel fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always fit blanking plugs to any open orifices or lines.

⚠️ Make sure the fuel lines are connected to the correct fuel line connector on the fuel filter. Failure to follow these instructions may result in damage to the engine or fuel injection system.

⚠️ Always carry out the cleaning process before carrying out any repairs to the fuel injection system components. Failure to follow these instructions may result in foreign matter ingress to the fuel injection system.

• NOTE: Note the position of the fuel lines before removal from the fuel filter.

1. Disconnect the fuel tank to fuel filter supply line from the fuel filter. For additional information, refer to: Quick Release Coupling - Push Connect (310-00 Fuel System - General Information, General Procedures).

2. Disconnect the fuel filter to fuel pump supply line from the fuel filter. For additional information, refer to: Quick Release Coupling - Push Connect (310-00 Fuel System - General Information, General Procedures).

   • Install a blanking plug to the fuel pump fuel supply line.

3. Disconnect the fuel pump to fuel filter fuel return line from the fuel filter. For additional information, refer to: Quick Release Coupling - Push Connect (310-00 Fuel System - General Information, General Procedures).
4. Disconnect the fuel pump to fuel filter fuel return line from the fuel filter.
   For additional information, refer to: Quick Release Coupling - Push Connect (310-00 Fuel System - General Information, General Procedures).

5. Remove the fuel filter.
   1. Press the fuel filter retaining tang.
   2. Remove the fuel filter.

6. Remove the fuel filter from the retaining bracket.

**Installation**

1. **WARNINGS:**
   - **Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components.** Highly flammable mixtures are always present and can ignite. Failure to follow these instructions may result in personal injury.
   - **This procedure involves fuel handling.** Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

2. **CAUTIONS:**
   - **Diesel fuel injection equipment is manufactured to very precise tolerances and fine clearances.** It is therefore essential that absolute cleanliness is observed when working with these components. Always fit blanking plugs to any open orifices or lines.
   - **Make sure the fuel lines are connected to the correct fuel line connector on the fuel filter.** Failure to follow these instructions may result in damage to the engine or fuel injection system.

3. **NOTE:** Make sure the fuel filter and fuel filter retaining bracket alignment marks align.

   Install the fuel filter to the retaining bracket.
2. Tighten to 7 Nm.

3. Install the fuel filter.

4. Connect the fuel pump to fuel filter fuel return line to the fuel filter. For additional information, refer to: Quick Release Coupling - Push Connect (310-00 Fuel System - General Information, General Procedures).

5. Connect the fuel pump to fuel filter fuel return line to the fuel filter. For additional information, refer to: Quick Release Coupling - Push Connect (310-00 Fuel System - General Information, General Procedures).

6. Connect the fuel pump to fuel filter fuel supply line to the filter. For additional information, refer to: Quick Release Coupling - Push Connect (310-00 Fuel System - General Information, General Procedures).
   - Remove the blanking plug.
7. Connect the fuel tank to fuel filter fuel supply line to the fuel filter. For additional information, refer to: Quick Release Coupling - Push Connect (310-00 Fuel System - General Information, General Procedures).

8. Bleed the low pressure fuel system. For additional information, refer to: Low-Pressure Fuel System Bleeding (310-00 Fuel System - General Information, General Procedures).
Fuel Tank and Lines - Fuel Level Sender LHV8 4.2L Petrol/V8 S/C 4.2L Petrol/2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, VIN Range: M45255->N52047

Removal

- **WARNINGS:**
  - Do not smoke or carry lighted tobacco or an open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.
  - Do not carry or operate cellular phones when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.
  - This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

1. Remove the transfer pump.
   For additional information, refer to: Fuel Transfer Pump - V8 4.2L Petrol/V8 S/C 4.2L Petrol/2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, VIN Range: M45255->N52047 (310-01 Fuel Tank and Lines, Removal and Installation).

2. Disconnect the fuel level sender electrical connector.

3. Remove the fuel level sender and harness.

Installation

- **WARNINGS:**
  - Do not smoke or carry lighted tobacco or an open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.
  - Do not carry or operate cellular phones when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.
  - This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

1. To install, reverse the removal procedure.
Fuel Tank and Lines - Fuel Level Sender LHV8 4.2L Petrol/V8 S/C 4.2L Petrol/2.5L NA
V6 - AJV6/3.0L NA V6 - AJ27, VIN Range: N52048->N99999

Removal

• WARNINGS:

⚠️ Do not smoke or carry lighted tobacco or an open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

⚠️ Do not carry or operate cellular phones when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

⚠️ This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

1. Remove the fuel transfer unit.
   For additional information, refer to: Fuel Transfer Unit - V8 4.2L Petrol/V8 S/C 4.2L Petrol/2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, VIN Range: N52048->N99999 (310-01 Fuel Tank and Lines, Removal and Installation).

2. Remove the fuel level sender and harness.
   • Remove and discard the fuel level sender harness tie straps.

Installation

• WARNINGS:

⚠️ Do not smoke or carry lighted tobacco or an open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

⚠️ Do not carry or operate cellular phones when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

⚠️ This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

1. To install, reverse the removal procedure.
Removal

1. Remove the fuel pump module. For additional information, refer to: Fuel Pump Module - V8 4.2L Petrol/V8 S/C 4.2L Petrol/2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, VIN Range: M45255->N52047 (310-01 Fuel Tank and Lines, Removal and Installation).

2. Disconnect the fuel level sender electrical connector.

3. Remove the fuel level sender and harness.

Installation

1. To install, reverse the removal procedure.
Fuel Tank and Lines - Fuel Level Sender RHV8 4.2L Petrol/V8 S/C 4.2L Petrol/2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, VIN Range: N52048->N99999

Removal

• WARNINGS:

⚠️ Do not smoke or carry lighted tobacco or an open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

⚠️ Do not carry or operate cellular phones when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

⚠️ This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

1. Remove the fuel pump module.
   For additional information, refer to: Fuel Pump Module - V8 4.2L Petrol/V8 S/C 4.2L Petrol/2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, VIN Range: M45255->N52047 (310-01 Fuel Tank and Lines, Removal and Installation).

2. Disconnect the fuel pump module electrical connector.

3. Disconnect the fuel level sender electrical connector.

4. Disconnect the fuel level sender electrical connector.
5. Disconnect the fuel level sender electrical connector.

6. Remove the fuel level sender and harness.

⚠️ Wash hands thoroughly after handling, as prolonged contact may cause irritation. Should irritation develop, seek medical attention.

- **NOTE:** For vehicles with worm drive clamp, refer to steps 14 and 24.
- **NOTE:** For vehicles with fuel pump locking ring, refer to steps 15 and 25.

Open the fuel tank filler pipe flap.

2. Disconnect the battery ground cable.

3. Detach the fuel tank filler pipe cap.

4. Release the pressure in the fuel system.
   For additional information, refer to: Fuel System Pressure Release (310-00 Fuel System - General Information, General Procedures).

5. Remove the rear seat cushion.
   For additional information, refer to: Rear Seat Cushion (501-10 Seating, Removal and Installation).
6. Detach and reposition the door opening weatherstrip.

7. Remove the scuff plate trim panel.

8. Detach and reposition the floor covering.

9. Detach and reposition the rear seat cushion insulation.

10. Remove the floor aperture cover.
11. Disconnect the fuel pump module quick release coupling.

12. Detach the fuel pump module electrical connector from the retaining bracket.

13. Disconnect the fuel pump module electrical connector.

14. NOTE: For vehicles with worm drive clamp.
   Remove and discard the fuel pump module worm drive clamp.
   - Remove and discard the O-ring seal.

15. NOTE: For vehicles with fuel pump locking ring.
   Using the special tool, remove the fuel transfer unit locking ring.
16. NOTE: All vehicles.
Detach and reposition the upper part of the fuel pump module.

17. Detach and reposition the left-hand rear door opening weatherstrip.

18. Remove the scuff plate trim panel.

19. Detach and reposition the floor covering.

20. Detach and reposition the rear seat cushion insulation.
21. Remove the floor aperture cover.

22. Detach the fuel transfer pump module electrical connector from the retaining bracket.

23. Disconnect the fuel transfer pump electrical connector.

24. NOTE: For vehicles with worm drive clamp.
Remove and discard the fuel transfer unit worm drive clamp.

25. NOTE: For vehicles with fuel pump locking ring.
Using the special tool, remove the fuel transfer unit locking ring.
26. NOTE: All vehicles.
Detach and reposition the upper part of the fuel transfer pump.

27. CAUTION: Make sure no damage occurs to the fuel level float.
Remove the fuel transfer pump.
- Disconnect the fuel cross over lines.

28. Remove and discard the fuel transfer pump module gasket.
29. Remove the fuel pump module.
- Remove and discard the fuel pump module gasket.

Installation

- WARNINGS:

⚠ Place the vehicle in a quarantined area and arrange "No Smoking/Petrol Fumes" signs about the vehicle.

⚠ Before any work is carried out on the fuel system, ground the vehicle to earth and maintain the ground connection until the work is complete.

⚠ Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

⚠ The fuel system remains pressurized for a long time after the ignition is switched off. The fuel pressure must be relieved before attempting any repairs. Failure to follow these instructions may result in personal injury.

⚠ After carrying out repairs, the fuel system must be checked visually for leaks. Failure to follow these instructions may result in personal injury.

⚠ This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

⚠ If taken internally do not induce vomiting, seek immediate medical attention. Failure to follow these instructions may result in personal injury.

⚠ If fuel contacts the eyes, flush the eyes with cold water or eyewash solution and seek medical attention.

⚠ Wash hands thoroughly after handling, as prolonged contact may cause irritation. Should irritation develop, seek medical attention.

• NOTE: For vehicles with fuel pump locking ring, refer to steps 2 and 13.
• NOTE: For vehicles with worm drive clamp, refer to steps 3 and 14.
1. **CAUTIONS:**

⚠️ On vehicles with supercharger make sure the arrow on the fuel pump module and the 'SC' marker on the fuel tank are aligned.

⚠️ On vehicles without supercharger make sure the arrow on the fuel transfer module and the 'NA' marker on the fuel tank are aligned.

⚠️ Make sure no damage occurs to the fuel level float.

• **NOTE:** Install a new gasket to the fuel pump module flange.

• **NOTE:** Take care not to stretch the gasket.

Install the fuel pump module.

1. Feed the fuel cross-over lines through the fuel pump module hole and across the front of the fuel tank saddle.

2. **NOTE:** For vehicles with fuel pump locking ring.

Using the special tool, install the fuel transfer unit locking ring.

- Tighten to 60 Nm.

3. **CAUTION:** If the vehicle is fitted with a worm drive clamp which is not fitted with a shear off cap, tighten the clamp to 4Nm.

• **NOTE:** For vehicles with worm drive clamp.

Install the new fuel transfer unit worm drive clamp.

- Tighten the clamp until the cap shears off.

4. **NOTE:** All vehicles.

Connect the fuel pump module electrical connector.
5. Attach the fuel pump module electrical connector to the retaining bracket.

6. Connect the fuel pump module quick release coupling.
   - Make sure the quick release coupling has latched onto the fuel pump module fuel pipe by pulling the pipe after the connection has been made.

7. Install the floor aperture cover.

8. Attach the rear seat cushion insulation.

9. Attach the floor covering.
10. Install the scuff plate trim panel.

11. Attach the door opening weatherstrip.

12. CAUTIONS:

⚠️ Vehicles with supercharger - make sure the arrow on the left-hand fuel pump module lines up with the 'SC' marker on the fuel tank.

⚠️ Vehicles without supercharger - make sure the arrow on the fuel transfer pump lines up with the 'NA' marker on the fuel tank.

⚠️ Make sure no damage occurs to the fuel level float.

• NOTE: Install a new gasket to the fuel transfer pump flange.

• NOTE: Take care not to stretch the gasket.

Install the fuel transfer pump.

13. NOTE: For vehicles with fuel pump locking ring.

Using the special tool, install the fuel transfer unit locking ring.

• Tighten to 60 Nm.

14. ⚠️ CAUTION: If the vehicle is fitted with a worm drive clamp which is not fitted with a shear off cap, tighten the clamp to 4Nm.

• NOTE: For vehicles with worm drive clamp.

Install the new fuel transfer unit worm drive clamp.

• Tighten the clamp until the cap shears off.
15. NOTE: All vehicles.
Connect the fuel transfer pump electrical connector.

16. Attach the fuel transfer pump module electrical connector to the retaining bracket.

17. Install the floor aperture cover.

18. Attach the rear seat cushion insulation.

19. Attach the floor covering.
20. Install the scuff plate trim panel.

21. Install the rear seat cushion. For additional information, refer to: Rear Seat Cushion (501-10 Seating, Removal and Installation).

22. Attach the fuel tank filler pipe cap.

23. Connect the battery ground cable.

24. Attach the door opening weatherstrip.

25. Close the fuel tank filler pipe flap.
**Warning:**

1. Place the vehicle in a quarantined area and arrange "No Smoking/Petrol Fumes" signs about the vehicle.
2. Before any work is carried out on the fuel system, ground the vehicle to earth and maintain the ground connection until the work is complete.
3. Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.
4. The fuel system remains pressurized for a long time after the ignition is switched off. The fuel pressure must be relieved before attempting any repairs. Failure to follow these instructions may result in personal injury.
5. After carrying out repairs, the fuel system must be checked visually for leaks. Failure to follow these instructions may result in personal injury.
6. This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.
7. If taken internally do not induce vomiting, seek immediate medical attention. Failure to follow these instructions may result in personal injury.
8. If fuel contacts the eyes, flush the eyes with cold water or eyewash solution and seek medical attention.
9. Wash hands thoroughly after handling, as prolonged contact may cause irritation. Should irritation develop, seek medical attention.

**Note:** Federal market vehicles, refer to step 14.

**Note:** Non federal market vehicles, refer to step 15.

**Note:** For vehicles with worm drive clamp, refer to step 14.

**Note:** For vehicles with fuel pump locking ring, refer to step 15.

1. **Note:** All vehicles.

   Open the fuel tank filler pipe flap.

2. Disconnect the battery ground cable.
   For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

3. Detach the fuel tank filler pipe cap.

4. Release the pressure in the fuel system.
   For additional information, refer to: Fuel System Pressure Release (310-00 Fuel System - General Information, General Procedures).

5. Drain the fuel system.

6. Remove the rear seat cushion.
   For additional information, refer to: Rear Seat Cushion (501-10 Seating, Removal and Installation).
7. Detach and reposition the door opening weatherstrip.

8. Remove the scuff plate trim panel.

9. Detach and reposition the floor covering.

10. Detach and reposition the rear seat cushion insulation.

11. Remove the floor aperture cover.
12. Disconnect the fuel pump module electrical connector.
   - Detach the fuel pump module wiring harness from the retaining bracket.

13. Disconnect the fuel pump module quick release coupling.

14. NOTE: For vehicles with worm drive clamp.
   Remove and discard the fuel transfer unit worm drive clamp.

15. NOTE: For vehicles with fuel pump locking ring.
   Using the special tool, remove the fuel transfer unit locking ring.

16. NOTE: All vehicles.
   Disconnect the fuel transfer module transfer feed tube.
17. Disconnect the left-hand fuel sender gauge electrical connector.

18. Disconnect the fuel transfer module transfer return tube.

19. **CAUTION:** Make sure no damage occurs to the fuel level float.

   Remove the fuel pump module.
   - Press down and rotate the base of the fuel pump module counterclockwise.

**Installation**

- **NOTE:** For vehicles with fuel pump locking ring, refer to step 6.
- **NOTE:** For vehicles with worm drive clamp, refer to step 5.

1. **CAUTIONS:**

   - **On vehicles with supercharger** make sure the arrow on the fuel pump module and the 'SC' marker on the fuel tank are aligned.

   - **On vehicles without supercharger** make sure the arrow on the fuel transfer module and the 'NA' marker on the fuel tank are aligned.

   - **Make sure no damage occurs to the fuel level float.**

- **NOTE:** All vehicles.

   Install the fuel pump module.
   - Press down and rotate the base of the fuel pump module clockwise.
2. Connect the transfer module transfer return tube.
   - Make sure the coupling has latched onto the fuel pump module by pulling the tube after the connection has been made.

3. Connect the left-hand fuel sender gauge electrical connector.

4. Connect the transfer module transfer feed tube.
   - Make sure the quick release coupling has latched onto the fuel pump module fuel tube by pulling the tube after the connection has been made.

5. NOTE: For vehicles with fuel pump locking ring.
   Using the special tool, install the fuel pump module locking ring.
   - Install a new O-ring seal.
   - Tighten to 60 Nm.

6. CAUTION: If the vehicle is fitted with a worm drive clamp which is not fitted with a shear off cap, tighten the clamp to 4Nm.
   - NOTE: For vehicles with worm drive clamp.
   Install the fuel pump module worm drive clamp.
   - Tighten the clamp until the cap shears off.
7. **NOTE: All vehicles.**

Connect the fuel pump module quick release coupling.
- Make sure the quick release coupling has latched onto the fuel pump module fuel pipe by pulling the pipe after the connection has been made.

8. Connect the fuel pump module electrical connector.
- Attach the fuel pump module wiring harness to the retaining bracket.

9. Install the floor aperture cover.

10. Attach the rear seat cushion insulation.

11. Attach the floor covering.
12. Install the scuff plate trim panel.

13. Attach the door opening weatherstrip.

14. Install the rear seat cushion.
   For additional information, refer to: Rear Seat Cushion (501-10 Seating, Removal and Installation).

15. Attach the fuel tank filler pipe cap.

16. Connect the battery ground cable.
   For additional information, refer to: Battery Connect (414-01 Battery, Mounting and Cables, General Procedures).

17. Close the fuel tank filler pipe flap.
Fuel Tank and Lines - Fuel Pump Module 2.7L V6 - TdV6

Removal

1. WARNINGS:

⚠️ Place the vehicle in a quarantined area and arrange "No Smoking/Petrol Fumes" signs about the vehicle.

⚠️ Before any work is carried out on the fuel system, ground the vehicle to earth and maintain the ground connection until the work is complete.

⚠️ Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

⚠️ The fuel system remains pressurized for a long time after the ignition is switched off. The fuel pressure must be relieved before attempting any repairs. Failure to follow these instructions may result in personal injury.

⚠️ After carrying out repairs, the fuel system must be checked visually for leaks. Failure to follow these instructions may result in personal injury.

⚠️ This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

⚠️ If taken internally do not induce vomiting, seek immediate medical attention. Failure to follow these instructions may result in personal injury.

⚠️ If fuel contacts the eyes, flush the eyes with cold water or eyewash solution and seek medical attention.

⚠️ Wash hands thoroughly after handling, as prolonged contact may cause irritation. Should irritation develop, seek medical attention.

Remove the fuel level sensor.
For additional information, refer to: Fuel Transfer Unit - 2.7L V6 - TdV6 (310-01 Fuel Tank and Lines, Removal and Installation).

2. Detach and reposition the door opening weatherstrip.
3. Remove the scuff plate trim panel.

4. Detach and reposition the floor covering.

5. Detach and reposition the rear seat cushion insulation.

6. Remove the floor aperture cover.

7. Detach the fuel pump module electrical connector from the retaining bracket.
8. Disconnect the fuel pump module electrical connector.

9. Disconnect the auxiliary heater fuel supply line quick release coupling. For additional information, refer to: Quick Release Coupling - Push Connect (310-00 Fuel System - General Information, General Procedures).

10. Disconnect the fuel supply line quick release coupling. For additional information, refer to: Quick Release Coupling - Push Connect (310-00 Fuel System - General Information, General Procedures).

11. **CAUTION:** Make sure no damage occurs to the fuel pump module when removing the locking ring.

   Using the special tool, remove the fuel pump module locking ring.

12. Detach and reposition the upper part of the fuel pump module.
13. Detach the fuel pump module from the fuel tank.

14. Disconnect the fuel transfer line quick release coupling. For additional information, refer to: *Quick Release Coupling - Push Connect* (310-00 Fuel System - General Information, General Procedures).

15. Feed the fuel transfer pipes across the front of the fuel tank saddle and through the fuel pump module aperture.

16. **CAUTION:** Make sure no damage occurs to the fuel level float. Remove the fuel pump module.

- Remove and discard the fuel pump module gasket.

**Installation**

- **WARNINGS:**
  - Place the vehicle in a quarantined area and arrange "No Smoking/Petrol Fumes" signs about the vehicle.
  - Before any work is carried out on the fuel system, ground the vehicle to earth and maintain the ground connection until the work is complete.
  - Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.
  - The fuel system remains pressurized for a long time after the ignition is switched off. The fuel pressure must be relieved before attempting any repairs. Failure to follow these instructions may result in personal injury.
After carrying out repairs, the fuel system must be checked visually for leaks. Failure to follow these instructions may result in personal injury.

This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

If taken internally do not induce vomiting, seek immediate medical attention. Failure to follow these instructions may result in personal injury.

If fuel contacts the eyes, flush the eyes with cold water or eyewash solution and seek medical attention.

Wash hands thoroughly after handling, as prolonged contact may cause irritation. Should irritation develop, seek medical attention.

1. **CAUTION:** Make sure no damage occurs to the fuel level float of fuel pump components.
   • **NOTE:** Install a new gasket to the fuel pump module flange.
   • **NOTE:** Take care not to stretch the gasket.
   Install the fuel pump module.

2. Feed the fuel transfer lines through the fuel pump module aperture and across the front of the fuel tank saddle.

3. Attach the fuel pump module to the fuel tank.

4. Connect the fuel transfer pipe quick release coupling.
   For additional information, refer to: Quick Release Coupling - Push Connect (310-00 Fuel System - General Information, General Procedures).
5. Reposition the upper part of the fuel pump module.

6. Align the arrow on the fuel pump module with the alignment marks on the fuel tank.

7. **CAUTION:** Make sure no damage occurs to the fuel pump module when installing the locking ring.

   Using the special tool, install the fuel pump module locking ring.
   - Tighten to 60 Nm.

8. Connect the fuel pump module quick release coupling. For additional information, refer to: Quick Release Coupling - Push Connect (310-00 Fuel System - General Information, General Procedures).

9. Connect the auxiliary heater fuel supply line quick release coupling. For additional information, refer to: Quick Release Coupling - Push Connect (310-00 Fuel System - General Information, General Procedures).
10. Connect the fuel pump module electrical connector.

11. Attach the fuel pump module electrical connector to the retaining bracket.

12. Install the floor aperture cover.

13. Attach the rear seat cushion insulation.

14. Attach the floor covering.
15. Install the scuff plate trim panel.

16. Attach the door opening weatherstrip.

17. Install the fuel level sensor.
For additional information, refer to: Fuel Transfer Unit - 2.7L V6 - TdV6
(310-01 Fuel Tank and Lines, Removal and Installation).
Removal

1. WARNINGS:

⚠️ Place the vehicle in a well ventilated, quarantined, area and arrange "No Smoking/Fuel Fumes" signs about the vehicle.

⚠️ Before any work is carried out on the fuel system, ground the vehicle to earth and maintain the ground connection until the work is complete.

⚠️ Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

⚠️ The fuel system remains pressurized for a long time after the ignition is switched off. The fuel pressure must be relieved before attempting any repairs. Failure to follow these instructions may result in personal injury.

⚠️ After carrying out repairs, the fuel system must be checked visually for leaks. Failure to follow these instructions may result in personal injury.

⚠️ This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

⚠️ If taken internally do not induce vomiting, seek immediate medical attention. Failure to follow these instructions may result in personal injury.

⚠️ If fuel contacts the eyes, flush the eyes with cold water or eyewash solution and seek medical attention.

⚠️ Wash hands thoroughly after handling, as prolonged contact may cause irritation. Should irritation develop, seek medical attention.

Drain the fuel tank.
For additional information, refer to: Fuel Tank Draining - VIN Range: N52048->N99999 (310-00 Fuel System - General Information, General Procedures).

2. Remove the driveshaft.
For additional information, refer to: Driveshaft (205-01 Driveshaft, Removal and Installation).

3. Remove the fuel tank filler pipe to fuel tank hose.
4. Remove the fuel tank heatshield.
   1. Remove the fuel tank heatshield retaining nuts.
   2. Remove the fuel tank heatshield.

5. Disconnect the fuel tank electrical connector.

6. **CAUTION:** When supporting the fuel tank, use a suitable packing material to prevent damage to the underside of the fuel tank.

   Remove the fuel tank.
   • Detach the fuel tank support straps.

**Installation**

1. To install, reverse the removal procedure.
   • Tighten to 35Nm.

   - Wash hands thoroughly after handling, as prolonged contact may cause irritation. Should irritation develop, seek medical attention.

   - **NOTE:** For vehicles with worm drive clamp, refer to step 13.
   
   - **NOTE:** For vehicles with fuel pump locking ring, refer to steps 14.

   Open the fuel tank filler pipe flap.

2. Disconnect the battery ground cable.

3. Detach the fuel tank filler pipe cap.

4. De-pressurize the fuel system.
   For additional information, refer to: **Fuel System Pressure Release** (310-00 Fuel System - General Information, General Procedures).

5. Remove the rear seat cushion.
   For additional information, refer to: **Rear Seat Cushion** (501-10 Seating, Removal and Installation).
6. Detach and reposition the door opening weatherstrip.

7. Remove the scuff plate trim panel.

8. Detach and reposition the floor covering.

9. Detach and reposition the rear seat cushion insulation.

10. Remove the floor aperture cover.
11. Detach the fuel transfer pump module electrical connector from the retaining bracket.

12. Disconnect the fuel transfer pump electrical connector.

13. NOTE: For vehicles with worm drive clamp.
   Remove the fuel pump module worm drive clamp.
   - Remove and discard the O-ring seal.

14. NOTE: For vehicles with fuel pump locking ring.
   Using the special tool, remove the fuel pump module locking ring.
   - Remove and discard the O-ring seal.

15. NOTE: All vehicles.
   Detach and reposition the upper part of the fuel transfer pump.
Installation

• WARNINGS:

⚠️ Place the vehicle in a quarantined area and arrange "No Smoking/Petrol Fumes" signs about the vehicle.

⚠️ Before any work is carried out on the fuel system, ground the vehicle to earth and maintain the ground connection until the work is complete.

⚠️ Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

⚠️ The fuel system remains pressurized for a long time after the ignition is switched off. The fuel pressure must be relieved before attempting any repairs. Failure to follow these instructions may result in personal injury.

⚠️ After carrying out repairs, the fuel system must be checked visually for leaks. Failure to follow these instructions may result in personal injury.

⚠️ This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

⚠️ If taken internally do not induce vomiting, seek immediate medical attention. Failure to follow these instructions may result in personal injury.

⚠️ If fuel contacts the eyes, flush the eyes with cold water or eyewash solution and seek medical attention.

⚠️ Wash hands thoroughly after handling, as prolonged contact may cause irritation. Should irritation develop, seek medical attention.

1. CAUTIONS:

⚠️ Vehicles with supercharger - make sure the arrow on the left-hand fuel pump module lines up with the ‘SC’ marker on the fuel tank.

⚠️ Vehicles without supercharger - make sure the arrow on the fuel transfer pump lines up with the ‘NA’ marker on the fuel tank.

⚠️ Make sure no damage occurs to the fuel level float.

• NOTE: Install a new gasket to the fuel transfer pump flange.

• NOTE: Take care not to stretch the gasket.

To install, reverse the removal procedure.

2. NOTE: For vehicles with fuel pump locking ring.

Using the special tool, install the fuel pump module locking ring.

• Install a new O-ring seal.

• Tighten to 60 Nm.
3. **CAUTION:** If the vehicle is fitted with a worm drive clamp which is not fitted with a shear off cap, tighten the clamp to 4Nm.

- **NOTE:** For vehicles with worm drive clamp.

  Install the fuel pump module worm drive clamp.
  
  - Tighten the clamp until the cap shears off.

  - Wash hands thoroughly after handling, as prolonged contact may cause irritation. Should irritation develop, seek medical attention.

- **NOTE:** For vehicles with worm drive clamp, refer to steps 14 and 25.
- **NOTE:** For vehicles with fuel pump locking ring, refer to steps 15 and 26.

1. **NOTE: All vehicles**
   - Open the fuel tank filler pipe flap.
2. Disconnect the battery ground cable.
   - For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).
3. Detach the fuel tank filler pipe cap.
4. Release the pressure in the fuel system.
   - For additional information, refer to: Fuel System Pressure Release (310-00 Fuel System - General Information, General Procedures).
5. Drain the fuel system.
   - For additional information, refer to: Fuel Tank Draining - VIN Range: N52048->N99999 (310-00 Fuel System - General Information, General Procedures).
6. Remove the rear seat cushion.
   - For additional information, refer to: Rear Seat Cushion (501-10 Seating, Removal and Installation).
7. Detach and reposition the door opening weatherstrip.

8. Remove the scuff plate trim panel.

9. Detach and reposition the floor covering.

10. Detach and reposition the rear seat cushion insulation.

11. Remove the floor aperture cover.
12. Disconnect the fuel pump module electrical connector.
   - Detach the fuel pump module wiring harness from the retaining bracket.

13. Disconnect the fuel pump module quick release coupling.

14. **NOTE:** For vehicles with worm drive clamp.
   - Remove the fuel pump module worm drive clamp.
     - Remove and discard the O-ring seal.

15. **NOTE:** For vehicles with fuel pump locking ring.
   - Using the special tool, remove the fuel pump module locking ring.
     - Remove and discard the O-ring seal.

16. **NOTE:** All vehicles.
    - Disconnect the fuel transfer unit transfer feed tube.
17. Disconnect the left-hand fuel sender gauge electrical connector.

18. Disconnect the fuel transfer unit transfer return tube.

   - Press down and rotate the fuel pump module counter-clockwise.

20. Detach and reposition the door opening weatherstrip.

21. Remove the scuff plate trim panel.
22. Detach and reposition the floor covering.

23. Detach and reposition the rear seat cushion insulation.

24. Remove the floor aperture cover.

25. **NOTE:** For vehicles with worm drive clamp.
   Remove and discard the fuel transfer unit worm drive clamp.

26. **NOTE:** For vehicles with fuel pump locking ring.
   Using the special tool, remove the fuel transfer unit locking ring.
27. **CAUTION:** Make sure no damage occurs to the fuel level float.

• **NOTE:** All vehicles.

Remove the fuel transfer unit.

- Press down and rotate the base of the fuel transfer unit counter-clockwise.
- Remove and discard the O-ring seal.

---

**Installation**

• **NOTE:** For vehicles with fuel pump locking ring, refer to steps 2 and 13.

• **NOTE:** For vehicles with worm drive clamp, refer to steps 3 and 14.

---

1. **CAUTION:** Make sure no damage occurs to the fuel level float.

• **NOTE:** All vehicles.

Install the fuel transfer unit.

- Press down and rotate the base of the fuel transfer unit clockwise.
- Install a new O-ring seal.

---

2. **NOTE:** For vehicles with fuel pump locking ring.

Using the special tool, install the fuel transfer unit locking ring.

- Tighten to 60 Nm.

---

3. **CAUTION:** If the vehicle is fitted with a worm drive clamp which is not fitted with a shear off cap, tighten the clamp to 4Nm.

• **NOTE:** For vehicles with worm drive clamp.

Install the new fuel transfer unit worm drive clamp.

- Tighten the clamp until the cap shears off.
4. NOTE: All vehicles.
   Install the floor aperture cover.

5. Attach the rear seat cushion insulation.

6. Attach the floor covering.

7. Install the scuff plate trim panel.

8. Attach the door opening weatherstrip.
9. **CAUTIONS:**

- **On vehicles with supercharger** make sure the arrow on the fuel pump module and the 'SC' marker on the fuel tank are aligned.

- **On vehicles without supercharger** make sure the arrow on the fuel transfer module and the 'NA' marker on the fuel tank are aligned.

  Secure the fuel pump module.
  - Press down and rotate the base of the fuel pump module clockwise.

10. Connect the fuel transfer unit transfer return tube.

    - Make sure the coupling has latched onto the fuel pump module by pulling the tube after the connection has been made.

11. Connect the left-hand fuel sender gauge electrical connector.

12. Connect the fuel transfer unit transfer feed tube.

    - Make sure the quick release coupling has latched onto the fuel pump module fuel tube by pulling the tube after the connection has been made.

13. **NOTE:** For vehicles with fuel pump locking ring.

    Using the special tool, install the fuel pump module locking ring.
    - Install a new O-ring seal.
    - Tighten to 60 Nm.
14. **CAUTION:** If the vehicle is fitted with a worm drive clamp which is not fitted with a shear off cap, tighten the clamp to 4Nm.
   - **NOTE:** For vehicles with worm drive clamp.
     Install the fuel pump module worm drive clamp...
     - Tighten the clamp until the cap shears off.

15. **NOTE:** All vehicles.
    Connect the fuel pump module quick release coupling.
    - Make sure the quick release coupling has latched onto the fuel pump module fuel pipe by pulling the pipe after the connection has been made.

16. Connect the fuel pump module electrical connector.
    - Attach the fuel pump module wiring harness to the retaining bracket.

17. Install the floor aperture cover.

18. Attach the rear seat cushion insulation.
19. Attach the floor covering.

20. Install the scuff plate trim panel.

21. Attach the door opening weatherstrip.

22. Install the rear seat cushion.
   For additional information, refer to: Rear Seat Cushion (501-10 Seating, Removal and Installation).

23. Attach the fuel tank filler pipe cap.

24. Connect the battery ground cable.
   For additional information, refer to: Battery Connect (414-01 Battery, Mounting and Cables, General Procedures).

25. Close the fuel tank filler pipe flap.

1. **WARNINGS:**

   - Place the vehicle in a quarantined area and arrange "No Smoking/Petrol Fumes" signs about the vehicle.
   - Before any work is carried out on the fuel system, ground the vehicle to earth and maintain the ground connection until the work is complete.
   - Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.
   - The fuel system remains pressurized for a long time after the ignition is switched off. The fuel pressure must be relieved before attempting any repairs. Failure to follow these instructions may result in personal injury.
   - After carrying out repairs, the fuel system must be checked visually for leaks. Failure to follow these instructions may result in personal injury.
   - This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.
   - If taken internally do not induce vomiting, seek immediate medical attention. Failure to follow these instructions may result in personal injury.
   - If fuel contacts the eyes, flush the eyes with cold water or eyewash solution and seek medical attention.
   - Wash hands thoroughly after handling, as prolonged contact may cause irritation. Should irritation develop, seek medical attention.

   Open the fuel tank filler pipe flap.

2. Disconnect the battery.

   For additional information, refer to: [Battery Disconnect and Connect](414-01 Battery, Mounting and Cables, General Procedures).

3. Detach the fuel tank filler pipe cap.

4. Remove the rear seat cushion.

   For additional information, refer to: [Rear Seat Cushion](501-10 Seating, Removal and Installation).

5. Detach and reposition the door opening weatherstrip.
6. Remove the scuff plate trim panel.

7. Detach and reposition the floor covering.

8. Detach and reposition the rear seat cushion insulation.

9. Remove the floor aperture cover.

10. Detach the fuel level sensor module electrical connector from the retaining bracket.
11. Disconnect the fuel level sensor electrical connector.

12. Disconnect the fuel return line from the fuel level sensor. For additional information, refer to: Quick Release Coupling - Push Connect (310-00 Fuel System - General Information, General Procedures).

13. **CAUTION:** Make sure no damage occurs to the fuel level sensor when removing the locking ring. Failure to follow this instruction will result in damage to the vehicle.

   Using the special tool, remove the fuel level sensor locking ring.

14. Detach and reposition the upper part of the fuel level sensor.

15. **CAUTION:** Make sure no damage occurs to the fuel level float.

   Detach the fuel transfer pipe retaining clip.
CAUTION: Make sure no damage occurs to the fuel level float. Remove the fuel level sensor.

**Installation**

* WARNINGS:

⚠️ Place the vehicle in a quarantined area and arrange "No Smoking/Petrol Fumes" signs about the vehicle.

⚠️ Before any work is carried out on the fuel system, ground the vehicle to earth and maintain the ground connection until the work is complete.

⚠️ Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

⚠️ The fuel system remains pressurized for a long time after the ignition is switched off. The fuel pressure must be relieved before attempting any repairs. Failure to follow these instructions may result in personal injury.

⚠️ After carrying out repairs, the fuel system must be checked visually for leaks. Failure to follow these instructions may result in personal injury.

⚠️ This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

⚠️ If taken internally do not induce vomiting, seek immediate medical attention. Failure to follow these instructions may result in personal injury.

⚠️ If fuel contacts the eyes, flush the eyes with cold water or eyewash solution and seek medical attention.

⚠️ Wash hands thoroughly after handling, as prolonged contact may cause irritation. Should irritation develop, seek medical attention.

* 1. CAUTIONS:

⚠️ Make sure no damage occurs to the fuel level float.

⚠️ Make sure the fuel level sensor flange alignment mark aligns with the arrow on the fuel tank.

• NOTE: Install a new gasket to the fuel level sensor flange.

• NOTE: Take care not to stretch the gasket.

To install, reverse the removal procedure.

* 2. CAUTION: Make sure no damage occurs to the fuel level sensor when installing the locking ring.

Tighten to 60 Nm.
Fuel Tank and Lines - Inertia Fuel Shutoff (IFS) Switch
Removal and Installation

**Removal**

1. Remove the cowl side trim panel.
   1. Detach the door opening weatherstrip.
   2. Detach the scuff plate trim panel.
   3. Remove the cowl side trim panel.

2. Disconnect the inertia fuel shutoff (IFS) switch electrical connector.

3. Remove the IFS switch.

**Installation**

1. To install, reverse the removal procedure.
### Acceleration Control - Torque Specifications

<table>
<thead>
<tr>
<th>Description</th>

<th>lb-ft</th>
<th>lb-in</th>
</tr>
</thead>
<tbody>
<tr>
<td>Accelerator pedal</td>
<td>10</td>
<td>7</td>
<td>89</td>
</tr>
</tbody>
</table>
When the accelerator pedal is applied, the two accelerator position sensors measure the pedal movement and provide an output voltage proportional to pedal movement to the engine control module (ECM). Two sensors are used as a safety feature. The accelerator pedal has two return springs to guarantee the accelerator returns to the zero position when the pedal is released. Whilst comparison checks are carried out on the accelerator pedal for rational values, communications within the ECM are monitored for rational values and responses.

The ECM then provides an output, based on the accelerator pedal position, which drives a DC motor which positions the throttle blade at the requested angle. The throttle blade position is monitored by two sensors for rational value.

The acceleration control system has the necessary safety features to monitor the correct operation of all the components. Depending on the failure state, the acceleration control system can be put in appropriate safe state, from restricting the RPM to limp home mode.
1. Verify the customer concern by operating the system.
2. Visually inspect for obvious signs of mechanical or electrical damage.
3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the concern is not visually evident, use a fault code reader to retrieve fault codes before proceeding to the Symptom Chart.

## Symptom Chart

</tr>
</tbody>
</table>
Is the resistance between 70 and 90 ohms?

**Yes**  
GO to D9. .  
INSTALL a new throttle motor relay. CLEAR the DTC. TEST the system for normal operation.

**No**  
INSTALL a new throttle motor relay. CLEAR the DTC. TEST the system for normal operation.

### D9: CHECK CONTINUITY OF THE THROTTLE MOTOR RELAY GROUND CIRCUIT

1. Disconnect the ECM electrical connector PI 1.
2. Measure the resistance between the throttle motor relay electrical connector FH 32D pin 2 (GR) and the ECM electrical connector PI 1 pin 52 (GR).

Is the resistance less than 5 ohms?

**Yes**  
DIAGNOSE the electronic engine control system. For additional information, refer to Section 303-14A Electronic Engine Controls. Section 303-14B Electronic Engine Controls. Section 303-14C Electronic Engine Controls.

**No**  
REPAIR the throttle motor relay ground circuit from the ECM to the engine compartment fuse box. CLEAR the DTC. TEST the system for normal operation.

---

### PINPOINT TEST E : DTC P1243

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>E1: CHECK THE ACCELERATOR PEDAL DEMAND SENSOR GROUND CIRCUIT</strong></td>
<td></td>
</tr>
<tr>
<td>1. Disconnect the ECM electrical connector PI 1 and the accelerator pedal electrical connector CA 88.</td>
<td></td>
</tr>
<tr>
<td>2. Measure the resistance between PI 1 pin 19 (BG) and CA 88 pin 6 (BG).</td>
<td></td>
</tr>
<tr>
<td>3. Measure the resistance between PI 1 pin 20 (BG) and CA 88 pin 3 (BG).</td>
<td></td>
</tr>
</tbody>
</table>

Is the resistance less than 5 ohms?

**Yes**  
DIAGNOSE the electronic engine control system. For additional information, refer to Section 303-14A Electronic Engine Controls. Section 303-14B Electronic Engine Controls. Section 303-14C Electronic Engine Controls.

**No**  
REPAIR the accelerator pedal demand sensor ground circuit from the accelerator pedal to the ECM. CLEAR the DTC. TEST the system for normal operation.
Acceleration Control - Accelerator Pedal
Removal and Installation

Removal

1. Remove the driver side instrument panel lower panel.

2. Disconnect the accelerator pedal electrical connector.

3. Remove the accelerator pedal.
   - Remove the accelerator pedal retaining screws.
   - Remove the accelerator pedal.

Installation

1. To install, reverse the removal procedure.
   - Tighten to 10 Nm.
Removal

All vehicles

1. Adjust the accelerator pedal to its lowest position.

Right-hand drive vehicles

2. Remove the driver side cowl side trim panel.
   1. Detach the front door aperture seal.
   2. Remove the driver side cowl side trim panel.

All vehicles

3. Disconnect the accelerator pedal electrical connector.

4. Remove the accelerator pedal bracket retaining pin.
   1. Remove the retaining clip.
   2. Remove the accelerator pedal bracket retaining pin.
5. Using a suitable T30 Torx key, remove the accelerator pedal retaining screw.

6. Remove the accelerator pedal.

Installation
All vehicles

1. Install the accelerator pedal.
   - Loosely install the accelerator pedal retaining screw.
2. Reposition and align the accelerator pedal.

2. **CAUTION:** Do not fully tighten the retaining screw using the 4 mm ball ended hexagonal key. Failure to follow this instruction may result in damage to the vehicle.

- **NOTE:** The 4 mm ball ended hexagonal key is for alignment of the retaining screw only.

1. Using a suitable 4 mm ball ended hexagonal key, install the accelerator retaining screw into the accelerator pedal housing.

2. Reposition and align the accelerator pedal.

3. **CAUTION:** Do not fully tighten the retaining screw using the 4 mm ball ended hexagonal key. Failure to follow this instruction may result in damage to the vehicle.

- **NOTE:** The 4 mm ball ended hexagonal key is for alignment of the retaining screw only.

   Using a suitable 4 mm ball ended hexagonal key, fit but do not fully tighten the accelerator pedal retaining screw.

4. Tighten the accelerator pedal retaining screws.
   - Tighten to 10 Nm.

5. Using a suitable T30 Torx key, tighten the accelerator pedal retaining screw.
   - Tighten to 10 Nm.
6. Install the accelerator pedal bracket retaining pin.
   1. Slide the accelerator pedal bracket retaining pin into the bracket.
   2. Install the accelerator pedal bracket retaining pin.

7. Connect the accelerator pedal electrical connector.

Right-hand drive vehicles

8. Attach the front door aperture seal.
   1. Install the passenger side cowl side trim panel.
   2. Attach the front door aperture seal.

<td>Adaptive speed control module - vehicles with adaptive speed control</td>
</tr>
</tbody>
</table>

**System operation**

The speed control system is inoperative below 27 mile/h (43 kph) and inoperative above the following speeds:

- 120 mile/h (193 km) for vehicles fitted with 2.5L/3.0L engine and automatic transmission.
- 125 mile/h (201 km) for all other variants.

The speed control system is designed to maintain a selected vehicle speed between these two parameters.

Any of the switches operated by the brake or clutch pedal (vehicles fitted with manual transmission) will interrupt the speed control operation by switching the signal to the engine control module (ECM). This will allow the system to go into STANDBY mode. Pressing the RESUME switch with the vehicle travelling above 27 mile/h (43 kph) while the system is in STANDBY mode will allow the vehicle to accelerate until the last set speed is resumed.

**Speed control switch - vehicles without adaptive speed control**

**RESUME Switch**

When the RESUME switch is pressed with the vehicle travelling above 27 mile/h (43 kph) with the system in STANDBY mode, allows the vehicle to accelerate until the last set speed is resumed. The RESUME switch will not function if the ignition switch has been cycled or if the...
vehicle speed is below 27 mile/h (43 kph).

CANCEL Switch
When the CANCEL switch is pressed with the vehicle travelling above 27 mile/h (43 kph) the system will enter STANDBY mode.

SET Switch
When the SET +/- switch is pressed with the vehicle travelling above 27 mile/h (43 kph) the system allows the vehicle speed to be maintained to ± 1 mile/h (1.62 kph). Pressing the SET +/- switch will increase or decrease the vehicle speed respectively until the switch is released. If the respective switch is pressed momentarily, the speed will accelerate or decelerate in 1 mile/h increments.

Brake Pedal Position (BPP) Switch
If the brake pedal is activated while the speed control system is active, the ECM receives a signal from the brake pedal position switch. This will cancel speed control and allow the throttle blade to return to the position as demanded by the accelerator pedal.

Speed control deactivation switch (brake).
If the brake pedal is activated while the speed control system is active, the ECM receives a signal from the speed control deactivator switch. This will cancel speed control and allow the throttle blade to return to the position as demanded by the accelerator pedal.

Speed control deactivation switch (clutch)
If the clutch pedal is activated while the speed control system is active, the ECM receives a signal from the clutch pedal position switch. This will cancel speed control and allow the throttle blade to return to the position as demanded by the accelerator pedal.

Adaptive speed control
On vehicles for certain markets, an adaptive speed control system is installed as an option. In addition to the normal vehicle speed control functions, this system enables a preset distance to be maintained behind a moving vehicle immediately ahead, without driver intervention.

Automatic Switch Off - Vehicles with Adaptive Speed Control
The adaptive speed control will disengage, but not clear the memory when:
- the CANCEL button is activated.
- the brake pedal is applied.
- the vehicle speed falls below 26Km/h (16mph).
- neutral, park or reverse gear positions are selected.
- traction control is activated.

The adaptive speed control will disengage, and clear the memory when:
- the ignition switch is set to position '0'.
- maximum vehicle speed is reached.
- the parkbrake is applied.
- a fault occurs in the adaptive speed control system.

Forward Alert Switch - Vehicles with Adaptive Speed Control

Forward Alert
The forward alert system is switched on and off by the forward alert switch. The forward alert system additionally provides warnings while the adaptive speed control is not activated.

Speed Control Module
The adaptive speed control module incorporates a radar sensor and yaw rate sensor to provide system control functions.

Adaptive Speed Control Failure

If a fault occurs during any adaptive speed control operation the adaptive speed control system will be deactivated and will remain in this state until the fault is rectified. The message center will display 'CRUISE NOT AVAILABLE'.
Speed Control - Speed Control
VIN Range: N52048->N99999

System operation

The speed control system is inoperative below 32 kph (20 mile/h) and inoperative above 250 kph (155 mile/h).

The speed control system is designed to maintain a selected vehicle speed between 32 kph (20 mile/h) and 180 kph (112 mile/h).

Any of the switches operated by the brake will interrupt the speed control operation by switching the signal to the engine control module (ECM). This will allow the system to go into STANDBY mode. Pressing the RESUME switch with the vehicle travelling above 32 kph (20 mile/h) while the system is in STANDBY mode will allow the vehicle to accelerate until the last set speed is resumed.

Speed Control Steering Wheel Switches
RESUME Switch
When the RESUME switch is operated with the vehicle travelling above 32 kph (20 mile/h) with the system in STANDBY mode, the vehicle is allowed to accelerate until the last set speed is resumed. The RESUME switch will not function if the ignition switch has been cycled or if the vehicle speed is below 32 kph (20 mile/h).

CANCEL Switch
When the CANCEL switch is operated with the vehicle travelling above 32 kph (20 mile/h) the system will enter STANDBY mode.

SET Switch
When the SET +/- switch is operated with the vehicle travelling above 32 kph (20 mile/h) the system allows the vehicle speed to be maintained to ± 1.62 kph (1 mile/h). Pressing the SET +/- switch will increase or decrease the vehicle speed respectively until the switch is released. If the respective switch is pressed momentarily, the speed will accelerate or decelerate in 1.62 kph (1 mile/h) increments.

Brake Pedal Position (BPP) Switch
If the brake pedal is operated while the speed control system is active, the ECM receives a signal from the BPP switch. This will cancel vehicle speed control and allow the throttle blade to return to the position as demanded by the accelerator pedal.

Speed Control Deactivation Switch (brake).
If the brake pedal is activated while the speed control system is active, the ECM receives a signal from the speed control deactivation switch. This will cancel speed control and allow the throttle blade to return to the position as demanded by the accelerator pedal.

Clutch Pedal Position Sensor
If the clutch pedal is activated while the speed control system is active, the ECM receives a signal from the clutch pedal position switch. This will cancel speed control and allow the throttle blade to return to the position as demanded by the accelerator pedal.

**Adaptive Speed Control**

On vehicles for certain markets, an adaptive speed control system is installed as an option. In addition to the normal vehicle speed control functions, this system enables a preset distance to be maintained behind a moving vehicle immediately ahead, without driver intervention.

**Automatic Switch Off - Vehicles with Adaptive Speed Control**

The adaptive speed control will disengage, but not clear the memory when:

- the CANCEL button is operated.
- the brake pedal is applied.
- the vehicle speed falls below 32 kph (20 mile/h).
- neutral, park or reverse gear positions are selected.
- traction control is activated.
- cruise override activated for more than five minutes.

The adaptive speed control will disengage, and clear the memory when:

- the ignition switch is set to position '0'.
- a fault occurs in the adaptive speed control system.

**Message center**

The message center will keep the driver informed by displaying messages and warnings.

**Forward Alert Switch - Vehicles with Adaptive Speed Control**

The forward alert system is switched on and off by the forward alert switch, which is incorporated into the message center switch. The forward alert system additionally provides warnings while the adaptive speed control is not activated.

**Speed Control Module - Vehicles with Adaptive Speed Control**
The speed control module provides system control functions.

Speed Control Sensor - Vehicles with Adaptive Speed Control

The speed control sensor incorporates the forward looking radar sensor.

Adaptive Speed Control Failure

If a fault occurs during any adaptive speed control operation, the adaptive speed control system will deactivate and will remain in this state until the fault is rectified. The 'CRUISE NOT AVAILABLE' message will be displayed on the message center on 'demand' by trying to operate the steering wheel control switches. This on 'demand' strategy is intended to show that adaptive speed control is not available and another fault may exist. For example: If an anti-lock brake system or traction control error message is displayed this would imply that the brake system may be effecting or inhibiting the adaptive speed control. If the message center displays 'CRUISE NOT AVAILABLE' permanently or no message is displayed, this may imply that the vehicle has an ECM fault.
Speed Control - Speed Control

**Principles of Operation**

There are two types of speed (cruise) control fitted, adaptive cruise control (ACC) and non-adaptive cruise control.

The non-adaptive system maintains a road speed selected by the driver from the steering wheel switches, and is cancelled by inputs from the steering wheel cancel switch, the brake pedal (the system will disengage if the brake pedal is pressed), road speed (the system will disengage if the road speed falls below 26 kph [16 mph]), gear selector position (the system will disengage if neutral, park or reverse gears are selected), traction or stability control (the system will disengage if the traction or stability control is activated).

The adaptive system also maintains a road speed selected by the driver from the steering wheel switches, and is cancelled by the same inputs (the only difference being that the selected speed will show in the message center display), but can also maintain a selected distance from the vehicle in front.

When the system is enabled, the vehicle will maintain the selected speed until another vehicle is detected travelling in the same lane and direction, when it will enter **FOLLOW MODE**.

In this mode, the vehicle will maintain a time gap from the vehicle in front, rather than the selected speed. **This is not a fault**, but a designed feature of the system. The time gap is adjustable, using the **HEADWAY** switches on the steering wheel switchpack, but will default to a longer gap, unless overridden by the driver.

When the vehicle enters **FOLLOW MODE**, the message center will display the ACC tell-tale symbol (see the owner's handbook), with a GAP indication for four seconds, and the vehicle will maintain the gap from the vehicle in front until:

- The vehicle in front accelerates to a speed above the selected speed, in which case the selected speed will be resumed
- The vehicle in front moves out of lane, or out of view, in which case the selected speed will be resumed
- The vehicle in front slows to below 26 km/h (16 mph), at which speed the system disengages, the message **DRIVER INTERVENE** will display on the message center, and any braking applied by the ACC system will reduce. **This is not a fault** but may involve the driver having to take control and brake him/herself.
- A new gap distance is set by the driver from the steering wheel switches

The ACC system can apply the brakes to maintain the gap to the vehicle in front. The braking force which the system can apply is limited, but can be overridden by the driver braking. This action will cancel the cruise control function, but the system will "remember" the selected speed, and will resume the selected speed by the driver pressing the **RESUME** switch on the steering wheel switchpack.

**NOTE:** When the system applies the brakes, the brake lights will function exactly as if the driver were braking.

It is possible (for example, when a slow-moving vehicle pulls out into the lane in front), for the degree of braking necessary to avoid a collision to exceed the maximum level of the ACC system. Should this happen, an audible warning will sound, accompanied by a red warning light and a **DRIVER INTERVENE** display on the message center, at which point, the driver must take action. **This is not a fault**, but a designed feature of the system.

Should the driver need to go faster than the selected speed, he/she can override the system simply by pressing the accelerator, in which case, the message center will display **CRUISE OVERRIDE**. When the pedal is released, the system will resume operation in whichever mode is appropriate, follow or selected speed.

**Detection**

As with most sensors, there are certain conditions under which detection issues can occur. The owner/driver's attention should be drawn to the driver's handbook to avoid misunderstandings as to what is, and isn't, a fault.

Detection issues may occur;

- When driving on a different line to the vehicle in front
- When vehicles edge into your lane
- When going into or coming out of a bend
- With detecting motorcycles
- With detecting stationary objects, such as traffic queues, broken down vehicles, etc

In circumstances such as these, the ACC system may brake late or unexpectedly, or may increase speed. **This is not a fault**, but is the system reacting to detection issues.

The owner's handbook makes it clear that the system should only be used under suitable conditions, but technicians should be wary of wasting time on complaints which are not actually faults.

**Inspection and verification**

1. **1.** Verify the customer concern.
2. **2.** Confirm which, if any, warning lights and/or messages were displayed on the instrument cluster.

**NOTE:** If any warning lights and/or messages were displayed when the fault occurred, refer to the Driver Information Table for DTCs associated with the display, then to the DTC index table for possible sources and actions. Some warnings will appear to clear when the ignition is cycled. This is often because the warning has flagged as a result of one of the vehicle's on-board diagnostic routines having run to detect the fault. If the same routine is not run when the ignition is switched **ON**, the warning will not reflag until the routine does run. See the DTC summaries for drive cycle routines.

3. **3.** Visually inspect for obvious signs of mechanical or electrical damage.

**Visual Inspection Chart**

<table>
<thead>

</tr>
</tbody>
</table>
4. Verify the following systems are working correctly:
   - Air intake system
   - Cooling system
   - Charging system
   - Fuel charging system
   - Ignition system

5. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

   • NOTE: If a DTC cannot be cleared, then there is a permanent fault present that flags again as soon as it is cleared. (The exception to this is P1260, which will only clear following an ignition OFF/ON cycle after rectification.)

6. If the cause is not visually evident and the Jaguar approved diagnostic system is not available, use a scan tool to retrieve the fault codes before proceeding to the diagnostic trouble code (DTC) index chart, or the symptom chart if no DTCs are set.

### Speed Control Module Levelling

An incorrectly aligned speed control module can cause incorrect system operation. Before starting any repair work on the ACC system, check the levelling of the speed control module. For further information, REFER to: Speed Control Module Alignment (310-03 Speed Control, General Procedures).

### Symptom Chart

Default mode definitions

**LIMP-HOME MODE**
- Throttle motor off
- Throttle motor relay off
- Throttle motor circuit off
- Fuel intervention
- Speed (cruise) control inhibited

**LIMP-HOME UNAVAILABLE**
- Power limitation
- Vehicle speed limited to 120 kph (75 mph)
- Reverse throttle progression enabled
- Speed (cruise) control inhibited

**REVERSE THROTTLE PROGRESSION**
- Throttle opening limited to maximum 30%

**NOTE:** The throttle operation uses the same map as for reverse gear.

**ENGINE SPEED LIMITED**
- Engine runs normally, up to 3000 rpm
- Engine speed restricted to 3000 rpm maximum, by fuel cut-off

**HIGH IDLE**
- Throttle valve kept in fixed position by motor
- Speed (cruise) control Inhibited

**SAFETY REDUNDANCY**
- Power limitation
- Vehicle speed limited to 120 kph (75 mph)
- Reverse throttle progression enabled
- Speed (cruise) control Inhibited

A2: CHECK THE FORWARD ALERT SWITCH TO ASCCM CIRCUIT FOR HIGH RESISTANCE

1 Disconnect the battery negative terminal. REFER to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures). 2 Disconnect the ASCCM electrical connector, FH107. 3 Measure the resistance between FC43, pin 07 (GW) and FH107, pin 12 (GW).  |
| Is the resistance greater than 5 ohms? |
| Yes REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. TEST the system for normal operation. |
| No GO to A3. |

A3: CHECK THE FORWARD ALERT SWITCH TO ASCCM CIRCUIT FOR SHORT CIRCUIT TO GROUND

1 Measure the resistance between FC43, pin 07 (GW) and GROUND.  |
| Is the resistance less than 10,000 ohms? |
| Yes REPAIR the short circuit. For additional information, refer to the wiring diagrams. TEST the system for normal operation. |
| No GO to A4. |

A4: CHECK THE FORWARD ALERT SWITCH GROUND CIRCUIT FOR SHORT TO B+

1 Measure the voltage between FC43, pin 06 (B) and GROUND.  |
| Is the voltage greater than 3 volts? |
| Yes REPAIR the short circuit. This circuit includes the splice IPS 35. For additional information, refer to the wiring diagrams. TEST the system for normal operation. This circuit includes the splice IPS 35. For additional information, refer to the wiring diagrams. TEST the system for normal operation. |
| No INSTALL a new forward alert switch. CLEAR the DTC. TEST the system for normal operation. If the DTC is repeated, contact dealer technical support for advice on possible ECM failure. |

PINPOINT TEST B : DTC P0566, P0567, P0569, P0570: CHECK THE STEERING WHEEL SWITCH CIRCUIT FOR SHORT TO GROUND

WARNING: TO AVOID ACCIDENTAL DEPLOYMENT AND POSSIBLE PERSONAL INJURY, THE BACKUP POWER SUPPLY MUST BE DEPLETED BEFORE REPAIRING OR REPLACING ANY AIR BAG SUPPLEMENTAL RESTRAINT SYSTEM (SRS) COMPONENTS. TO DEPLETE THE BACKUP POWER SUPPLY ENERGY, DISCONNECT THE BATTERY GROUND CABLE AND WAIT ONE MINUTE. FAILURE TO FOLLOW THIS INSTRUCTION MAY RESULT IN PERSONAL INJURY.

PINPOINT TEST E : DTC P1697: ADAPTIVE SPEED CONTROL HEADWAY SWITCH(ES) CIRCUIT MALFUNCTION

WARNING: TO AVOID ACCIDENTAL DEPLOYMENT AND POSSIBLE PERSONAL INJURY, THE BACKUP POWER SUPPLY MUST BE DEPLETED BEFORE REPAIRING OR REPLACING ANY AIR BAG SUPPLEMENTAL RESTRAINT SYSTEM (SRS) COMPONENTS. TO DEPLETE THE BACKUP POWER SUPPLY ENERGY, DISCONNECT THE BATTERY GROUND CABLE AND WAIT ONE MINUTE. FAILURE TO FOLLOW THIS INSTRUCTION MAY RESULT IN PERSONAL INJURY.

TEST CONDITIONS | DETAILS/RESULTS/ACTIONS
--- | ---
E1: CHECK THE SPEED CONTROL HEADWAY - SWITCH FUNCTION

1. Disconnect the battery negative terminal.
   REFER to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).
2. Wait one minute for the system to become safe.
3. Disconnect the steering wheel switch electrical connector, SQ02.
4. Connect an ohmmeter across pins 01 (SR) and 03 (S) of the speed control switch.
5. Operate the HEADWAY switch.

Does the resistance switch between 4300 and 600 ohms as the switch is operated?
Yes
   GO to E2.
No
   INSTALL a new speed control switch assembly.
   REFER to: Speed Control Switch (310-03 Speed Control, Removal and Installation).
   CLEAR the DTC. TEST the system for normal operation.

E2: CHECK THE SPEED CONTROL HEADWAY + SWITCH FUNCTION

1. Operate the HEADWAY switch.

Does the resistance switch between 4300 and 300 ohms as the switch is operated?
Yes
   GO to E3.
No
   INSTALL a new speed control switch assembly.
   REFER to: Speed Control Switch (310-03 Speed Control, Removal and Installation).
   CLEAR the DTC. TEST the system for normal operation.

E3: CHECK THE SPEED CONTROL SWITCH INTERNAL HARNESS FOR SHORT CIRCUIT TO GROUND

1. Measure the resistance between the steering wheel switch electrical connector, SQ02 pin 01 (SR) and GROUND.
2. Measure the resistance between the steering wheel switch electrical connector, SQ02 pin 03 (S) and GROUND.

Is either resistance less than 10,000 ohms?
Yes
   REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
No
   Check the clockspring for short circuit to ground. GO to Pinpoint Test B. test 2. (The clockspring is the same for adaptive and non-adaptive vehicles).

PINPOINT TEST F : DTC C1935, B2369: ADAPTIVE SPEED CONTROL CHIME MODULE CIRCUIT MALFUNCTION

TEST CONDITIONS | DETAILS/RESULTS/ACTIONS
--- | ---
F1: CHECK THE POWER SUPPLY TO THE ADAPTIVE SPEED CONTROL CHIME MODULE

1. Disconnect the adaptive speed control chime module electrical connector, FC120.
2. Turn the ignition switch to the ON position.
3. Measure the voltage between FC120, pin 01 (YR) and GROUND.
Is the voltage greater than 10 volts?

**Yes**

- **GO to F2.**

**No**

- REPAIR the circuit between the adaptive speed control chime module and battery. This circuit includes the primary junction box, (fuse 16). For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

### F2: CHECK THE ADAPTIVE SPEED CONTROL CHIME MODULE TO ASCCM CIRCUIT FOR HIGH RESISTANCE

1. Turn the ignition switch to the **OFF** position.
2. Disconnect the battery negative terminal.
3. REFER to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).
4. Disconnect the ASCCM electrical connector, FH107.
5. Measure the resistance between FC120, pin 03 (G) and FH107, pin 06 (G).

Is the resistance greater than 5 ohms?

**Yes**

- REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

**No**

- **GO to F3.**

### F3: CHECK THE ADAPTIVE SPEED CONTROL CHIME MODULE TO ASCCM CIRCUIT FOR SHORT TO B+

1. Reconnect the battery negative terminal.
2. REFER to: Battery Connect (414-01 Battery, Mounting and Cables, General Procedures).
3. Measure the voltage between FC120, pin 03 (G) and GROUND.

Is the voltage greater than 3 volts?

**Yes**

- REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

**No**

- **GO to F4.**

### F4: CHECK THE ADAPTIVE SPEED CONTROL CHIME MODULE TO ASCCM CIRCUIT FOR SHORT TO GROUND

1. Measure the resistance between FC120, pin 03 (G) and GROUND.

Is the resistance less than 10,000 ohms?

**Yes**

- REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

**No**

- INSTALL a new adaptive speed control chime module. CLEAR the DTC. TEST the system for normal operation.
**Speed Control - Speed Control**

**VIN Range:** N13089->N52047

**Diagnosis and Testing**

### Principles of Operation

There are two types of speed (cruise) control fitted, adaptive cruise control (ACC) and non-adaptive cruise control.

The non-adaptive system maintains a road speed selected by the driver from the steering wheel switches, and is cancelled by inputs from the steering wheel, gear selector position (the system will disengage if REVERSE gears are selected), traction or stability control (the system will disengage if the traction or stability control is activated).

The adaptive system also maintains a road speed selected by the driver from the steering wheel switches, and is cancelled by the same inputs (the only difference being that the stored set speed will show in the message center display), but can also maintain a selected gap from the vehicle in front.

The ACC system fitted to this vehicle varies from past ACC systems in that the forward looking radar (FLR) sensor is a separate component and not integrated into the ACC module.

When the system is enabled, the vehicle will maintain the selected speed until another vehicle is detected travelling in the same lane and direction, when it will enter **FOLLOW MODE**.

In this mode, the vehicle will maintain a time gap from the vehicle in front, rather than the selected speed. **This is not a fault**, but a designed feature of the system. The time gap is adjustable, using the **HEADWAY** switches on the steering wheel switch assembly, but will default to a longer gap, unless overridden by the driver.

When the vehicle enters **FOLLOW MODE**, the message center will display the ACC tell-tale symbol (see the owner's handbook), with a **GAP** indication for four seconds, and the vehicle will maintain the gap from the vehicle in front until:

- the vehicle in front accelerates to a speed above the stored set speed, in which case the stored set speed will be resumed.
- the vehicle in front moves out of lane, or out of view, in which case the stored set speed will be resumed.
- the vehicle in front slows to below 26 km/h (16 mph), at which speed the system disengages, the message **DRIVER INTERVENE** will display on the message center accompanied by a chime, and any braking applied by the ACC system will be smoothly reduced.
  **This is not a fault** but may involve the driver having to take control and brake him/herself.
- a new gap distance is set by the driver from the steering wheel switches.

The ACC system can apply the brakes to maintain the gap to the vehicle in front. The braking force which the system can apply is limited, but can be overridden by the driver braking. This action will cancel the cruise control function, but the system will "remember" the stored set speed, and will resume the stored set speed by the driver pressing the **RESUME** switch on the steering wheel switch assembly.

**NOTE:** When the system applies the brakes, the brake lights will function exactly as if the driver were braking.

It is possible (for example, when a slow-moving vehicle pulls out into the lane in front), for the degree of braking necessary to avoid a collision to exceed the maximum level of the ACC system. Should this happen, an audible warning will sound, accompanied by a **red** warning light and a **DRIVER INTERVENE** display on the message center, at which point, the driver must take action. **This is not a fault**, but a designed feature of the system.

Should the driver need to go faster than the stored set speed, he/she can override the system simply by pressing the accelerator, in which case, the message center will display **CRUISE OVERRIDE**. When the pedal is released, the system will resume operation in whichever mode is appropriate, follow or selected speed.

### Detection

As with most sensors, there are certain conditions under which detection issues can occur. The owner/driver's attention should be drawn to the driver's handbook to avoid misunderstandings as to what is, and isn't, a fault.

Detection issues may occur:

- when driving on a different line to the vehicle in front
- when vehicles edge into your lane.
- when going into or coming out of a bend.
- with detecting motorcycles.
- with detecting stationary objects, such as traffic queues, broken down vehicles, etc.

In circumstances such as these, the ACC system may brake late or unexpectedly, or may increase speed. **This is not a fault**, but is the system reacting to detection issues.

The owner's handbook makes it clear that the system should only be used under suitable conditions, but technicians should be wary of wasting time on complaints which are not actually faults.

### Inspection and verification

1. **1.** Verify the customer concern.
2. **2.** Confirm which, if any, warning lights and/or messages were displayed on the instrument cluster.
3. **3.** Visually inspect for obvious signs of mechanical or electrical damage.

#### Visual Inspection Chart

</tbody>
</table>
4. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

5. If the cause is not visually evident use the Jaguar approved diagnostic system or a scan tool to retrieve the fault codes before proceeding to the diagnostic trouble code (DTC) index chart, or the symptom chart if no DTCs are set.

**Forward looking radar (FLR) sensor levelling**

An incorrectly aligned FLR sensor can cause incorrect system operation. Before starting any repair work on the ACC system, check the levelling of the FLR sensor. This is carried out in a similar way to the module levelling in previous systems. REFER to: **Speed Control Module Alignment** (310-03 Speed Control, General Procedures).

**Symptom Chart**

- **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

Pinpoint Tests

PINPOINT TEST A : DTC C1459: FORWARD ALERT SWITCH CIRCUIT TESTS

**CAUTION:** When probing connectors to take measurements in the course of the pinpoint tests, use the adaptor kit, part number 3548-1358-00.

* NOTE: When performing electrical voltage or resistance tests, always use a digital multimeter (DMM) accurate to 3 decimal places, and with an up-to-date calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.

* NOTE: For a quick function check of the switch action, monitor the LED function as the switch is operated.

PINPOINT TEST C : DTC B2373: FORWARD ALERT SWITCH LED CIRCUIT TESTS
### TEST CONDITIONS | DETAILS/RESULTS/ACTIONS

| C1: CHECK THE FORWARD ALERT SWITCH LED CIRCUIT FOR OPEN CIRCUIT |
|---|---|
| 1. Disconnect the battery negative terminal. |
| 2. Disconnect the ACC module connector IP78. |
| 3. Disconnect the forward alert switch connector IP50. |
| 4. Measure the resistance between the ACC module connector IP78, pin 05 (U) and forward alert switch connector IP50, pin 07 (U). |

Is the resistance greater than 5 ohms?

| Yes | REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation. |
| No | GO to C2. |

### C2: CHECK THE FORWARD ALERT SWITCH LED CIRCUIT FOR SHORT CIRCUIT TO B+

| 1. Reconnect the battery negative terminal. |
| 2. Turn the ignition switch to the ON position. |
| 3. Measure the voltage between the ACC module connector IP78, pin 05 (U) and GROUND. |

Is the voltage greater than 3 volts?

| Yes | REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation. |
| No | INSTALL a new forward alert switch. REFER to: Speed Control Deactivator Switch (310-03 Speed Control, Removal and Installation). CLEAR the DTC. TEST the system for normal operation. If the DTC is repeated, INSTALL a new ACC module, not the forward looking sensor. REFER to: Speed Control Module (310-03 Speed Control, Removal and Installation). |

**PINPOINT TEST D : DTC C1920: FORWARD ALERT SWITCH LED CIRCUIT TESTS**

| 1. Disconnect the battery negative terminal. |
| 2. Disconnect the ACC module connector IP78. |
| 3. Disconnect the forward alert switch connector IP50. |
| 4. Measure the resistance between the ACC module connector, pin 05 (U) and GROUND. |

Is the resistance less than 10,000 ohms?

| Yes | REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation. |
| No | INSTALL a new forward alert switch. REFER to: Speed Control Deactivator Switch (310-03 Speed Control, Removal and Installation). CLEAR the DTC. TEST the system for normal operation. If the DTC is repeated, INSTALL a new ACC module, not the forward looking sensor. REFER to: Speed Control Module (310-03 Speed Control, Removal and Installation). |

### PINPOINT TEST E : DTC C1935: CHIME CIRCUIT TESTS

| 1. Disconnect the battery negative terminal. |
| 2. Disconnect the ACC module connector IP78. |
| 3. Disconnect the chime module connector IP11. |
| 4. Measure the resistance between the ACC module connector IP78, pin 06 (R) and chime module connector IP11, pin 03 (R). |

Is the resistance greater than 5 ohms?

| Yes | REPAIR the open circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation. |
| No | GO to E2. |

### E2: CHECK THE CHIME CIRCUIT FOR SHORT CIRCUIT TO B+

| 1. Reconnect the battery negative terminal. |
| 2. Connect the battery ground terminal. |
| 3. Turn the ignition switch to the ON position. |
| 4. Measure the voltage between the ACC module connector IP78, pin 06 (R) and GROUND. |

Is the voltage greater than 3 volts?

| Yes | REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation. |
| No | INSTALL a new chime module. CLEAR the DTC. TEST the system for normal operation. If the DTC is repeated, INSTALL a new ACC module, not the forward looking sensor. REFER to: Speed Control Module (310-03 Speed Control, Removal and Installation). |
**PINPOINT TEST F : DTC B2369: CHIME CIRCUIT TEST**

**CAUTION:** When probing connectors to take measurements in the course of the pinpoint tests, use the adaptor kit, part number 3548-1358-00.

**NOTE:** When performing electrical voltage or resistance tests, always use a digital multimeter (DMM) accurate to 3 decimal places, and with an up-to-date calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.

## PINPOINT TEST I : SPEED CONTROL SWITCH CIRCUIT TESTS

### WARNING: To avoid accidental deployment and possible personal injury, the back-up power supply must be depleted before repairing or replacing any air bag supplemental restraint system (SRS) components. To deplete the back-up power supply energy, disconnect the battery GROUND cable and wait one minute. Failure to follow this instruction may result in personal injury.

### CAUTION: When probing connectors to take measurements in the course of the pinpoint tests, use the adaptor kit, part number 3548-1358-00.
• NOTE: When performing electrical voltage or resistance tests, always use a digital multimeter (DMM) accurate to 3 decimal places, and with an up-to-date calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.

### TEST CONDITIONS

#### I1: CHECK THE STEERING WHEEL SPEED CONTROL SWITCH CIRCUIT FOR OPEN CIRCUIT

1. Disconnect the battery negative terminal.
2. Wait one minute for the system to become safe.
3. Disconnect the ECM connector PI01.
4. Measure the resistance between the ECM connector PI01, pin 47 (WG) and ECM connector PI01, pin 48 (YG).

Is the resistance 4310 ohms?
- Yes: GO to I2.
- No: GO to I8.

#### I2: CHECK THE STEERING WHEEL SPEED CONTROL RESUME SWITCH CIRCUIT

1. Measure the resistance between the ECM connector PI01, pin 47 (WG) and ECM connector PI01, pin 48 (YG).
2. Operate the RESUME switch.

Does the resistance switch between 4,310 ohms and 2,110 ohms when the switch is operated?
- Yes: GO to I3.
- No: INSTALL a new speed control switch assembly.

#### I3: CHECK THE STEERING WHEEL SPEED CONTROL SET+ SWITCH CIRCUIT

1. Measure the resistance between the ECM connector PI01, pin 47 (WG) and ECM connector PI01, pin 48 (YG).
2. Operate the SET+ switch.

Does the resistance switch between 4,310 ohms and 1,110 ohms when the switch is operated?
- Yes: GO to I4.
- No: INSTALL a new speed control switch assembly.

#### I4: CHECK THE STEERING WHEEL SPEED CONTROL HEADWAY- SWITCH CIRCUIT

1. Measure the resistance between the ECM connector PI01, pin 47 (WG) and ECM connector PI01, pin 48 (YG).
2. Operate the HEADWAY- switch.

Does the resistance switch between 4,310 ohms and 600 ohms when the switch is operated?
- Yes: GO to I5.
- No: INSTALL a new speed control switch assembly.

#### I5: CHECK THE STEERING WHEEL SPEED CONTROL HEADWAY+ SWITCH CIRCUIT

1. Measure the resistance between the ECM connector PI01, pin 47 (WG) and ECM connector PI01, pin 48 (YG).
2. Operate the HEADWAY+ switch.

Does the resistance switch between 4,310 ohms and 300 ohms when the switch is operated?
- Yes: GO to I6.
- No: INSTALL a new speed control switch assembly.

#### I6: CHECK THE STEERING WHEEL SPEED CONTROL SET- SWITCH CIRCUIT

1. Measure the resistance between the ECM connector PI01, pin 47 (WG) and ECM connector PI01, pin 48 (YG).
2. Operate the SET- switch.

Does the resistance switch between 4,310 ohms and 120 ohms when the switch is operated?
- Yes: GO to I7.
- No: INSTALL a new speed control switch assembly.

#### I7: CHECK THE STEERING WHEEL SPEED CONTROL CANCEL SWITCH CIRCUIT

1. Measure the resistance between the ECM connector PI01, pin 47 (WG) and ECM connector PI01, pin 48 (YG).
2. Operate the CANCEL switch.

Does the resistance switch between 4,310 ohms and zero ohms when the switch is operated?
- Yes: No fault is indicated with the steering wheel speed control switches or circuit. To continue the diagnostics, return to the Symptom Chart.
- No: INSTALL a new speed control switch assembly.

#### I8: CHECK THE STEERING WHEEL SPEED CONTROL SWITCH CIRCUIT FOR OPEN CIRCUIT

1. Disconnect the clockspring connector SW08.
2. Measure the resistance between the clockspring connector SW08, pin 08, component side and clockspring connector SW08, pin 06, component side.

Is the resistance 4,310 ohms?
- Yes: GO to I10.
- No: GO to I9.

#### I9: CHECK THE STEERING WHEEL SPEED CONTROL SWITCH FOR OPEN CIRCUIT

1. Disconnect the steering wheel speed control switch.
Measure the resistance between the steering wheel speed control switch connector pins 01 and 02 component side.

Is the resistance 4,310 ohms?
Yes
INSTALL a new clockspring. TEST the system for normal operation.
No
INSTALL a new speed control switch assembly.
REFER to: Speed Control Switch (310-03 Speed Control, Removal and Installation).
TEST the system for normal operation.

**I10: CHECK THE STEERING WHEEL SPEED CONTROL SWITCH CIRCUIT FOR OPEN CIRCUIT**

Measure the resistance between the ECM connector PI01, pin 47 (WG) and clockspring connector SW08, pin 08 (YR).

Is the resistance greater than 5 ohms?
Yes
REPAIR the circuit between ECM connector PI01, pin 47 (WG) and clockspring connector SW08, pin 08 (YR). For additional information, refer to the wiring diagrams. TEST the system for normal operation.
No
GO to I11.

**I11: CHECK THE STEERING WHEEL SPEED CONTROL SWITCH CIRCUIT FOR OPEN CIRCUIT**

Measure the resistance between the ECM connector PI01, pin 48 (YG) and clockspring connector SW08, pin 06 (YG).

Is the resistance greater than 5 ohms?
Yes
REPAIR the circuit between ECM connector PI01, pin 48 (YG) and clockspring connector SW08, pin 06 (YG). For additional information, refer to the wiring diagrams. TEST the system for normal operation.
No
INSTALL a new speed control switch assembly.
REFER to: Speed Control Switch (310-03 Speed Control, Removal and Installation).
TEST the system for normal operation.

**PINPOINT TEST J : BRAKE CANCEL SWITCH CIRCUIT TEST**

CAUTION: When probing connectors to take measurements in the course of the pinpoint tests, use the adaptor kit, part number 3548-1358-00.

* NOTE: When performing electrical voltage or resistance tests, always use a digital multimeter (DMM) accurate to 3 decimal places, and with an up-to-date calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
</table>

**J1: CHECK THE BRAKE CANCEL SWITCH CIRCUIT FOR OPEN**

1. Disconnect the battery negative terminal.
2. Disconnect the ECM connector PI01.
3. Reconnect the battery negative terminal.
4. Turn the ignition switch to the ON position.
5. Measure the voltage between the ECM connector PI01, pin 09 (U) and GROUND.

Is the voltage less than 12 volts?
Yes
GO to J3.
No
GO to J2.

**J2: CHECK THE BRAKE CANCEL SWITCH FUNCTION**

Does the voltage drop to zero with the brake pedal pressed?
Yes
No fault is indicated with the brake cancel switch or circuit. To continue the diagnostics, return to the Symptom Chart.
No
INSTALL a new brake cancel switch.
REFER to: Speed Control Deactivator Switch (310-03 Speed Control, Removal and Installation).
TEST the system for normal operation.

**J3: CHECK THE VOLTAGE TO THE BRAKE CANCEL SWITCH**

1. Disconnect the brake cancel switch connector SW08.
2. Measure the voltage between the brake cancel connector SW08, pin 01 (WG) and GROUND.

Is the voltage less than 10 volts?
Yes
REPAIR the circuit between the brake cancel switch connector SW08, pin 01 (WG) and splice ECS12. For additional information, refer to the wiring diagrams. TEST the system for normal operation.
No
GO to J4.

**J4: CHECK THE BRAKE CANCEL SWITCH CIRCUIT FOR OPEN CIRCUIT**

1. Turn the ignition switch to the OFF position.
2. Measure the resistance between the ECM connector PI01, pin 09 (U) and brake cancel switch connector CR77, pin 02 (U).

Is the resistance greater than 5 ohms?
Yes
REPAIR the circuit between the ECM connector PI01, pin 09 (U) and the brake cancel switch connector CR77, pin 02 (U). For additional information, refer to the wiring diagrams. TEST the system for normal operation.
No
INSTALL a new brake cancel switch.
REFER to: Speed Control Deactivator Switch (310-03 Speed Control, Removal and Installation).
TEST the system for normal operation.
### Speed Control - Speed Control Module Alignment

**General Procedures**

<table>
<thead>
<tr>
<th>Special Tool(s)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Inclinometer</td>
</tr>
<tr>
<td>501-F007</td>
</tr>
</tbody>
</table>

**E3164**

- **NOTE:** Make sure the vehicle is positioned on level ground such as the headlamp alignment area.

1. Remove the left-hand front bumper access cover.
2. Using the special tool, check the speed control module vertical levelling.

3. Level the speed control module.
   - Rotate the speed control module levelling bolt to achieve a reading of zero degrees ± 0.75°.

4. Using the special tool, check the speed control module vertical levelling.

5. Install the left-hand front bumper access cover.
6. Carry out the speed control module calibration procedure. For further information, refer to the Jaguar approved diagnostic system.
Speed Control - Speed Control Deactivator Switch
Removal and Installation

**Removal**

1. Remove the driver side instrument panel lower panel.

2. Reposition the driver seat to its maximum rearward position.

3. Remove the speed control deactivator switch.
   1. Disconnect the speed control deactivator switch electrical connector.
   2. Remove the speed control deactivator switch.

**Installation**

1. To install, reverse the removal procedure.
   - Operate the brake pedal to allow the speed control deactivator switch to remain in the fully extended position during installation.
   - Releasing and then pulling back on the pedal until the pedal reaches the stop in the brake booster, will adjust the speed control de-activator switch plunger to the required setting.
Speed Control - Speed Control Module
Removal and Installation

Removal

1. ▶️ CAUTION: Electronic modules are sensitive to static electrical charges. If exposed to these charges, damage may result.

   • NOTE: Make sure the audio unit keycode is available before disconnecting the battery ground cable.

   Disconnect the battery ground cable.

   For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

2. Remove the driver side instrument panel lower trim.

3. Disconnect the speed control module electrical connector.

4. Remove the speed control module.
   - Remove the speed control module retaining nuts.

Installation

1. Install the speed control module.
   - Tighten to 5 Nm.
2. Connect the speed control module electrical connector.

3. Install the driver side instrument panel lower trim.

4. Connect the battery ground cable.
   For additional information, refer to: Battery Connect (414-01 Battery, Mounting and Cables, General Procedures).

5. Using the approved Jaguar diagnostic system configure the speed control module.
Speed Control - Speed Control Sensor
Removal and Installation

Removal

1. Disconnect the battery ground cable. For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

2. Remove the radiator splash shield. For additional information, refer to: Radiator Splash Shield (501-02 Front End Body Panels, Removal and Installation).

3. Disconnect the speed control sensor electrical connector.

4. Remove the left-hand front bumper access cover.

5. Remove the speed control sensor.
   - Remove the bolts.

6. Remove the speed control sensor retaining bracket.
   - Remove the nuts.

Installation

1. Adjust the speed control sensor levelling bolt shoulder to mounting bracket clearance to 4.5 mm.
2. Install the speed control sensor.
   - Tighten to 5 Nm.

3. Connect the speed control sensor electrical connector.

4. Install the radiator splash shield.
   For additional information, refer to: Radiator Splash Shield (501-02 Front End Body Panels, Removal and Installation).

5. Connect the battery ground cable.
   For additional information, refer to: Battery Connect (414-01 Battery, Mounting and Cables, General Procedures).

6. Check and adjust the speed control sensor levelling.
   For additional information, refer to: Speed Control Module Alignment (310-03 Speed Control, General Procedures).

7. Install the left-hand front bumper access cover.
Speed Control - Speed Control Switch
Removal and Installation

Removal

1. Remove the driver airbag module. For additional information refer to Section 501-20A Safety Belt System Section 501-20B Supplemental Restraint System

2. Disconnect the speed control switch electrical connector.

3. Remove the speed control switch

Installation

1. To install, reverse the removal procedure.
   - Tighten to 2 Nm.

Climate Control System - General Information - Climate Control System
Description and Operation

The purpose of the air distribution system is to route air to the designated registers. This is accomplished when air enters the plenum and is directed to the desired ducts by the use of air distribution doors.

The air distribution system contains the heater core and evaporator core, blower motor and distribution doors. All of the air is mixed and distributed from the plenum assembly depending on the distribution door positions.

For additional information, refer to: Air Distribution and Filtering (412-01 Air Distribution and Filtering, Description and Operation).

Heating/Defrosting

The heating system is a water valve controlled system. The ambient air is passed through the cabin air filter, directed through and/or around the heater core and evaporator core, mixed and distributed from the plenum assembly to the floor, panel and/or the defrost ducts as desired.

For additional information, refer to: Heating and Ventilation (412-02A Heating and Ventilation, Description and Operation).

Auxiliary Heater - Vehicles with Diesel engine

The system consists of a fuel operated heater unit and a fuel dosing pump.

Fuel for the heater system is taken from the vehicle fuel tank, through a line attached to the fuel pump module. Fuel is drawn from the fuel tank by a lift pump and supplied via the dosing pump to the heater unit. In the heater unit, the fuel delivered by the fuel pump is burned and the resultant heat output is used to heat the engine coolant.

An electronic control unit (ECU) integrated into the heater unit controls the operation of the heater unit and the dosing pump. The climate control unit controls the operation of the re-circulation flaps on initial start up.

For additional information, refer to: Auxiliary Heater (412-02B Auxiliary Heating, Description and Operation).

Heater Core and Evaporator core

The heater core consists of a number of fins and tubes in an arrangement to extract heat from the engine coolant and transfer the heat to the air that passes through the heater core. The evaporator core is a plate/fin type arrangement.

For additional information, refer to: Air Conditioning (412-03 Air Conditioning, Description and Operation).

Air Conditioning Line Peanut Fitting

Peanut Fitting Assembly

<table>
<thead>
<tr>
<th>Item</th>
<th>Part Number</th>
<th>Description</th>
</tr>
</thead>
</table>
| 1    | -           | Female air conditioning line.
| 2    | -           | Stud.                        |
| 3    | -           | Male air conditioning line.  |
| 4    | -           | Retaining nut.               |
| 5    | -           | O-ring seal.                 |

The connections between the air conditioning (A/C) condensor core/receiver drier and the connections between the lines use peanut fittings.

- The male and female line of the peanut fitting are retained with a nut.
- An O-ring seal is installed around the tube on the male line.
- The female line is welded to the tube and is not adjustable.
- Support the female line with a wrench to prevent the twisting of the tubes.
- The male line will pivot around the tube to allow for alignment with the female line during assembly.
- When correctly assembled, the mating surfaces of the male and female fittings should be flush.

Blower motor

The brushless blower motor pulls air from the air inlet and forces it into the plenum assembly where it is mixed and distributed. The blower motor has seven speeds (vehicles with telematics have eleven speeds) and is controlled by the climate control assembly.

Air conditioning refrigerant

The R-134a air conditioning system uses a hydrofluorocarbon (HFC) non-CFC based refrigerant. R-134a requires the use of Jaguar compressor oil or equivalent meeting Jaguar specification. Do not use R-12 tools and equipment when repairing an R-134a system unless specified in the workshop manual. Never mix R-12 and R-134a refrigerants and oils. They are not compatible.

Air Conditioning (A/C) System

The air conditioning (A/C) system is a multi-piece, single case design, with an integral blower motor. The system allows the operator to...
control the temperature by delivering heated or cooled air to maintain a constant temperature. In addition, during A/C operation, it reduces the relative humidity of air inside the vehicle. Controls are provided to adjust the temperature and system functions, including blower motor speeds for desired airflow. Ambient air is passed through during all system operations except for MAX A/C cooling (when recirculated air is used) and OFF.

For additional information, refer to: Air Conditioning (412-03 Air Conditioning, Description and Operation).

**Control System Inputs**

The climate control system inputs can be selected from the climate control assembly which offers either AUTO or manual control (MODE).

**Control System Outputs**

The air inlet, air distribution and air temperature blend doors are all controlled by electronic actuators.

For additional information, refer to: Control Components (412-04 Control Components, Description and Operation).
Climate Control System - General Information - Climate Control System

Diagnosis and Testing

- NOTE: All air conditioning (A/C) related tests should be run in an ambient temperature of at least 10°C (50°F).

1. Verify the customer concern by operating the system.
2. Visually inspect for obvious signs of mechanical or electrical damage.
3. Listen for any unusual noises during climate control system operation.
4. Inspect the air conditioning (A/C) system with an ultraviolet (UV) lamp for traces of UV sensitive leak trace dye.

### Visual Inspection Chart

5. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
6. If the cause is not visually evident, verify the symptom and refer to the Jaguar Approved Diagnostic System.
1. WARNINGS:

⚠️ Use extreme care and observe all safety precautions related to the use of refrigerants. Due to refrigerant hazards, always wear safety goggles and non-penetrable gloves when working on or flushing air conditioning (A/C) systems. Failure to follow this instruction may result in personal injury.

⚠️ When flushing the A/C system, refer to the manufacturers equipment instructions for additional information. Failure to do so may result in system damage or personal injury.

⚠️ The A/C refrigerant analyzer must be used before the recovery of any vehicle's A/C refrigerant. Failure to do so puts shop bulk refrigerant at risk of contamination. If the vehicle A/C refrigerant is contaminated, refer the customer to return to the repair facility that performed the last A/C repair. If the customer wishes to pay the additional cost, use the A/C recovery equipment that is designated for recovering contaminated A/C refrigerant. All contaminated A/C refrigerant must be disposed of as hazardous waste. For additional information, refer to the manufacturers equipment instructions. Failure to follow this instruction may result in personal injury.

⚠️ Prior to using the A/C flushing equipment for the first time, follow the operating instructions. Failure to follow this instruction may result in personal injury.

⚠️ CAUTION: Prior to flushing, remove and discard the desiccant sack. Depending on the equipment used, other A/C components may have to be removed prior to flushing. For additional information, refer to the manufacturers equipment instructions before flushing the A/C system.

Recover the refrigerant.
For additional information, refer to Air conditioning (A/C) System Recovery, Evacuation and Charging in this section.

2. Remove the desiccant sack.
For additional information, refer to Section 412-03 Air Conditioning.

3. Flush the system. For additional information, refer to the manufacturers equipment instructions.

4. Install new refrigerant lines if blocked with debris.

5. Install a new desiccant sack.
For additional information, refer to Section 412-03 Air Conditioning.

6. Add the required amount of oil to the A/C system depending on the repair procedure.
For additional information, refer to Refrigerant Oil Adding in this section.

7. Evacuate and charge the A/C system.
For additional information, refer to Air conditioning (A/C) System Recovery, Evacuation and Charging in this section.

8. Carry out fluorescent dye leak detection test.
For additional information, refer to Fluorescent Dye Leak Detection in this section.

9. Check the A/C system for correct operation.
All vehicles

1. **WARNING:** Jaguar Cars Limited. recommend the use of a charging station to carry out recover, evacuation and charging of the refrigerant system. Follow the manufacturers equipment procedures and instructions. Failure to follow this instruction may result in personal injury.

• **CAUTIONS:**

   - The air conditioning (A/C) refrigerant analyzer must be used before the recovery of any vehicle’s A/C refrigerant. Failure to do so puts shop bulk refrigerant at risk of contamination. If the vehicle A/C refrigerant is contaminated, refer the customer to return to the repair facility that carried out the last A/C repair. If the customer wishes to pay the additional cost, use the A/C recovery equipment that is designated for recovering contaminated A/C refrigerant. All contaminated A/C refrigerant must be disposed of as hazardous waste. For all equipment, follow the manufacturers equipment procedures and instructions. Failure to follow this instruction may result in personal injury.

   - Do not add R-12 refrigerant to an A/C system that requires the use of R-134a refrigerant. These two types of refrigerant should never be mixed. Doing so may cause damage to the A/C system.

   - Connect the charging station. For additional information, refer to the manufacturers equipment instructions.

2. Recover the refrigerant. For additional information, refer to the manufacturers equipment instructions.

3. Carry out the required repair procedure.

4. Add the required amount of oil to the A/C system depending on the repair procedure. For additional information, refer to: [Refrigerant Oil Adding](#).

5. Evacuate the A/C system. For additional information, refer to the manufacturers equipment instructions.

6. Check the A/C system for a sufficient vacuum. For additional information, refer to the manufacturers equipment instructions.

All except vehicles with diesel engine

7. Charge the A/C system with 750 grams of refrigerant.

Vehicles with diesel engine

8. Charge the A/C system with 700 grams of refrigerant.

All vehicles

9. Check the A/C system for correct operation.

10. Carry out fluorescent dye leak detection test. For additional information, refer to: [Fluorescent Dye Leak Detection](#).

For additional information, refer to: [Refrigerant Oil Adding](#) and [Fluorescent Dye Leak Detection](#).
1. If contaminated refrigerant is detected DO NOT recover the refrigerant into your R-134a OR R-12 recovery/recycling equipment. Take the follow actions:

1. Repeat the test to verify contaminated refrigerant is present.

2. Advise the customer of the contaminated A/C system and any additional cost to repair the system. The customer may wish to return to the repair facility performing the last A/C repair.

3. Recover the contaminated refrigerant using suitable recovery only equipment designed for capturing and storing contaminated refrigerant. This equipment must only be used to recover contaminated refrigerant to prevent the spread to other vehicles. As an alternative, contact an A/C repair facility in your area with the proper equipment to perform the repair.

4. On completion of the recovery of the contaminated refrigerant, it will be necessary to carry out the A/C system flushing procedure. For additional information, refer to Air Conditioning (AC) System Flushing in this section.
General Procedures

1. **WARNING:** Good ventilation is necessary in the area where A/C leak testing is to be carried out. If the surrounding air is contaminated with refrigerant gas, the leak detector will indicate this gas all the time. Odors from other chemicals such as antifreeze, diesel fuel, disc brake cleaner, or other cleaning solvents can cause the same problem. A fan, even in a well ventilated area, is very helpful in removing small traces of contamination from the air that might affect the leak detector. Failure to follow this instruction may result in personal injury.

   Attach an R-134a manifold gauge set or use a UL-approved recovery/recycling device such as an R-134a A/C refrigerant center (which meets SAE Standard J 1991). For additional information, refer to the manufacturers equipment instructions.
   
   - Both gauges should indicate 413-551 kPa (60-80 psi) at 24°C (75°F) with the engine off.
   - If little or no pressure is indicated, carry out the air conditioning (A/C) system recovery, evacuation and charging procedure. For additional information, refer to Air Conditioning (AC) System Recovery, Evacuation and Charging in this section.

2. Use an R134a Automatic calibration halogen leak detector to leak test the refrigerant system. For additional information, refer to the manufacturers equipment instructions.

3. If a leak is found, carry out the air conditioning (A/C) system recovery procedure. For additional information, refer to Air Conditioning (AC) System Recovery, Evacuation and Charging in this section.
1. **WARNING:** Eye protection glasses supplied with the ultraviolet (UV) lamp should be used to protect eyesight from harm.

- **NOTE:** The air conditioning (A/C) system has an R-134a leak trace dye wafer incorporated into the desiccant bag. The exact location of leaks can be pinpointed by the bright yellow/green glow of the tracer dye. Since more than one leak may exist, always inspect each component. If it is necessary to add dye (due to a severe leakage for example) use proprietary tracer dye injection equipment.

   Check for leaks using ultraviolet (UV) lamp.

2. Check all components, fittings and lines of the A/C system.

3. Carry out the repair. For additional information, refer to Section 412-03 Air Conditioning.

4. After the leak is repaired, remove any traces of leak trace dye with a general purpose oil solvent.

5. Check the A/C system for correct operation.

6. Verify the repair by operating the system for a short time and inspecting with the (UV) lamp.
1. Check for leaks using ultraviolet (UV) Lamp. For additional information, refer to Fluorescent Dye Leak Detection in this section.

2. NOTE: Any time a hose or component connection leak is observed, the component and fitting must be separated, cleaned and a new O-ring fitted and lubricated with air conditioning compressor oil. For additional information, refer to Specifications in this section.

• NOTE: When separating A/C joints, cap the open connections immediately. Do not leave open to atmosphere.

O-ring seal surfaces must be free of dirt, lint, burrs and scratches. The O-ring and connector should be lubricated with air conditioning compressor oil.

For additional information, refer to Specifications in this section.
1. WARNINGS:

⚠️ Use extreme care and observe all safety precautions related to the use of refrigerants. Failure to follow this instruction may result in personal injury.

⚠️ For additional information, refer to the manufacturers equipment instructions. Failure to follow this instruction may result in personal injury and system damage.

   Install the manifold gauge set. For additional information, refer to the manufacturers equipment instructions.

2. Carry out the repair.

3. Remove the manifold gauge set. For additional information, refer to the manufacturers equipment instructions.

4. Carry out fluorescent dye leak detection test. For additional information, refer to Flourescent Dye Leak Detection in this section.

5. Check air conditioning (A/C) system for correct operation.
Climate Control System - General Information - Refrigerant Oil Adding

General Procedures

• NOTE: When separating air conditioning (A/C) connections, cap the open connections immediately. Do not leave open to the atmosphere.

   • When replacing components of the air conditioning refrigerant system, add oil to the replacement components. For additional information, refer to Specifications in this section.
   • If evidence of a leak is found, source of the leak is to be rectified.
1. WARNINGS:

Use extreme care and observe all safety precautions related to the use of refrigerants. Failure to follow this instruction may result in personal injury.

The A/C refrigerant analyzer must be used before the recovery of any vehicle's A/C refrigerant. Failure to do so puts shop bulk refrigerant at risk of contamination. If the vehicle A/C refrigerant is contaminated, refer the customer to return to the repair facility that carried out the last A/C repair. If the customer wishes to pay the additional cost, use the A/C recovery equipment that is designated for recovering contaminated A/C refrigerant. All contaminated A/C refrigerant must be disposed of as hazardous waste. For all equipment, follow the equipment manufacturers procedures and instructions. Failure to follow this instruction may result in personal injury.

• NOTE: Jaguar Cars Ltd. supports the efficient usage, recovery and recycling of the refrigerant used in passenger car air conditioners. Jaguar Cars Ltd. recommends the use of UL-approved recovery/recycling device such as R-134a A/C refrigerant center (which meets SAE Standard J 1991) during any A/C system repair and recharge procedure which requires that the system be evacuated.

Use R-134a A/C Refrigerant Centre to evacuate and recover the A/C system.

• Follow the equipment manufactures procedures and instructions for use of equipment.
## Air Distribution and Filtering -

The purpose of the air distribution system is to route air to the designated registers. This is accomplished when ambient air enters the plenum through the cabin air filter and is routed to the desired outlets by use of distribution doors.

The cabin air filter is a combination particulate and odour filter.

The air distribution system contains the heater core and evaporator core, blower motor and distribution doors. All of the air is mixed and distributed from the plenum assembly depending on the distribution door positions.

Air ducts direct air to the registers depending on the specific request from the climate control assembly. For additional information, refer to Section 412-04 Control Components.
Air Distribution and Filtering - Air Distribution and Filtering

Diagnosis and Testing

For additional information, refer to Section 412-00 Climate Control System - General Information
Air Distribution and Filtering - Cabin Air Filter

Removal

1. Remove the cowl vent screen.  
   For additional information, refer to Section 501-02 Front End Body Panels.

2. Open the cabin air filter housing cover.
   - Detach the retaining tangs

3. Remove the cabin air filter.

Installation

1. NOTE: Make sure the new cabin air filter is fitted correctly, with the air flow markings on the cabin air filter showing the direction of air flow.

   To install, reverse the removal procedure.
Air Distribution and Filtering - Center Registers

Removal

1. **CAUTION:** Make sure damage does not occur to the instrument panel finish panel.
   
   Remove the instrument panel finish panel.

2. Remove the center registers.

Installation

1. To install, reverse the removal procedure.
Air Distribution and Filtering - Driver Side Register

Removal

1. **CAUTION:** Make sure damage does not occur to the instrument panel finish panel.
   - Remove the instrument panel finish panel.

2. Remove the instrument cluster finish panel.
   - 1. Remove the retaining screws.
   - 2. Remove the instrument cluster finish panel.

3. Remove the driver side register.

Installation

1. To install, reverse the removal procedure.
### Removal

1. Lower and extend the steering column to its maximum rearward position.
2. Remove the instrument cluster. For additional information, refer to Section [413-01 Instrument Cluster].
3. Remove the driver side register.

4. Remove the driver side register duct retaining screw.

5. Detach the driver side register duct.
   1. Release the driver side register duct from the instrument panel.
   2. Detach the driver side register duct.

6. Remove the driver side register duct.

### Installation
1. To install, reverse the removal procedure.
   - Tighten to 3Nm.
Removal

1. Remove the floor console. For additional information, refer to Section 501-12 Instrument Panel and Console.
2. Release the floor console register duct retaining tangs.
3. Remove the floor console register duct.

Installation

1. To install, reverse the removal procedure.
**Removal**

1. Remove the driver side instrument panel lower trim panel.

2. Remove the front footwell duct left-hand retaining bolt.

3. Remove the front footwell duct left-hand.
   1. Detach footwell lamp from the front footwell duct left-hand.
   2. Remove the front footwell duct left-hand.

**Installation**

1. To install, reverse the removal procedure.
   - Tighten to 3Nm.
Air Distribution and Filtering - Front Footwell Duct RH
Removal and Installation

Removal

1. Remove the passenger side instrument panel lower trim panel.

2. Remove the front footwell duct right-hand retaining bolt.

3. Remove the front footwell duct right-hand.
   1. Detach the footwell lamp from the front footwell duct right-hand.
   2. Remove the front footwell duct right-hand.

Installation

1. To install, reverse the removal procedure.
   - Tighten to 3Nm.
Air Distribution and Filtering - Passenger Side Register
Removal and Installation

Removal

1. **CAUTION:** Make sure damage does not occur to the instrument panel finish panel.
   Remove the instrument panel finish panel.

2. **CAUTION:** Make sure damage does not occur to the air bag module finish panel.
   Remove the passenger air bag module finish panel.

3. Remove the passenger side register.
   1. Remove the passenger side register retaining screws
   2. Remove the passenger side register.

Installation

1. To install, reverse the removal procedure.
Removal

1. Remove the passenger air bag module. For additional information, refer to Section 501-20A Safety Belt System / 501-20B Supplemental Restraint System.
2. Remove the passenger side register.
   1. Remove the passenger side register retaining screws
   2. Remove the passenger side register.
3. Remove the passenger side register duct retaining screw.
4. Detach passenger side register duct.
   1. Reposition the passenger air bag module electrical harness.
   2. Release the passenger side register duct from the instrument panel.
   3. Detach passenger side register duct.
5. Remove the passenger side register duct.

Installation
1. To install, reverse the removal procedure.
   - Tighten to 3Nm.
Air Distribution and Filtering - Rear Footwell Duct

Removal

1. Remove the instrument panel.
   For additional information, refer to Section 501-12 Instrument Panel and Console.

2. Remove the front seat.
   For additional information, refer to Section 501-10 Seating.

3. Detach the rear footwell duct.
   - Remove the rear footwell duct retaining clips.

4. **CAUTION:** Make sure damage does not occur to the floor covering.
   Reposition the floor covering to access the rear floor duct.

5. Remove the rear footwell duct.
   1. Remove the rear footwell duct retaining clips.
   2. Remove the rear footwell duct.

Installation

1. To install, reverse the removal procedure.

Heating and Ventilation - Heating and Ventilation
Description and Operation

The heating and defrosting system:

- controls the vehicle air temperature and, during air conditioning (A/C) operation, reduces the relative humidity of the air inside the vehicle.
- delivers heated or cooled air to maintain the vehicle interior temperature and comfort level.
- controls the brushless blower motor speed.
- allows temperature to be adjusted individually by the driver and the passenger to maintain comfort.
- uses a reheat method to provide conditioned air to the passenger compartment. All airflow from the blower motor passes through the A/C evaporator core. Temperature is regulated by reheating a portion of the air and blending it with the remaining cool air to achieve the desired temperature.
- blends the air temperature by regulating the flow of engine coolant to separate halves of the heater core. A dual coolant flow valve is used to control the flow of coolant.

The blower motor draws ambient air through the cabin air filter during all system operations except for MAX A/C cooling (when recirculated air is used) and OFF. For additional information, refer to Section 412-03 Air Conditioning.

Heater core

The heater core consists of fins and tubes arranged to extract heat from the engine coolant and transfer it to the air passing through the heater core. The heater core is separated into two sections. Air passing through one section is directed to the driver side of the vehicle, while air passing through the other section is directed to the passenger side of the vehicle. The heater core has separate inlet ports with a common outlet port.
Dual coolant control valve

The dual coolant valve regulates the flow of engine coolant to each half of the heater core. Two electric solenoids, which are individually actuated by the heater control module, are the control elements. The valve contains three ports:

- inlet port - coolant from the engine
- outlet port - coolant to driver side of heater core
- outlet port - coolant to passenger side of heater core

Auxiliary coolant flow pump vehicles fitted with 4.2L engine

The auxiliary coolant flow pump is electrically driven and provides increased coolant flow during low engine speed operation. The pump is also used to circulate coolant after the engine is turned off under certain conditions.

Blower motor

The brushless blower motor pulls air from the air inlet and forces it into the plenum assembly where it is mixed and distributed. The blower motor has eleven speeds (vehicles with telematics have seven speeds) and is controlled by the climate control assembly.
Heating and Ventilation - Heating and Ventilation

Diagnosis and Testing

REFER to Section 412-00 Climate Control System - General Information.
Removal

1. Remove the air deflector.
   For additional information, refer to: Air Deflector (501-02 Front End Body Panels, Removal and Installation).

2. Disconnect the auxiliary coolant flow pump electrical connector.

3. NOTE: Using a suitable tool, clamp the hose to minimize coolant loss.
   Detach the lower coolant hose.

4. NOTE: Using a suitable tool, clamp the hose to minimize coolant loss.
   Detach the upper coolant hose.

5. Remove the auxiliary coolant flow pump.

Installation
1. Install the auxiliary coolant flow pump.

2. Attach the upper coolant hose.
   - Remove the pipe clamp.

3. Attach the lower coolant hose.
   - Remove the pipe clamp.

4. Connect the auxiliary coolant flow pump electrical connector.

5. Remove the coolant expansion tank pressure cap.

6. Fill the cooling system up to the MAX mark on the coolant expansion tank using a fifty percent mixture of Jaguar premium cooling system fluid or equivalent, meeting Jaguar specification WSS M97B44-D and fifty percent water.

7. Install the coolant expansion tank pressure cap.

8. START and RUN the engine.

9. Set the heating system to MAX heat, the blower motor to MAX speed and the air distribution to instrument panel registers.

10. **CAUTION:** Observe the engine temperature gauge. If the engine starts to over-heat switch off immediately and allow to cool. Failure to follow this instruction may result in damage to the vehicle.

    Allow the engine to RUN until hot air is emitted from the instrument...
panel registers, while observing the engine temperature gauge.

11. Switch off the engine.

12. Allow the engine to cool.

13. **WARNING:** Never remove the coolant pressure cap under any circumstances while the engine is operating. Failure to follow this instruction may result in personal injury. To avoid having scalding hot coolant or steam blow out of the cooling system, use extreme care when removing the coolant pressure cap from a hot cooling system. Wait until the engine has cooled, then wrap a thick cloth around the coolant pressure cap and turn it slowly until the pressure begins to release. Step back while the pressure is released from the system. When certain all the pressure has been released (still with a cloth) turn and remove the coolant pressure cap from the coolant expansion tank. Failure to follow these instructions may result in personal injury.

Release the cooling system pressure.

- Remove the coolant expansion tank pressure cap.

14. Fill the cooling system up to the MAX mark on the coolant expansion tank using a fifty percent mixture of Jaguar premium cooling system fluid or equivalent, meeting Jaguar specification WSS M97B44-D and fifty percent water.

15. Install the coolant expansion tank pressure cap.

16. Raise the vehicle.

17. Check for water leaks.

18. Install the air deflector.

For additional information, refer to: Air Deflector (501-02 Front End Body Panels, Removal and Installation).
Removal

1. Carry out the cooling system drain procedure. For additional information, refer to Section 303-03A Engine Cooling / 303-03B Supercharger Cooling / 303-03C Engine Cooling.

2. Remove the radiator upper hose.

3. Detach the thermostat housing lower hose.

4. Disconnect the coolant expansion tank lower hose.

5. Disconnect the heater hose.
6. Detach the auxiliary coolant flow pump.
   1. Remove the retaining bolts.
   2. Detach the auxiliary coolant flow pump.

7. Remove the auxiliary coolant flow pump and hoses.
   1. Disconnect the electrical connector.
   2. Remove the auxiliary coolant flow pump and hoses.

8. Remove the auxiliary coolant flow pump hoses.

9. Remove the auxiliary coolant flow pump retaining bracket.

Installation
1. To install, reverse the removal procedure.
   - Tighten to 10 Nm.

2. Carry out the cooling system filling and bleeding procedure. For additional information, refer to Section 303-03A Engine Cooling / 303-03B Supercharger Cooling / 303-03C Engine Cooling.
Removal

1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 Battery, Mounting and Cables.
2. Remove the passenger side instrument panel closing panel.

3. Remove the blower motor.
   1. Disconnect the electrical connector.
   2. Remove the blower motor.

Installation

1. To install, reverse the removal procedure.
Removal

All vehicles

1. Drain the cooling system. For additional information, refer to Section 303-03A Engine Cooling / 303-03B Supercharger Cooling / 303-03C Engine Cooling.
2. Remove the wheel and tire assembly.
3. Remove the fender splash shield.
4. Remove the air deflector.
5. Remove the drive belt splash shield.
6. Disconnect the dual coolant flow valve bottom hose.

For vehicles fitted with 4.2L engine

7. Remove the radiator upper hose.

All vehicles

8. Disconnect the dual coolant flow valve electrical connector.

9. Disconnect the heater hose couplings.
10. Disconnect the auxiliary coolant flow pump electrical connector.

11. Remove the dual coolant flow valve.
   1. Remove the retaining bolt.
   2. Remove the dual coolant flow valve.

12. Remove the dual coolant flow valve hoses.

**Installation**

1. To install, reverse the removal procedure.
   - Tighten to 10 Nm.
Removal

1. Remove the radiator splash shield. For additional information, refer to: Radiator Splash Shield (501-02 Front End Body Panels, Removal and Installation).

2. NOTE: Using a suitable tool, clamp the hose to minimise coolant loss.
   Detach the heater box return hose.

3. NOTE: Using a suitable tool, clamp the hose to minimise coolant loss.
   Detach the heater box supply hoses.

4. NOTE: Using a suitable tool, clamp the hose to minimise coolant loss.
   Detach the auxiliary heater supply and return hoses.

5. Detach the dual coolant flow valve.
   • Remove the dual coolant flow valve bracket retaining bolt.
6. Remove the dual coolant flow valve.
   - Disconnect the dual coolant flow valve electrical connector.

**Installation**

1. Install the dual coolant flow valve.
   - Connect the dual coolant flow valve electrical connector.

2. Attach the dual coolant flow valve.
   - Tighten to 17 Nm.

3. Attach the auxiliary heater supply and return hoses.
   - Remove the pipe clamp.
4. Attach the heater box supply hoses.
   - Remove the pipe clamp.

5. Attach the heater box return hose.
   - Remove the pipe clamp.

6. Lower the vehicle.

7. Remove the coolant expansion tank pressure cap.

8. Fill the cooling system up to the MAX mark on the coolant expansion tank using a fifty percent mixture of Jaguar premium cooling system fluid or equivalent, meeting Jaguar specification WSS M97B44-D and fifty percent water.

9. Install the coolant expansion tank pressure cap.

10. START and RUN the engine.

11. Set the heating system to MAX heat, the blower motor to MAX speed and the air distribution to instrument panel registers.

12. **CAUTION:** Observe the engine temperature gauge. If the engine starts to over-heat switch off immediately and allow to cool. Failure to follow this instruction may result in damage to the vehicle.

   Allow the engine to RUN until hot air is emitted from the instrument panel registers, while observing the engine temperature gauge.

13. Switch off the engine.

14. Allow the engine to cool.

15. **WARNING:** Never remove the coolant pressure cap under any circumstances while the engine is operating. Failure to follow this instruction may result in personal injury. To avoid having scalding hot coolant or steam blow out of the cooling system, use extreme care when removing the coolant pressure cap from a hot cooling system. Wait until the engine has cooled, then wrap a thick cloth around the coolant pressure cap and turn it slowly until the pressure begins to release. Step back while the pressure is released from the system. When certain all the pressure has been released (still with a cloth) turn and remove the coolant pressure cap from the coolant expansion tank. Failure to follow these instructions may result in personal injury.

   Release the cooling system pressure.
   - Remove the coolant expansion tank pressure cap.

16. Fill the cooling system up to the MAX mark on the coolant expansion tank using a fifty percent mixture of Jaguar premium cooling system fluid or equivalent, meeting Jaguar specification WSS M97B44-D and fifty percent water.

17. Install the coolant expansion tank pressure cap.

18. Raise the vehicle.

19. Check for water leaks.

20. Install the radiator splash shield.

For additional information, refer to: **Radiator Splash Shield** (501-02 Front End Body Panels, Removal and Installation).
Heating and Ventilation - Heater Core and Evaporator Core Housing
Removal and Installation

All vehicles

1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 Battery, Mounting and Cables.

2. Carry out the air conditioning recovery procedure. For additional information, refer to Section 412-00 Climate Control System – General Information.

Right-hand drive vehicles without supercharger

3. Remove the heater hose. For additional information, refer to Heater Hose in this section.

Left-hand drive vehicles and vehicles with supercharger

4. Drain the cooling system. For additional information, refer to Section 303-03A Engine Cooling / 303-03B Supercharger Cooling / 303-03C Engine Cooling.

5. Disconnect the heater hoses from the heater core and evaporator core housing.

Vehicles with supercharger

6. Remove the throttle body. For additional information, refer to Section 303-04A Fuel Charging and Controls / 303-04B Fuel Charing and Controls / 303-04C Fuel Charging and Controls / 303-04D Fuel Charing and Controls – Turbocharger.

All vehicles

7. NOTE: Cap the air conditioning ports.

Disconnect the expansion valve manifold and tube assembly.

- Remove and discard the O-ring seals.
8. Remove the heater core and evaporator core housing retaining nut.

9. Remove the heater core and evaporator core housing retaining nut.
10. Remove the heater core and evaporator core housing retaining nut.

11. Remove the instrument panel. For additional information, refer to Section 501-12 Instrument Panel and Console.

12. Detach the rear footwell ducts.
   - Remove the pin-type retainers.
   - Detach the rear footwell ducts.

13. Remove the engine control module (ECM) retaining bracket.

14. Remove the heater core and evaporator core housing retaining bolt.
15. Disconnect the heater core and evaporator core housing electrical connector.

16. NOTE: The heater core and evaporator core housing will still contain coolant. Protect the interior of the vehicle from any spillages.

Remove the heater core and evaporator core housing.

**Installation**

All vehicles

1. Install the heater core and evaporator core housing.
2. Connect the heater core and evaporator core housing electrical connector.

3. Install the heater core and evaporator core housing retaining bolt.
   - Tighten to 7 Nm.
4. Install the ECM retaining bracket.

5. Attach the rear footwell ducts.
   - Install the pin-type retainers.

6. Install the instrument panel.
   For additional information, refer to Section 501-12 Instrument Panel and Console.

7. Install the heater core and evaporator core housing retaining nut.
   - Tighten to 7 Nm.
8. Install the heater core and evaporator core housing retaining nut.
   • Tighten to 7 Nm.

9. Install the heater core and evaporator core housing retaining nut.
   Tighten to 7 Nm.

10. NOTE: Uncap the air conditioning ports.
    Connect the expansion valve manifold and tube assembly.
    • Install new O-ring seals.
    • Tighten to 8 Nm.

Vehicles with supercharger

11. Install the throttle body. For additional information, refer to Section

Left-hand drive vehicles and vehicles with supercharger
12. Connect the heater hoses to the heater core and evaporator core housing.

13. Carry out the cooling system filling and bleeding procedure. For additional information, refer to Section 303-03A Engine Cooling / 303-03B Supercharger Cooling / 303-03C Engine Cooling.

Right-hand drive vehicles without supercharger

14. Install the heater hose.
   For additional information, refer to Heater Hose in this section.

All vehicles

15. Carry out the air conditioning evacuation and charge procedure.
   For additional information, refer to Section 412-00 Climate Control System - General Information.

16. Connect the battery ground cable.
   For additional information, refer to Section 414-01 Battery, Mounting and Cables.
Removal

All vehicles

1. Carry out the cooling system drain procedure. For additional information, refer to Section 303-03A Engine Cooling / 303-03B Supercharger Cooling / 303-03C Engine Cooling.
2. Remove the cowl vent screen. For additional information, refer to Section 501-02 Front End Body Panels.
3. Remove the engine compartment support.

Right-hand drive vehicles

4. Detach the ground cable.

5. NOTE: Brake booster vacuum hose is attached to the induction manifold by a quick release coupling.

   Detach the brake booster vacuum hose from the induction manifold.
6. Disconnect the heater hose from the heater core.

Right-hand drive vehicles fitted with 2.5L and 3.0L engines.

7. Disconnect the engine breather hoses.

All vehicles

8. Disconnect the heater hose couplings.

9. Disconnect the heater hose.
10. Detach the heater hose assembly bracket.

11. Raise and support vehicle. For additional information, refer to Section 100-02 Jacking and Lifting.

12. Remove the heater hose assembly retaining bolt.

13. Lower the vehicle. Remove the heater hose assembly.

14. Remove the heater hose assembly.

**Installation**

1. To install, reverse the removal procedure.

2. Tighten to 7 Nm.

3. Tighten to 25 Nm.

4. Carry out the cooling system filling and bleeding procedure. For additional information, refer to Section 303-03A Engine Cooling / 303-03B Supercharger Cooling / 303-03C Engine Cooling.
1. Remove the heater core and evaporator core housing. For additional information, refer to [Heater core and evaporator core housing](#) in this section.

2. Remove the blower motor.
   1. Disconnect the electrical connector.
   2. Remove the blower motor.

3. Remove the heater core pipe retaining bracket.

4. Remove the blower motor housing.

5. Disconnect the air discharge temperature sensor.
6. Disconnect the cold air bypass blend door actuator.

7. Remove the thermostatic expansion valve insulation.

8. Remove the heater core and evaporator core housing retaining bolts.

9. Remove the heater core and evaporator core housing retaining bolts.

10. Remove the upper heater core and evaporator core housing.
    - Detach the retaining tang.

11. Remove the evaporator core.
    1. Remove the heater core.
    2. Remove the evaporator core.

**Assembly**
   1. To assemble, reverse the disassembly procedure.

Auxiliary Heating - Auxiliary Heater
Description and Operation

The system consists of a fuel operated heater unit and a fuel dosing pump.

Fuel for the heater system is taken from the vehicle fuel tank, through a fuel line attached to the fuel pump module. Fuel is drawn from the fuel tank by the dosing pump to the heater unit. In the heater unit, the fuel delivered by the fuel pump is burned and the resultant heat output is used to heat the engine coolant.

An electronic control module integrated into the heater unit controls the operation of the heater unit and the dosing pump. The climate control unit controls the operation of the re-circulation flaps on initial start up.

The auxiliary heater is located behind the left hand side of the front bumper and is accessed via the radiator splash shield.

The auxiliary heater operates in two stages. The system will only ever operate if the engine is running. The ambient temperature has to be below 10°C (50°F) and the coolant temperature has to be lower than 87°C (189°F) at the start of the journey.

The first stage will operate until the coolant temperature reaches 87°C (189°F), and it will then go to the second stage until the coolant temperature reaches 90°C (194°F). At this point the system will switch off. It will switch on again if the coolant temperature drops below 79°C (174°F).

The auxiliary heater will not operate if:

- the supply voltage is below 10.25V
- it is in 'fault lockout'
Auxiliary Heating - Auxiliary Heater
Diagnosis and Testing

1. For diagnosis and testing of the fuel-fired heater, REFER to: Fuel Fired Booster Heater (412-02B Auxiliary Heating, Diagnosis and Testing).
Auxiliary Heating - Fuel Fired Booster Heater
Diagnosis and Testing

Principles of operation

The auxiliary heater is a fuel-fired unit which can only operate when the engine is running, when the ambient temperature is below 10 degrees C (50 degrees F), and the coolant temperature is below 87 degrees C (189 degrees F) at the start of the journey.

There are two stages to the operation of the system:

Stage one (full power mode)

The system operates from cold until the coolant temperature reaches 87 degrees C (189 degrees F), when it switches to:

Stage two (half power mode)

The system operates from 87 degrees C (189 degrees F) until the coolant temperature reaches 90 degrees C (194 degrees F), at which point the system switches off.

The system will switch back on if the coolant temperature drops below 79 degrees C (174 degrees F).

The auxiliary heater will not operate if:

- The supply voltage is below 10.25 volts
- The system is in fault lock-out
- The fuel warning light is illuminated
- The coolant temperature is greater than 90 degrees
- The system does not receive a request from the climate control module

For additional information on the operation of the system. REFER to: Auxiliary Heater (412-02B Auxiliary Heating, Description and Operation).

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

<table>
<thead>
<tr>
<th>Mechanical</th>
<th>Electrical</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fuel supply</td>
<td>Fuses</td>

<td>Control module</td>
</tr>
<tr>
<td>Auxiliary heater fuel pump</td>
<td></td>
</tr>
</tbody>
</table>

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. A function check option is available using the Jaguar approved diagnostic system. Run this check before condemning any part of the system.

</table>
DTC | Description | Possible causes | Action
--- | --- | --- | ---
U1A00 | Bus communication fault | Network bus fault | REFER to: Communications Network - VIN Range: N13089->N99999 (418-00, Diagnosis and Testing).
U1A03 | Configuration mis-match | VID block incorrectly configured for vehicle | Reconfigure using the Jaguar approved diagnostic system.
U1A446C | Low fuel warning | Low fuel level detected | No action necessary. The auxiliary heater will not operate at low fuel levels. Refill with fuel, clear the DTC.

Pinpoint tests

**CAUTION:** When probing connectors to take measurements in the course of the pinpoint tests, use the adaptor kit, part number 3548-1358-00. Failure to follow this instruction may result in damage to the vehicle.

- **NOTE:** This section contains references to Parameter Identifiers (PIDs). Where the Jaguar approved diagnostic system is not available, a scantool may be used to access these PIDs, all of which give information, and some of which can be used to both read information and to activate components. The format of the information may vary, depending on the tool used.
- **NOTE:** When performing voltage or resistance tests, always use a digital multimeter (DMM) accurate to 3 decimal places, and with an up-to-date calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.
- **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.
- **NOTE:** If a DTC is detected, all DTCs must be cleared after the concern is repaired. Failure to clear all DTCs may cause driveability concerns.

Auxiliary Heating - Auxiliary Heater

Removal

1. Remove the fender splash shield.
   For additional information, refer to: Fender Splash Shield (501-02 Front End Body Panels, Removal and Installation).

2. Remove the radiator splash shield.

3. Using suitable hose clamping tools, clamp the fuel fired heater coolant hoses to minimise coolant loss.

4. Disconnect the fuel fired heater electrical connectors.

5. Disconnect the fuel fired heater fuel line.
6. Remove the fuel fired heater retaining nuts.

7. Detach the fuel fired heater.
   - Remove the fuel fired heater retaining bolt.

8. Remove the fuel fired heater.
   - Disconnect the coolant hoses.

**Installation**

1. Install the fuel fired heater.
   - Connect the coolant hoses.
2. Attach the fuel fired heater.
   - Install the fuel fired heater retaining bolt.

3. Install the fuel fired heater retaining nuts.

4. Connect the fuel fired heater fuel line.

5. Connect the fuel fired heater electrical connectors.

6. Remove the hose clamping tools.
7. Install the radiator splash shield.

8. Install the fender splash shield.
   For additional information, refer to: Fender Splash Shield (501-02 Front End Body Panels, Removal and Installation).

9. CAUTION: Do not RUN the engine with the coolant expansion tank pressure cap removed. Failure to follow this instruction may cause damage to the vehicle.
   START and RUN the engine.

10. SET the heating system to MAX heat, the blower motor to MAX speed and the air distribution to instrument panel registers.

11. CAUTION: Observe the engine temperature gauge. If the engine starts to over-heat switch off immediately and allow to cool. Failure to follow this instruction may cause damage to the vehicle.
   Allow the engine to RUN until hot air is emitted from the instrument panel registers, while observing the engine temperature gauge.

12. Switch off the engine.

13. Allow the engine to cool.

14. WARNING: Never remove the coolant pressure cap under any circumstances while the engine is operating. Failure to follow this instruction may result in personal injury. To avoid having scalding hot coolant or steam blow out of the cooling system, use extreme care when removing the coolant pressure cap from a hot cooling system. Wait until the engine has cooled, then wrap a thick cloth around the coolant pressure cap and turn it slowly until the pressure begins to release. Step back while the pressure is released from the system. When certain all the pressure has been released (still with a cloth) turn and remove the coolant pressure cap from the coolant expansion tank. Failure to follow these instructions may result in personal injury.
   Release the cooling system pressure.
   
   • Remove the coolant expansion tank pressure cap.

15. Fill the cooling system up to the MAX mark on the coolant expansion tank using a fifty percent mixture of Jaguar Premium Cooling System Fluid or equivalent, meeting Jaguar specification WSS M97B44-D and fifty percent water.

16. Install the coolant expansion tank pressure cap.

Air Conditioning - Air Conditioning
Description and Operation

The air conditioning (A/C) system is a clutch cycling, thermostatic expansion valve type. The system components are:

- A/C Compressor
- Compressor clutch
- Condenser core
- Evaporator core
- Thermostatic expansion valve
- Desiccant bag
- Connecting refrigerant lines

The refrigeration system operation is controlled by the:

- Thermostatic expansion valve.
- Evaporator discharge temperature sensor.
- A/C Compressor relief valve.
- Pressure cut off switch.
- Engine control module (ECM)
- Climate control module

The refrigerant system incorporates a variable capacity A/C compressor. The A/C compressor clutch engagement is controlled by the ECM.

The DATC module monitors the evaporator discharge temperature sensor and communicates with the ECM to control clutch cycling. The DATC also monitors the ambient air temperature and disables A/C operation when the ambient air temperature is below 0°C (30°F).

The pressure switch is located in the A/C compressor discharge line and communicates with the ECM. If high or low refrigerant pressures are experienced, the ECM will interrupt A/C compressor operation.

</tbody>
</table>
The pressure relief valve is installed in the A/C compressor manifold and tube assembly and protects the system from excessively high refrigerant pressure.

The thermostatic expansion valve, which is mounted to the evaporator core supply and return lines, contains an adjustable orifice which provides the restriction that separates the high and low pressure liquid phases in the refrigerant system.

### Item Part Number Description
1 — Manifold and tube assembly - thermostatic expansion valve
2 — Tube assembly - condenser to thermostatic expansion valve
3 — Pressure cutoff switch
4 — Condenser core
5 — A/C Compressor
6 — Manifold and tube assembly - A/C compressor

### A/C Compressor and Clutch Assembly
- NOTE: The internal A/C compressor components are not serviced separately. The A/C scroll compressor is serviced only as an assembly.

The A/C compressor has the following characteristics:

- A variable capacity function controlled by a suction pressure device.
- Vehicles fitted with 4.2L engine a displacement of 105cc.
- Vehicles fitted with 2.5L and 3.0L engine a displacement of 90cc.
- A fixed and orbiting scroll to provide refrigerant compression.
- A non-serviceable shaft seal.

### Item Part Number Description
1 — Clutch field coil
2 — Field coil snap ring
3 — Clutch pulley
4 — Pulley snap ring
5 — Clutch hub spacer
6 — Clutch
7 — Clutch nut

The magnetic A/C clutch has the following characteristics:

- It drives the compressor shaft.
- When battery positive voltage is applied to the A/C clutch field coil, the clutch disc and hub assembly is drawn toward the A/C clutch pulley.
- The magnetic force locks the clutch disc and hub assembly and the A/C clutch pulley together as one unit, causing the compressor shaft to rotate.
When battery positive voltage is removed from the A/C clutch field coil, springs in the clutch disc and hub assembly move the clutch disc away from the A/C clutch pulley.

A/C Compressor Pressure Relief Valve

An A/C compressor pressure relief valve is incorporated in the compressor A/C manifold and tube to:

- relieve unusually high refrigerant system discharge pressure buildups.
- prevent damage to the A/C compressor and other system components.
- avoid total refrigerant loss by closing after the excessive pressure has been relieved.

Condenser Core

The A/C condenser core has the following characteristics:

- It is an aluminum fin and tube design heat exchanger located in front of the vehicle radiator.
- It cools compressed refrigerant gas by allowing air to pass over fins and tubes to extract heat and by condensing gas to liquid refrigerant as it is cooled.
- The tube assembly mounted on the side of the condenser core contains the desiccant bag.

Desiccant bag

The desiccant bag removes any retained moisture in the A/C system. The A/C system has an R-134a leak trace dye wafer incorporated into the desiccant bag.

Refrigerant Lines

The manifold and tube assembly - thermostatic expansion valve carries high pressure liquid to the thermostatic expansion valve and low pressure gas from the thermostatic expansion valve to the manifold and tube assembly-compressor. The manifold and tube assembly - A/C compressor carries the high pressure gas from the A/C compressor to the condenser core. It also carries the low pressure gas received from the manifold and tube assembly-thermostatic expansion valve to the compressor, houses the low pressure service port and has a serviceable high pressure relief valve.

- The manifold and tube assembly - A/C compressor used vehicles with fitted 4.2L engine are not interchangeable With vehicles fitted with 2.5L and 3.0L engine.

The tube assembly - condenser to thermostatic expansion valve carries high pressure liquid to the manifold and tube assembly-thermostatic expansion and houses the high pressure service port.

Evaporator Core

The A/C evaporator core is the plate/fin type with a unique refrigerant flow path.

- A mixture of refrigerant and oil exits the thermostatic expansion valve (TXV) and enters the evaporator tank area through the 12.7 mm (0.5 in) tube.
- The tank area is divided into three sections: front inlet, front outlet and rear tank.
- The refrigerant enters the evaporator core tank area at the front inlet, flows down through the core and up the back side in a "U-flow" pattern.
- The refrigerant moves into the rear tank area and across to the other half of the core. The refrigerant moves down through the core and back up the front side of the core to the front outlet tank area.
- The refrigerant at this point is in a gaseous state. It exits the evaporator through the 16 mm (0.64 in) tube then passes through the TXV.
The thermostatic expansion valve has the following characteristics:

- It is mounted on the evaporator core supply and return lines.
- It is a block-type valve.
- It contains an internal sensing bulb to increase the effectiveness of temperature sensing.
- It is not serviceable. A new thermostatic expansion valve must be installed as a unit.

### Pressure cutoff switch

The pressure cutoff switch monitors the A/C compressor discharge pressure and communicates with the ECM. The ECM will interrupt A/C compressor operation in the event that the pressure cutoff switch indicates high system discharge pressures. It is also used to sense no or low charge conditions. If the pressure is below a predetermined value for a given ambient temperature, the ECM will not allow the clutch to engage.

- The pressure cutoff switch is mounted on a Schrader-type valve fitting on the compressor to condenser discharge line.
- A valve depressor, located inside the threaded end of the pressure cutoff switch, presses on the Schrader valve stem and allows the pressure cutoff switch to monitor the compressor discharge pressure.
- When the compressor discharge pressure rises to approximately 2,896 kPa (420 psi), the ECM will interrupt the compressor clutch coil circuit and disengage the compressor.
- When the pressure drops to approximately 1,724 kPa (250 psi) the ECM will enable the A/C compressor circuit.
- Controls the signal to the ECM to control the fan speed.

### Service Gauge Port Valves

**WARNING:** Wear eye protection when opening/servicing the service gauge port valves.

The high-pressure service gauge port valve is located on the tube assembly - condenser to thermostatic expansion valve.

The low pressure service gauge port valve is located on the manifold and tube assembly - A/C compressor.
Item | Part Number | Description
--- | --- | ---
1 | — | A/C charging valve cap
2 | — | Low pressure service gauge port valve
3 | — | Schrader-type valve
4 | — | O-ring seal
5 | — | High pressure service gauge port valve
6 | — | A/C charging valve cap

The fitting is an integral part of the refrigerant line or component.

- Special couplings are necessary for both the high side and low side service gauge ports.
- A new Schrader-type valve can be installed if the seal leaks.
- Always install the A/C charging valve cap on the service gauge port valves after repairing the refrigerant system.
Air Conditioning - Air Conditioning
Diagnosis and Testing
For additional information refer to Section 412-00 Climate Control System - General Information
Removal

1. Carry out the air conditioning (A/C) system recovery procedure. For additional information, refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging (412-00 Climate Control System - General Information, General Procedures).

2. Disconnect the battery ground cable. For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

3. Remove the air deflector. For additional information, refer to: Air Deflector (501-02 Front End Body Panels, Removal and Installation).

4. Detach the accessory drive belt.
   1. Rotate the accessory drive belt tensioner counter-clockwise. Use a 3/8 inch square drive bar to rotate the accessory drive belt tensioner.
   2. Detach the accessory drive belt.

5. Disconnect the A/C compressor supply and return lines.
   - Remove and discard the A/C compressor O-ring seals.
   - Cap the exposed ports.

6. Disconnect the A/C compressor electrical connector.
Installation

1. Add the correct amount of A/C refrigerant oil to the A/C compressor. For additional information, refer to: Refrigerant Oil Adding (412-00 Climate Control System - General Information, General Procedures).

2. Install the A/C compressor.
   - Tighten to 25 Nm.

3. Connect the A/C compressor electrical connector.

4. NOTE: Un-cap the exposed ports.
   - Install new A/C compressor O-ring seals.
     - Lubricate the new O-ring seals with A/C refrigerant oil.

5. Clean off any oil residue that may contain A/C system fluorescent dye.

6. Connect the A/C compressor supply and return lines.
   - Tighten to 20 Nm.

7. Remove the A/C compressor.
7. Attach the accessory drive belt.
   1. Rotate the accessory drive belt tensioner counter-clockwise.
   2. Use a 3/8 inch square drive bar to rotate the accessory drive belt tensioner.
   2. Attach the accessory drive belt.

8. Install the air deflector.
   For additional information, refer to: **Air Deflector** (501-02 Front End Body Panels, Removal and Installation).

9. Connect the battery ground cable.
   For additional information, refer to: **Battery Connect** (414-01 Battery, Mounting and Cables, General Procedures).

10. Carry out the A/C system evacuation and charging procedure.
    For additional information, refer to: **Air Conditioning (A/C) System Recovery, Evacuation and Charging** (412-00 Climate Control System - General Information, General Procedures).

11. Carry out the A/C system fluorescent dye leak detection procedure.
    For additional information, refer to: **Fluorescent Dye Leak Detection** (412-00 Climate Control System - General Information, General Procedures).

### Removal

All vehicles

1. Carry out the air conditioning (A/C) system recovery procedure. For additional information, refer to: [Air Conditioning (A/C) System Recovery, Evacuation and Charging](412-00 Climate Control System - General Information, General Procedures).

2. Disconnect the battery ground cable. For additional information, refer to: [Battery Disconnect and Connect](414-01 Battery, Mounting and Cables, General Procedures).

3. Remove the left-hand wheel and tire assembly. For additional information, refer to: [Wheel and Tire](204-04 Wheels and Tires, Removal and Installation).

4. Remove the air deflector. For additional information, refer to: [Air Deflector](501-02 Front End Body Panels, Removal and Installation).

5. Reposition the drive belt splash shield.
   - Remove the drive belt splash shield retaining clip.

6. Disconnect the A/C compressor electrical connector.
7. Detach the A/C compressor supply and return lines.
   - Remove and discard the A/C compressor O-ring seals.
   - Cap the exposed ports.

Left-hand drive vehicles

8. Remove the steering gear shaft pinch bolt.

9. Detach the steering gear.

10. Secure the steering gear.

All vehicles
11. Remove the left-hand engine mounting lower retaining bolt.

12. Lower the vehicle.

13. Remove the air cleaner outlet pipe. For additional information, refer to: Air Cleaner Outlet Pipe (303-12B Intake Air Distribution and Filtering - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Removal and Installation).

14. Detach the accessory drive belt.
   1. Rotate the accessory drive belt tensioner counter-clockwise.
   2. Detach the accessory drive belt.

Vehicles without supercharger

15. Remove the throttle body. For additional information, refer to: (303-04B Fuel Charging and Controls - V8 4.2L Petrol/V8 S/C 4.2L Petrol)

All vehicles

16. Install the engine left-hand lifting eye.
17. Using the special tools, raise the engine to a suitable height.

18. Raise the vehicle.
19. Remove the engine mounting and bracket assembly.

20. Lower the vehicle.
21. Remove the A/C compressor lower left-hand retaining bolt.
22. Remove the A/C compressor.

**Installation**

*All vehicles*

1. Add the correct amount of A/C refrigerant oil to the A/C compressor. For additional information, refer to: [Refrigerant Oil Adding](#) (412-00 Climate Control System - General Information, General Procedures).

2. Install the A/C compressor.
   - Tighten to 25 Nm.

3. Install the A/C compressor lower left-hand retaining bolt.
   - Tighten to 25 Nm.

4. Raise the vehicle.

5. Install the engine mounting and bracket assembly.
   - Tighten to 25 Nm.

6. Lower the vehicle.
7. Using the special tools, lower the engine.

8. Remove the engine left-hand lifting eye.

Vehicles without supercharger

9. Install the throttle body. For additional information, refer to: (303-04B Fuel Charging and Controls - V8 4.2L Petrol/V8 5.2L Petrol)
   Throttle Body - Vehicles Without: Supercharger, VIN Range: M45255->N52047 (Removal and Installation),
   Throttle Body - Vehicles Without: Supercharger, VIN Range: N52048->N99999 (Removal and Installation).

All vehicles

10. Attach the accessory drive belt.
    1. Rotate the accessory drive belt tensioner counter-clockwise.
    1. Use a 3/8 inch square drive bar to rotate the accessory drive belt tensioner.
    2. Attach the accessory drive belt.

11. Install the air cleaner outlet pipe.
    For additional information, refer to: Air Cleaner Outlet Pipe (303-12B Intake Air Distribution and Filtering - V8 4.2L Petrol/V8 5.2L Petrol, Removal and Installation).

12. Raise the vehicle.
13. Install the left-hand engine mounting lower retaining bolt.
   - Tighten to 63 Nm.

Left-hand drive vehicles

14. Detach the steering gear.

15. Attach the steering gear.
   - Tighten to 100 Nm.

16. Install the steering gear shaft pinch bolt.
   - Tighten to 35 Nm.

All vehicles

17. **NOTE:** Un-cap the exposed ports.

Install new A/C compressor O-ring seals.
   - Lubricate the new O-ring seals with A/C refrigerant oil.
18. Attach the A/C compressor supply and return lines.
   - Tighten to 20 Nm.

19. Connect the A/C compressor electrical connector.

20. Clean off any oil residue that may contain A/C system fluorescent dye.

21. Reposition the drive belt splash shield.
   - Install the drive belt splash shield retaining clip.

22. Install the air deflector.
    For additional information, refer to: Air Deflector (501-02 Front End Body Panels, Removal and Installation).

23. Install the left-hand front wheel and tire assembly.
    For additional information, refer to: Wheel and Tire (204-04 Wheels and Tires, Removal and Installation).

24. Connect the battery ground cable.
    For additional information, refer to: Battery Connect (414-01 Battery, Mounting and Cables, General Procedures).

25. Carry out the A/C system evacuation and charging procedure.
    For additional information, refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging (412-00 Climate Control System - General Information, General Procedures).

26. Carry out the A/C system fluorescent dye leak detection procedure.
    For additional information, refer to: Fluorescent Dye Leak Detection (412-00 Climate Control System - General Information, General Procedures).
Removal

All vehicles

1. Carry out the air conditioning (A/C) system recovery procedure. For additional information, refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging (412-00 Climate Control System - General Information, General Procedures).

2. Disconnect the battery ground cable. For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

3. Remove the accessory drive belt. For additional information, refer to: Accessory Drive Belt - 2.7L V6 - TdV6 (303-05 Accessory Drive, Removal and Installation).

4. Disconnect the turbocharger to charge air cooler tube.

Vehicles with automatic transmission

5. Remove the cooling fan motor and shroud. For additional information, refer to: Cooling Fan Motor and Shroud (303-03C Engine Cooling - 2.7L V6 - TdV6, Removal and Installation).

6. Remove the transmission fluid cooler. For additional information, refer to: Transmission Fluid Cooler (307-02 Transmission/Transaxle Cooling, Removal and Installation).

All vehicles

7. Remove the turbocharger to charge air cooler.

8. Disconnect the air cleaner lower outlet tube.
9. Remove the air cleaner upper outlet tube.

10. Detach the A/C compressor supply and return lines.
    - Remove and discard the A/C compressor O-ring seals.
    - Cap the exposed ports.

11. Disconnect the A/C compressor electrical connector.

12. Remove the A/C compressor left-hand lower retaining bolt.
    - Position the A/C pipe retaining bracket to one side.

13. Reposition the air cleaner lower outlet tube to one side to gain access to the A/C compressor right-hand lower retaining bolt.
14. Remove the A/C compressor right-hand lower retaining bolt.

15. Lower the vehicle.

16. **CAUTION:** Carefully remove the A/C compressor past the coolant pipes. Failure to follow this instruction, may result in damage to the coolant pipes.

   Remove the A/C compressor upper retaining bolts and remove the A/C compressor.

### Installation

**All vehicles**

1. Add the correct amount of A/C refrigerant oil to the A/C compressor. For additional information, refer to: [Refrigerant Oil Adding](#) (412-00 Climate Control System - General Information, General Procedures).

2. **CAUTION:** Carefully install the A/C compressor past the coolant pipes. Failure to follow this instruction, may result in damage to the coolant pipes.

   Install the A/C compressor.
   
   - Install the A/C compressor upper retaining bolts.
   - Tighten to 25 Nm.

3. Raise the vehicle.

4. Install the A/C compressor right-hand lower retaining bolt.

   - Tighten to 25 Nm.
5. Move the air cleaner lower outlet tube back to the original position.

6. **NOTE:** Un-cap the exposed ports. 
   Install new A/C compressor O-ring seals. 
   - Lubricate the new O-ring seals with A/C refrigerant oil.

7. Connect the A/C compressor supply and return lines. 
   - Tighten to 20 Nm.

8. **NOTE:** The A/C pipe retaining bracket must be positioned in the correct orientation before installing the the left hand lower A/C compressor retaining bolt 
   Install the A/C compressor left hand lower retaining bolt. 
   - Tighten to 25 Nm.

9. Connect the A/C compressor electrical connector.
10. Install the air cleaner upper outlet tube.

11. Connect the air cleaner lower outlet tube.

12. Install the turbocharger to charge air cooler.

13. Install the transmission fluid cooler.  
   For additional information, refer to: Transmission Fluid Cooler (307-02 Transmission/Transaxle Cooling, Removal and Installation).

   For additional information, refer to: Cooling Fan Motor and Shroud (303-03C Engine Cooling - 2.7L V6 - TdV6, Removal and Installation).

15. Connect the turbocharger to charge air cooler tube.

16. Install the accessory drive belt.  
   For additional information, refer to: Accessory Drive Belt - 2.7L V6 - TdV6 (303-05 Accessory Drive, Removal and Installation).

17. Connect the battery ground cable.  
   For additional information, refer to: Battery Connect (414-01 Battery, Mounting and Cables, General Procedures).
18. Carry out the A/C system evacuation and charging procedure. For additional information, refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging (412-00 Climate Control System - General Information, General Procedures).

19. Carry out the A/C system fluorescent dye leak detection procedure. For additional information, refer to: Fluorescent Dye Leak Detection (412-00 Climate Control System - General Information, General Procedures).

**Removal**

1. Remove the air conditioning (A/C) compressor. For additional information, refer to: Air Conditioning (A/C) Compressor - 2.5L NA V6 - AJ27
   3.0L NA V6 - AJ27 (412-03 Air Conditioning, Removal and Installation).

2. **NOTE:** Make sure special tool is holding the clutch.
   Using the special tool, loosen the A/C clutch retaining nut.

3. Remove the A/C clutch.
   - Remove the A/C clutch retaining nut.
4. Remove the A/C clutch shim.

5. Remove the A/C clutch pulley circlip.

6. **CAUTION: Do not use air tools.**
   Using the special tool, remove the A/C clutch pulley.

7. Remove the A/C sensor retaining plate.

8. Detach the A/C sensor.
9. Remove the A/C clutch and clutch field coil circlip.

10. Remove the A/C clutch and clutch field coil.

**Installation**

1. Install the A/C clutch and clutch field coil.

2. **CAUTION:** Make sure the circlip is installed and seated correctly. Failure to follow this instruction may result in damage to the vehicle.

   Install the A/C clutch and clutch field coil circlip.
3. Attach the A/C temperature sensor.

4. Install the A/C temperature sensor retaining plate.
   - Tighten to 6 Nm.

5. NOTE: The A/C clutch bearing and pulley is a slip fit on the compressor. If correctly aligned it should slip on easily. If difficulty is experienced on installation, use the special tool and gently tap the A/C clutch pulley.
   Using the special tool, install the A/C clutch pulley.

6. CAUTION: Make sure the circlip is installed and seated correctly. Failure to follow this instruction may result in damage to the vehicle.
   Install the A/C clutch pulley circlip.

7. Install the A/C clutch shim.
8. Install the A/C clutch.
   - Install the A/C clutch retaining nut.

9. **NOTE:** Make sure special tool is holding the clutch.
   Using the special tool, tighten the A/C clutch retaining nut.
   - Tighten to 26 Nm.

10. Measure and adjust the air gap by removing or installing A/C clutch shims.
   - Air gap to be set between 0.35 mm (0.01 in) to 0.75 mm (0.03 in).

11. Install the air conditioning (A/C) compressor. For additional information, refer to:
    For additional information, refer to: [Air Conditioning (A/C) Compressor - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27](412-03 Air Conditioning, Removal and Installation).
Air Conditioning - Condenser Core
Removal and Installation

Removal

1. Carry out the air conditioning (A/C) system recovery procedure. For additional information, refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging (412-00 Climate Control System - General Information, General Procedures).

2. Remove the radiator splash shield. For additional information, refer to: Radiator Splash Shield (501-02 Front End Body Panels, Removal and Installation).

3. Detach the coolant pipe.

4. Remove the radiator lower cowl.

5. Detach the adaptive cruise control (ACC) module bracket.

6. Remove the power steering oil cooler retaining nut.
7. Detach the power steering oil cooler.
   - Using a suitable tie strap, tie the power steering oil cooler aside.

8. Remove the A/C condenser core retaining stud.

9. NOTE: Cap the exposed ports.
   Disconnect the condenser core return line.
   - Remove and discard the O-ring seals.

10. Detach the condenser core.

11. NOTE: Cap the exposed ports.
    Disconnect the condenser core supply line.
    - Remove and discard the O-ring seals.
12. Remove the condensor core.

**Installation**

1. Add the correct amount of A/C refrigerant oil to the A/C Condensor core. For additional information, refer to: [Refrigerant Oil Adding](#) (412-00 Climate Control System - General Information, General Procedures).

2. Install the condensor core.

3. **NOTE:** Lubricate the new O-ring seals with A/C refrigerant oil.
   - **NOTE:** Un-cap the exposed ports
     - Connect the condensor core supply line.
     - **Tighten to 8 Nm.**

4. Attach the condensor core.
   - **Tighten to 8 Nm.**
5. NOTE: Lubricate the new O-ring seals with A/C refrigerant oil.
   - NOTE: Un-cap the exposed ports
   Connect the condensor core return line.
   - Tighten to 8 Nm.

6. Install the A/C condenser core retaining stud.
   - Tighten to 8 Nm.

7. Attach the power steering oil cooler.
   - Remove the tie strap.

8. Install the power steering oil cooler retaining nut.
   - Tighten to 8 Nm.

9. Attach the adaptive cruise control (ACC) module bracket.
   - Tighten to 7 Nm.
10. Install the radiator lower cowl.

11. Attach the coolant pipe.

12. Install the radiator splash shield. For additional information, refer to: Radiator Splash Shield (501-02 Front End Body Panels, Removal and Installation).

13. Carry out the air conditioning (A/C) system charging procedure. For additional information, refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging (412-00 Climate Control System - General Information, General Procedures).
Removal

1. Carry out the air conditioning (A/C) system recovery procedure. For additional information, refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging (412-00 Climate Control System - General Information, General Procedures).

2. Remove the radiator splash shield. For additional information, refer to: Radiator Splash Shield (501-02 Front End Body Panels, Removal and Installation).

3. Detach the coolant pipe.

4. Remove the radiator lower cowl.

5. Detach the power steering fluid cooler.

6. Remove the desiccant bag retaining bracket.
7. **CAUTION:** Do not leave the A/C system open to atmosphere for longer than five minutes.
   - **NOTE:** Discard the O-ring seals.
   - **NOTE:** Cap the exposed ports.
   
   Remove and discard the desiccant bag.
   - Remove the desiccant bag retaining bolts.

**Installation**

1. Add the correct amount of A/C refrigerant oil to the desiccant bag. For additional information, refer to: Refrigerant Oil Adding (412-00 Climate Control System - General Information, General Procedures).
2. Install new desiccant bag O-ring seals.
   - Lubricate the new O-ring seals with A/C refrigerant oil.

3. **CAUTION:** Do not leave the desiccant bag exposed to atmosphere for longer than five minutes.
   - **NOTE:** Un-cap the exposed ports.
   
   Install the new desiccant bag.
   - Tighten to 8 Nm.

4. Install the desiccant bag retaining bracket.
   - Tighten to 8 Nm.

5. Attach the power steering fluid cooler.

6. Clean off any oil residue that may contain A/C system flourescent dye.
7. Install the radiator lower cowl.

8. Attach the coolant pipe.

9. Install the radiator splash shield.
   For additional information, refer to: Radiator Splash Shield (501-02 Front End Body Panels, Removal and Installation).

10. Carry out the air conditioning (A/C) system charging procedure.
    For additional information, refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging (412-00 Climate Control System - General Information, General Procedures).
Air Conditioning - Pressure Cutoff Switch V8 4.2L Petrol/V8 S/C 4.2L Petrol/2.5L NA V6 - AJV6/3.0L NA V6 - AJ27

Removal and Installation

**Vehicles with 2.5L or 3.0L engine**

1. Remove the air cleaner. For additional information, refer to Section 303-12A Intake Air Distribution and Filtering / 303-12B Intake Air Distribution and Filtering / 303-12C Intake Air Distribution and Filtering.

**Vehicles with 4.2L engine**

2. Remove the air cleaner. For additional information, refer to Section 303-12A Intake Air Distribution and Filtering / 303-12B Intake Air Distribution and Filtering / 303-12C Intake Air Distribution and Filtering.

**All vehicles**

3. Disconnect the pressure cutoff switch electrical connector.

4. Remove the pressure cut-off switch.
   - Remove and discard the pressure cutoff switch O-ring seal.

**Installation**

**All vehicles**

1. Install a new pressure cutoff switch O-ring seal.
   - Lubricate the new O-ring seal with A/C refrigerant oil.

2. Install the pressure cutoff switch.
   1. Tighten to 8 Nm.
3. Connect the pressure cutoff switch electrical connector.

4. Clean off any oil residue that may contain A/C system fluorescent dye.

**Vehicles with 2.5L or 3.0L engine**

5. Install the air cleaner. For additional information, refer to Section 303-12A Intake Air Distribution and Filtering / 303-12B Intake Air Distribution and Filtering / 303-12C Intake Air Distribution and Filtering.

**Vehicles with 4.2L engine**

6. Install the air cleaner. For additional information, refer to Section 303-12A Intake Air Distribution and Filtering / 303-12B Intake Air Distribution and Filtering / 303-12C Intake Air Distribution and Filtering.

**All vehicles**

7. Carry out the A/C system fluorescent dye leak detection procedure. For additional information, refer to Section 412-00 Climate Control System - General Information.
Removal

1. Carry out the air conditioning (A/C) system recovery procedure. For additional information, refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging (412-00 Climate Control System - General Information, General Procedures).

2. Remove the radiator splash shield. For additional information, refer to: Radiator Splash Shield (501-02 Front End Body Panels, Removal and Installation).

3. Disconnect the pressure cutoff switch electrical connector.

4. Remove the pressure cutoff switch.
   - Remove and discard the pressure cutoff switch O-ring seal.

Installation

1. Install a new pressure cutoff switch O-ring seal.
   - Lubricate the new O-ring seal with A/C refrigerant oil.

2. Install the pressure cutoff switch.
   - Tighten to 8 Nm.
3. Connect the pressure cutoff switch electrical connector.

4. Clean off any oil residue that may contain A/C system fluorescent dye.

5. Install the radiator splash shield.  
   For additional information, refer to: Radiator Splash Shield (501-02 Front End Body Panels, Removal and Installation).

6. Carry out the A/C system evacuation and charging procedure.  
   For additional information, refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging (412-00 Climate Control System - General Information, General Procedures).

7. Carry out the A/C system fluorescent dye leak detection procedure.  
   For additional information, refer to: Fluorescent Dye Leak Detection (412-00 Climate Control System - General Information, General Procedures).

</tbody>
</table>
The climate control assembly is a single module packaged in the instrument panel console of the vehicle. It is a microprocessor-based control consisting of a bezel assembly (including all buttons and switches), a main control board and a housing for the unit.

The climate control assembly provides the following driver interface controls:

- Climate control assembly ON/OFF switch/fan speed switch
- Manual temperature adjustment switches (drivers/passengers)
- DUAL temperature selection switch
- DEFROST switch
- Heated front screen ON/OFF switch
- Heated rear screen ON/OFF switch
- Manual air distribution MODE switch
- Fahrenheit/Centigrade option switch
- AUTO mode switch
- A/C selection switch
- Recirculate air switch

Operating any of the climate control assembly controls activates a chime emitted from the instrument cluster.

The climate control assembly automatically maintains a selected temperature for the interior of the vehicle. The system regulates the volume of airflow between the instrument panel registers, floor console registers, front and rear floor ducts, windshield defroster and side window registers. The system can automatically select between fresh and recirculated air with an optional manual override. The climate control assembly will try to provide both driver and passenger with their selected temperature for comfort. The fan controls and air distribution are not controlled individually.

**Blower Motor Control**

The climate control system has a variable blower speed control provided by a brushless blower motor. The operator has the option of manually selecting one of eleven preset blower speeds from the control panel (seven preset blower speeds with telematics fitted) or...
selecting to operate the climate control assembly in automatic mode.

In automatic mode, the blower speed is determined as a function of many input variables. Based on the desired in-vehicle temperature, the system constantly monitors the ambient temperature, discharge air temperatures, in-vehicle temperature and sunload levels then calculates the desired blower setting.

There are special conditions that affect the blower speed while in the automatic mode of operation.

In a cold ambient temperature condition, the climate control assembly implements a Cold Engine Lock Out (CELO) feature with the blower motor. For a cold vehicle interior, the climate control assembly will operate in low blower/defrost mode until the engine coolant temperature reaches a required value. Once the engine coolant has warmed up the blower motor will continue in the automatic mode.

At very high vehicle speeds, monitored via the Standard Corporate Protocol (SCP) vehicle speed status message, the climate control assembly system may adjust the blower motor speed to maintain constant air flow. This may be necessary in situations where the ram air effects at high speed changes the air flow into the vehicle interior.

For vehicles fitted with a cellular phone, the climate control assembly may lower the blower motor speed to reduce the level of ambient noise in the vehicle interior when the phone is in use. The status of the cellular phone is monitored via the SCP cellular phone ON/OFF message.

Air Distribution Control

The climate control system has variable position control provided by the electrical actuators. The system gives the option of manually selecting one of five preset air distribution modes or operating the climate control assembly in automatic mode.

Climate Control - Battery Disconnection

The climate control assembly will store the panel settings in volatile memory. Therefore, in the event of battery disconnection, or interruption of the supply, the information is lost. After reconnection, historical fault codes are available, and the panel will be set to OFF. An average automatic setting will be recovered when the climate control assembly is next switched ON.

If the battery is disconnected, the panel settings will be lost. The customers personal settings should be recorded and re-set before the vehicle is returned to the customer.
Control Components - Control Components
Diagnosis and Testing

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the cause is not visually evident, verify the symptom and refer to the Jaguar Approved Diagnostic System.
Control Components - Air Discharge Temperature Sensor
Removal and Installation

Removal

1. Remove the driver side instrument panel lower trim panel.

2. Disconnect the air discharge temperature sensor electrical connector.

3. Remove the air discharge temperature sensor.

Installation

1. To install, reverse the removal procedure.
Removal

1. Remove the radiator splash shield. For additional information, refer to Section 501-02 Front End Body Panels.
2. Remove the radiator lower cowl.
3. Disconnect the ambient air temperature electrical connector.
4. Remove the ambient air temperature sensor.

Installation

1. To install, reverse the removal procedure.
Control Components - Climate Control Assembly

Removal

1. Disconnect the battery ground cable. For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

2. Remove the instrument panel console. For additional information, refer to: Instrument Panel Console (501-12 Instrument Panel and Console, Removal and Installation).

3. Remove the climate control assembly.
   1. Remove the climate control assembly retaining screws.
   2. Remove the climate control assembly.

Installation

1. NOTE: If a new climate control module is installed, it must be configured using the Jaguar approved diagnostic system.

   To install, reverse the removal procedure.
Control Components - Cold Air Bypass Blend Door Actuator
Removal and Installation

Removal
1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 Battery, Mounting and Cables.
2. Remove the driver side instrument panel lower trim panel.
3. Disconnect the cold air bypass blend door actuator electrical connector.
4. Remove the cold air bypass blend door actuator retaining bolts.
5. Remove cold air bypass blend door actuator.

Installation
1. NOTE: During installation make sure the actuator is fully meshed with the driven flap before tightening the bolts.
   To install, reverse the removal procedure.
Control Components - Defrost Vent/Register Blend Door Actuator
Removal and Installation

Removal

All vehicles

1. Disconnect the battery ground cable.
   For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

Left-hand drive vehicles

2. Remove the instrument cluster.
   For additional information, refer to: Instrument Cluster (413-01 Instrument Cluster, Removal and Installation).
3. Remove the defrost vent/register blend door actuator.
   1. Disconnect the electrical connector.
   2. Remove the 3 retaining bolts.

Right-hand drive vehicles

4. Remove the glove compartment.
   For additional information, refer to: Glove Compartment (501-12 Instrument Panel and Console, Removal and Installation).
5. Remove the defrost vent/register blend door actuator.
   1. Disconnect the electrical connector.
   2. Remove the 3 retaining bolts.

Installation

1. NOTE: During installation make sure the actuator is fully meshed with the driven flap before tightening the bolts.

   To install, reverse the removal procedure.
Control Components - Footwell Vent/Duct Blend Door Actuator
Removal and Installation

Removal

All vehicles

1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 Battery, Mounting and Cables.
2. Remove the front footwell duct left-hand. For additional information, refer to Section 412-01 Air Distribution and Filtering.

Left-hand drive vehicles

3. Reposition the in-vehicle temperature sensor venturi pipe.

All vehicles

4. Remove the footwell vent/duct blend door actuator.
   1. Disconnect the electrical connector.
   2. Remove the retaining bolts.
   3. Remove the footwell vent/duct blend door actuator.

Installation

1. NOTE: During installation make sure the actuator is fully meshed with the driven flap before tightening the bolts.

To install, reverse the removal procedure.
Control Components - Instrument Panel Blend Door Actuator
Removal and Installation

Removal

All vehicles

1. Disconnect the battery ground cable.
   For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

Left-hand drive vehicles only

2. Remove the glove compartment.
   For additional information, refer to: Glove Compartment (501-12 Instrument Panel and Console, Removal and Installation).

3. Disconnect the instrument panel blend door actuator remote linkage.
   1. Disconnect the electrical connector.
   2. Disconnect the instrument panel blend door actuator remote linkage.

4. Remove the instrument panel blend door actuator.
   1. Remove the retaining bolts.
   2. Remove the instrument panel blend door actuator.

Right-hand drive vehicles

5. Remove the instrument cluster.
   For additional information, refer to: Instrument Cluster (413-01 Instrument Cluster, Removal and Installation).

6. Disconnect the instrument panel blend door actuator remote linkage.
   1. Disconnect the electrical connector.
   2. Disconnect the instrument panel blend door actuator remote linkage.
Installation

1. NOTE: During installation make sure the actuator is fully meshed with the driven flap before tightening the bolts.

To install, reverse the removal procedure.
Control Components - In-Vehicle Temperature Sensor

Removal and Installation

All vehicles.
1. Reposition the steering column to its maximum rearward position.
2. Disconnect the battery ground cable.
   For additional information, refer to Section 414-01 Battery, Mounting and Cables.

Left-hand drive vehicles.
3. Remove the ignition lock cylinder.
   For additional information, refer to Section 211-04 Steering Column.

All vehicles.
4. **CAUTION:** Make sure damage does not occur to the instrument panel finish panel.
   Remove the instrument panel finish panel.

5. Remove the instrument cluster finish panel.
   1. Remove the retaining screws.
   2. Remove the instrument cluster finish panel.

6. Remove the instrument panel lower trim panel.

7. Remove the steering column finish panel retaining screws.
8. Remove the steering column finish panel.
   1. Remove the steering column finish panel retaining screws.
   2. Remove the steering column finish panel.

9. Detach the steering column lower shroud.

10. Remove the lower steering column lower shroud.

11. Disconnect the in-vehicle temperature sensor electrical connector.

12. Disconnect the in-vehicle temperature sensor hose.
13. Remove the in-vehicle temperature sensor.

**Installation**

1. **CAUTION:** Make sure the in-vehicle temperature sensor is correctly installed to the instrument panel locating tang before installing the retaining screws.

   To install, reverse the removal procedure.
   - Tighten to 3Nm.
Control Components - Recirculation Blend Door Actuator
Removal and Installation

Removal

1. Remove the glove compartment.
   For additional information, refer to Section 501-12 Instrument Panel and Console.
2. Remove the recirculation blend door actuator retaining bolts.
3. Disconnect the recirculation blend door actuator electrical connector.
4. Remove the recirculation blend door actuator.
   1. Disconnect the control rod.
   2. Remove the recirculation blend door actuator.

Installation

1. NOTE: During installation make sure the actuator is fully meshed with the driven flap before tightening the bolts.

To install, reverse the removal procedure.
Control Components - Sunload Sensor
Removal and Installation

Removal

1. Remove both A-pillar trim panels.
   For additional information, refer to Section 501-05 Interior Trim and Ornamentation.

2. NOTE: Left-hand shown, right-hand similar.
   Detach the instrument panel defroster vent trim panel retaining clips in the order shown.

3. Detach the instrument panel defroster vent trim panel.

4. Detach the wiring harness from the instrument panel defroster vent trim panel.

5. Remove the instrument panel defroster vent trim panel.
   • Disconnect the electrical connector.
6. **NOTE:** Note the positions of the instrument panel insulators. Remove and discard the instrument panel insulators.

7. Remove the sunload sensor.

---

**Installation**

1. **CAUTION:** Make sure all adhesive has been removed from the insulator mating surfaces.

   Install new instrument panel isolators into the positions noted during removal.

2. Using suitable tool, cut the insulator as shown.
   
   1. Make sure the instrument panel isolator is in the position noted during removal.
   
   2. Using suitable tool, cut the insulator as shown.

3. Make sure the instrument panel defroster vent trim panel rear retaining tangs are correctly located to the instrument panel defroster vent trim panel.
   
   1. Make sure the instrument panel defroster vent trim panel front retaining tangs are correctly located to the instrument panel defroster vent trim panel.
   
   2. Make sure the instrument panel defroster vent trim panel rear retaining tangs are correctly located to the instrument panel defroster vent trim panel.
4. Install the new sunload sensor.

5. Install the instrument panel defroster vent trim panel.
   - Connect the electrical connector.

6. Attach the instrument panel defroster vent trim panel.
   1. Locate the instrument panel defroster vent trim panel front retaining tangs.
   2. Attach the instrument panel defroster vent trim panel.

7. NOTE: Left-hand shown, right-hand similar.
   Attach the instrument panel defroster vent trim panel.
   - Locate the instrument panel defroster vent trim panel retaining clips.

8. Install both A-pillar trim panels.
   For additional information, refer to Section 501-05 Interior Trim and Ornamentation.
1. **Verify the customer concern.**
2. **Visually inspect for obvious signs of mechanical or electrical damage.**

### Instrument Cluster -

#### General specifications

<table>
<thead>
<tr>
<th>Item</th>
<th>Specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Illumination bulb.</td>
<td>3.0 Watt</td>
</tr>
</tbody>
</table>
The instrument cluster provides the driver with information, indicators and warning indicators on the vehicle systems. The gauges and warning indicators may use the outputs from common sensors to carry out their respective functions.

For European vehicles the anti-lock brake system (ABS) and electric park brake system, the warning indicator is combined, illuminating as an amber exclamation mark.

Instrument cluster bulbs.

There are ten serviceable bulbs fitted to the instrument cluster. Two are indicator bulbs, one fitted each side of the instrument cluster. The remaining bulbs are backlighting bulbs.

### Vehicles built 02/2004 onwards

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the cause is not visually evident, verify the symptom and refer to the Jaguar Approved Diagnostic System.
Removal

1. Remove the instrument cluster.
   For additional information, refer to Instrument Cluster in this section.

2. **CAUTION:** Disassembly and assembly of the instrument cluster must only be carried out in an electrostatically protected area.
   Remove the instrument cluster housing.

3. Remove the indicator bulb.

Installation

1. To install, reverse the removal procedure.
Instrument Cluster - Instrument Cluster
Removal and Installation

Removal

All vehicles

1. **CAUTION:** Do not leave the instrument cluster face down for any length of time.
   Reposition the steering column to its maximum rearward position.

2. Disconnect the battery ground cable.
   For additional information, refer to: Battery Ground Cable (414-01 Battery, Mounting and Cables, Removal and Installation).

3. **CAUTION:** Make sure damage does not occur to the instrument panel finish panel.
   Remove the instrument panel finish panel.

4. Remove the instrument cluster finish panel.
   1. Remove the instrument cluster finish panel retaining screws.
   2. Remove the instrument cluster finish panel.

   Vehicles built up to 01/2004

5. Remove the instrument panel lower trim panel.

6. Remove the steering column finish panel retaining screws.
7. Detach the steering column lower shroud.

8. Remove the steering column lower shroud.

9. **CAUTION:** Make sure damage does not occur to the instrument cluster lens.
   - Remove the steering column finish panel.
     1. Remove the steering column finish panel retaining screws.
     2. Remove the steering column finish panel.

All vehicles

10. Detach the instrument cluster.
    1. Remove the instrument cluster retaining screws.
    2. Detach the instrument cluster.

Vehicles built up to 01/2004
11. Remove the instrument cluster.
   1. Disconnect the electrical connectors.
   2. Remove the instrument cluster.

Vehicles built 02/2004 onwards

12. Remove the instrument cluster.
   • Disconnect the electrical connectors.

Installation

1. NOTE: If a new instrument cluster is to be fitted, record the eleven digit alpha numeric code from the steering column label.

   To install, reverse the removal procedure.

2. NOTE: The position of the brake pedal crash bracket.

   Detach the steering column.
   • Support the weight of the steering column.
3. Record the eleven digit alpha numeric code from the steering column label.

4. **WARNING:** Make sure the brake pedal crash bracket is correctly located. Failure to follow this instruction may result in personal injury.

   **CAUTION:** Make sure the brake pedal crash bracket is correctly located. Failure to follow this instruction may result in component damage.

   • **NOTE:** Tighten the retaining nuts in the sequence shown.

   Attach the steering column.
   - Tighten to 25 Nm.

5. **NOTE:** This step is only necessary when installing a new component.

   Carry out the instrument cluster configuration application. For further information, refer to the Jaguar approved diagnostic system.
Removal

1. Remove the instrument cluster. For additional information, refer to Instrument Cluster in this section.

2. CAUTION: Disassembly and assembly of the instrument cluster must only be carried out in an electrostatically protected area.

   Remove the instrument cluster lens.

Installation

1. CAUTION: Care must be taken when installing the cluster lens to prevent damage to the instrument cluster pointers.

   To install, reverse the removal procedure.

- Horn switch
- Generic Electronic Module (GEM)

The horn system is designed to sound the horn when the horn switch is operated. The horn relay is supplied voltage at all times through the power distribution box fuse 16 (15A). Operating the horn switch provides a ground circuit to the coil side of the horn relay. In turn, the switch side of the horn relay is closed, allowing voltage to be applied to the horn.
Horn - Horn
Diagnosis and Testing

Overview
The horns for this model year now operate through the front electronic module rather than the general electronic module as in previous years.
The rest of the circuit remains the same, operating across the standard corporate protocol (SCP) network between modules and hard-wired elsewhere.
For additional information, refer to the electrical guides.

Inspection and verification
1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual inspection chart

<table>
<thead>
<tr>
<th>Mechanical</th>
<th>Electrical</th>

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

Using the Jaguar approved diagnostic system or a scan tool, check for diagnostic trouble codes (DTCs) indicating an SCP network fault.

Pinpoint tests

⚠️ CAUTION: When probing connectors to take measurements in the course of the pinpoint tests, use the adaptor kit, part number 3548-1358-00.
• NOTE: When carrying out tests, always use a digital multi-meter (DMM) accurate to 3 decimal places, and with an up-to-date calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.

A2: CHECK FOR GROUND AT THE HORN ASSEMBLY

| 1. Measure the resistance between: |
| FH29, harness side | Battery |
| Pin 02 | Negative terminal |
Is the resistance less than 10 ohms?
Yes
INSTALL a new horn assembly.
REFER to: Horn (413-06 Horn, Removal and Installation).
Test for normal operation.
No
REPAIR the high resistance circuit. For additional information, refer to the electrical guides. Test for normal operation.

A3: CHECK THE HORN POWER CIRCUIT FOR HIGH RESISTANCE
1 Remove the horn relay (relay 12, front power distribution fuse box).
2 Measure the resistance between:

<table>
<thead>
<tr>
<th>FH29, harness side</th>
<th>Relay base</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 01</td>
<td>Pin 05</td>
</tr>
</tbody>
</table>

Is the resistance less than 10 ohms?
Yes
GO to A4.
No
REPAIR the high resistance circuit. For additional information, refer to the electrical guides. Test for normal operation.

A4: CHECK THE POWER SUPPLIES TO THE HORN RELAY
1 Measure the voltage between:

<table>
<thead>
<tr>
<th>Relay base</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 01</td>
<td>Negative terminal</td>
</tr>
<tr>
<td>Pin 03</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Are both voltages greater than 10 volts?
Yes
GO to A5.
No
REPAIR the power supply circuit(s). This circuit includes fuse 16 of the front power distribution fuse box (see visual inspection). For additional information, refer to the electrical guides. Test for normal operation.

A5: CHECK THE HORN RELAY SIGNAL
1 Connect an ohmmeter between:

<table>
<thead>
<tr>
<th>Relay base</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

2 Operate the horn switch and monitor the meter reading.
   - Check the switch at all four corners of the horn push pad

Does the resistance switch to less than 10 ohms when the horn switch is operated?
Yes
INSTALL a new horn relay. Test for normal operation.
No
GO to A6.

A6: CHECK THE HORN RELAY SIGNAL CIRCUIT FOR HIGH RESISTANCE
1 Disconnect the front electronic module connector, FH59.
2 Measure the resistance between:

<table>
<thead>
<tr>
<th>FH59, harness side</th>
<th>Relay base</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 08</td>
<td>Pin 02</td>
</tr>
</tbody>
</table>

Is the resistance less than 10 ohms?
Yes
CHECK for DTCs indicating a front electronic module or SCP network fault. For horn switch and circuit tests. GO to Pinpoint Test B.
No
REPAIR the high resistance circuit. For additional information, refer to the electrical guides. Test for normal operation.

PINPOINT TEST B : HORN SWITCH AND CIRCUITS

WARNING: The backup power supply energy must be depleted before any supplementary restraint system components are disconnected. To deplete the backup supply energy, disconnect the battery negative cable and wait one minute to avoid accidental deployment and personal injury. Failure to follow this instruction may result in personal injury.

TEST CONDITIONS | DETAILS/RESULTS/ACTIONS
---|---
B1: CHECK THE HORN SWITCH OPERATION AFTER THE CLOCKSPRING
1 Disconnect the battery negative terminal.
2 Disconnect the clockspring connector, FC117.
3 Connect an ohmmeter between:

<table>
<thead>
<tr>
<th>FC117, component side</th>
<th>FC117, component side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 06</td>
<td>Pin 07</td>
</tr>
</tbody>
</table>

4 Operate the horn switch and monitor the meter reading.
   - Check the switch at all four corners of the horn push pad

Does the resistance switch to less than 10 ohms when the horn switch is operated?
Yes
GO to B2.
No
GO to B3.

B2: CHECK THE HORN SWITCH TO INSTRUMENT CLUSTER CIRCUIT FOR HIGH RESISTANCE
1 Disconnect the instrument cluster connector, FC8.
2 Measure the resistance between:

<table>
<thead>
<tr>
<th>FC117, harness side</th>
<th>FC8, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 07</td>
<td>Pin 09</td>
</tr>
</tbody>
</table>

Is the resistance less than 10 ohms?
Yes
INSTALL a new horn switch.
REFER to: Horn Switch (413-06 Hom, Removal and Installation).
Test for normal operation.
No
REPAIR the high resistance circuit. For additional information, refer to the electrical guides. Test for normal operation.
B3: CHECK THE HORN SWITCH OPERATION BEFORE THE CLOCKSPRING

1. Remove the driver airbag assembly.
2. Disconnect the horn switch connector, SQ5.
3. Connect an ohmmeter between:

<table>
<thead>
<tr>
<th>SQ5, component side</th>
<th>SQ5, component side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 01</td>
<td>Pin 02</td>
</tr>
</tbody>
</table>

4. Operate the horn switch and monitor the meter reading.
   - Check the switch at all four corners of the horn push pad

Does the resistance switch to less than 10 ohms when the horn switch is operated?

- Yes: GO to B5.
- No: GO to B4.

B4: CHECK THE HARNESS BETWEEN THE HORN SWITCH AND THE CLOCKSPRING FOR HIGH RESISTANCE

1. Remove the steering wheel.
2. Disconnect the clockspring connector, SQ2.
3. Measure the resistance between:

<table>
<thead>
<tr>
<th>SQ5, harness side</th>
<th>SQ2, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Pin 05</td>
</tr>
<tr>
<td>Pin 01</td>
<td>Pin 04</td>
</tr>
</tbody>
</table>

Is the resistance less than 10 ohms?

- Yes: GO to B5.
- No: REPAIR the high resistance circuit. For additional information, refer to the electrical guides. Test for normal operation.

B5: CHECK THE CLOCKSPRING FOR HIGH RESISTANCE

1. Measure the resistance between:

<table>
<thead>
<tr>
<th>SQ2, component side</th>
<th>FC117, component side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 04</td>
<td>Pin 06</td>
</tr>
<tr>
<td>Pin 05</td>
<td>Pin 07</td>
</tr>
</tbody>
</table>

Is the resistance less than 10 ohms?

- Yes: CHECK for DTCs indicating an instrument cluster, front electronic module or SCP network fault. For horn circuit and relay tests. GO to Pinpoint Test A.

PINPOINT TEST C : HORN CIRCUIT AND RELAY (HORN SOUNDING CONTINUOUSLY)

**TEST CONDITIONS**

**DETAILS/RESULTS/ACTIONS**

C1: CHECK FOR SHORT CIRCUIT TO POWER IN THE HORN ASSEMBLY CIRCUIT

1. Remove the horn relay (relay 12, front power distribution fuse box).

Does the horn stop?

- Yes: GO to C2.
- No: REPAIR the short circuit to power in the circuit between the front power distribution fuse box and the horn. For additional information, refer to the electrical guides. Refit the relay, test for normal operation.

C2: CHECK FOR SHORT CIRCUIT TO GROUND IN THE FEM TO FPDB CIRCUIT

1. Disconnect the FEM connector, FH59.
2. Measure the resistance between:

<table>
<thead>
<tr>
<th>FH59, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 08</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

- Yes: GO to C3.
- No: REPAIR the short circuit. For additional information, refer to the electrical guides. Test for normal operation.

C3: CHECK FOR SHORT CIRCUIT TO GROUND IN THE HORN SWITCH TO INSTRUMENT CLUSTER CIRCUIT

1. Disconnect the instrument cluster connector, FC8.
2. Without pressing the horn switch, measure the resistance between:

<table>
<thead>
<tr>
<th>FC8, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 09</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

- Yes: CHECK for DTCs indicating an instrument cluster, front electronic module or SCP network fault.
- No: GO to C4.

C4: CHECK THE HORN SWITCH OPERATION AFTER THE CLOCKSPRING

1. Disconnect the battery negative terminal.
2. Disconnect the clockspring connector, FC117.
3. Connect an ohmmeter between:

<table>
<thead>
<tr>
<th>FC117, component side</th>
<th>FC117, component side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 06</td>
<td>Pin 07</td>
</tr>
</tbody>
</table>

4. Operate the horn switch and monitor the meter reading.
   - Check the switch at all four corners of the horn push pad
Does the resistance switch between open circuit and less than 10 ohms when the horn switch is operated?

Yes

CHECK for DTCs indicating an instrument cluster, front electronic module or SCP network fault.

No

GO to C5.

C5: CHECK THE HORN SWITCH OPERATION BEFORE THE CLOCKSPRING

1. Remove the driver airbag assembly.
2. Disconnect the horn switch connector, SQ5.
3. Connect an ohmmeter between:

<table>
<thead>
<tr>
<th>SQ5, component side</th>
<th>SQ5, component side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 01</td>
<td>Pin 02</td>
</tr>
</tbody>
</table>

4. Operate the horn switch and monitor the meter reading.
   - Check the switch at all four corners of the horn push pad

Does the resistance switch between open circuit and less than 10 ohms when the horn switch is operated?

Yes

GO to C6.

No

INSTALL a new horn switch.

REFER to: Horn Switch (413-06 Horn, Removal and Installation).
Test for normal operation.

C6: CHECK THE HARNESS BETWEEN THE HORN SWITCH AND THE CLOCKSPRING FOR SHORT CIRCUIT TO GROUND

1. Remove the steering wheel.
2. Disconnect the clockspring connector, SQ2.
3. Measure the resistance between:

<table>
<thead>
<tr>
<th>SQ5, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Negative terminal</td>
</tr>
<tr>
<td>Pin 01</td>
<td></td>
</tr>
</tbody>
</table>

Are the resistances greater than 100 Kohms?

Yes

GO to C7.

No

REPAIR the short circuit. For additional information, refer to the electrical guides. Test for normal operation.

C7: CHECK THE CLOCKSPRING FOR SHORT CIRCUIT TO GROUND

1. Measure the resistance between:

<table>
<thead>
<tr>
<th>SQ2, component side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 04</td>
<td>Negative terminal</td>
</tr>
<tr>
<td>Pin 05</td>
<td></td>
</tr>
</tbody>
</table>

Are the resistances greater than 100 Kohms?

Yes

CHECK for DTCs indicating an instrument cluster, front electronic module or SCP network fault.

No

INSTALL a new clockspring.

Test for normal operation.
**Removal**

1. Remove the front bumper cover. For additional information, refer to Section [501-19 Bumpers].
2. Disconnect the electrical connector.
3. Remove the horn.

**Installation**

1. To install, reverse the removal procedure.
Horn - Horn Switch
Removal and Installation

Removal
1. Remove the driver air bag module. For additional information, refer to Section 501-20A Safety Belt System / 501-20B Supplemental Restraint System.
2. Disconnect the electrical connectors.

3. Remove the horn switch.
   1. Remove the horn switch retaining bolts.
   2. Remove the horn switch.

Installation
1. To install, reverse the removal procedure.
   - Tighten to 5 Nm.
**Information and Message Center - Information and Message Center**

**Description and Operation**

**Vehicles built up to 01/2004**

The driver's information and message center has a liquid crystal (LCD) display and is located at the lower area of the instrument cluster.

The message center displays messages in text form for the driver, including odometer readings and trip computer data. It can also provide information normally covered by conventional warning lamps or indicate that a feature such as the cruise control is operating.

Located either side of the message center are two lamps, red for warning and amber for caution. When a message is displayed, the appropriate lamp will illuminate to attract the driver's attention and to signify the importance of the message.

### Vehicles built 02/2004 onwards

<table>
<thead>
<tr>

<td>Amber Warning Lamp</td>
</tr>
</tbody>
</table>

The instrument cluster has two driver's information and message centers, which are liquid crystal (LCD) display. Both information and message centers are located in the lower area of the tachometer and speedometer.

The message centers display messages in text form for the driver, including odometer readings, trip computer data, clock and cruise control. They can also provide information normally covered by conventional warning lamps or indicate that a feature such as the cruise control is operating.

Located above the left hand side message center are two lamps, red for warning and amber for caution. When a message is displayed, the appropriate lamp will illuminate to attract the driver's attention and to signify the importance of the message.

**Trip Computer**

Pressing the trip computer cycle switch displays trip data on the left hand side message center. Warning and information messages have priority over trip data. If a driver information message is displayed prior to activation of the trip computer, the trip data will appear for 10 seconds only, before being replaced by the original message.

Each successive press of the trip switch causes the computer to continually cycle through the stored data which is then displayed on the message center.

![Trip Computer Switch](image)

E30184

The trip computer switch pack, mounted on the instrument panel is only enabled while the trip computer output is displayed. Refer to the Drivers Handbook for full operating instructions.

**Oil Change Reminder Indicator - Vehicles with Diesel Particulate Filter (DPF)**

The service required reminder indicator informs the driver that the engine requires an engine oil change due to excessive build-up of fuel within the engine oil. This is due to the diesel particulate filter (DPF) regeneration process where additional fuel quantities are added to increase exhaust gas temperatures. As a result small quantities of unburnt fuel remain in the combustion chamber and bypass the piston rings into the engine oil.

The amount of excessive fuel is calculated by the powertrain control module (ECM). The ECM monitors the engine operating conditions and the values from the exhaust gas temperature sensor during the DPF regeneration process and calculates the amount of fuel in the oil. If the fuel content exceeds the permitted level, the ECM will illuminate the service required reminder indicator in the instrument cluster.

After the engine oil has been changed, a service indicator reset procedure must be carried out. For additional information, refer to: Oil Change Indicator Reset (413-09 Warning Devices, General Procedures).
1. **Verify the customer concern.**

2. **Visually inspect for obvious signs of electrical damage.**

### Visual Inspection Chart

3. **If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.**

4. **If the cause is not visually evident, verify the symptom and refer to the Jaguar Approved Diagnostic System.**
Information and Message Center - Message Center Switch

Removal

1. Detach the message centre switch.

2. Remove the message centre switch.
   - Disconnect the electrical connector.

Installation

1. To install, reverse the removal procedure.
Warning Devices - Warning Devices
Description and Operation

Driver Audible Warning

The audible warning system provides the driver with an audible warning when the key is in the ignition lock cylinder, a door is open, headlights are on or the safety belt is not engaged. The driver will also be provided with a visual warning message displayed in the message center when the ignition lock cylinder is in the ON position. The system uses a number of inputs to provide the driver with audible and visual warnings.

Instrument Cluster

- CAUTIONS:

⚠️ If a red warning light is displayed in the instrument cluster the vehicle must be stopped as soon as possible, but only when it is safe to do so. A red warning light indicates a primary warning. Primary warnings must be reported to a Jaguar Dealer and investigated immediately. Failure to follow these instructions may result in damage to the vehicle.

⚠️ If an amber warning light is displayed in the instrument cluster the driver must take the appropriate action, but only when it is safe to do so. An amber warning light indicates a secondary warning. Secondary warnings must be reported to a Jaguar Dealer and investigated at the drivers earliest opportunity. Failure to follow these instructions may result in damage to the vehicle.

The instrument cluster acts as a system monitor for the audible and visual warnings. It receives inputs from switches and sensors directly or through the multiplex link from another module and triggers the necessary audible or visual warnings.

Message Center

- CAUTIONS:

⚠️ If a red warning light is displayed in the instrument cluster the vehicle must be stopped as soon as possible, but only when it is safe to do so. A red warning light indicates a primary warning. Primary warnings must be reported to a Jaguar Dealer and investigated immediately. Failure to follow these instructions may result in damage to the vehicle.

⚠️ If an amber warning light is displayed in the instrument cluster the driver must take the appropriate action, but only when it is safe to do so. An amber warning light indicates a secondary warning. Secondary warnings must be reported to a Jaguar Dealer and investigated at the drivers earliest opportunity. Failure to follow these instructions may result in damage to the vehicle.

When warning messages are displayed they have an associated warning light, red or amber, located within the instrument cluster which will come on to indicate the message priority. If more than one message is active, each message will be displayed in turn for 2 seconds in order of priority.

Ignition Lock Cylinder (North America Only)

An audible warning will sound continuously when the drivers door is open and the key is in the ignition lock cylinder, on removal of the key the audible warning will stop.

Luggage Compartment Switch

The luggage compartment switch will activate a visual warning when the ignition lock cylinder is in the ON position and the luggage compartment is ajar.

Door Ajar Switches

The door ajar switches will activate a visual warning when the ignition lock cylinder is in the ON position and any of the doors are ajar.

Headlamp Switch

An audible warning will sound continuously when the driver door is ajar and the vehicle lamps are on. The audible warning is provided whether the key is in or out of the ignition lock cylinder and will cease after five minutes or when the lamps are switched off or when the door is closed.

Direction Indicators

An audible warning and a flashing green arrow on the instrument cluster indicates that the selected direction indicator is on. If a direction indicator lamp should fail, the audible warning will sound at twice the normal speed and the corresponding flashing green arrow will flash at twice the normal speed.

Hazard Warning

An audible warning and both flashing green arrows on the instrument cluster indicates that the hazard warning lights are on, also the hazard warning light switch symbol will be illuminated and flashing.

Safety Belt Reminder

The safety belt reminder switch is an integral part of the front safety belt buckle. An audible warning will sound continuously for approximately six seconds (North America only) when the driver turns the ignition lock cylinder to the ON position and the safety belt is not engaged, a warning lamp will also be illuminated and show continuously (the warning lamp will illuminate for one minute only in North America). The audible warning and warning lamp will cease if the safety belt is engaged. (If only the driver is present the safety belt warning will relate only to the driver. If both front seats are occupied the safety belt reminder will relate to both front seats). The passenger seat weight sensor is used to determine if the passenger seat is occupied.

Beltminder
The beltminder function is an additional warning to the safety belt reminder. Under the conditions where a front seat occupant is unbelted or becomes unbelted and the vehicle is moving above 16 km/h (10 mile/h) then an additional audible warning of an intermittent tone will start accompanied by the safety belt warning lamp flashing. The intermittent audible warning and flashing lamp will last for 10 seconds and will repeat every 30 seconds for five minutes. The additional warnings will stop when all occupants seated in the front of the vehicle have their safety belts fastened or if the vehicle speed drops below 5 km/h (3 mile/h).

North American Beltminder

The system will function the same as for European beltminder after 75 seconds.

Beltminder Disabling

This process is common to both European and North American beltminder.

**NOTE:** Steps two to five must be completed within 60 seconds.

1. Turn the ignition lock cylinder to the **ON** position (do not start the engine).
2. Buckle the driver safety belt buckle and wait until the safety belt warning lamp extinguishes.
3. Unbuckle the driver safety belt buckle and wait until the safety belt warning lamp illuminates.
4. Repeat Steps three and four a further eight times.
5. When the driver safety belt buckle is unbuckled for the ninth time a single audible warning will sound. The single audible warning is acknowledgment that the beltminder feature has been disabled.

The beltminder feature will be disabled until the above process (steps one to six) are repeated. Upon repeating the process the beltminder feature will be reactivated.

**Air Bag Inactive Warning**

If a fault is present in the supplementary restraints system and the warning lamp in the instrument cluster is inoperative, then the restraints control module will send a signal to the instrument cluster to activate an audible warning. The audible warning will not sound for the first 90 seconds when the ignition lock cylinder is in the **ON** position. The audible warning will then sound continuously for 5 seconds and stay silent for 5 seconds, this sequence repeats 5 times and the function will repeat every 30 minutes until the fault has been rectified.

**Parking Brake Warning**

Operation of the parking brake when the vehicle is in motion will cause the message 'PARKBRAKE ON' to be displayed in the message center, the warning lamp in the instrument cluster will be displayed and an audible warning will sound.

**Parking Aid**

**CAUTION:** It is the drivers responsibility to check for any obstacles and judge the vehicles distance from them. Overhanging objects, barriers, thin obstructions or painted surfaces may not be detected by the vehicles parking aid. Failure to follow this instruction may result in damage to the vehicle.

**NOTE:** Front parking aid will also operate when reverse gear is selected.

Parking aid provides an audible proximity warning when parking. If an obstacle is detected at the front or rear of the vehicle, an audible warning will sound from the front or rear speakers respectively, the audible warning will increase in speed as the vehicle approaches the obstacle. The front and rear parking aid audible warning will become continuous when an object is detected at or within 300 mm (12 inch) from the rear of the vehicle or approximately 250 mm (10 inch) from the front of the vehicle. If the parking aid has a fault when engaging reverse gear or switching the ignition lock cylinder to the **ON** position, a single 3 second audible warning will sound. Parking aid will be automatically disabled as soon as a fault is detected.

**Adaptive Cruise Control (ACC)**

**WARNING:** It is the drivers responsibility to slow the vehicle down when the 'DRIVER INTERVENE' message is displayed in the message center. Failure to follow this instruction may result in personal injury.

**CAUTION:** It is the drivers responsibility to slow the vehicle down when the 'DRIVER INTERVENE' message is displayed in the message center. Failure to follow this instruction may result in damage to the vehicle.

If adaptive cruise control (ACC) is active, an amber warning light is illuminated to indicate that the vehicle is in 'FOLLOW MODE' and is automatically maintaining the set distance from the vehicle immediately ahead. Maximum braking which is applied to the ACC system is limited and can be overridden by the driver applying the brakes. If the ACC system predicts that it's maximum braking level will not be sufficient, an audible warning will sound and the message 'DRIVER INTERVENE' will be displayed in the message center. If the vehicle speed decreases below 30 km/h (18 mile/h) the ACC system will be automatically switched off and the instrument warning light will go out. If the brakes have been applied by the ACC system, they will be slowly released, this will be accompanied by an audible warning, the message 'DRIVER INTERVENE' will again be displayed in the message center.

**Adaptive Cruise Control (ACC) Failure**

**WARNING:** It is the drivers responsibility to slow the vehicle down when the 'DRIVER INTERVENE' message is displayed in the message center. Failure to follow this instruction may result in personal injury.

**CAUTION:** It is the drivers responsibility to slow the vehicle down when the 'DRIVER INTERVENE' message is displayed in the message center. Failure to follow this instruction may result in damage to the vehicle.

If a fault occurs during the operation of the ACC system in 'CRUISE' or 'FOLLOW' modes, the ACC system will switch off and cannot be used until the fault is cleared. The message 'DRIVER INTERVENE' will be displayed briefly in the message center followed by the message...
'CRUISE NOT AVAILABLE'. If failure of the ACC or any related system occurs at any other time the message 'CRUISE NOT AVAILABLE' will be displayed and it will not be possible to active the ACC system. Accumulated debris, dirt, snow or ice on the ACC sensor or it's cover may inhibit the ACC operation. Fitting of a vehicle front protector or metallized badges may also affect ACC operation. If this occurs and audible warning will sound and the message 'DRIVER INTERVENE' will be briefly displayed in the message center followed by the message 'ACC SENSOR BLOCKED'. This will render the ACC system inactive.
Warning Devices - Warning Devices
Diagnosis and Testing

Inspection and Verification

1. **1.** Verify the customer concern.

2. **2.** Visually inspect for obvious signs of mechanical or electrical damage.

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **4.** If the cause is not visually evident, verify the symptom and refer to the Jaguar Approved Diagnostic System.
1. NOTE: Steps 2 to 5 must be completed within 3 seconds for successful service mode resetting.

• NOTE: Ignition key in the OFF position.

Press and hold down the trip computer CLEAR/RESET button.

2. Continue to hold down the trip computer CLEAR/RESET button and turn the ignition switch to the ON position.

3. Release the trip computer CLEAR/RESET button.

4. Press and hold down the trip computer TRIP button located on the left-hand steering column multifunction switch.

5. Continue to hold down the trip computer TRIP button and press and hold down the trip computer CLEAR/RESET button.

6. Continue to hold down the trip computer TRIP and CLEAR/RESET buttons, RESETTING SERVICE MODE will display in the information and message center if steps 2 to 5 are completed successfully.

7. After 10 seconds the information and message center will then display SERVICE MODE RESET once the process is complete.

8. NOTE: If the information and message center does NOT display SERVICE MODE RESET, steps 1 to 8 must be repeated.

Release the trip computer TRIP and CLEAR/RESET buttons and turn the ignition switch to the OFF position.
Parking Aid - Parking Aid

Description and Operation

Vehicles built up to 01/2004

The function of the parking aid is to provide an audible warning to the driver of the distance to obstacles near the rear bumper of the vehicle when reversing. The system provides an assistance to the driver when reversing in order to help avoid collision with obstacles.

The sensor range at the rear of the vehicle should be 1.8 meters. This should extend the full width of the rear bumper and reduce to 50cm at the vehicle corners. The vertical range is adequate to protect the highest and lowest points of the rear of the vehicle. The system will detect curbs with heights of at least 18cm. Obstacles, such as curbs, that are low enough to pass under the vehicle until they make contact with the tires will not be detected.

The system activates a specific speaker with a tone signifying the distance to the obstacle. The tone consists of a beep and defined space ratio which varies depending on the calculated distance. When the distance to the obstacle is less than 20cm the speaker tone is continuous.

Vehicles built 02/2004 onwards

</tbody>
</table>

The reversing aid is continuously in operation, unless towing when the system automatically switches off. If the reverse aid develops a fault the tone will sound continuously for three seconds when the ignition is switched on or the reverse gear is selected.
The function of the parking aid is to provide an audible warning to the driver of the distance to obstacles near the front and rear bumpers of the vehicle when parking. The system provides an assistance to the driver in order to help avoid collision with obstacles.

The sensor range at the front of the vehicle should be 0.8 meters. This should extend the full width of the front bumper and reduce to 60cm at the vehicle corners. The vertical range is adequate to protect the highest and lowest points of the front of the vehicle. The system will detect curbs with heights of at least 18cm. Obstacles, such as curbs, that are low enough to pass under the vehicle until they make contact with the tires will not be detected.

The sensor range at the rear of the vehicle should be 1.8 meters. This should extend the full width of the rear bumper and reduce to 60cm at the vehicle corners. The vertical range is adequate to protect the highest and lowest points of the rear of the vehicle. The system will detect curbs with heights of at least 18cm. Obstacles, such as curbs, that are low enough to pass under the vehicle until they make contact with the tires will not be detected.

The system activates a specific speaker at the front or the rear of the vehicle with a tone signifying the distance to the obstacle. The tone consists of a beep and defined space ratio which varies depending on the calculated distance. When the distance to the obstacle is less
than 20 cm (7.8 inches) the speaker tone is continuous.

The parking aid system comprises of:

- a module mounted in the spare wheel well just rearward of the spare tire.
- four rear bumper mounted sensors.
- four front bumper mounted sensors.
- two audible speakers, the rear mounted on the rear parcel shelf and the front incorporated in the instrument cluster.
- a cancellation switch that is mounted into the roof console. This is fitted for the driver to disable the system when in slow moving traffic. This stops the front parking aid continuously monitoring the vehicle in front.

The overhead console switch contains a Light Emitting Diode (LED) to inform the driver of the system status:

- LED **ON** - System Active
- LED **OFF** - System Inactive
- LED **FLASHING** - System Fault

The reverse parking aid is active when reverse gear is selected, unless towing (with a Jaguar approved towbar) when the system automatically switches off. If the parking aid system develops a fault the tone will sound continuously for three seconds when the ignition is switched on or when the reverse gear is selected, and the overhead console switch LED will flash.

The front parking aid remains inactive after the ignition is switched to the **ON** position until the overhead console switch is pressed or reverse gear is selected. The system will then remain active up to 15 kph (9.5 mph) in a forward gear, or until the overhead console switch is pressed. The front parking aid system becomes inactive if the overhead console switch is pressed while the system is active, or at all forward speeds above 15 kph (9.5 mph).
Parking Aid - Parking Aid
Diagnosis and Testing

Inspection and Verification

1. **Verify the customer concern.**
2. **Visually inspect for obvious signs of electrical damage.**

<table>
<thead>
<tr>
<th>Visual Inspection Chart</th>

</table>

3. **If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.**
4. **If the cause is not visually evident, verify the symptom and refer to the Jaguar Approved Diagnostic System.**
Parking Aid - Front Parking Aid Sensor
Vehicles Built From: 02/2004

Removal

1. Remove the front bumper cover. For additional information, refer to: Front Bumper Cover (501-19 Bumpers, Removal and Installation).
2. Disconnect the electrical connector.

3. CAUTION: Make sure excessive pressure or tools are not used when removing the front parking aid sensor from the housing.

   Remove the front parking aid sensor.

Installation

1. To install, reverse the removal procedure.
Parking Aid - Parking Aid Module
Removal and Installation

**Removal**

All vehicles

1. Remove the spare wheel.

Vehicles built up to 01/2004

2. Disconnect the electrical connector.

Vehicles built 02/2004 onwards

3. Detach the harness.

   1. Disconnect the electrical connectors.
   2. Detach the harness.

All vehicles

4. Remove the parking aid module.

**Installation**

1. To install, reverse the removal procedure.
Parking Aid - Parking Aid Speaker
Removal and Installation

Removal

1. Remove the parcel shelf. For additional information, refer to Section 501-05 Interior Trim and Ornamentation.
2. Disconnect the electrical connector.
3. Remove the parking aid speaker.

Installation

1. To install, reverse the removal procedure.
Parking Aid - Rear Parking Aid Sensor
Vehicles Built From: 02/2004

Removal

1. Remove the rear bumper cover. For additional information, refer to: Rear Bumper Cover (501-19 Bumpers, Removal and Installation).
2. Disconnect the electrical connector.

3. **CAUTION:** Make sure excessive pressure or tools are not used when removing the rear parking aid sensor from the housing.

   Remove the rear parking aid sensor.

Installation

1. To install, reverse the removal procedure.
Removal

1. Remove the rear bumper cover. For additional information, refer to Section 501-19 Bumpers.
2. Disconnect the electrical connector.

3. **CAUTION:** Make sure excessive pressure or tools are not used when removing the parking aid sensor from the housing.

Remove the parking aid sensor.

Installation

1. To install, reverse the removal procedure.
Battery and Charging System - General Information - Charging System

Description and Operation

The charging system for vehicles fitted with 2.5L or 3.0L engines consist of a 120 amp output, L3B, generator and regulator assembly. Vehicles fitted with 2.7L Diesel engines consist of a 150 amp output, SC2, generator and regulator assembly. Vehicles fitted with 4.2L engines consist of a 130 amp output, SC1, generator and regulator assembly. The generator and regulator assembly generates electrical power to the vehicle electrical system with electricity when the engine is running and maintain the battery in a charged state.

The generator is belt driven by the accessory drive belt. For additional information, refer to: Accessory Drive (303-05 Accessory Drive, Description and Operation).

When the engine is started, the generator begins to generate alternating current (AC) which is converted to direct current (DC) internally. The DC current and voltage is controlled by the voltage regulator, located inside the generator, and then supplied to the battery through the main battery positive cable.

The 2.5L/3.0L and 2.7L Diesel generators are solidly mounted to the engine, while the 4.2L generator is pivot mounted. The generators are driven at approximately three times engine speed.

Vehicles fitted with 2.5L or 3.0L engine (L3B generator)

Vehicles fitted with manual transmission have a one way clutch fitted to the drive pulley, which reduces belt slip.

The Engine control module (ECM) can switch the voltage regulator between two voltages to optimize the charging of the battery.

The low voltage regulator setting is 13.6 volts and the high voltage regulator setting 15.3 volts, measured with the generator at 25 degrees centigrade (77 degrees Fahrenheit) and charging at a rate of 5 amps. These values decrease with a rise in temperature or current flow.

The ECM determines the output voltage setting of the generator. The high voltage setting is always selected by the ECM once the vehicle has started. The ECM determines the period of time that the high voltage setting is selected for.

There are three different time periods selected by the ECM which is dependent upon the vehicle conditions when the vehicle is started:

- The longest period of time is selected if the ECM determines that the vehicle has been 'soaking' for sufficient time to allow the engine coolant temperature (ECT) and the air intake temperature (IAT) to fall within 6 degrees centigrade (43 degrees Fahrenheit) of each other.
- The intermediate time period is selected when the ECT and the IAT is below 15 degrees centigrade (59 degrees Fahrenheit).
- The shortest time period is the default time and is used to provide a short period of boost charge.

At the end of these time periods the voltage is always set to the low voltage setting to prevent the battery from being over charged.

The time periods are variable depending upon the temperature and battery voltage. The target voltage of the battery varies between 14 volts and 15 volts depending upon the ambient temperature and the vehicle operating conditions.

The ECM determines the output voltage setting of the generator. The high voltage setting is always selected by the ECM once the vehicle has started. The ECM determines the period of time that the high voltage setting is selected for.

Vehicles fitted with 2.7L Diesel engine (SC2 generator)

All vehicles use a PCM (Pulse Control Modulated) generator. This allows the output voltage to be controlled between 12.5 & 16V via a signal from the ECM.

This voltage is controlled between 13.5V & 15.5V. The system voltage is tailored more closely to the demands of the battery. At low ambient temperatures (as measured by the air conditioning ambient air sensor), the charging voltage is higher to improve charge acceptance. At high ambient temperatures the voltage is lower to reduce electrolyte loss and unnecessary battery self-heating. Also built into the strategy, is the ability to measure the battery voltage at Ignition On. A battery with low voltage at Ignition On is boosted charged at a higher voltage for a calculated time before returning to its 'Base Characteristic' (defined by the prevailing ambient temperatures). The time and boost voltage depends upon the temperature and battery voltage at Ignition On.

All vehicles have a one way clutch fitted to the drive pulley, which reduces belt slip.

Vehicles fitted with 4.2L engine (SC1 generator)

The battery charging voltage is determined by the temperature of the generator. In cold conditions, starting the vehicle from cold the battery voltage will be between 14.2 volts and 15.1 volts and will reduce as the engine warms up. In hot conditions starting the vehicle when the engine is already warm the battery voltage will be between 13.5 volts and 14.3 volts.

A fault in the wiring or the connections from the generator to the ECM, will cause a fault code to be generated and stored in the ECM and the charge warning indicator lamp to be displayed in the instrument cluster after a short time.

With the ignition switch in the RUN position the charge warning lamp will be displayed in the instrument cluster when the generator is not generating power.

If a fault is detected with the generator a fault code will be generated and stored by the ECM. The charge warning indicator lamp will also be displayed in the IC. Units should be repaired as an assembly and not dismantled for repair.

For additional information, refer to: Generator (414-02 Generator and Regulator, Description and Operation).
12V LEAD ACID BATTERY CARE MANUAL FOR DEALER / RETAILER USE

DESCRIPTION AND OPERATION

INTRODUCTION

This publication sets out, for the benefit of dealers / retailers worldwide, requirements for the care and maintenance of batteries, from the vehicles hand-over to the dealer / retailer to the handover to the customer or in the case of a spare part battery from is delivery to the dealer / retailer to its fitment to a customer vehicle.

It applies to all types of 12 volt Lead Acid Batteries used, whether they are conventional flooded technology or Absorbed Glass Mat (AGM) technology and also applies to both Primary and Secondary or Auxiliary Batteries.

The clearly laid out and illustrated sections guide dealers / retailers through each stage of the vehicles or spare parts receipt, storage, pre-delivery and customer hand-over. This publication can be used as a guide to the handling and care of batteries in service. It is vital to appreciate that unless each process is rigorously applied on all vehicles, the customer will receive a vehicle with a battery or a spare part battery which will not provide a satisfactory service life.

It is very important that all tests quoted throughout this publication are adhered to. If they are applied incorrectly batteries could be scrapped unnecessarily. Refer to the battery testing section for detailed information.

It is equally important therefore to note the following key points:

- Most new vehicles leave the factory with either a transit relay installed and/or have a transit mode programmed into the vehicle control modules. The transit relay must be removed and the transit mode disabled (where applicable) using an approved diagnostic system, NOT MORE THAN 24 HOURS before the customer takes delivery.
- 12 Volt Lead Acid Batteries rely on internal chemical processes to create a voltage and deliver current. These processes and the internal chemical structure of the battery can be damaged if the battery is allowed to discharge over a number of weeks / months, or is left in a discharged state for a lengthy time period. For this reason the battery must be tested / re-charged if necessary every month, and MUST BE re-charged after every three month period of storage. Refer to the vehicle storage manual and update the vehicle history sheet.
- Under no circumstances should the battery be disconnected with the engine running because under these conditions the alternator can give a very high output voltage. This high transient voltage will damage the electronic components in the vehicle. Loose or incomplete battery connections may also cause high transient voltage.
- On vehicles with conventional ignition keys, these must not be left in the ignition lock barrel when the transit relay has been removed, otherwise quiescent current will increase and the battery will discharge more rapidly.
- Two types of Lead acid batteries are used; standard Flooded type and AGM (Absorbed Glass Mat) or VRLA (Valve regulated Lead Acid) types. AGM batteries offer improved resistance to cycling as seen in stop start applications. AGM Batteries are fully sealed and cannot have the electrolyte level topped up.

Dealers and retailers involved in the storage, handling of vehicles and spare parts batteries have a responsibility to ensure that only vehicles and spare parts having a fully satisfactory battery may be processed further through the distribution selling chain.

NOTE: It is very important that test processes quoted throughout this publication are adhered to.

If they are not adhered to correctly batteries could be scrapped unnecessarily or a battery with an issue remains in use. Refer to the battery testing section for detailed information.

2. GENERAL RULES FOR BATTERY CARE

FREQUENCY OF BATTERY CONDITION CHECKS.

Any battery in storage whether it is in a vehicle or in spare parts inventory must have its charge status checked every 30 days as described in Appendix A, and must be recharged every 90 days as described in the "Battery Charging and Maintenance" section of this manual.

DEALER DEMONSTRATION VEHICLES

Due to the high depth of discharge a dealer demonstration vehicle battery may experience, batteries that are fitted to vehicles used as dealer demonstration vehicles must be connected to a power supply / charger capable of delivering 50 Amps or more whilst the vehicle is being demonstrated and the engine is not running. This will prevent the battery from being damaged from "energy throughput " wear out during a demonstration.

SOFTWARE REFLESH, SDD WORK OR IGNITION ON RELATED WORKSHOP ACTIVITIES.

Due to the high electrical current demand and high depth of Discharge that can occur during vehicle software re-flash activities, SDD work or ignition on related work in the workshop, vehicles that are undergoing such activities MUST have the electrical system on the vehicle...
Jump Starting New vehicles Before They Have Been Delivered to the Customer.

- It is the dealer / retailers responsibility to ensure the battery is not allowed to go flat by following the instructions and processes defined in this manual.
- However if circumstances dictate that a new vehicle must be jump started due to a flat battery whilst the vehicle is in the dealer / retailers care, the battery on this vehicle must be replaced with a new one prior to delivery to the customer at the dealer / retailers liability.
- The vehicle should also undergo investigation as to why the battery went flat.
- Do not connect the jump starting cable to the negative (-) terminal of the battery. Always connect to the recommended earthing point. As defined in the owners handbook or service documentation for that vehicle.

Jump Starting or Boost Charging Vehicles in Service

Do not connect the jump starting cable to the negative (-) terminal of the battery. Always connect to the recommended earthing point. As defined in the owners handbook or service documentation for that vehicle.

Charging AGM Batteries

AGM batteries must not be charged with voltages above 14.8 Volts. Doing so will damage them.

Testing AGM Batteries

Midtronics 393, 394, 493 and 494 testers are not capable of testing AGM batteries. Doing so can give an incorrect result.

When it is necessary to test an AGM battery use the Midtronics EXP1080 tester or the GR1 Diagnostics Charger.

3. EQUIPMENT (MINIMUM STANDARD) (pictures are for illustration only)

Traction Battery Charger (or similar stand-alone charger)
Digital Multi-Meter or Digital Volt-Ohm Meter (DVOM)

Midtronics GR-1 Diagnostic Charger
4. HEALTH AND SAFETY PRECAUTIONS

• WARNINGS:

**BATTERY CELLS CONTAIN SULPHURIC ACID AND EXPLOSIVE MIXTURES OF HYDROGEN AND OXYGEN GASES. IT IS THEREFORE ESSENTIAL THAT THE FOLLOWING SAFETY PRECAUTIONS ARE OBSERVED.**

**Batteries emit highly explosive hydrogen at all times, particularly during charging. To prevent any potential form of ignition occurring when working in the vicinity of a battery:**

- Do not smoke when working near batteries.
- Avoid sparks, short circuits or other sources of ignition in the battery vicinity.
- Switch off current before making or breaking electrical connections.
- Ensure battery charging area is well ventilated.
- Ensure the charger is switched off when: a) connecting to a battery; b) disconnecting from the battery.
- Always disconnect the ground cable from the battery terminal first and reconnect it last.

**Batteries contain poisonous and highly corrosive acid. To prevent personal injury, or damage to clothing or the vehicle, the following working practices should be followed when topping up, checking electrolyte specific gravity, removal, refitting or carrying batteries:**

- Always wear suitable protective clothing (an apron or similar), safety glasses, a face mask and suitable gloves.
- If acid is spilled or splashed onto clothing or the body, it must be neutralized immediately and then rinsed with clean water. A solution of baking soda or household ammonia and water may be used as a neutralizer.
- In the event of contact with the skin, drench the affected area with water. In the case of contact with the eyes, bathe the affected area with cool clean water for approximately 15 minutes and seek urgent medical attention.
- If battery acid is spilled or splashed on any surface of a vehicle, it should be neutralized and rinsed with clean water.
- Heat is generated when acid is mixed with water. If it becomes necessary to prepare electrolyte of a desired specific gravity, SLOWLY pour the concentrated acid into water (not water into acid), adding small amounts of acid while stirring. Allow the electrolyte to cool if noticeable heat develops. With the exception of lead or lead-lined containers, always use non-metallic receptacles or funnels. Do not store acid in excessively warm locations or in direct sunlight.

**Due to their hazardous contents, the disposal of batteries is strictly controlled. When a battery is scrapped, ensure it is disposed of safely, complying with local environmental regulations. If in doubt, contact your local authority for advice on disposal facilities.**

5. DETERMINING BATTERY CONDITION

The tools used for determining the condition of the battery will depend upon whether it is installed in a vehicle or in spare parts inventory. Concerning an installed battery, procedures will vary if the vehicle is new, or already in service with a customer.

- NOTE: The term 'New Vehicle' refers to a vehicle at any part of the delivery process from leaving the factory to arriving at a port of entry, dealership, retailer, including any storage facilities en route or a vehicle being stored prior to sale at dealership/retailer.

- NOTE: Midtronics 393, 394, 493 and 494 testers must not be used to test AGM batteries as these testers are not capable of correctly testing AGM batteries and can give an incorrect result. For AGM battery testing use the EXP1080 tester or the GR1 Diagnostics charger.

NEW VEHICLES

A Midtronics tester should be used to assess the condition of the battery for new vehicles. The test results should be recorded on the Storage History Sheet (see Vehicle Storage manual).
Scenario 1 - Dealership / Retailer (Responsibility: Dealer / Retailer)

1. Within 24 hours of arrival at the dealer / retailer proceed as follows:
   - Perform a Midtronics battery test (See Appendix A.)
   - Carry out the recommended actions accordingly.

2. If the Midtronics result is “Good Battery” the vehicle may be stored.
   - For all new vehicles in storage the transit relay MUST be fitted, or the Transit Mode enabled where used. For vehicles without a transit relay or a Transit Mode, the battery negative cable MUST BE DISCONNECTED from the battery.

3. The battery must be tested and/or re-charged every month and MUST be re-charged after every three month period.

4. Record your test results on the Storage History Sheet (see Vehicle Storage Manual) to indicate when a re-charge will be necessary.

Scenario 2 - Delivery to the Customer (Responsibility: Dealer / Retailer)

• NOTE: It is essential that the following actions are conducted in the 24 hours prior to the agreed hand over time:

1. Perform a Midtronics Battery test (See Appendix A).

2. Carry out the recommended actions accordingly.

3. The vehicle should only be released to the customer if Midtronics has tested the battery as “Good Battery”

Spare Part Batteries

Lead acid batteries will, as a result of natural chemical processes, slowly self discharge themselves over a period of time (even when open circuit and no electrical load applied).

In the case of spare parts batteries, a Midtronics tester should be used to assess the condition of new spare parts batteries.

The batteries must be stored such that they cannot get wet and are not in direct sunlight.

Any batteries which are dropped must be scrapped. This applies even if no external damage is apparent.

Scenario 1 - Spare Part Batteries Within Dealer Stock But Not Yet Fitted To A Vehicle (Responsibility: Dealer / Retailer)

1. For a battery in the Dealer parts or in ready to use stock but not yet fitted to a vehicle the following rules must be followed:
   - Check the battery condition on receipt by performing a Midtronics battery test (See Appendix A).
   - The battery condition should be rechecked every 30 days by performing a Midtronics battery test (See Appendix A).
   - If required batteries should be recharged as described in the "Battery Charging and Maintenance" section of this manual.

2. All batteries must be controlled via a FIFO (First In First Out) process to ensure aged batteries are not held and the batteries are not allowed to age unnecessarily.

VEHICLES IN SERVICE

The Midtronics hand-held tester or the Midtronics Diagnostic Charger are the preferred tools to assess battery condition for vehicles in service. The test results should be recorded on the In-Service Battery Report Form (See Appendix B).

Midtronics Testing - In-Service Testing Only

• NOTE: The battery surface charge must be removed before this test in accordance with the procedure in Appendix A. Ensure that the battery terminal connectors are clean. When connecting the Midtronics testing equipment, connect the RED clip to the positive (+) battery terminal first, and then connect the BLACK clip to the negative (-) battery terminal. Rock the clips backward and forward to ensure a good connection to the battery.

1. Perform a Midtronics battery test (See Appendix A).

2. Carry out the recommended actions accordingly.

6. BATTERY CHARGING AND MAINTENANCE

BATTERY CHARGING
It is essential that a suitably ventilated defined area exists in each dealership / retailer for battery charging. Likewise, an area should be allotted for scrap batteries, and clearly indicated as such. It is recommended that dealers / retailers always have fully charged batteries ready for use. However the battery MUST BE tested and charged if necessary every month, and charged after three months irrespective of any test.

**CAUTIONS:**

- Batteries must be re-charged after a maximum of 3 months storage (see Storage History sheet in the New Vehicle Storage Manual).

- It is very important that when charging batteries using the traction charger or other stand-alone chargers that the charger is set for the correct type of battery before charging commences. If the wrong switch is selected the result would be a battery that is not charged fully and / or overheating can occur. Follow the manufacturers operating instructions.

- Do not charge AGM batteries with voltages over 14.8 volts as this will damage the battery.

To bring a serviceable but discharged battery back to a fully charged condition proceed as follows:

- Check and if necessary top-up the battery electrolyte level.
- Charge the battery using the Midtronics Diagnostic Charger (USA) or Traction Charger (all other markets) following the manufacturers operating instructions.

**NOTE:** When using the Midtronics Diagnostic Charger, automatic mode must always be used. After charging and analysis, the charger may display ‘Top-Off Charging’, press STOP to end. Do not stop charging until the current falls to 5A or less, otherwise the battery will not be fully charged.

**POST-CHARGE TEST METHODS**

**New Batteries, Batteries in Storage and In-Service Batteries**

The purpose of this test is to ensure that the charging process has fully charged the battery.

**NOTE:** IT IS RECOMMENDED THAT THIS TEST IS CONDUCTED AT LEAST 24 HOURS AFTER THE CHARGE CYCLE IS COMPLETED.
CAUTION: DO NOT connect the tester to any other circuit or chassis point.

1. Attach the Midtronics Tester to the battery.
2. Follow the instructions on the tester to test the battery. Ensure the correct battery type and size is selected.
3. Perform the action based on the tester results (see the tester results chart in the Vehicles in Service sub-section of Determining Battery Condition Section).
4. Enter the readings and test code obtained on the In Service Battery Report Form.

• NOTE: Midtronics 393, 394, 493 and 494 testers must not be used to test AGM batteries as these testers are not capable of correctly testing AGM batteries and can give an incorrect result. For AGM battery testing use the EXP1080 tester or the GR1 Diagnostics charger.

BATTERY REPLACEMENT

If it is determined that a battery requires replacement, always refer to the appropriate section of the workshop manual for instructions on removing and installing the battery from the vehicle.

On in service vehicles fitted with a Battery Monitoring System (BMS), the BMS module must be reset following the installation of a new battery. The BMS module reset procedure must be performed using an approved diagnostic system.

CHECK/TOP-UP BATTERY ELECTROLYTE – Only Applicable to certain Flooded Types of Battery.

• WARNINGS:

AGM TECHNOLOGY BATTERIES ARE FULLY SEALED FOR LIFE AND NO ATTEMPT SHOULD BE MADE TO CHECK OR TOP UP THE ELECTROLYTE LEVEL.

BEFORE CHECKING AND TOPPING-UP THE BATTERY ELECTROLYTE, REFER TO THE HEALTH AND SAFETY PRECAUTIONS SECTION.

Check to ensure the battery is of a type suitable for topping up. These types of batteries will have cell plugs visible on the top face of the battery or a removable access panel to allow access to the cells.

On batteries with a clear or opaque case and level marks, check the electrolyte level by visual inspection of the maximum level indicator mark on the battery casing indicating adequate level above the battery separators.

On batteries with black cases, remove the cell plugs or access panel and ensure the electrolyte level is level with the indicator in the cell hole. A flashlight may be required to see the electrolyte level on this type of battery.

CAUTION: DO NOT overfill.

If the electrolyte level is low, top-up using distilled water.

Maintenance free and Valve Regulated (AGM) batteries are sealed and therefore cannot be topped up.

CHARGING SYSTEM TEST AND DIAGNOSIS

For all vehicles, refer to the Charging System - Diagnosis and Testing in section 414-00 of the Workshop Manual.

VEHICLE QUIESCENT CURRENT TESTING
NOTE: On vehicles fitted with a Battery Monitoring System (BMS), the diagnostic routine for quiescent drain testing in the approved diagnostic system should be utilized.

NOTE: If a customer complains of a vehicle battery that discharges continuously or when left for a prolonged period of time, it is recommended that a quiescent drain test is performed as described below.

NOTE: The battery drain should be measured using an approved diagnostic system or a Digital Multi-Meter (DVOM).

The vehicle should be in the locked/armed state (for example vehicle alarm fully armed), all doors, engine and luggage compartment lids are open and latched (so as to appear closed from an electrical point of view). The test should take place after the vehicle has entered shutdown mode. The time taken for this to occur after the ignition is switched off varies according to model - Refer to Quiescent Drain in section 414-00 of the Workshop Manual.

NOTE: When the vehicle is armed, the effect of the security system Light Emitting Diode (LED) flashing is to cause a pulsation in the measured current drain. In this case, either the average current should be taken (using a Digital Multi-Meter (DVOM) with an averaging system) or the current reading taken, ignoring the brief high current peaks.

EQUIPMENT

Approved diagnostic system with current probe or Digital Multi-Meter (DVOM) with current probe.

METHOD OF MEASUREMENT

Using an Approved Diagnostic System

1. Switch off all electrical loads and ensure that the ignition is off.
2. Connect the current probe to the approved diagnostic system.
3. Calibrate the probe.
4. Install a clamp around the battery lead/junction box lead.
5. Go to the Quiescent Current Testing section.

Using a Digital Multi-Meter (DVOM)

• NOTE: Do not use an in-line DVOM to measure the quiescent drain on vehicles fitted with an electronic throttle. The current exceeds the maximum amount the fuse in the DVOM is capable of handling.
1. Switch off all electrical loads and ensure that the ignition is off.
2. Connect the current probe to the DVOM.
3. Calibrate the probe.
4. Install a clamp around the battery lead/junction box lead.
5. Go to the following Quiescent Current Testing section.

QUIESCENT CURRENT TESTING

1. Switch ignition to 'on' or select ignition mode in keyless vehicles and switch to 'off' (do not crank).
2. Remove key from ignition switch (where applicable).
3. Open and latch all doors, hood and luggage compartment lid.
4. Record the amperage readings after the shutdown period. The model specific Amperage readings for quiescent drain are referenced in Quiescent Drain in section 414-00 of the Workshop Manual
5. Record the final reading on the battery report form Appendix B.

• NOTE: The preferred method of testing following an excessive current consumption figure is to use a current probe around individual junction box leads to the various suspected circuits to identify a potential cause. This is in preference to the old method of removing fuses for the following reasons:
  • Many modules take a considerable time to power down. Each time a fuse is removed and re-fitted, the quiescent drain current may take an extended period of time to return to normal (typically up to 45 minutes).
  • The drain may be caused by a module remaining active and preventing the quiescent drain from reducing to normal levels.
  • The drain may be caused by a relay winding that is activated. Pulling the fuse can allow this to 'reset' and the drain will be lost and go un-diagnosed.

APPENDIX A BATTERY TEST PROCESS

It is recommended that this test is conducted at least 24 hours after the vehicle engine has been run or the battery charged to avoid the need of surface charge removal or if this time constraint is unacceptable due to circumstances, then conduct the charge strip removal process.

Part 1 - Surface Charge Removal

• NOTE: Before carrying out a battery test you must ensure that there is no battery surface charge present.

• NOTE: The battery may be tested either on a bench or on the vehicle.
  • In the case of on-vehicle testing, the battery must be isolated from the vehicle by removal of the battery negative (-) cable from the battery terminal before the measurement is taken unless the vehicle has a transit relay fitted or is in transit mode.

A vehicle which has had its battery charged or been driven in a 24 hour period before the test, must have its surface charge removed using one of the following methods:
1. If 24 hours have passed since the last time the engine was run or the battery charged, proceed to ‘Part 2 - Battery Test’.
2. Turn on the ignition. Switch on the headlamps on high beam for a minimum 3 minutes.
3. Switch off the headlamps. For vehicles tested after the transit relay has been removed, disconnect the battery by removal of the negative (-) cable. Vehicles with a transit relay fitted or with a low current transport mode enabled do not need to have the battery disconnected.
4. Wait a maximum of 5 minutes before recording test results for any battery measurements.

**Part 2 - Battery Test**

- NOTE: The battery surface charge must be removed before this test in accordance with the procedure in Part 1 above. Ensure that the battery terminal connectors are clean. When connecting the Midtronics testing equipment, connect the RED clip to the positive (+) battery terminal first, and then connect the BLACK clip to the negative (-) battery terminal. Rock the clips backward and forward to ensure a good connection to the battery.
- NOTE: Midtronics 393, 394, 493 and 494 testers must not be used to test AGM batteries as these testers are not capable of correctly testing AGM batteries and can give an incorrect result. For AGM battery testing use the EXP1080 tester or the GR1 Diagnostics charger.

**CAUTION:** DO NOT connect the tester to any other circuit or chassis point other than the battery negative terminal.

1. Attach the Midtronics tester to the battery.
2. Follow the instructions on the tester to test the battery. Ensure the correct battery type and size is selected.
3. Perform the action based on the tester results (see table below).
4. Enter the readings and test code obtained on the Battery Report Form (Appendix B) or equivalent which records as a minimum the technician's name, Vehicle Identification Number (VIN), Date of check, Midtronics code and Battery Voltage from the Midtronics tester.

At the end of the test, the battery negative (-) cable should be re-attached to the battery terminal.

**Diagnostics (Battery Testing)**

1. Loose battery clamps Yes * No
2. Loose hold down clamps Yes No
3. Corroded terminal posts Yes * No
4. Physical damage/leaks Yes No
5. Low electrolyte Yes * No
6. FEAD belt tension OK * Not OK
7. Surface charge removed Yes * No
8. Voltage (appendix A) Yes * No
9. Quiescent Drain mA *
10. Vent tube correctly installed Yes No
11. Midtronics test Code before charging *

If Midtronics indicates that the battery needs re-charging, charge the battery for 24 hours.

Code after charge *

Result after charge *

If "good and re-charge" charge the battery for an additional 24 hours.

If "charge and re-test" for both before and after 24 hours charge renew the battery.

Only renew the battery if "renew battery", "bad cell" or charge and re-test has been displayed twice.

PINPOINT TEST A : LOW INPUT ON THE VOLTAGE REQUEST SIGNAL WIRE FROM THE ECM (P1146). VEHICLES FITTED WITH 2.5L OR 3.0L ENGINE.

TEST CONDITIONS

A1: CHECK THE VOLTAGE REGULATOR REQUEST SIGNAL WIRE FOR A SHORT TO GROUND
1 Disconnect the ECM electrical connector P11 and the generator electrical connector PI47.
2 Measure the resistance between electrical connector or PI47 pin 1 (YR) and ground.

 Is the resistance less than 10,000 ohms?
Yes
REPAIR short to ground between the generator and the ECM. CLEAR the DTC. TEST the system for normal operation.
No
GO to A2.

A2: CHECK THE VOLTAGE REGULATOR REQUEST SIGNAL WIRE FOR OPEN CIRCUIT
1 Measure the resistance between electrical connector PI47 pin 1 (YR) and ECM electrical connector P11 pin 53 (SR).

 Is the resistance less than 5 ohms?
Yes
GO to A3.
No
REPAIR the circuit from the ECM to the generator. CLEAR the DTC. TEST the system for normal operation.

A3: CHECK THE OPERATION OF THE GENERATOR CHARGE WARNING INDICATOR LAMP
1 Connect the ECM electrical connector P11 and the generator electrical connector or PI47.
2 CLEAR the DTC. START and RUN the engine at 1500 RPM with no electrical load applied.

 Does the generator charge warning indicator lamp illuminate within 30 seconds of the engine being started?
Yes
INSTALL a new generator. CLEAR the DTC. TEST the system for normal operation. If the DTC is repeated INSTALL a new ECM. For additional information REFER to Section 303-14A Electronic Engine Controls / 303-14B Electronic Engine Controls / 303-14C Electronic Engine Controls.
No
GO to A4.

A4: CHECK THE OPERATION OF THE GENERATOR CHARGE WARNING INDICATOR LAMP AFTER 15 MINUTES
1 RUN the engine at idle for 15 minutes and then increase engine speed to 1500 RPM for one minute with no electrical load applied.

 Does the generator charge warning indicator lamp illuminate or is DTC repeated?
Yes
INSTALL a new generator. CLEAR the DTC. TEST the system for normal operation. If the DTC is repeated INSTALL a new ECM. For additional information REFER to Section 303-14A Electronic Engine Controls / 303-14B Electronic Engine Controls / 303-14C Electronic Engine Controls.
No
DIAGNOSE the ECM. For additional information REFER to Section 303-14A Electronic Engine Controls / 303-14B Electronic Engine Controls / 303-14C Electronic Engine Controls.

PINPOINT TEST B : GENERATOR OVERCHARGING (P1244). VEHICLES FITTED WITH 2.5L OR 3.0L ENGINE.

TEST CONDITIONS

B1: CHECK THE VOLTAGE REGULATOR REQUEST SIGNAL WIRE FOR A SHORT TO BATTERY POSITIVE
1 Disconnect the ECM electrical connector P11 and the generator connector PI47.
2 Measure the resistance between electrical connector or PI47 pin 1 (YR) and the generator battery positive cable.

 Is the resistance less than 10,000 ohms?
Yes
REPAIR short to the generator battery positive cable. CLEAR the DTC. TEST the system for normal operation.
No
GO to B2.

B2: CHECK THE VOLTAGE REGULATOR REQUEST SIGNAL WIRE FOR OPEN CIRCUIT
1 Measure the resistance between electrical PI1 pin 53 (YR) and PI47 pin 1 (YR).

 Is the resistance less than 5 ohms?
Yes
INSTALL a new generator. CLEAR the DTC. TEST the system for normal operation. If the DTC is repeated INSTALL a new ECM. For additional information REFER to Section 303-14A Electronic Engine Controls / 303-14B Electronic Engine Controls / 303-14C Electronic Engine Controls.
No
REPAIR the circuit from the ECM to the generator. CLEAR the DTC. TEST the system for normal operation.

PINPOINT TEST C : CHARGING SYSTEM FAILURE (1632). VEHICLES FITTED WITH 2.5L OR 3.0L ENGINE.

TEST CONDITIONS

C1: CHECK THE BATTERY VOLTAGE WITH THE ENGINE RUNNING AND NO ELECTRICAL LOADS APPLIED
1 START and RUN the engine at idle with no electrical load applied.
2 Measure the maximum battery voltage reached with in 5 minutes.

 Is the voltage less than 14.5 volts?
Yes
GO to C2.
No
GO to C6.

C2: CHECK THE BATTERY
1 Carry out a battery condition test.
Is the battery ok?
Yes
   GO to C3.
No
   INSTALL a new battery. CLEAR the DTC. TEST the system for normal operation.

C3: CHECK FOR BATTERY VOLTAGE AT PI 47 WITH ENGINE RUNNING AND NO ELECTRICAL LOADS APPLIED
1 START vehicle and allow to idle.
2 DISCONNECT the generator electrical connector PI 47
3 MEASURE the voltage at PI 47 pin 1 (YR) with in 5 minutes of vehicle start.
   Is the voltage more than 10 volts?
Yes
   GO to C9.
No
   GO to C4.

C4: CHECK THE VOLTAGE REGULATOR REQUEST (C TERMINAL) SIGNAL WIRE FOR A SHORT TO GROUND
1 Measure the resistance between electrical connector PI47 pin 1 (YR) and ground.
   Is the resistance less than 10,000 ohms?
Yes
   REPAIR the circuit from the ECM to the generator. Clear the DTC. TEST the system for normal operation.
No
   INSTALL a new generator. CLEAR the DTC. TEST the system for normal operation. If the DTC is repeated INSTALL a new ECM. For additional information REFER to Section 303-14A Electronic Engine Controls / 303-14B Electronic Engine Controls / 303-14C Electronic Engine Controls.

C5: CHECK CONTINUITY OF THE VOLTAGE REGULATOR REQUEST (C TERMINAL) SIGNAL WIRE
1 Disconnect the battery ground cable.
2 Disconnect the ECM electrical connector PI1 and the generator electrical or PI47.
3 Measure the resistance between electrical connector PI47 pin 1 (YR) and ECM electrical connector PI pin 53 (YR).
   Is the resistance less than 5 ohms?
Yes
   GO to C4.
No
   REPAIR the circuit from the ECM to the generator. Clear the DTC. TEST the system for normal operation.

C6: CHECK THE GENERATOR CHARGE WARNING INDICATOR LAMP AND COOLING FAN OPERATION WITH THE ENGINE RUNNING AT IDLE SPEED
1 START and RUN the engine at idle speed for 15 minutes with no electrical load applied.
   Is the generator charge warning indicator and the cooling fans operating at maximum speed?
Yes
   GO to C8.
No
   GO to C7.

C7: CHECK THE GENERATOR CHARGE WARNING INDICATOR LAMP AND COOLING FAN OPERATION WITH THE ENGINE RUNNING FOR A FURTHER MINUTE AT 1500 RPM
1 Increase the engine speed to 1500 RPM for one minute with no electrical load applied.
   Is the generator charge warning lamp illuminated and cooling fans operating at maximum speed?
Yes
   GO to C8.
No
   INSTALL a fully charged slave battery. CLEAR the DTC. TEST the system for normal operation.

C8: CHECK C TERMINAL FOR A SHORT TO BATTERY POSITIVE CABLE
1 Disconnect the battery ground cable.
2 Disconnect the ECM electrical connector PI1 and the generator electrical connector PI47.
3 Measure the resistance between the generator electrical connector PI47 pin 1 (YR) and the generator battery positive cable.
   Is the resistance less than 10,000 ohms?
Yes
   REPAIR the circuit from the ECM to the generator. CLEAR the DTC. TEST the system for normal operation.
No
   INSTALL a new generator. CLEAR the DTC. TEST the system for normal operation. If the DTC is repeated INSTALL a new ECM. For additional information REFER to Section 303-14A Electronic Engine Controls / 303-14B Electronic Engine Controls / 303-14C Electronic Engine Controls.

C9: CHECK THE GENERATOR 'L' TERMINAL WIRE FOR A SHORT TO GROUND
1 Measure the resistance between electrical connector PI47 pin 1 (YR) and ground.
   Is the resistance less than 10,000 ohms?
Yes
   REPAIR the circuit between the electrical connector PI47 pin 1 (YR) and the ECM. Clear the DTC. TEST the system for normal operation.
No
   GO to C10.

C10: CHECK THE GENERATOR 'L' TERMINAL WIRE FOR A SHORT TO BATTERY POSITIVE
1 Measure the resistance between electrical connector PI47 pin 1 (YR) and battery positive
   Is the resistance less than 10,000 ohms?
Yes
   REPAIR the circuit from the ECM to the generator. Clear the DTC. TEST the system for normal operation.
No
   GO to C11.

C11: CHECK THE CONTINUITY OF THE GENERATOR 'L' TERMINAL WIRE
1 Disconnect the battery ground cable.
2 Disconnect the ECM electrical connector PI1 and the generator electrical connector PI47.
3 Measure the resistance between PI1 pin 79 (YR) and PI47 pin 1 (YR).
   Is the resistance less than 5 ohms?
Yes
   INSTALL a new generator. TEST the system for normal operation. If the DTC is repeated INSTALL a new ECM. For additional information REFER to Section 303-14A Electronic Engine Controls / 303-14B Electronic Engine Controls / 303-14C Electronic Engine Controls.
No
   GO to C10.

<tr>
<td>2</td>
<td>MEASURE the voltage at generator electrical connector PI 47 pin 2 (GO)</td>
</tr>
</tbody>
</table>
Is the voltage more than 10 volts?
Yes  GO to E3.
No   REPAIR the circuit between the ignition switch and the generator electrical connector. CLEAR the DTC. TEST the system for normal operation.

E3: CHECK THE SIGNAL WIRE (FR) FOR A SHORT TO BATTERY POSITIVE
1  Disconnect the battery ground cable.
2  Measure the resistance between electrical connector PI47 pin 3 (WR) and the generator battery positive cable.

Is the resistance less than 10,000 ohms?
Yes  REPAIR the short to the generator battery positive cable. CLEAR the DTC. TEST the system for normal operation.
No  GO to E4.

E4: CHECK THE SIGNAL WIRE (FR) FOR A SHORT TO GROUND
1  Measure the resistance between electrical connector PI47 pin 3 (WR) and ground.

Is the resistance less than 10,000 ohms?
Yes  REPAIR the circuit from the ECM to the generator. CLEAR the DTC. TEST the system for normal operation.
No  GO to E5.

E5: CHECK THE SIGNAL WIRE (FR) FOR OPEN CIRCUIT
1  Disconnect the ECM electrical connector PI1 and the generator electrical connector PI47.
2  Measure the resistance between electrical connector PI47 pin 3 (WR) and the ECM electrical connector PI1 pin 65 (WR).

Is the resistance less than 5 ohms?
Yes  INSTALL a new generator. CLEAR the DTC. TEST the system for normal operation.
No   REPAIR the circuit from the ECM to the generator. CLEAR the DTC. TEST the system for normal operation.

PINPOINT TEST F: THE GENERATOR CHARGE WARNING INDICATOR LAMP IS ON WITH THE ENGINE RUNNING VEHICLES FITTED WITH 4.2L ENGINE

F2: CHECK THE BATTERY
1  Carry out a battery condition test.

Is the battery ok?
Yes  GO to F3.
No  INSTALL a new battery. TEST the system for normal operation.

F3: CHECK THE BATTERY VOLTAGE WITH THE ENGINE RUNNING AND NO ELECTRICAL LOADS APPLIED
1  START and RUN the engine at idle in park. Measure the battery voltage.

Is the voltage less than 13 volts?
Yes  GO to F5.
No  GO to F4.

F4: CHECK THE GROUND CIRCUIT
1  Turn the ignition switch to the RUN position. Measure the resistance between the generator casing and the battery negative cable.

Is the resistance less than 5 ohms?
Yes  GO to F7.
No   REPAIR the ground circuit between the generator to the battery negative terminal. TEST the system for normal operation.

F5: CHECK THE GENERATOR OUTPUT VOLTAGE AT THE GENERATOR BATTERY POSITIVE CABLE TERMINAL, WITH THE ENGINE RUNNING AND NO ELECTRICAL LOADS APPLIED
1  START and RUN the engine at idle in park. Measure the voltage between the generator battery positive cable electrical connector ST7 (R) and generator casing.

Is the voltage less than 13 volts?
Yes  GO to F6.
No   REPAIR the positive battery cable circuit from the generator to the battery. TEST the system for normal operation.

F6: CHECK THE CHARGE WARNING LAMP IS ILLUMINATED WITH THE ENGINE RUNNING
1  INSPECT the charge warning lamp.

Is the charge warning lamp illuminated?
Yes  GO to F7.
No   GO to F1.

F7: CHECK GENERATOR CONNECTOR PI47 FOR DAMAGE
1  INSPECT generator connector PI47 for damage, make sure connector is correctly installed.

Is the generator connector PI47 damaged?
Yes  REPAIR generator connector PI47. TEST the system for normal operation.
No  GO to F8.
F8: CHECK FOR IGNITION SUPPLY VOLTAGE TO THE GENERATOR
1. Disconnect the generator electrical connector PI47.
2. Turn the ignition to the RUN position.
3. Measure the voltage between the generator connector PI47 pin 2 (GO) and ground.

Is the voltage less than 10 volts?

Yes  GO to F9.

No   GO to F11.

F9: CHECK FUSE 15 IN THE PRIMARY JUNCTION FUSE BOX
1. Check the fuse.

Is the fuse ok?

Yes   REPAIR the circuit between ignition and the generator. TEST the system for normal operation.

No    GO to F10.

F10: CHECK FUSE 15 OF THE PRIMARY JUNCTION FUSE BOX FOR A SHORT TO GROUND
1. Measure the resistance between electrical connector CA2 pin 1 (GO) and ground.

Is the resistance less than 10,000 ohms?

Yes   REPAIR short to ground between the primary junction fuse box and the generator. INSTALL a new fuse. TEST the system for normal operation.

No    INSTALL a new fuse. TEST the system for normal operation.

F11: CHECK FOR BATTERY VOLTAGE AT SUPPLY (S TERMINAL) WIRE
1. Measure the voltage between the generator electrical connector PI47 pin 3 (NG) and ground.

Is the voltage less than 10 volts?

Yes  GO to F12.

No   GO to F14.

F12: CHECK FUSE 30 IN THE REAR DISTRIBUTION BOX
1. Check the fuse.

Is the fuse ok?

Yes   REPAIR the circuit between rear power distribution box and the generator. TEST the system for normal operation.

No    GO to F13.

F13: CHECK FUSE 30 IN THE REAR DISTRIBUTION BOX FOR A SHORT TO GROUND
1. Measure the resistance between electrical connector CA64 pin 34 (NG) and ground.

Is the resistance less than 10,000 ohms?

Yes   REPAIR short to ground between the rear distribution box and the generator. INSTALL a new fuse. TEST the system for normal operation.

No    INSTALL a new fuse. TEST the system for normal operation.

F14: CHECK THE GENERATOR 'L' TERMINAL WIRE FOR A SHORT TO GROUND
1. Measure the resistance between electrical connector PI47 pin 1 (YR) and ground.

Is the resistance less than 10,000 ohms?

Yes  REPAIR the circuit between the electrical connector PI47 pin 1 (YR) and the ECM. Clear the DTC. TEST the system for normal operation.

No   GO to F15.

F15: CHECK THE GENERATOR 'L' TERMINAL WIRE FOR A SHORT TO BATTERY
1. Measure the resistance between electrical connector PI47 pin 1 (YR) and battery positive.

Is the resistance less than 10,000 ohms?

Yes  REPAIR the circuit from the ECM to the generator. Clear the DTC. TEST the system for normal operation.

No   GO to F16.

F16: CHECK THE CONTINUITY OF THE GENERATOR 'L' TERMINAL WIRE FOR A SHORT TO BATTERY
1. Disconnect the battery ground cable.
2. Disconnect the ECM electrical connector PI1 and the generator electrical connector PI47.
3. Measure the resistance between PI1 pin 79 (YR) and PI47 pin 1 (YR).

Is the resistance less than 5 ohms?

Yes  INSTALL a new generator. TEST the system for normal operation. If the DTC is repeated INSTALL a new ECM. For additional information REFER to Section 303-14A Electronic Engine Controls / 303-14B Electronic Engine Controls / 303-14C Electronic Engine Controls. or REFER to Section 303-14A Electronic Engine Controls / 303-14B Electronic Engine Controls.

No   REPAIR the circuit from the ECM to the generator. TEST the system for normal operation.

PINPOINT TEST G : THE GENERATOR CHARGE WARNING INDICATOR LAMP IS ON WITH THE ENGINE RUNNING VEHICLES FITTED WITH 2.5L OR 3.0L ENGINE

TEST CONDITIONS  DETAILS/RESULTS/ACTIONS

G1: CHECK THE BATTERY VOLTAGE
1. Measure the battery voltage.

Is the voltage less than 12 volts?

Yes  Charge the battery. GO to G2.

No   GO to G3.

G2: CHECK THE BATTERY
1. Carry out a battery condition test.
Is the battery ok?
Yes  **GO to G3.**
No  INSTALL a new battery. TEST the system for normal operation.

**G3: CHECK THE BATTERY VOLTAGE WITH THE ENGINE RUNNING AND NO ELECTRICAL LOADS APPLIED**

1. START and RUN the engine at idle in park. Measure the battery voltage.

Is the voltage less than 13 volts?
Yes  **GO to G5.**
No  **GO to G4.**

**G4: CHECK THE GROUND CIRCUIT**

1. Turn the ignition switch to the RUN position. Measure the resistance between the generator casing and the battery negative cable.

Is the resistance less than 5 ohms?
Yes  **GO to G7.**
No  REPAIR the ground circuit between the generator to the battery negative terminal. TEST the system for normal operation.

**G5: CHECK THE GENERATOR OUTPUT VOLTAGE AT THE GENERATOR BATTERY POSITIVE CABLE TERMINAL, WITH THE ENGINE RUNNING AND NO ELECTRICAL LOADS APPLIED**

1. START and RUN the engine at idle in park. Measure the voltage between the generator battery positive cable electrical connector ST7 (R) and generator casing.

Is the voltage less than 13 volts?
Yes  **GO to G6.**
No  **GO to G4.**

**G6: CHECK THE CHARGE WARNING LAMP IS ILLUMINATED WITH THE ENGINE RUNNING**

1. INSPECT the charge warning lamp.

Is the charge warning lamp illuminated?
Yes  **GO to G7.**
No  **GO to G1.**

**G7: CHECK GENERATOR CONNECTOR PI47 FOR DAMAGE**

1. INSPECT generator connector PI47 for damage, make sure connector is correctly installed.

Is the generator connector PI47 damaged?
Yes  REPAIR generator connector PI47. TEST the system for normal operation.
No  **GO to G8.**

**G8: CHECK FOR IGNITION SUPPLY VOLTAGE TO THE GENERATOR**

1. Disconnect the generator electrical connector PI47.
2. Turn the ignition to the RUN position.
3. Measure the voltage between the generator connector PI47 pin 2 (GO) and ground.

Is the voltage less than 10 volts?
Yes  **GO to G9.**
No  **GO to G11.**

**G9: CHECK FUSE 15 IN THE PRIMARY JUNCTION FUSE BOX**

1. Check the fuse.

Is the fuse ok?
Yes  **GO to G10.**
No  **REPAIR** the circuit between ignition and the generator. TEST the system for normal operation.

**G10: CHECK FUSE 15 OF THE PRIMARY JUNCTION FUSE BOX FOR A SHORT TO GROUND**

1. Measure the resistance between electrical connector CA2 pin 1 (GO) and ground.

Is the resistance less than 10,000 ohms?
Yes  REPAIR short to ground between the primary junction fuse box and the generator. INSTALL a new fuse. TEST the system for normal operation.
No  INSTALL a new fuse. TEST the system for normal operation.

**G11: CHECK THE GENERATOR 'L' TERMINAL WIRE FOR A SHORT TO GROUND**

1. Measure the resistance between electrical connector PI47 pin 1 (YR) and ground.

Is the resistance less than 10,000 ohms?
Yes  REPAIR the circuit between the electrical connector PI47 pin 1 (YR) and the ECM. Clear the DTC. TEST the system for normal operation.
No  **GO to G12.**

**G12: CHECK THE GENERATOR 'L' TERMINAL WIRE FOR A SHORT TO BATTERY**

1. Measure the resistance between electrical connector PI47 pin 1 (YR) and battery positive

Is the resistance less than 10,000 ohms?
Yes  REPAIR the circuit from the ECM to the generator. Clear the DTC. TEST the system for normal operation.
No  **GO to G13.**

**G13: CHECK THE CONTINUITY OF THE GENERATOR 'L' TERMINAL WIRE**

1. Disconnect the battery ground cable.
2. Disconnect the ECM electrical connector PI1 and the generator electrical connector PI47
3. Measure the resistance between PI1 pin 79 (YR) and PI47 pin 1 (YR).
Is the resistance less than 5 ohms?
Yes
INSTALL a new generator. TEST the system for normal operation. If the DTC is repeated INSTALL a new ECM. For additional information REFER to Section 303-14A Electronic Engine Controls / 303-14B Electronic Engine Controls / 303-14C Electronic Engine Controls, or REFER to Section 303-14A Electronic Engine Controls / 303-14B Electronic Engine Controls.
No
REPAIR the circuit from the ECM to the generator. TEST the system for normal operation.

PINPOINT TEST H : GENERATOR NOT CHARGING - BATTERY KEEPS GOING FLAT

<td>No</td>
<td>CHECK the air conditioning compressor. For additional information REFER to Section 412-03 Air Conditioning. CHECK the power steering pump. For additional information</td>
</tr>
</tbody>
</table>
## Base Voltage Test

**NOTE:** Prior to running this test, turn the headlamps on for 30 seconds to remove any surface charge from the battery. Wait until the voltage stabilizes before carrying out the base voltage test.

1. With the ignition switched off and no electrical loads switched on, connect the negative lead of a digital multimeter to the battery negative cable clamp.
2. Connect the positive lead of the digital multimeter to the battery positive terminal cable clamp.
3. Read and record the battery voltage shown on the digital multimeter. This is called base voltage and will be used in later tests.

## No-Load Test

1. Connect the Digital Multimeter leads across the battery terminals.
2. Read the voltage (base voltage) if battery voltage is less than 12.5 volts. recharge battery before test.
3. Start the engine.
4. Run the engine to 1500 RPM with no electrical load.
5. Read the voltage. If the voltage increase is less than 0.5 volts over the base voltage, carry out the following Load Test. If there is no voltage increase, carry out the on-vehicle charging system test.

## Battery Condition Test

**WARNINGS:**

- Batteries contain sulphuric acid and explosive mixtures of hydrogen and oxygen gases; protective clothing should be worn to avoid the risk of personal injury.

- Avoid sparks and all sources of ignition when working on the battery.

**CAUTIONS:**

- Do not carry out this test if the battery voltage is below 12.5 volts.
Do not carry out this test for longer than 15 seconds or damage to the battery may occur.

• NOTE: Make sure that the high rate discharge is capable of applying a load of 300 Amps to the battery.

1. **1.** Connect the high rate discharge tester to the battery.
2. **2.** Observe and record the voltage reading of the battery.
3. **3.** Turn the switch ON for 15 seconds.
4. **4.** Observe and record the minimum voltage reading of the battery.
5. **5.** Turn the switch to the off position.
6. **6.** Observe the voltage reading of the battery.

The battery voltage should not fall below 9.6 volts at a temperature of 21 degrees centigrade (seventy degrees fahrenheit) when carrying out the test.

The battery should recover to the voltage when the test is complete.
Battery and Charging System - General Information - Charging System

2.7L V6 - TdV6

Diagnosis and Testing

Overview

There are changes to diagnostics for 2006 MY, the most obvious of which will be the change to 7-digit diagnostic trouble codes (DTCs) from the familiar 5-digit.

Refer to the DTC index in this section for guidance on how to use these codes with the Jaguar approved diagnostic system or a scan tool.

For information on the operation of the system, REFER to: Charging System (414-00 Battery and Charging System - General Information, Description and Operation).

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical and electrical damage.

### Mechanical
- Generator
- Front end accessory drive (FEAD) belt condition and tension
- Accessory drive belt tensioner
- Generator pulley
- Generator fittings/connections

### Electrical
- Generator
- Battery
- Starter motor
- Harnesses and connectors
- Rear power distribution box
- Starter motor megafuse
- Charge warning light function
- Controller area network (CAN) circuit fault
- Engine control module (ECM)

3. Check the vehicle battery condition and state of charge before condemning any charging system components. For additional information, refer to the battery care manual.

4. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

5. If the cause is not visually evident use the Jaguar approved diagnostic system or a scan tool to retrieve the fault codes before proceeding to the DTC index, or the symptom chart if no DTCs are set.

Symptom chart

<table>
<thead>
<tr>
<th>Symptom</th>
<th>Possible cause</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Charge warning light does not come on</td>
<td>Bulb/Circuit fault, Generator fault, CAN circuit fault, ECM fault</td>
<td>Check the warning light function with the ignition on and the engine off. Replace bulbs or repair the circuit(s) as necessary. Check for DTCs indicating a generator, CAN or ECM fault.</td>
</tr>
<tr>
<td>Charge warning light stays on/battery discharges</td>
<td>Accessory drive belt broken, Generator pulley slipping on shaft, Generator fault, Battery cable fault, CAN circuit fault, ECM fault</td>
<td>Check fuse 30 of the rear power distribution box. GO to Pinpoint Test D. Check the battery and generator cables. GO to Pinpoint Test C. Check for DTCs indicating a generator fault. Check the accessory drive belt condition and tension (see visual inspection chart). Check that the pulley does not rotate independently of the generator. Check for DTCs indicating a CAN or ECM fault.</td>
</tr>
<tr>
<td>Charge warning light intermittent</td>
<td>Accessory drive belt slipping, Battery cable fault, Generator wiring fault, Generator fault, CAN circuit fault</td>
<td>Check the accessory drive belt condition and tension (see visual inspection chart). Check the battery and generator cables. GO to Pinpoint Test C. Check for DTCs indicating a generator or CAN circuit fault. Note that the use of a power pack or boost charger may bring the warning light on until disconnected.</td>
</tr>
<tr>
<td>Battery discharges without the charge warning light staying on</td>
<td>Battery fault, Battery quiescent drain, Intermittent generator fault</td>
<td>Check the battery condition, check for battery drain. Refer to the battery care manual. Check for DTCs indicating a generator fault. It is possible for the altcom circuit to short to ground without setting a DTC. If no other reason for discharge can be found, check this circuit. GO to Pinpoint Test A.</td>
</tr>
<tr>
<td>Noise (mechanical)</td>
<td>Accessory drive belt slipping, Generator fault</td>
<td>Check the accessory drive belt condition and tension (see visual inspection chart). Disconnect the accessory drive belt and check that the generator rotates freely. For additional information, REFER to: Accessory Drive Belt - 2.7L V6 - TdV6 (303-05 Accessory Drive, Removal and Installation).</td>
</tr>
</tbody>
</table>

DTC index

• NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

• NOTE: For a full list of powertrain DTCs, REFER to: Electronic Engine Controls (303-14C Electronic Engine Controls - 2.7L V6 - TdV6, Diagnosis and Testing).

**Pinpoint tests**

⚠️ **CAUTION:** When probing connectors to take measurements in the course of the pinpoint tests, use the adaptor kit, part number 3548-1358-00. Failure to follow this instruction may result in damage to the vehicle.

- **NOTE:** When performing voltage or resistance tests, always use a digital multimeter (DMM) accurate to 3 decimal places, and with an up-to-date calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.
- **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.
- **NOTE:** If DTCs are recorded and a fault is not present when performing the pinpoint tests, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

**PINPOINT TEST A : GENERATOR MONITOR CIRCUIT**

**TEST CONDITIONS**

**DETAILS/RESULTS/ACTIONS**

**A1: CHECK THE MONITOR CIRCUIT FOR SHORT CIRCUIT TO GROUND**

- **Generator, C073**
  - Voltage sense circuit: Pin 01
  - Alacom: Pin 02
  - Altmon: Pin 03

- **ECM, C101**
  - Altmon: Pin F2

---

**TEST CONDITIONS**

**DETAILS/RESULTS/ACTIONS**

**A2: CHECK WHETHER THE SHORT CIRCUIT IS IN THE HARNESS OR THE MODULE**

1. Key off.
2. Disconnect the generator connector, C073.
3. Key on, engine off.
4. Measure the resistance between:
   - C073, harness side
   - Battery
   - Pin 03

   Is the resistance greater than 10 Kohms?

   - Yes: GO to A3.
   - No: GO to A2.
A3: CHECK THE MONITOR CIRCUIT FOR SHORT CIRCUIT TO POWER

1. Key off.
2. Disconnect the ECM connector, C101.
3. Key on, engine off.
4. Measure the resistance between:
   - C073, harness side
   - Battery
   - Pin 03
   - Negative terminal

   Is the resistance greater than 10 Kohms?
   Yes
   - An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. Refer to the warranty policy and procedures manual if a module is suspect.
   No
   - REPAIR the short circuit. For additional information, refer to the wiring diagrams. Clear the DTC, test the system for normal operation.

A4: CHECK WHETHER THE SHORT CIRCUIT IS IN THE HARNESS OR THE MODULE

1. Key off.
2. Disconnect the ECM connector, C101.
3. Key on, engine off.
4. Measure the resistance between:
   - C073, harness side
   - Battery
   - Pin 03
   - Negative terminal

   Is the resistance greater than 10 Kohms?
   Yes
   - GO to A5.
   No
   - GO to A4.

A5: CHECK THE MONITOR CIRCUIT FOR HIGH RESISTANCE

1. Key off.
2. Disconnect the ECM connector, C101.
3. Key on, engine off.
4. Measure the resistance between:
   - C073, harness side
   - C101, harness side
   - Pin 03
   - Pin F2

   Is the resistance less than 10 ohms?
   Yes
   - An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness.
   No
   - REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. Clear the DTC, test the system for normal operation.

PINPOINT TEST B : GENERATOR COMMAND CIRCUIT

TEST CONDITIONS DETAILS/RESULTS/ACTIONS

B1: CHECK THE COMMAND CIRCUIT FOR SHORT CIRCUIT TO GROUND

<table>
<thead>
<tr>
<th>Generator, C073</th>

ECM, C101 | Circuit Pin
--- | ---
Altcom | H1

1. Key off.
2. Disconnect the generator connector, C073.
3. Key on, engine off.
4. Measure the resistance between:

<table>
<thead>
<tr>
<th>C073, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 10 Kohms?
- Yes: GO to B3.
- No: GO to B2.

**B2: CHECK WHETHER THE SHORT CIRCUIT IS IN THE HARNESS OR THE MODULE**

1. Key off.
2. Disconnect the ECM connector, C101.
3. Key on, engine off.
4. Measure the resistance between:

<table>
<thead>
<tr>
<th>C073, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 10 Kohms?
- Yes: An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. Refer to the warranty policy and procedures manual if a module is suspect.
- No: REPAIR the short circuit. For additional information, refer to the wiring diagrams. Clear the DTC, test the system for normal operation.

**B3: CHECK THE COMMAND CIRCUIT FOR SHORT CIRCUIT TO POWER**

1. Measure the resistance between:

<table>
<thead>
<tr>
<th>C073, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 10 Kohms?
- Yes: An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. Refer to the warranty policy and procedures manual if a module is suspect.
- No: REPAIR the short circuit. For additional information, refer to the wiring diagrams. Clear the DTC, test the system for normal operation.

**B4: CHECK WHETHER THE SHORT CIRCUIT IS IN THE HARNESS OR THE MODULE**

1. Key off.
2. Disconnect the ECM connector, C101.
3. Key on, engine off.
4. Measure the resistance between:

<table>
<thead>
<tr>
<th>C073, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 10 Kohms?
- Yes: An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. Refer to the warranty policy and procedures manual if a module is suspect.
- No: REPAIR the short circuit. For additional information, refer to the wiring diagrams. Clear the DTC, test the system for normal operation.

**B5: CHECK THE COMMAND CIRCUIT FOR HIGH RESISTANCE**

1. Key off.
2. Disconnect the ECM connector, C101.
3. Key on, engine off.
4. Measure the resistance between:

<table>
<thead>
<tr>
<th>C073, harness side</th>
<th>C101, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Pin H1</td>
</tr>
</tbody>
</table>

Is the resistance less than 10 ohms?
- Yes: An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness.
- No: REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. Clear the DTC, test the system for normal operation.

**PINPOINT TEST C: BATTERY CABLE VOLT DROP**
- NOTE: Check the megafuses before carrying out volt drop tests.
- NOTE: Check the security of the engine and battery grounds before carrying out volt drop tests.
• NOTE: Check that the battery is in good condition and well-charged. 
REFER to: Battery Charging (414-00 Battery and Charging System - General Information, General Procedures).

## C1: CHECK FOR GENERATOR OUTPUT

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>

<td><strong>Generator</strong></td>
<td><strong>Battery</strong></td>
</tr>
</tbody>
</table>

Is the voltage less than 0.5 volts?
- **Yes**
  - An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. Check for DTCs indicating another cause of the concern.
- **No**
  - CHECK the connections at either end of the circuit for cleanliness and security. Check for high resistance in the circuit. Clean or replace as necessary. Test the system for normal operation.

## PINPOINT TEST D : GENERATOR VOLTAGE SENSE CIRCUIT

• NOTE: Check fuse 30 of the rear power distribution box before beginning this test.

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Key off.</strong></td>

</table>
1. Before charging a discharged battery inspect and repair the following conditions, if necessary:

- Loose accessory drive belt.
- Pinched or grounded wiring harness to the generator or voltage regulator.
- Loose wiring harness connections at the generator or voltage regulator.
- Loose or corroded connections at battery, headlamp panel junction wire or engine ground.
- Carry out generator charging checks.
- Excessive battery quiescent drain due to:
  1. engine compartment, load space, glove compartment and courtesy lamps remaining on (switch damaged or out of adjustment, glove compartment left open).

### Battery Charging - Maintenance-Free Batteries

**WARNINGS:**

- KEEP BATTERIES OUT OF REACH OF CHILDREN. BATTERIES CONTAIN SULPHURIC ACID, AVOID CONTACT WITH SKIN, EYES OR CLOTHING. SHIELD YOUR EYES WHEN WORKING NEAR THE BATTERY TO PROTECT AGAINST POSSIBLE SPLASHING OF THE ACID SOLUTION. IN CASE OF ACID CONTACT WITH SKIN OR EYES, FLUSH IMMEDIATELY WITH WATER FOR A MINIMUM OF 15 MINUTES AND SEEK PROMPT MEDICAL ATTENTION. IF ACID IS SWALLOWED, CALL A PHYSICIAN IMMEDIATELY. FAILURE TO FOLLOW THESE INSTRUCTIONS MAY RESULT IN PERSONAL INJURY.

- BATTERIES NORMALLY PRODUCE EXPLOSIVE GASES WHICH CAN CAUSE PERSONAL INJURY, THEREFORE DO NOT ALLOW FLAMES, SPARKS, OR LIGHTED SUBSTANCES TO COME NEAR THE BATTERY. WHEN CHARGING OR WORKING NEAR A BATTERY ALWAYS SHIELD YOUR FACE AND PROTECT YOUR EYES. ALWAYS PROVIDE ADEQUATE VENTILATION. FAILURE TO FOLLOW THESE INSTRUCTIONS MAY RESULT IN PERSONAL INJURY.

1. Cold batteries will not readily accept a charge. Therefore, batteries should be allowed to warm up approximately to 15 degrees centigrade (59 degrees Fahrenheit) before charging. This may require 12 hours at room temperature depending on the initial temperature and battery size.

2. A battery which has been completely discharged may be slow to accept a charge initially, and in some cases may not accept a charge at the normal charger setting. When batteries are in this condition, charging can be started by use of the 'dead battery' switch which is fitted to certain types of battery chargers. Follow the manufacturer's instructions when carrying out this procedure.

3. To determine whether a battery is accepting a charge, follow the manufacturer's instructions for the charger.

4. After releasing dead battery switch and with the charger still operating, measure battery voltage. If the voltage is 12 volts or higher, the battery may be accepting a charge and may be capable of being recharged. If the temperature of the battery is below 15 degrees centigrade (59 degrees Fahrenheit) the battery may require charging for up to two hours before the charge rate is high enough to show on the charger ammeter. It has been found that all un-damaged batteries can be charged by this procedure. If a battery cannot be charged by this procedure, it should be replaced.

5. A rapid recharge procedure has been developed for recharging batteries that have passed the 'No-Load Test' and only need a recharge. This can be due to non start battery failures or battery discharged in vehicle due to key-off loads.

6. The battery can be rapidly recharged by using either of the following methods:

   1. Perform a two hour charge using a constant current of 20 amps (manual setting on the charger).
   2. Perform a two hour charge using a constant voltage (automatic setting on the charger).

### Quiescent Current Measurement

1. NOTE: The following quiescent current measurement does not apply to vehicles fitted with the Tracker system. If the vehicle is fitted with the tracker system the quiescent current may be up to 14 milliamps higher. If non-jaguar approved accessories are installed the following measurements may not apply.

   Disconnect the battery ground cable.
   For additional information, refer to Section 414-01 Battery, Mounting and Cables.
2. Check the vehicle off-load battery voltage. If below 12.5 volts, install a fully charged slave battery for the tests and recharge the vehicle battery.

3. Connect a suitable ammeter to the battery with the negative test lead clip to the negative battery terminal, and the positive test lead clip to the battery negative lead.

4. **NOTE:** Make sure that all electrical accessories are switched off.

   Operate the key fob unlock button to disarm the vehicle security system.
   - Switch the ignition to the RUN position for a 10 second duration.
   - **1.** Switch the ignition to the OFF position. Remove the key.
   - Close the vehicle doors and luggage compartment lid.

5. Monitor the ammeter reading for 30 minutes.

6. After 30 minutes the quiescent current reading should be no greater than 30 milliamps.

7. Disconnect the ammeter. Reconnect the battery ground cable. For additional information, refer to Section 414-01 Battery, Mounting and Cables.

The battery fitted is a 12 volts (DC) high cold cranking amperage type.

The battery cables consist of heavy duty negative and positive cables. They are bolted to the battery clamp distributor poles which are of dissimilar size to avoid reverse connection.

Vehicles built from 02/2004

The battery positive cable is routed externally along the right-hand side of the vehicle and is protected by the floor undertray and a jacking shield at the right-hand side rear jacking point.

Care must be taken when jacking and lifting the vehicle on the right-hand side.
Battery, Mounting and Cables - Battery

Diagnosis and Testing

For additional information, REFER to Section 414-00 Battery and Charging System - General Information.
Battery, Mounting and Cables - Battery Connect

General Procedures

- **WARNINGS:**

  - Batteries produce explosive gases which may cause personal injury. Do not expose the battery to a naked flame. When charging or working near a battery wear protective clothing and eye protectors. Always provide adequate ventilation. Failure to follow these instructions may result in personal injury.

  - Batteries contain sulphuric acid, avoid contact with skin, eyes and clothing. Shield your eyes when working near the battery to protect against possible contact of the acid solution. In case of contact with the skin or eyes, flush immediately for a minimum of 15 minutes and seek prompt medical attention. If swallowed call a physician immediately. Failure to follow these instructions may result in personal injury.

  - CAUTION: Make sure all electrical systems are off before connecting the battery negative cable. Failure to follow these instructions may result in damage to the electrical system.

- **NOTE:** Following reconnection of the battery, the engine should be allowed to idle as the stored idle and drive values contained within the engine control module (ECM) have been lost. This may cause driveability concern if the following procedure is not carried out.

1. Connect the battery negative cable.
   - Tighten to 4 Nm.

2. Start the engine and allow to idle until the engine reaches normal operating temperature.

3. Switch the engine off.

4. Restart the engine and allow to idle for approximately two minutes (this will allow the ECM to learn the idle values).

5. Apply and hold the brake pedal, select drive and allow the engine to idle for a further two minutes.

6. Drive the vehicle for approximately five miles/eight kilometers of varied driving to enable the ECM to complete its learning strategy.

7. Reset the audio unit and climate control assembly to original settings to avoid customer complaint.
Battery, Mounting and Cables - Battery Disconnect and Connect

General Procedures

• WARNINGS:

**WARNING:** Batteries produce explosive gases which may cause personal injury. Do not expose the battery to a naked flame. When charging or working near a battery wear protective clothing and eye protectors. Always provide adequate ventilation. Failure to follow these instructions may result in personal injury.

**WARNING:** Batteries contain sulphuric acid, avoid contact with skin, eyes and clothing. Shield your eyes when working near the battery to protect against possible contact of the acid solution. In case of contact with the skin or eyes, flush immediately for a minimum of fifteen minutes and seek prompt medical attention. If swallowed call a physician immediately. Failure to follow these instructions may result in personal injury.

**WARNING:** Audio unit key code saving devices must not be used when working on supplementary restraint systems or fuel systems. When using these devices the vehicle electrical system is still live but with a reduced current flow. Failure to follow this instruction may result in personal injury.

**WARNING:** The backup power supply energy must be depleted before any supplementary restraint system repairs are carried out. To deplete the backup supply energy, first disconnect the battery negative cable, then disconnect the battery positive cable and wait one minute to avoid accidental deployment and personal injury. Failure to follow this instruction may result in personal injury.

**CAUTION:** Make sure the engine is not running before disconnecting the battery negative cable to avoid damage to the electrical system.

• NOTE: Before disconnecting the battery make sure that no data is required from the engine control module (ECM), as battery cable disconnection will erase any fault codes and idle/drive values held in the keep alive memory (KAM). It is not necessary to disconnect or remove electronic control modules.

• NOTE: When the battery is disconnected all previous climate control assembly settings and fault codes will be lost. It is necessary to record any settings or fault codes before battery disconnection to prevent customer complaint.

• NOTE: This procedure should be used to disconnect the battery while carrying out repairs that refer to the battery being disconnected

1. Obtain and record the audio unit keycode and preset radio frequencies.
2. Reposition the luggage compartment floor covering.
3. Disconnect the battery ground cable.
1. Disconnect the battery ground cable. For additional information, refer to Battery Disconnect in this section.
2. Disconnect the battery positive cable.
3. Remove the battery.
   - Remove the battery retaining bracket.
   - Detach the battery vent tube
   - Remove the battery.

**Installation**

1. To install, reverse the removal procedure.
Battery, Mounting and Cables - Battery Ground Cable

Removal and Installation

1. Disconnect the battery ground cable. For additional information, refer to Battery Disconnect in this section.
2. Remove the battery ground cable.

Installation

1. Tighten to 12 Nm.

2. Connect the battery ground cable. For additional information, refer to Battery Connect in this section.
**Battery, Mounting and Cables - Battery Tray**

**Removal**

1. Remove the battery. For additional information, refer to Battery in this section.
2. Remove the spare wheel and tire.
3. Detach the power distribution box.
   1. Detach the power distribution box retaining tangs.
   2. Detach the power distribution box.
4. Remove the battery tray.
   1. Remove the battery tray retaining bolts.
   2. Remove the battery tray.

**Installation**

1. To install, reverse the removal procedure.
   1. Tighten to 10 Nm.

Generator and Regulator - Generator

Description and Operation

The charging system for vehicles fitted with 2.5L or 3.0L engines consist of a 120 amp output, L3B, generator and regulator assembly. Vehicles fitted with 2.7L Diesel engines consist of a 150 amp output, SC2, generator and regulator assembly. Vehicles fitted with 4.2L engines consist of a 130 amp output, SC1, generator and regulator assembly. The generator and regulator assembly generates electrical power to the vehicle electrical system with electricity when the engine is running and maintain the battery in a charged state.

The generator is belt driven by the accessory drive belt. For additional information, refer to: Accessory Drive (303-05 Accessory Drive, Description and Operation).

When the engine is started, the generator begins to generate alternating current (AC) which is converted to direct current (DC) internally. The DC current and voltage is controlled by the voltage regulator, (located inside the generator) and then supplied to the battery through the main battery positive cable.

The 2.5L/3.0L and 2.7L Diesel generators are solidly mounted to the engine, while the 4.2L generator is pivot mounted. The generators are driven at approximately three times engine speed.

Vehicles fitted with 2.5L or 3.0L engine (L3B generator)

Vehicles fitted with manual transmission have a one way clutch fitted to the drive pulley, which reduces belt slip.

The engine control module (ECM) can switch the voltage regulator between two voltages to optimize the charging of the battery.

The low voltage regulator setting is 13.6 volts and the high voltage regulator setting 15.3 volts, measured with the generator at 25 degrees centigrade (77 degrees fahrenheit) and charging at a rate of 5 amps. These values decrease with a rise in temperature or current flow.

The ECM determines the output voltage setting of the generator. The high voltage setting is always selected by the ECM once the vehicle has started. The ECM determines the period of time that the high voltage setting is selected for.

There are three different time periods selected by the ECM which is dependent upon the vehicle conditions when the vehicle is started:

- The longest period of time is selected if the ECM determines that the vehicle has been 'soaking' for sufficient time to allow the engine coolant temperature (ECT) and the air intake temperature (IAT) to fall within 6 degrees centigrade (43 degrees Fahrenheit) of each other.
- The intermediate time period is selected when the ECT and the IAT is below 15 degrees centigrade (59 degrees Fahrenheit).
- The shortest time period is the default time and is used to provide a short period of boost charge.

At the end of these time periods the voltage is always set to the low voltage setting to prevent the battery from being over charged.

The time periods are variable depending upon the temperature and battery voltage. The target voltage of the battery varies between 14 volts and 15 volts depending upon the ambient temperature and the vehicle operating conditions. Once this target voltage has been achieved, providing the vehicle has been operating for at least the shortest time period, the ECM will reduce the voltage regulator to the minimum setting of 13.6 volts.

Vehicles fitted with 2.7L Diesel engine (SC2 generator)

All vehicles use a PCM (Pulse Control Modulated) generator. This allows the output voltage to be controlled between 12.5 & 16V via a signal from the ECM.

This voltage is controlled between 13.5V & 15.5V. The system voltage is tailored more closely to the demands of the battery. At low ambient temperatures (as measured by the air conditioning ambient air sensor), the charging voltage is higher to improve charge acceptance. At high ambient temperatures the voltage is lower to reduce electrolyte loss and unnecessary battery self-heating. Also built into the strategy, is the ability to measure the battery voltage at Ignition On. A battery with low voltage at Ignition On is boost charged at a higher voltage for a calculated time before returning to its 'Base Characteristic' (defined by the prevailing ambient temperatures). The time and boost voltage depends upon the temperature and battery voltage at Ignition On.

All vehicles have a one way clutch fitted to the drive pulley, which reduces belt slip.

Vehicles fitted with 4.2L engine (SC1 generator)

The battery charging voltage is determined by the temperature of the generator. In cold conditions, starting the vehicle from cold the battery voltage will be between 14.2 volts and 15.1 volts and will reduce as the engine warms up. In hot conditions starting the vehicle when the engine is already warm the battery voltage will be between 13.5 volts and 14.3 volts.

A fault in the wiring or the connections from the generator to the ECM, will cause a fault code to be generated and stored in the ECM and the charge warning indicator lamp to be displayed in the instrument cluster after a short time.

With the ignition switch in the RUN position the charge warning lamp will be displayed in the instrument cluster when the generator is not generating power.

If a fault is detected with the generator a fault code will be generated and stored by the ECM. The charge warning indicator lamp will also be displayed in the IC. Units should be repaired as an assembly and not dismantled for repair.
Generator and Regulator - Generator
Diagnosis and Testing

For additional information, refer to section 414-00 Battery and Charging System - General Information.
Removal

1. Disconnect the battery ground cable.  
   For additional information, refer to Section 414-01 Battery, Mounting and Cables.

2. Remove the air deflector  
   For additional information, refer to Section 501-02 Front End Body Panels.

3. Detach the accessory drive belt.  
   1. Rotate the accessory drive belt tensioner counter-clockwise.  
      1. Use a 3/8 inch square drive bar to rotate the accessory drive belt tensioner.  
   2. Detach the accessory drive belt.

4. Detach the generator battery positive cable protective cover.

5. Remove the battery positive cable retaining nut.

6. Disconnect the generator electrical connector.
7. Remove the generator.

Installation

1. To install, reverse the removal procedure.
   - Tighten to 48 Nm.

2. Tighten to 12 Nm.
Generator and Regulator - Generator 2.7L V6 - TdV6
Removal and Installation

Special Tool(s)
Accessory belt detensioner.
303-703

Removal

1. Disconnect the battery.
   For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

2. Remove the air cleaner.
   For additional information, refer to: Air Cleaner (303-12C Intake Air Distribution and Filtering - 2.7L V6 - TdV6, Removal and Installation).

3. Remove the cooling fan motor and shroud.
   For additional information, refer to: Cooling Fan Motor and Shroud (303-03C Engine Cooling - 2.7L V6 - TdV6, Removal and Installation).

4. Detach the accessory drive belt.
   1. Using the special tool, rotate the accessory drive belt tensioner counter clockwise.
   2. Detach the accessory drive belt.

5. Disconnect the generator electrical connector.

6. Detach the generator battery positive cable protective cover.
7. Disconnect the battery positive cable.

8. Remove the generator lower securing bolts.

9. Lower the vehicle.

10. Protect the radiator cooling fins.

11. Remove the generator.
- Remove the generator upper retaining bolt.

Installation
1. Install the generator.
   - Install the generator upper retaining bolt.
   - Tighten to 47Nm.

2. Remove the protection for the radiator cooling fins.

3. Raise the vehicle.

4. Install the generator lower securing bolts.
   - Tighten to 47Nm.

5. Connect the battery positive cable.

6. Attach the generator battery positive cable protective cover.
7. Attach the accessory drive belt.
   1. Using the special tool, rotate the accessory drive belt
tensioner counter clockwise.
   2. Attach the accessory drive belt.

8. Install the cooling fan motor and shroud.
   For additional information, refer to: Cooling Fan Motor and Shroud
   (303-03C Engine Cooling - 2.7L V6 - TdV6, Removal and Installation).

9. Install the air cleaner.
   For additional information, refer to: Air Cleaner (303-12C Intake Air
   Distribution and Filtering - 2.7L V6 - TdV6, Removal and Installation).

10. Connect the battery.
    For additional information, refer to: Battery Connect (414-01 Battery,
    Mounting and Cables, General Procedures).

Removal

All vehicles

1. Disconnect the battery ground cable. For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

2. Detach the accessory drive belt.
   1. Rotate the accessory drive belt tensioner counter-clockwise.
   2. Use a 3/8 inch square drive bar to rotate the accessory drive belt tensioner.
   3. Detach the accessory drive belt.

3. Remove the air deflector.
   For additional information, refer to: Air Deflector (501-02 Front End Body Panels, Removal and Installation).

4. Remove the generator air duct.

5. Remove the splash shield.

6. Remove the right-hand engine mounting lower retaining bolt.
7. Lower the vehicle.

Vehicles without supercharger

8. Remove the throttle body. For additional information, refer to: (303-04B Fuel Charging and Controls - V8 4.2L Petrol/V8 S/C 4.2L Petrol)

   Throttle Body - Vehicles Without: Supercharger, VIN Range: M45255->N52047 (Removal and Installation),
   Throttle Body - Vehicles Without: Supercharger, VIN Range: N52048->N99999 (Removal and Installation).

All vehicles

9. NOTE: Vehicles with supercharger shown, vehicles without supercharger similar.

   Install the special tool.

10. NOTE: Vehicles with supercharger shown, vehicles without supercharger similar.

   Using the special tools, raise the engine to a suitable height.

11. Raise the vehicle.

Right-hand drive vehicles

12. Remove the steering gear shaft pinch bolt.
13. Detach the steering gear.

14. Secure the steering gear.

All vehicles

15. Remove the engine mounting and bracket assembly.

16. Detach the wiring harness.

17. Detach the generator battery positive cable protective cover.
18. Disconnect the battery positive cable.

19. Disconnect the generator electrical connector.

20. Remove the generator.

**Installation**

All vehicles

1. To install reverse the removal procedure.
   - Tighten the generator upper retaining bolt to 21 Nm.
   - Tighten the generator lower retaining bolts to 40 Nm.
2. Tighten to 12 Nm.

3. Tighten to 25 Nm.

Right-hand drive vehicles

4. Tighten to 100 Nm.

5. Tighten to 35 Nm.

All vehicles
6. Tighten to 63 Nm.
Information and Entertainment System - General Information - Audio System

Diagnosis and Testing

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect for obvious signs of mechanical or electrical damage.

### Visual Inspection Chart

<table>
<thead>
<tr>
<th>Mechanical</th>
<th>Electrical</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Audio unit damage</td>

<tr>
<td>• Scratched/dirty compact discs</td>
<td>• Speakers</td>
</tr>
</tbody>
</table>

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. If the cause is not visually evident, verify the symptom and refer to the Jaguar Approved Diagnostic System.
1. NOTE: Advise the customer of the need for regular tape head cleaning. It is recommended that the tape heads are cleaned after every 15 hours of play.

- NOTE: The audio unit incorporates a reminder facility to indicate when 15 hours of tape has played has occurred. For more detail please refer to the audio handbook.

- NOTE: Question the customer on the type of tapes that are normally used. Low quality tapes can not only damage the cassette player heads, the plastic shells may twist and jam in the deck. Loose cassette labels may also become detached in the deck and jam the deck's operation. Jaguar Audio use high quality cassette decks which have precision moving parts, and need to be operated with care.

- NOTE: Make sure that the cleaning cassette is used prior to any assessment of tape audio quality.

Apply isopropyl alcohol to the cleaning cassette and insert it into the cassette player and run it for approximately 30 seconds.

The choice of two entertainment systems is available; base or premium. The radio or mini disc player and the aerial are common to both. Both systems may be operated remotely by use of switches located on the steering wheel.

The premium system has the addition of different speakers, touch screen control and a CD autochanger. The CD autochanger is located in the luggage compartment.

Refer to the Sound System Handbook for setting-up procedures and use, after diagnostic or repair operations.

Audio Unit - Amplifier
Removal and Installation

Removal

1. Reposition the luggage compartment floor covering.
   1. Detach the luggage compartment floor covering.
   2. Reposition the luggage compartment floor covering.

2. Reposition the luggage compartment side trim panel.
   1. Remove the luggage compartment side trim retaining clip.
   2. Reposition the luggage compartment side trim panel.

3. Disconnect the audio unit amplifier electrical connectors.

4. Remove the audio unit amplifier.
   • Remove the audio unit amplifier retaining nuts.

Installation

1. To install, reverse the removal procedure.
   1. Tighten to 4 Nm.
Audio Unit - Audio Unit
Removal and Installation

Removal

1. Remove the instrument panel console. For additional information, refer to Section 501-12 Instrument Panel and Console.
2. NOTE: Left-hand shown, right-hand similar.
   Remove the audio unit.
   • Remove the retaining screws.

Installation

1. To install, reverse the removal procedure.
   1. Tighten to 2 Nm.
Audio Unit - Compact Disc (CD) Changer
Removal and Installation

Removal

1. Reposition the luggage compartment floor covering.
   1. Detach the luggage compartment floor covering.
   2. Reposition the luggage compartment floor covering.

2. Reposition the luggage compartment side trim panel.
   1. Remove the luggage compartment side trim retaining clip.
   2. Reposition the luggage compartment side trim panel.

3. Disconnect the audio unit amplifier electrical connectors.

4. Reposition the compact disc changer and audio unit amplifier.
5. Disconnect the compact disc changer electrical connectors.

6. Remove the compact disc changer.

**Installation**

1. To install, reverse the removal procedure.
   - Tighten to 1 Nm.
Audio Unit - Steering Wheel Audio Controls
Removal and Installation

1. Remove the driver airbag module. For additional information, refer to Section 501-20A Safety Belt System / 501-20B Supplemental Restraint System.

2. Detach the steering wheel audio controls.

3. Remove the steering wheel audio controls.

Installation

1. To install, reverse the removal procedure.
The antenna cable is split into two sections:

- Audio unit to floor console connector.
- Floor console connector to antenna isolator module.

The antenna cable is split into two sections:

- Audio unit to floor console connector.
- Floor console connector to antenna isolator module.

There are two antennas fitted to the vehicle, an AM antenna and an FM antenna, both are located in the rear windshield glass. The AM antenna is above the heated rear windshield element to the left-hand side. The FM antenna utilizes the heated rear windshield demist element but does not carry the demist current. The power connector to the demist screen has a filter in line called a positive wavetrap and the ground connector to the demist screen has a filter called a negative wavetrap.

An optional diversity FM antenna is available with the premium sound system, similar to the AM/FM antenna, except that three FM antennas are derived from the demist pattern. As the demist screen is split to create the extra antennas, a double wavetrap is fitted which has two positive connectors. The antenna isolator switches between the three FM inputs and sends the strongest to the radio.

The antenna isolator module controls both antennas.
**Antenna - Antenna**

Diagnosis and Testing

**Inspection and Verification**

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious signs of electrical damage.

**Visual Inspection Chart**

<table>

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **4.** If the cause is not visually evident, verify the symptom and refer to the Jaguar Approved Diagnostic System.
Antenna - Antenna Isolator Module
Removal and Installation

Removal

1. Remove the C-pillar trim panel.
   For additional information, refer to Section 501-05 Interior Trim and Ornamentation.
2. Disconnect the antenna isolator module electrical connectors.
3. Remove the antenna isolator module retaining bracket.
4. Remove the antenna isolator module.
   - Remove the retaining screw.

Installation

1. To install, reverse the removal procedure.
Speakers - Speakers

Description and Operation

Optimum acoustic detail is achieved through mounting each speaker high on each door panel.

On the Premium sound system there are:

- Four door speakers which incorporate high frequency tweeters within the mid range cone.
- Two sub-woofers.
Speakers - Speakers
Diagnosis and Testing

Inspection and Verification

1. **1.** Verify the customer concern.

2. **2.** Visually inspect for obvious signs of electrical damage.

Exterior Lighting - Exterior Lighting

Description and Operation

The headlamp switch is located on the multifunction switch. The switch operates the sidelights, the dipped and main beam lamps, the switch also features an auto lamps function (operates the headlamps when the sunload sensor detects low light levels) and the exit delay variable timer switch (allows the headlamps to stay on for a period of time from ten seconds to two minutes).

Each headlamp assembly consists of two headlamp units, the main beam lamp unit is the inner and the dipped beam, front parking (side) lamp and the turn signal lamp unit is the outer. Access for bulb replacement is from the engine compartment.

The high intensity headlamps (HID), if fitted, consists of a headlamp bulb and ballast fitted to the headlamp. Dynamic levelling sensors (fitted to the front and rear suspension) and a module (fitted behind the glove box).

The license plate lamps are fitted in the license plate housing. Each bulb is accessible after removing the relevant lens.

Each rear lamp assembly incorporates a stop/tail lamp, an auxiliary tail lamp, a fog lamp, a reversing lamp and a direction indicator lamp. Access for bulb replacement is from the luggage compartment. The high mounted stoplamp is powered via the stoplamp switch, it is fitted to the parcel shelf and is replaceable as a unit.

The side repeater lamps are located within the front fender.

The sidemarker lamps are located within the rear bumper/front bumper and are supplied as part of a high level bumper assembly, (the side markers are located in the bumper by tangs on one side of the unit and held in position by a spring clip on the other side).

Vehicles built up to 01/2004

The fog lamps are located in recesses in the front bumper. The two retaining screws are located behind the anti-theft cover and splitter vane.

Vehicles built 02/2004 onwards

The fog lamps are located in recesses in the front bumper. The fog lamps are located by three retaining screws, which can be accessed from the rear of the fog lamp.
Exterior Lighting - Headlamps
Diagnosis and Testing

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of electrical damage.

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the cause is not visually evident, verify the symptom and refer to the Jaguar Approved Diagnostic System.
1. NOTE: All adjustments should be made at room temperature.

Prepare the vehicle for headlamp adjustment.

- Place the vehicle on a level surface.
- Before adjusting the headlamps, check them for faulty lenses, reflectors and blackened bulbs, and install new components as necessary.
- Check the tire pressures and correct as necessary. For additional information, refer to Section 204-04 Wheels and Tires.
- The vehicle must be at normal unladen weight.
- Normalize the suspension.

2. Reset headlamp adjustment switch.
   1. Set the headlamp adjust switch to '0'.

3. Adjust the headlamp using the adjustment bolts.
Removal

1. Remove the headlamp assembly. For additional information, refer to Headlamp Assembly in this section.
2. Remove the ballast module.
   - Remove the ballast module retaining screws.

Installation

1. To install, reverse the removal procedure.
**Removal**

1. Remove the radiator splash shield. For additional information, refer to: [Radiator Splash Shield](#) (501-02 Front End Body Panels, Removal and Installation).
2. Disconnect the electrical connector.
3. Remove the front fog lamp.

**Installation**

1. To install, reverse the removal procedure.
Exterior Lighting - Front Fog Lamp
Vehicles Built Up To: 01/2004

Removal

1. Remove the air splitter grille.
   1. Remove the three clips.
   2. Remove the air splitter grille.

2. Remove the front fog lamp anti-theft cover.

3. Remove the front fog lamp.

4. Disconnect the fog lamp electrical connector.

Installation

1. To install, reverse the removal procedure.
**Exterior Lighting - Headlamp Assembly**

**Removal**

1. Remove the front bumper cover. For additional information, refer to Section 501-19 Bumpers
2. Disconnect the headlamp electrical connector.

3. Remove lamp assembly retaining bolt.

4. Remove lamp assembly.

**Installation**

1. To install, reverse the removal procedure.
2. Align the headlamp beam.
Removal

1. Remove the headlamp assembly.
   For additional information, refer to Headlamp Assembly in this section.
2. Remove the bulb cover.
   - Turn the bulb cover counterclockwise.
3. Remove the bulb.
   - Turn the bulb counterclockwise (electrical connector will disengage automatically).

Installation

1. To install, reverse the removal procedure.
   1. Line up the arrows and housing
   2. Turn the bulb clockwise.
2. Check the aim of the dip beam headlamps.
Removal

1. Remove the glove compartment. For additional information, refer to Section 501-12 Instrument Panel and Console.

2. Disconnect the headlamp levelling module electrical connector.

3. Remove the headlamp levelling module.
   - Remove the headlamp levelling module retaining nuts.

Installation

1. NOTE: Recalibrate the headlamp levelling module. For additional information, refer to the Jaguar Approved Diagnostic System.

   To install, reverse the removal procedure.
Removal

1. Remove the front headlamp unit.
   For additional information, refer to: Headlamp Assembly (417-01 Exterior Lighting, Removal and Installation).
2. Rotate and detach the headlamp leveling motor.
   1. Remove the high intensity discharge burner cover.
   2. Rotate and detach the headlamp leveling motor.
3. Remove the headlamp leveling motor.
   1. Gently pull the reflector assembly rearwards.
   2. Remove the headlamp leveling motor.
      - Disconnect the headlamp leveling motor electrical connector.

Installation

1. To install, reverse the removal procedure.
   - Make sure the internal pivot is located in the slide.
2. Check the headlamp adjustment.
   For additional information, refer to: Headlamp Adjustment (417-01 Exterior Lighting, General Procedures).
Removal

1. Remove the front headlamp unit. For additional information, refer to in this Lamp Assembly—Headlamp.
2. Rotate and remove the headlamp adjuster cell.
   - Make sure the internal pivot is disengaged from the slide.

Installation

1. To install, reverse the removal procedure.
   - Make sure the internal pivot is located in the slide.
Exterior Lighting - Headlamp Leveling Sensor
Removal and Installation

**Removal**

1. Remove the right-hand front wheel and tire assembly.
   For additional information, refer to Section [204-04 Wheels and Tires](#).
2. Disconnect the headlamp leveling sensor electrical connector.
3. Remove the headlamp leveling sensor pivot nut.
4. Detach the headlamp leveling sensor.
   - Remove the headlamp leveling sensor retaining nuts.

**Installation**

1. To install, reverse the removal procedure.
Exterior Lighting - Headlamp Leveling Switch
Removal and Installation

Removal
1. Detach the headlamp levelling switch.
2. Remove the headlamp levelling switch.
   • Disconnect the electrical connector.

Installation
1. To install, reverse the removal procedure.
Removal

1. Reposition the luggage compartment floor covering.
   1. Detach the luggage compartment floor covering.
   2. Reposition the luggage compartment floor covering.

2. Detach luggage compartment side trim panel.

3. Disconnect the electrical connector.
4. Adjust the rear lamp assembly adjustment screws to give a minimum clearance of 5 mm between the rear lamp assembly and the body.

5. Remove the rear lamp assembly.

**Installation**

1. Install the rear lamp assembly.
   - Tighten to 5 Nm.
2. Adjust the rear lamp assembly adjustment screws to give a clearance of 2 mm between the rear lamp assembly and the body.

3. Connect the electrical connector.

4. Attach luggage compartment side trim panel.

5. Reposition the luggage compartment floor covering.
Removal

1. Remove the luggage compartment rear trim panel.

2. Detach luggage compartment side trim panel.

3. Detach the rear lamp assembly bulb holder.

4. Remove the rear lamp assembly.

Installation

1. To install, reverse the removal procedure.
**Exterior Lighting - Stoplamp Switch**

**Removal**

1. Remove the brake pedal position (BPP) switch. For additional information, refer to: Brake Pedal Position (BPP) Switch (303-14C Electronic Engine Controls - 2.7L V6 - TdV6, Removal and Installation).

2. Release the stoplamp switch.
   - Rotate the stoplamp switch 45 degrees clockwise.

3. Remove the stoplamp switch.
   - Disconnect the electrical connector.

**Installation**

1. **CAUTIONS:**

   - Make sure that the brake pedal remains in the rest position during this procedure.
   - The bracket is keyed to avoid incorrect orientation. Failure to correctly align the switch may result in damage to the vehicle.

   Install the stoplamp switch.
   - Locate the stoplamp switch in the bracket.
   - Rotate the stoplamp switch 45 degrees counter-clockwise.

2. Connect the electrical connector.

3. Install the BPP switch.
   For additional information, refer to: Brake Pedal Position (BPP) Switch (303-14C Electronic Engine Controls - 2.7L V6 - TdV6, Removal and Installation).
The interior lighting system consists of the following components:

- One front interior lamp and two map reading lamps.
- Front footwell lamps.
- Two rear interior lamps with integral reading lamps.
- Front/rear door puddle lamps.
- Glove compartment lamp.
- Vanity mirror lamps.
- Two luggage compartment lamps.

The automatic operation of the interior lights is controlled by the front electronics module (FEM). Pressing the interior light switch in the overhead console switches the interior lighting control from automatic to ON position. When the switch is in the ON position if any of the doors are open, none of the individual interior lamps can be turned off.

In the AUTOMATIC position, when the interior lights have faded out, each lamp can be switched on or off by pressing the associated switch. Also in this position, if a door is open when the vehicle is driven the interior lighting will fade off and then fade back on again when the vehicle slows down.

With the switch AUTOMATIC position the following times apply to the interior lights fading out assuming lights on.

The interior lamp is incorporated in the roof console.

For additional information, refer to Section **501-12 Instrument Panel and Console**.

<table>
<thead>
<tr>

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. If the cause is not visually evident, verify the symptom and refer to the Jaguar Approved Diagnostic System.
Daytime Running Lamps (DRL) - Daytime Running Lamps (DRL)

Description and Operation

DRL use the full intensity low beam headlamps which are permanently illuminated when the vehicle is being driven. DRL are used in a number of markets and there are two systems to cover these markets.

DRL CANADIAN MARKET

DRL for this market use full intensity low beam headlamps. The side marker lamps and license plate lamps will be on, but instrument cluster illumination will be off. DRL are active when the following parameters are met:

- Parking brake is off on vehicles with manual transmission or PARK is not selected on vehicles with automatic transmission
- Ignition switch is in the ignition position (II)
- The central junction box receives an engine running signal
- The lighting control switch is in the off or side lamps position. If the switch is in the 'AUTO' position the DRL will be active when the light sensor is not operating the headlamps using the auto lamps function.

If the above conditions are met, the low beam headlamps are illuminated by a Pulse Width Modulated signal (PWM) for the vehicles fitted with halogen headlamps (when the average voltage exceeds 14V). Vehicles with High Intensity Discharge (HID) headlamps operate the dip beam at normal supply voltage.

The front park lamps (including front side markers) and low beam lamps are illuminated from the Front Electronic Module (FEM), the rear park lamps (including the rear side markers and the license plate lamps) are illuminated by the Rear Electronic Module (REM).

If the lighting control switch is moved to the side lamp or headlamp positions or the auto lamps feature has activated the headlamps, DRL are deactivated and normal side lamp and headlamp functionality is operational.

NOTE: When DRL are active, the headlamp flash function using the left hand steering column multifunction switch will operate normally.

The high beam headlamp function using the left hand steering column stalk switch will be deactivated.

When the parking brake is applied on manual transmission vehicles or the selector lever is in the PARK position on automatic transmission vehicles, DRL are turned off. This is to reduce battery discharge during long periods of engine idling in cold climate conditions. When the parking brake is released or the selector lever is moved from the PARK position, normal DRL functionality is restored.

DRL DENMARK, HOLLAND, NORWAY, SWEDEN, FINLAND AND POLAND

NOTE: DRL for Poland is on vehicles from 2008MY.

DRL for these markets use full intensity low beam headlamps. Side lamps and license plate lamps will be on, but instrument cluster illumination will be off. DRL are active when the following parameters are met:

- Ignition switch is in the ignition position (II)
- The central junction box receives an engine running signal
- The lighting control switch is in the off position. If the switch is in the 'AUTO' position the DRL will be active when the light sensor is not operating headlamps using the auto lamps function.

If the above conditions are met, the low beam headlamps are illuminated by a Pulse Width Modulated signal (PWM) for the vehicles fitted with halogen headlamps (when the average voltage exceeds 14V). Vehicles with High Intensity Discharge (HID) headlamps operate the dip beam at normal supply voltage.

The front park lamps (including front side markers) and low beam lamps are illuminated from the Front Electronic Module (FEM), the rear park lamps (including the rear side markers and the license plate lamps) are illuminated by the Rear Electronic Module (REM).

If the lighting control switch is moved to the side lamp or headlamp positions or the auto lamps feature has activated the headlamps, DRL are deactivated and normal side lamp and headlamp functionality is operational.

NOTE: When DRL are active, the headlamp flash function using the left hand steering column multifunction switch will operate normally.

The high beam headlamp function using the left hand steering column stalk switch will be deactivated.
Daytime Running Lamps (DRL) - Daytime Running Lamps (DRL)

Diagnosis and Testing

1. Verify the customer concern.
2. Visually inspect for obvious signs of electrical damage.

Module Communications Network - Communications Network
VIN Range: M45255->N52047
Diagnosis and Testing

Principles of Operation

The vehicle has four module communication networks. Only three of these networks are connected to the diagnostic connector. The standard corporate protocol (SCP) and controller area network (CAN), which are an unshielded twisted pair cable: data bus plus and data bus minus and the International Standard Organization (ISO) 9141 communication network, which is a single wire network. The digital data bus (D2B), which is a fibre optic ring network can only be accessed through the SCP network. The SCP, CAN and ISO networks can be connected to the Jaguar Approved Diagnostic System by one connector called the diagnostic connector. This makes troubleshooting these systems easier by allowing one smart tester to be able to diagnose and control any module on the three networks from one connector. Diagnosis of the D2B network is through the entertainment system audio unit. The diagnostic connector is located on the driver's side, under the instrument panel.

The ISO 9141 communications network does not permit inter-module communications. When the Jaguar Approved Diagnostic System communicates to modules on the ISO 9141 communication network, the diagnostic system must ask for all information; the modules initiate communications.

The SCP communication network remains operational even with severing of one of the bus wires. Communications will also continue if one of the bus wires is shorted to ground or battery positive voltage (B+), or if some, but not all, termination resistors are lost.

Unlike the SCP communication network, the ISO 9141 communication network will not function if the wire is shorted to ground or battery positive voltage (B+). Also, if one of the modules on the ISO 9141 network loses power or shorts internally, communication to that module will fail.

The anti-lock brake system (ABS), traction control (TC) and dynamic stability control (DSC) module is connected to the CAN communication network. It controls the brake pressure to the four wheels to keep the vehicle under control while braking. This module also communicates with the yaw and steering wheel angle sensors to help in sensing a loss of vehicle control. For additional information, REFER to Section 206-09 Anti-Lock Control - Stability Assist.

The entertainment system audio unit is connected to the SCP communication network and also to the D2B network. The D2B communicates with the compact disc and the cellular phone transceiver and the amplifier. For additional information on the compact disc, REFER to Section 419-07 Information and Entertainment System - General Information.

For additional information on the cellular phone, REFER to Section 419-08 Cellular Phone.

The climate control module is connected to the CAN communication network. The climate control assembly automatically maintains a selected temperature for the interior of the vehicle. For additional information, REFER to Section 412-00 Climate Control System - General Information.

The instrument cluster (IC) is connected to the CAN and SCP communication networks. The instrument cluster displays information received on the SCP including speedometer, odometer, fuel, and message center warnings. The instrument cluster displays information received on the CAN including ABS, air conditioning, transmission and engine condition. The instrument cluster also controls the passive anti-theft system (PATS), and the steering column lock actuator (SCLA). For instrument cluster operation, REFER to Section 413-00 Instrument Cluster and Panel Illumination.

For PATS operation, REFER to Section 419-01A Anti-Theft - Active / 419-01B Anti-Theft - Passive. For the steering column lock actuator operation, REFER to Section 211-04 Steering Column.

The instrument cluster, steering column lock actuator and the engine control module (ECM) are all configured together. Replacing one requires the others to be re-configured.

The front electronic module (FEM) is connected to the SCP communication network. The FEM controls both interior and front exterior lighting, hazard and indicator functions, adjustable pedals, levels (low brake/washer fluid, low oil pressure) and memory functions. For additional information REFER to Section 419-10 Multifunction Electronic Modules.

The ECM is connected to both the CAN and ISO 9141 communication networks. The ECM controls the engine performance, electronic ignition, emission controls, speed control, and on board diagnostics. For additional information REFER to Section 303-14A Electronic Engine Controls / 303-14B Electronic Engine Controls / 303-14C Electronic Engine Controls. Or REFER to Section 303-14A Electronic Engine Controls / 303-14B Electronic Engine Controls / 303-14C Electronic Engine Controls.

The vehicle emergency message system module (VEMS) is connected to the D2B communication network. The module allows a user to request emergency assistance (police, ambulance, fire, recovery) or directions to a desired location at the touch of a button. Also, if any of the vehicle's airbags are deployed while the VEMS system is powered ON, the system automatically issues a call for emergency assistance. For additional information, refer to REFER to Section 419-05 Telematics.

The restraint control module (RCM) is connected to the ISO 9141 communication network. The RCM controls the deployment of the air bags based on sensor input. For additional information; REFER to Section 501-20A Safety Belt System / 501-20B Supplemental Restraint System.

The voice activated control module (VACM) is connected to the D2B communication network. This allows the user to select functions by giving a nine voice command. The VACM sends the command information by D2B to the correct module or audio unit.

The navigation control (NAV) module is connected to the SCP network. The navigation control module receives inputs from the GPS antenna and various other sensors. For additional information, refer to REFER to Section 419-07 Navigation System.

The driver door module (DDM) is connected to the SCP communication network. The module controls many functions including power windows, power locks, and keyless remote entry. The DDM also communicates with the driver seat module (DSM) to control power seat and mirror memory. For additional information, REFER to Section 419-10 Multifunction Electronic Modules.

The driver seat module (DSM) is connected to the SCP communication network. The DSM controls the driver power seat. The module also communicates with the DDM to control the driver seat memory and both outside memory mirror functions. For additional information, REFER to Section 419-10 Multifunction Electronic Modules.

The rear electronic control module (REM) is connected to the SCP network. The REM controls the exterior rear lamps, the heated rear window, inertia switch operation, trailer functionality, fuel pump driver circuit and luggage compartment lid. For additional information REFER to Section 419-10 Multifunction Electronic Modules.
The steering column lock actuator (SCLA) is connected to the SCP communication network. The module controls locking of the steering column and is only equipped on vehicles with manual transmissions. It is controlled by the instrument cluster. For additional information, refer to Section 211-05 Steering Column Switches.

The adaptive damping module is connected to the SCP communication network. The module calculates the movement of the vehicle and adjusts the suspension accordingly. For additional information, refer to Section 204-05 Vehicle Dynamic Suspension.

The electronic park brake (EPB) module is connected to the SCP communication network. The electronic park brake module controls the electrical functions of the park brake system. For additional information, refer to Section 206-05 Parking Brake and Actuation.

The high intensity discharge (HID) headlamp module is connected to the ISO 9141 communication network and also the CAN communication network. The high intensity discharge headlamp module regulates the lamp output. For additional information, refer to Section 417-01 Exterior Lighting.

The transmission selector lever (JGM) is connected to the CAN communication network. The transmission selector lever communicates with the transmission control module (TCM) and also performs its own internal fault monitoring. For additional information, refer to Section 307-05 Automatic Transmission/Transaxle External Controls.

The transmission control module (TCM) is connected to the CAN communication network. The TCM controls the automatic gearbox control solenoids as well as communicating with other powertrain components on the CAN communication network. The TCM also provides for legislated diagnostics. For additional information, refer to Section 307-01 Automatic Transmission/Transaxle.

The reverse parking aid module is connected to the ISO 9141 communication network. The reverse parking aid module controls the electrical components of the parking aid system.

Inspection and Verification

1. Verify the customer concern by operating the system.
2. Visually inspect for obvious signs of mechanical, electrical or optical damage.

<table>

3. If the concern remains after the inspection, connect the approved Jaguar diagnostic system to the data link connector (DLC) located beneath the instrument panel and select the vehicle to be tested from diagnostic system menu. If the diagnostic tester does not communicate with the vehicle:
   - check that the program card is properly installed.
   - check that the correct version of the program card is installed.
   - check the connections to the vehicle.
   - check the ignition switch position.
   - check the vehicle battery condition.

4. If the concern is not visually evident, verify the symptom and refer to the Symptom Chart.

Symptom Chart

- NOTE: Network DTCs may be set by an error, or communications failure in the network. Individual DTCs are in the table, alongside their respective modules, but may also be set by a combination of factors affecting the network, which would result in multiple DTCs being set for one error, or, as in the case of an open circuit, no DTC being set.
DTC; P1637, P1799, E521, E516: The module Does Not Respond to the Jaguar approved diagnostic system — anti-lock brake control module or DSC.

DTC; P1699, E518, E516: The module Does Not Respond to the Jaguar approved diagnostic system — Climate control module.

DTC; P1638, P1798, E520, E516: The module Does Not Respond to the Jaguar approved diagnostic system — instrument cluster (IC).

DTC; E516, P1797, P1642: The module Does Not Respond to the Jaguar approved diagnostic system — Dynamic stability control module (DSM).

DTC; P1643, P1796, E522: The module Does Not Respond to the Jaguar approved diagnostic system — transmission control module (TCM).

P1603. TC M EEPROM failure.

Battery discharged. TCM has lost it's adaptive values.

Water ingress into TCM or adaptive values.

Test

Wire or connection in the control area network (CAN), anti-lock brake control module or DSC.

* Wire or connection in the CAN network.

** Test A.

Wire or connection in the CAN network.

** Test B.

Wire or connection in the SCP network.

** Test C.

Wire or connection in the SCP network.

** Test D.

Wire or connection in the SCP network.

** Test E.

Wire or connection in CAN network.

Wire or connection in the ISO 9141 network.

** Test Q.

Wire or connection in SCP network.

** Test R.

Wire or connection in the ISO 9141 network.

** Test S.

Wire or connection in the ISO 9141 network.

** Test T.

Wire or connection in the SCP network.

** Test U.

Wire or connection in the SCP network.

** Test V.

DTCs set as a result of DTCs from other modules in CAN network.

** Test W.

Wire or connection in the D2B network.

** Test X.

Wire or connection in the D2B network.

** Test Y.

Wire or connection in the D2B network.

** Test Z.

Wire or connection in the D2B network.

** Test AA.

Wire or connection in the D2B network.

** Test AB.

Wire or connection in the D2B network.

** Test AC.

Wire or connection in the D2B network.

** Test AD.
One or more D2B modules not responding. "Wake-up" signal fault. | Faulty "wake-up" signal circuit. | GO to Pinpoint Test AE.
One or more D2B modules not responding. Permanent supply fault. | Faulty permanent supply circuit. | GO to Pinpoint Test AE.
One or more D2B modules not responding. Accessory switched supply fault. | Faulty accessory switched supply circuit. | GO to Pinpoint Test AG.
One or more D2B modules not responding. Ignition switched supply fault. | Faulty ignition switched supply circuit. | GO to Pinpoint Test AH.

## Pinpoint Tests

**CAUTIONS:**
- Be careful when probing the fuse junction panel, power distribution box or any connectors. Damage will result to the connector receptacle if the probe or terminal being used is too large.
- Electronic modules are sensitive to static electrical charges. If exposed to these charges, damage may result.
- **NOTE:** If DTCs are recorded and the symptom is not present when performing the pinpoint tests, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

### PINPOINT TEST A: THE MODULE DOES NOT RESPOND TO THE JAGUAR APPROVED DIAGNOSTIC TESTER — ANTI-LOCK BRAKE CONTROL MODULE

A7: CHECK FOR OPEN CIRCUIT ON CAN + BETWEEN DIAGNOSTIC CONNECTOR AND THE ABS MODULE

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Disconnect the ABS module electrical connector, FH103.
4. Measure the resistance between the diagnostic connector, FC001, pin 006 (Y) and FH103, pin 012 (Y).

Is the resistance less than 5 ohms?
- Yes: GO to A9.
- No: REPAIR the CAN + circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

A8: CHECK FOR OPEN CIRCUIT ON CAN - BETWEEN DIAGNOSTIC CONNECTOR AND THE ABS MODULE

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Measure the resistance between the diagnostic connector, FC001, pin 014 (G) and FH103, pin 015 (G).

Is the resistance less than 5 ohms?
- Yes: GO to A9.
- No: REPAIR the CAN - circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

A9: CHECK FOR CORRECT BUS TERMINATION

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Reconnect the ABS module electrical connector, FC001.
4. Measure the resistance between the diagnostic connector, FC001, pins 006 (Y) and 014 (G).

Is the resistance between 50 and 70 ohms?
- Yes: INSTALL a new ABS module, or DSC module. REFER to Section 206-09 Anti-Lock Control - Stability Assist. CLEAR the DTC. TEST the system for normal operation.
- No: GO to A10.

A10: CHECK CONTINUITY OF THE CAN + CIRCUIT

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Disconnect the ECM electrical connector, PI001, and the IC connector, FC015.
4. Measure the resistance between PI001, pin 124 (Y) and FC015, pin 018 (Y).

Is the resistance less than 5 ohms?
- Yes: GO to A11.
- No: REPAIR the CAN + circuit between PI001, pin 124 and FC015, pin 017. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

A11: CHECK CONTINUITY OF THE CAN - CIRCUIT

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Measure the resistance between PI001, pin 123 (G) and FC015, pin 019 (G).

Is the resistance less than 5 ohms?
- Yes: GO to A12.
- No: REPAIR the CAN + circuit between PI001, pin 123 and FC015, pin 019. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

A12: CHECK FOR LOSS OF TERMINATION WITHIN THE ECM

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Measure the resistance between pins 123 and 124 of the ECM.

Is the resistance between 100 and 140 ohms?
- Yes: INSTALL a new ECM. REFER to Section 303-14A Electronic Engine Controls / 303-14B Electronic Engine Controls / 303-14C Electronic Engine Controls. CLEAR the DTC. TEST the system for normal operation. Before replacing an ECM, contact Dealer technical support.
- No: GO to A13.

A13: CHECK FOR LOSS OF TERMINATION WITHIN THE INSTRUMENT CLUSTER

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Measure the resistance between pins 018 and 019 of the instrument cluster.

Is the resistance between 100 and 140 ohms?
- No: INSTALL a new instrument cluster. REFER to Section 413-01 Instrument Cluster. CLEAR the DTC. TEST the system for normal operation.

PINPOINT TEST B : P1699, E518: THE MODULE DOES NOT RESPOND TO THE JAGUAR APPROVED DIAGNOSTIC TESTER — DUAL AUTOMATIC TEMPERATURE CONTROL (DATC) MODULE

B1: CHECK CLIMATE CONTROL MODULE FOR DAMAGE

1. Disconnect the climate control module electrical connector, FC28.
2. INSPECT the climate control module for damage.
Does the climate control module indicate any signs of damage?

Yes

INSTALL a new climate control module.

REFER to Section 412-00 Climate Control System - General Information.

CLEAR the DTC. TEST the system for normal operation.

No

GO to B2.

B2: CHECK CAN + FOR SHORT CIRCUIT TO GROUND

1. Reconnect the climate control module electrical connector, FC28.
2. Turn the ignition switch to the OFF position.
3. Disconnect the battery negative terminal.
4. Measure the resistance between the diagnostic connector FC001 pin 006, (Y) and GROUND.

Is the resistance less than 5 ohms?

Yes

REPAIR the CAN + circuit. CLEAR the DTC. TEST the system for normal operation.

No

GO to B3.

B3: CHECK CAN + FOR SHORT CIRCUIT TO BATTERY

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Measure the resistance between the diagnostic connector FC001 pin 006, (Y) and pin 016, BATTERY.

Is the resistance less than 5 ohms?

Yes

REPAIR the CAN + circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No

GO to B4.

B4: CHECK CAN - FOR SHORT CIRCUIT TO GROUND

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Measure the resistance between the diagnostic connector FC001 pin 014 (G) and GROUND.

Is the resistance less than 5 ohms?

Yes

REPAIR the CAN - circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No

GO to B5.

B5: CHECK CAN - FOR SHORT CIRCUIT TO BATTERY

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Measure the resistance between the diagnostic connector FC001 pin 014 (G) and pin 016, BATTERY.

Is the resistance less than 5 ohms?

Yes

REPAIR the CAN - circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No

GO to B6.

B6: CHECK SHORT CIRCUIT BETWEEN CAN + AND CAN -

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Measure the resistance between the diagnostic connector FC001 pins 006 (Y) and 014 (G).

Is the resistance less than 5 ohms?

Yes

REPAIR the CAN - and CAN + circuits. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No

GO to B7.

B7: CHECK FOR OPEN CIRCUIT ON CAN + BETWEEN DIAGNOSTIC CONNECTOR AND THE CLIMATE CONTROL MODULE MODULE

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Disconnect the climate control module module electrical connector, FC028. (FC041 on non-navigation vehicles).
4. Measure the resistance between FC001 pin 006 (Y) and FC028 pin 012 (Y). (FC041 on non-navigation vehicles).

Is the resistance less than 5 ohms?

Yes

GO to B8.

No

REPAIR the CAN + circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

B8: CHECK FOR OPEN CIRCUIT ON CAN - BETWEEN DIAGNOSTIC CONNECTOR AND THE CLIMATE CONTROL MODULE MODULE

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Measure the resistance between FC001 pin 014 (G) and FC028, pin 001 (G).

Is the resistance less than 5 ohms?

Yes

GO to B9.

No

REPAIR the CAN - circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

B9: CHECK FOR CORRECT BUS TERMINATION

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Reconnect the climate control module module electrical connector, FC028.
4. Measure the resistance between the diagnostic connector FC001, pins 006 (Y) and 014 (G).
Is the resistance between 50 and 70 ohms?
Yes
INSTALL a new climate control module module.
REFER to Section 412-00 Climate Control System - General Information.
CLEAR the DTC. TEST the system for normal operation.
No
GO to B10.

**B10: CHECK CONTINUITY OF THE CAN + CIRCUIT**

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Disconnect the ECM electrical connector, PI001, and the IC connector, FC015.
4. Measure the resistance between PI001, pin 124 (Y) and FC015, pin 018 (Y).

Is the resistance less than 5 ohms?
Yes
GO to B11.
No
REPAIR the CAN + circuit between PI001, pin 124 and FC015, pin 018. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

**B11: CHECK CONTINUITY OF THE CAN - CIRCUIT**

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Measure the resistance between PI001, pin 123 (G) and FC015, pin 019 (G).

Is the resistance less than 5 ohms?
Yes
GO to B12.
No
REPAIR the CAN + circuit between PI001, pin 123 and FC015, pin 019. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

**B12: CHECK FOR LOSS OF TERMINATION WITHIN THE ECM**

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Measure the resistance between pins 123 and 124 of the ECM.

Is the resistance between 100 and 140 ohms?
Yes
GO to B13.
No
INSTALL a new ECM. REFER to Section 303-14A Electronic Engine Controls / 303-14B Electronic Engine Controls / 303-14C Electronic Engine Controls. Or REFER to Section 303-14A Electronic Engine Controls / 303-14B Electronic Engine Controls / 303-14C Electronic Engine Controls. CLEAR the DTC. TEST the system for normal operation.

**B13: CHECK FOR LOSS OF TERMINATION WITHIN THE INSTRUMENT CLUSTER**

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Measure the resistance between pins 018 and 019 of the instrument cluster.

Is the resistance between 100 and 140 ohms?
Yes
Possible intermittent fault. Recheck DTCs.
INSTALL a new instrument cluster.
REFER to Section 413-01 Instrument Cluster.
CLEAR the DTC. TEST the system for normal operation.
No
GO to C2.

**PINPOINT TEST C : P1638, P1798, E520: THE MODULE DOES NOT RESPOND TO THE JAGUAR APPROVED DIAGNOSTIC TESTER — INSTRUMENT CLUSTER**

</table>
1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Measure the resistance between the diagnostic connector FC001 pin 014 (G) and GROUND.

**Is the resistance less than 5 ohms?**

- **Yes**
  - REPAIR the CAN - circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
  - **GO to C5.**
- **No**
  - **GO to C6.**

### C5: CHECK CAN - FOR SHORT CIRCUIT TO BATTERY

1. Turn the ignition switch to the OFF position.
2. Measure the resistance between the diagnostic connector FC001 pin 014 (G) and pin 016 BATTERY.

**Is the resistance less than 5 ohms?**

- **Yes**
  - REPAIR the CAN - circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
  - **GO to C6.**
- **No**
  - **REPAIR the CAN + circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.**

### C6: CHECK FOR SHORT CIRCUIT BETWEEN CAN + AND CAN -

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Measure the resistance between the diagnostic connector FC001 pins 006 (Y) and 014 (G).

**Is the resistance less than 5 ohms?**

- **Yes**
  - REPAIR the CAN - and CAN + circuits. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
  - **GO to C7.**
- **No**
  - **GO to C8.**

### C7: CHECK FOR OPEN CIRCUIT ON CAN + BETWEEN DIAGNOSTIC CONNECTOR AND THE INSTRUMENT CLUSTER

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Disconnect the instrument cluster electrical connector, FC015.
4. Measure the resistance between FC001 pin 006 (Y) and FC015, pin 008 (Y).

**Is the resistance less than 5 ohms?**

- **Yes**
  - REPAIR the CAN + circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
  - **GO to C8.**
- **No**
  - **REPAIR the CAN - circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.**

### C8: CHECK FOR OPEN CIRCUIT ON CAN - BETWEEN DIAGNOSTIC CONNECTOR AND THE INSTRUMENT CLUSTER

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Measure the resistance between FC001 pin 014 (G) and FC015, pin 009 (G).

**Is the resistance less than 5 ohms?**

- **Yes**
  - GO to C9.
- **No**
  - **REPAIR the CAN - circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.**

### C9: CHECK FOR CORRECT BUS TERMINATION

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Reconnect the instrument cluster electrical connector, FC015.
4. Measure the resistance between the diagnostic connector FC001, pins 006 (Y) and 014 (G).

**Is the resistance between 50 and 70 ohms?**

- **Yes**
  - INSTALL a new instrument cluster. REFER to Section 413-01 Instrument Cluster.
  - CLEAR the DTC. TEST the system for normal operation.
- **GO to C10.**

### C10: CHECK CONTINUITY OF THE CAN + CIRCUIT

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Disconnect the ECM electrical connector, PI001, and the IP connector, FC015.
4. Measure the resistance between PI001, pin 124 (Y) and FC015, pin 018 (Y).

**Is the resistance less than 5 ohms?**

- **Yes**
  - **GO to C11.**
- **No**
  - **REPAIR the CAN + circuit between PI001, pin 124 and FC015, pin 018. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.**

### C11: CHECK CONTINUITY OF THE CAN - CIRCUIT

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Measure the resistance between PI001, pin 123 (G) and FC015, pin 019 (G).

**Is the resistance less than 5 ohms?**

- **Yes**
  - **GO to C12.**
- **No**
  - **REPAIR the CAN + circuit between PI001, pin 123 and FC015, pin 019. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.**

### C12: CHECK FOR LOSS OF TERMINATION WITHIN THE ECM

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.

**Is the resistance between 50 and 70 ohms?**

- **Yes**
  - **INSTALL a new ECM. REFER to Section 413-01 Instrument Cluster.**
  - CLEAR the DTC. TEST the system for normal operation.
- **No**
  - **REPAIR the CAN + circuit between PI001, pin 123 and FC015, pin 019. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.**
Measure the resistance between pins 123 and 124 of the ECM.

Is the resistance between 100 and 140 ohms?

Yes

GO to C13.

No

INSTALL a new ECM. REFER to Section 303-14A Electronic Engine Controls / 303-14B Electronic Engine Controls / 303-14C Electronic Engine Controls. CLEAR the DTC. TEST the system for normal operation.

C13: CHECK FOR LOSS OF TERMINATION WITHIN THE INSTRUMENT CLUSTER

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Measure the resistance between pins 018 and 019 of the instrument cluster.

Is the resistance between 100 and 140 ohms?

Yes

Possible intermittent fault. Recheck DTCs.

No

INSTALL a new instrument cluster. REFER to Section 413-01 Instrument Cluster. CLEAR the DTC. TEST the system for normal operation.

</tbody>
</table>
Disconnect the ECM electrical connector, PI001.
Measure the resistance between FC001 pin 006 (Y) and PI001, pin 124 (Y).

Is the resistance less than 5 ohms?
Yes
GO to D8.
No
REPAIR the CAN + circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

D8: CHECK FOR OPEN CIRCUIT ON CAN - BETWEEN DIAGNOSTIC CONNECTOR AND THE ECM

1. Turn the ignition switch to the OFF position.
2. Disconnect the ECM electrical connector, PI001.
3. Measure the resistance between FC001 pin 014 (G) and PI001, pin 123 (G).

Is the resistance less than 5 ohms?
Yes
GO to D9.
No
REPAIR the CAN - circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

D9: CHECK FOR CORRECT BUS TERMINATION

1. Turn the ignition switch to the OFF position.
2. Disconnect the ECM electrical connector, PI001.
3. Measure the resistance between the diagnostic connector FC001, pins 006 (Y) and 014 (G).

INSTALL a new ECM. REFER to Section 303-14A Electronic Engine Controls / 303-14B Electronic Engine Controls / 303-14C Electronic Engine Controls. CLEAR the DTC. TEST the system for normal operation. Before replacing a ECM, contact Dealer technical support.

D10: CHECK CONTINUITY OF THE CAN + CIRCUIT

1. Turn the ignition switch to the OFF position.
2. Disconnect the ECM electrical connector, PI001.
3. Disconnect the IP connector, FC015.
4. Measure the resistance between PI001, pin 124 (Y) and FC015, pin 018 (Y).

Is the resistance less than 5 ohms?
Yes
GO to D11.
No
REPAIR the CAN + circuit between PI001, pin 124 and FC015, pin 018. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

D11: CHECK CONTINUITY OF THE CAN - CIRCUIT

1. Turn the ignition switch to the OFF position.
2. Disconnect the ECM electrical connector, PI001.
3. Measure the resistance between PI001, pin 123 (G) and FC015, pin 019 (G).

Is the resistance less than 5 ohms?
Yes
GO to D12.
No
REPAIR the CAN + circuit between PI001, pin 123 and FC015, pin 019. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

D12: CHECK FOR LOSS OF TERMINATION WITHIN THE ECM

1. Turn the ignition switch to the OFF position.
2. Disconnect the ECM electrical connector, PI001.
3. Measure the resistance between pins 123 and 124 of the ECM.

INSTALL a new ECM. REFER to Section 303-14A Electronic Engine Controls / 303-14B Electronic Engine Controls / 303-14C Electronic Engine Controls. CLEAR the DTC. TEST the system for normal operation. Before replacing a ECM, contact Dealer technical support.

D13: CHECK FOR LOSS OF TERMINATION WITHIN THE INSTRUMENT CLUSTER

1. Turn the ignition switch to the OFF position.
2. Disconnect the ECM electrical connector, PI001.
3. Measure the resistance between pins 018 and 019 of the instrument cluster.

INSTALL a new instrument cluster. REFER to Section 413-01 Instrument Cluster. CLEAR the DTC. TEST the system for normal operation.

PINPOINT TEST E : P1637: THE MODULE DOES NOT RESPOND TO THE JAGUAR APPROVED DIAGNOSTIC TESTER — TRANSMISSION CONTROL MODULE (TCM)

TEST CONDITIONS
DETAILS/RESULTS/ACTIONS
E1: CHECK TCM FOR DAMAGE
1. Disconnect the TCM.
2. INSPECT the TCM and main control valve body
Does the TCM indicate any signs of damage?

Yes

INSTALL a new TCM and main control valve body.
REFER to Section 307-01 Automatic Transmission/Transaxle.
CLEAR the DTC. TEST the system for normal operation.

No

GO to E2.

E2: CHECK CAN + FOR SHORT CIRCUIT TO GROUND

1. Reconnect the TCM electrical connector GB02.
2. Turn the ignition switch to the OFF position.
3. Disconnect the battery negative terminal.
4. Measure the resistance between the diagnostic connector FC001 pin 006, (Y) and GROUND.

Is the resistance less than 5 ohms?

Yes

REPAIR the CAN + circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No

GO to E3.

E3: CHECK CAN + FOR SHORT CIRCUIT TO BATTERY

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Measure the voltage between the diagnostic connector FC001, pin 006, (Y) and pin 016, BATTERY.

Is the resistance less than 5 ohms?

Yes

REPAIR the CAN + circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No

GO to E4.

E4: CHECK CAN - FOR SHORT CIRCUIT TO GROUND

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Measure the resistance between the diagnostic connector FC001, pin 014 (G) and GROUND.

Is the resistance less than 5 ohms?

Yes

REPAIR the CAN - circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No

GO to E5.

E5: CHECK CAN - FOR SHORT CIRCUIT TO BATTERY

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Measure the resistance between the diagnostic connector FC001, pin 014 (G) and pin 016, BATTERY.

Is the resistance less than 5 ohms?

Yes

REPAIR the CAN - circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No

GO to E6.

E6: CHECK FOR SHORT CIRCUIT BETWEEN CAN + AND CAN -

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Measure the resistance between the diagnostic connector FC001, pins 006 (Y) and 014 (G).

Is the resistance less than 5 ohms?

Yes

REPAIR the CAN - and CAN + circuits. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No

GO to E7.

E7: CHECK FOR OPEN CIRCUIT ON CAN + BETWEEN DIAGNOSTIC CONNECTOR AND THE TCM

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Disconnect the TCM electrical connector, GB02.
4. Measure the resistance between FC001, pin 006 (Y) and GB02, pin 006 (Y).

Is the resistance less than 5 ohms?

Yes

GO to E8.

No

REPAIR the CAN + circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

E8: CHECK FOR OPEN CIRCUIT ON CAN - BETWEEN DIAGNOSTIC CONNECTOR AND THE TCM

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Measure the resistance between FC001, pin 014 (G) and GB02, pin 016 (B.).

Is the resistance less than 5 ohms?

Yes

GO to E9.

No

REPAIR the CAN - circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

E9: CHECK FOR CORRECT BUS TERMINATION

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Reconnect the TCM electrical connector, GB02.
4. Measure the resistance between the diagnostic connector FC001, pins 006 (Y) and 014 (G).
Is the resistance between 50 and 70 ohms?
Yes
INSTALL a new TCM.
REFER to Section 307-01 Automatic Transmission/Transaxle.
CLEAR the DTC. TEST the system for normal operation.
No
GO to E10.

E10: CHECK CONTINUITY OF THE CAN + CIRCUIT
1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Disconnect the ECM electrical connector, PI001, and the IP connector, FC015.
4. Measure the resistance between PI001 pin 124 (Y) and FC015, pin 018 (Y).
Is the resistance less than 5 ohms?
Yes
GO to E11.
No
REPAIR the CAN + circuit between PI001, pin 124 and FC015, pin 018. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

E11: CHECK CONTINUITY OF THE CAN - CIRCUIT
1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Measure the resistance between PI001, pin 123 (G) and FC015, pin 019 (G).
Is the resistance less than 5 ohms?
Yes
GO to E12.
No
REPAIR the CAN - circuit between PI001, pin 123 and FC015, pin 019. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

E12: CHECK FOR LOSS OF TERMINATION WITHIN THE ECM
1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Measure the resistance between pins 123 and 124 of the ECM.
Is the resistance between 110 and 140 ohms?
Yes
GO to E13.
No
INSTALL a new ECM. REFER to Section 303-14A Electronic Engine Controls / 303-14B Electronic Engine Controls / 303-14C Electronic Engine Controls. Or REFER to Section 303-14A Electronic Engine Controls / 303-14B Electronic Engine Controls / 303-14C Electronic Engine Controls. CLEAR the DTC. TEST the system for normal operation.

E13: CHECK FOR LOSS OF TERMINATION WITHIN THE INSTRUMENT CLUSTER
1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Measure the resistance between pins 018 and 019 of the instrument cluster.
Is the resistance between 110 and 140 ohms?
Yes
Possible intermittent fault. Recheck DTCs.
INSTALL a new instrument cluster.
REFER to Section 413-01 Instrument Cluster.
CLEAR the DTC. TEST the system for normal operation.
No
INSTALL a new instrument cluster.
INSTALL a new ECM. REFER to Section 303-14A Electronic Engine Controls / 303-14B Electronic Engine Controls / 303-14C Electronic Engine Controls. CLEAR the DTC. TEST the system for normal operation.

| **G2: CHECK THE SCP + FOR SHORT CIRCUIT TO GROUND** | |
| 1 | Turn the ignition switch to the OFF position. |
| 2 | Disconnect the battery negative terminal. |
| 3 | Measure the resistance between the diagnostic connector FC001 pin 2, (Y) and GROUND. |
| | Is the resistance less than 5 ohms? |
| Yes | REPAIR the SCP + circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation. |
| No | GO to G3. |

| **G3: CHECK THE SCP + FOR SHORT CIRCUIT TO BATTERY** | |
| 1 | Turn the ignition switch to the OFF position. |
| 2 | Disconnect the battery negative terminal. |
| 3 | Measure the resistance between the diagnostic connector FC001 pin 2, (Y) and pin 016, BATTERY. |
| | Is the resistance less than 5 ohms? |
| Yes | REPAIR the SCP + circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation. |
| No | GO to G4. |

| **G4: CHECK THE SCP - FOR SHORT CIRCUIT TO GROUND** | |
| 1 | Turn the ignition switch to the OFF position. |
| 2 | Disconnect the battery negative terminal. |
| 3 | Measure the resistance between the diagnostic connector FC001 pin 10, (U) and GROUND. |
| | Is the resistance less than 5 ohms? |
| Yes | REPAIR the SCP - circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation. |
| No | GO to G5. |

| **G5: CHECK THE SCP - FOR SHORT CIRCUIT TO BATTERY** | |
| 1 | Turn the ignition switch to the OFF position. |
| 2 | Disconnect the battery negative terminal. |
| 3 | Measure the resistance between the diagnostic connector FC001 pin 10, (U) and pin 016, BATTERY (OY). |
| | Is the resistance less than 5 ohms? |
| Yes | REPAIR the SCP - circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation. |
| No | GO to G6. |

| **G6: CHECK FOR SHORT CIRCUIT BETWEEN SCP + AND SCP -** | |
| 1 | Turn the ignition switch to the OFF position. |
| 2 | Disconnect the battery negative terminal. |
| 3 | Measure the resistance between the diagnostic connector FC001 pin 10, (U) and pin 2, (Y). |
| | Is the resistance less than 5 ohms? |
| Yes | REPAIR the SCP + and/or SCP - circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation. |
| No | GO to G7. |

| **G7: CHECK FOR OPEN CIRCUIT ON SCP + BETWEEN THE DIAGNOSTIC CONNECTOR AND THE EPB MODULE** | |
| 1 | Turn the ignition switch to the OFF position. |
| 2 | Disconnect the battery negative terminal. |
| 3 | Disconnect the EPB module electrical connector, CA242. |
| 4 | Measure the resistance between the diagnostic connector FC001, pin 002 (Y) and CA242, pin 001 (Y). |
| | Is the resistance less than 5 ohms? |
| Yes | GO to G8. |
| No | REPAIR the SCP + circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation. |

| **G8: CHECK FOR OPEN CIRCUIT ON SCP - BETWEEN THE DIAGNOSTIC CONNECTOR AND THE EPB MODULE** | |
| 1 | Turn the ignition switch to the OFF position. |
| 2 | Disconnect the battery negative terminal. |
| 3 | Disconnect the EPB module electrical connector, CA242. |
| 4 | Measure the resistance between the diagnostic connector FC001, pin 010 (U) and CA242, pin 007 (U). |
| | Is the resistance less than 5 ohms? |
| Yes | GO to G9. |
| No | REPAIR the SCP - circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation. |
G9: CHECK FOR CORRECT BUS TERMINATION ON SCP +

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Reconnect the EPB module electrical connector, CA242.
4. Measure the resistance between the diagnostic connector FC001, pin 2 (Y) and GROUND.

Is the resistance 90 to 150 ohms?

Yes
   INSTALL a new EPB module.
   REFER to Section 206-05 Parking Brake and Actuation.
   CLEAR the DTC. TEST the system for normal operation.

No
   GO to G10.

G10: CHECK THE CONTINUITY OF THE FRONT ELECTRONIC MODULE (FEM) SCP + CIRCUIT

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Disconnect the FEM electrical connector, FH059.
4. Measure the resistance between FC001, pin 2 (Y) and FH059, pin 7 (Y).

Is the resistance less than 5 ohms?

Yes
   GO to H11.

No
   REPAIR the circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

G11: CHECK FOR LOSS OF SCP + TERMINATION WITHIN THE FEM

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Disconnect the FEM electrical connectors, FH059, and FH060.
4. Measure the resistance between FH059, pin 007 (Y), and FH060, pin 011 (Y) of the FEM. (Reconnect the FEM following completion of the test).

Is the resistance 140 to 220 ohms?

No
   GO to H12.

Yes
   INSTALL a new FEM.
   REFER to Section 419-10 Multifunction Electronic Modules.

G12: CHECK THE CONTINUITY OF THE REAR ELECTRONIC MODULE (REM) SCP + CIRCUIT

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Disconnect the REM electrical connector, CA102.
4. Measure the resistance between FC001, pin 2 (Y) and CA102, pin 001 (Y).

Is the resistance less than 5 ohms?

Yes
   GO to H13.

No
   REPAIR the circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

G13: CHECK FOR LOSS OF SCP + TERMINATION WITHIN THE REM

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Disconnect the REM electrical connector, CA102.
4. Measure the resistance between CA102, pin 001 (Y), and CA102, pin 012 (B) of the REM. (Reconnect the REM following completion of the test).

Is the resistance 140 to 220 ohms?

No
   GO to H14.

Yes
   INSTALL a new REM.
   REFER to Section 419-10 Multifunction Electronic Modules.

G14: CHECK CONTINUITY OF THE INSTRUMENT CLUSTER (IC) SCP + CIRCUIT

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Disconnect the IC electrical connector, FC015.
4. Measure the resistance between FC001, pin 002 (Y) and FC015, pin 020 (Y).

Is the resistance less than 5 ohms?

Yes
   GO to H15.

No
   REPAIR the circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

G15: CHECK FOR LOSS OF SCP + TERMINATION WITHIN THE INSTRUMENT CLUSTER

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Disconnect the IC electrical connector, FC015.
4. Measure the resistance between FC015, pin 020 (Y) and FC014, pin 014 of the IC.

Is the resistance 140 to 220 ohms?

Yes
   Possible intermittent fault. Recheck DTCs.

No
   INSTALL a new IC.
   REFER to Section 413-01 Instrument Cluster.
   CLEAR the DTC. TEST the system for normal operation.

PINPOINT TEST H : THE MODULE DOES NOT RESPOND TO THE JAGUAR APPROVED DIAGNOSTIC TESTER — INSTRUMENT CLUSTER (IC)
**H1: CHECK IC FOR DAMAGE**

1. Disconnect the IC electrical connector FC015.
2. INSPECT the IC for damage.

Does the IC indicate any signs of damage?

**Yes**

- INSTALL a new IC.
- REFER to Section 501-12 Instrument Panel and Console.
- CLEAR the DTC. TEST the system for normal operation.

**No**

- GO to H2.

**H2: CHECK THE SCP + FOR SHORT CIRCUIT TO GROUND**

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Measure the resistance between the diagnostic connector FC001 pin 2, (Y) and GROUND.

Is the resistance less than 5 ohms?

**Yes**

- REPAIR the SCP + circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

**No**

- GO to H3.

**H3: CHECK THE SCP + FOR SHORT CIRCUIT TO BATTERY**

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Measure the resistance between the diagnostic connector FC001 pin 2, (Y) and pin 016, BATTERY.

Is the resistance less than 5 ohms?

**Yes**

- REPAIR the SCP + circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

**No**

- GO to H4.

**H4: CHECK THE SCP - FOR SHORT CIRCUIT TO GROUND**

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Measure the resistance between the diagnostic connector FC001 pin 10, (U) and GROUND.

Is the resistance less than 5 ohms?

**Yes**

- REPAIR the SCP - circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

**No**

- GO to H5.

**H5: CHECK THE SCP - FOR SHORT CIRCUIT TO BATTERY**

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Measure the resistance between the diagnostic connector FC001 pin 10, (U) and pin 016, BATTERY (OY).

Is the resistance less than 5 ohms?

**Yes**

- REPAIR the SCP - circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

**No**

- GO to H6.

**H6: CHECK FOR SHORT CIRCUIT BETWEEN SCP + AND SCP -**

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Measure the resistance between the diagnostic connector FC001 pin 10, (U) and pin 2, (Y).

Is the resistance less than 5 ohms?

**Yes**

- REPAIR the SCP + and/or SCP - circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

**No**

- GO to H7.

**H7: CHECK FOR OPEN CIRCUIT ON SCP + BETWEEN THE DIAGNOSTIC CONNECTOR AND THE IC**

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Disconnect the IC electrical connector, FC015.
4. Measure the resistance between the diagnostic connector FC001, pin 2 (Y) and FC015, pin 20 (Y).

Is the resistance less than 5 ohms?

**Yes**

- GO to H8.

**No**

- REPAIR the SCP + circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

**H8: CHECK FOR OPEN CIRCUIT ONSCP - BETWEEN THE DIAGNOSTIC CONNECTOR AND THE IC**

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Disconnect the IC electrical connector, FC015.
4. Measure the resistance between the diagnostic connector FC001, pin 10 (U) and FC015, pin 10 (U).

Is the resistance less than 5 ohms?

**Yes**

- GO to M9.

**No**

- REPAIR the SCP - circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

**H9: CHECK FOR CORRECT BUS TERMINATION ON SCP +**
1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Disconnect the IC electrical connector, FC015.
4. Measure the resistance between the diagnostic connector FC001, pin 2 (Y) and GROUND.

Is the resistance 90 to 150 ohms?
   Yes
   INSTALL a new IC.
   REFER to Section 501-12 Instrument Panel and Console.
   CLEAR the DTC. TEST the system for normal operation.
   GO to H10.
   No
   GO to H11.

**H10: CHECK THE CONTINUITY OF THE FRONT ELECTRONIC MODULE (FEM) SCP + CIRCUIT**

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Disconnect the FEM electrical connector, FH059.
4. Measure the resistance between FC001, pin 2 (Y) and FH059, pin 7 (Y).

Is the resistance less than 5 ohms?
   Yes
   GO to H11.
   No
   REPAIR the circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

**H11: CHECK FOR LOSS OF SCP + TERMINATION WITHIN THE FEM**

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Disconnect the FEM electrical connectors, FH059, and FH060.
4. Measure the resistance between FH059, pin 007 (Y), and FH060, pin 011 (Y) of the FEM. (Reconnect the FEM following completion of the test).

Is the resistance 140 to 220 ohms?
   No
   GO to H12.
   Yes
   INSTALL a new FEM.
   REFER to Section 419-10 Multifunction Electronic Modules.
   GO to H12.

**H12: CHECK THE CONTINUITY OF THE REAR ELECTRONIC MODULE (REM) SCP + CIRCUIT**

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Disconnect the REM electrical connector, CA102.
4. Measure the resistance between FC001, pin 2 (Y) and CA102, pin 001 (Y).

Is the resistance less than 5 ohms?
   No
   GO to H13.
   Yes
   INSTALL a new REM.
   REFER to Section 419-10 Multifunction Electronic Modules.
   GO to H14.

**H13: CHECK FOR LOSS OF SCP + TERMINATION WITHIN THE REM**

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Disconnect the REM electrical connector, CA102.
4. Measure the resistance between CA102, pin 001 (Y), and CA102, pin 012 (B) of the REM. (Reconnect the REM following completion of the test).

Is the resistance 140 to 220 ohms?
   No
   GO to H14.
   Yes
   INSTALL a new REM.
   REFER to Section 419-10 Multifunction Electronic Modules.
   GO to H15.

**H14: CHECK CONTINUITY OF THE INSTRUMENT CLUSTER (IC) SCP + CIRCUIT**

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Disconnect the IC electrical connector, FC015.
4. Measure the resistance between FC001, pin 002 (Y) and FC015, pin 020 (Y).

Is the resistance less than 5 ohms?
   Yes
   GO to H15.
   No
   REPAIR the circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

**H15: CHECK FOR LOSS OF SCP + TERMINATION WITHIN THE INSTRUMENT CLUSTER**

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Disconnect the IC electrical connector, FC015.
4. Measure the resistance between FC015, pin 020 (Y) and FC014, pin 014 of the IC.

Is the resistance 140 to 220 ohms?
   Yes
   Possible intermittent fault. Recheck DTCs.
   INSTALL a new IC.
   REFER to Section 413-01 Instrument Cluster.
   CLEAR the DTC. TEST the system for normal operation.
   GO to H14.
   No
   INSTALL a new IC.
   REFER to Section 413-01 Instrument Cluster.
   CLEAR the DTC. TEST the system for normal operation.

**PINPOINT TEST I : THE MODULE DOES NOT RESPOND TO THE JAGUAR APPROVED DIAGNOSTIC TESTER —REAR ELECTRONIC MODULE (REM)**

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
</table>

**TEST CONDITIONS**

**DETAILS/RESULTS/ACTIONS**
I1: CHECK IC FOR DAMAGE

1. Disconnect the REM electrical connector CA102.
2. INSPECT the REM for damage.

Does the REM indicate any signs of damage?

Yes
1. INSTALL a new REM.
   REFER to Section 419-10 Multifunction Electronic Modules.
   CLEAR the DTC. TEST the system for normal operation.

No
1. GO to I2.

I2: CHECK THE SCP + FOR SHORT CIRCUIT TO GROUND

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Measure the resistance between the diagnostic connector FC001 pin 2, (Y) and GROUND.

Is the resistance less than 5 ohms?

Yes
1. REPAIR the SCP + circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No
1. GO to I3.

I3: CHECK THE SCP + FOR SHORT CIRCUIT TO BATTERY

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Measure the resistance between the diagnostic connector FC001 pin 2, (Y) and pin 016, BATTERY.

Is the resistance less than 5 ohms?

Yes
1. REPAIR the SCP + circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No
1. GO to I4.

I4: CHECK THE SCP - FOR SHORT CIRCUIT TO GROUND

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Measure the resistance between the diagnostic connector FC001 pin 10, (U) and GROUND.

Is the resistance less than 5 ohms?

Yes
1. REPAIR the SCP - circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No
1. GO to I5.

I5: CHECK THE SCP - FOR SHORT CIRCUIT TO BATTERY

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Measure the resistance between the diagnostic connector FC001 pin 10, (U) and pin 016, BATTERY (OY).

Is the resistance less than 5 ohms?

Yes
1. REPAIR the SCP - circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No
1. GO to I6.

I6: CHECK FOR SHORT CIRCUIT BETWEEN SCP + AND SCP -

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Measure the resistance between the diagnostic connector FC001 pin 10, (U) and pin 2, (Y).

Is the resistance less than 5 ohms?

Yes
1. REPAIR the SCP + and/or SCP - circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No
1. GO to I7.

I7: CHECK FOR OPEN CIRCUIT ON SCP + BETWEEN THE DIAGNOSTIC CONNECTOR AND THE REM

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Disconnect the REM electrical connector, CA102.
4. Measure the resistance between the diagnostic connector FC001, pin 2 (Y) and CA102, pin 001 (Y).

Is the resistance less than 5 ohms?

Yes
1. GO to I8.

No
1. REPAIR the SCP + circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

I8: CHECK FOR OPEN CIRCUIT ON SCP - BETWEEN THE DIAGNOSTIC CONNECTOR AND THE REM

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Disconnect the REM electrical connector, CA102.
4. Measure the resistance between the diagnostic connector FC001, pin 10 (U) and CA102, pin 002 (U).

Is the resistance less than 5 ohms?

Yes
1. GO to I9.

No
1. REPAIR the SCP - circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

I9: CHECK FOR CORRECT BUS TERMINATION ON SCP +

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
Reconnect the IC electrical connector, FC015.

Measure the resistance between the diagnostic connector FC001, pin 2 (Y) and GROUND.

Yes
- INSTALL a new IC.
- REFER to Section 501-12 Instrument Panel and Console.
- CLEAR the DTC. TEST the system for normal operation.

No
- GO to H10.

**I10: CHECK THE CONTINUITY OF THE FRONT ELECTRONIC MODULE (FEM) SCP + CIRCUIT**

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Disconnect the FEM electrical connector, FH059.
4. Measure the resistance between FC001, pin 2 (Y) and FH059, pin 7 (Y).

Yes
- INSTALL a new IC.
- REFER to Section 501-12 Instrument Panel and Console.
- CLEAR the DTC. TEST the system for normal operation.

No
- GO to H11.

**I11: CHECK FOR LOSS OF SCP + TERMINATION WITHIN THE FEM**

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Disconnect the FEM electrical connectors, FH059, and FH060.
4. Measure the resistance between FH059, pin 007 (Y), and FH060, pin 011 (Y) of the FEM. (Reconnect the FEM following completion of the test).

Yes
- INSTALL a new FEM.
- REFER to Section 419-10 Multifunction Electronic Modules.

No
- REPAIR the circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

**I12: CHECK THE CONTINUITY OF THE REAR ELECTRONIC MODULE (REM) SCP + CIRCUIT**

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Disconnect the REM electrical connector, CA102.
4. Measure the resistance between FC001, pin 2 (Y) and CA102, pin 001 (Y).

Yes
- INSTALL a new REM.
- REFER to Section 419-10 Multifunction Electronic Modules.

No
- REPAIR the circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

**I13: CHECK FOR LOSS OF SCP + TERMINATION WITHIN THE REM**

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Disconnect the REM electrical connector, CA102.
4. Measure the resistance between CA102, pin 001 (Y), and CA102, pin 012 (B) of the REM. (Reconnect the REM following completion of the test).

Yes
- INSTALL a new REM.
- REFER to Section 419-10 Multifunction Electronic Modules.

No
- GO to H14.

**I14: CHECK CONTINUITY OF THE INSTRUMENT CLUSTER (IC) SCP + CIRCUIT**

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Disconnect the IC electrical connector, FC015.
4. Measure the resistance between FC001, pin 002 (Y) and FC015, pin 020 (Y).

Yes
- GO to H15.

No
- REPAIR the circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

**I15: CHECK FOR LOSS OF SCP + TERMINATION WITHIN THE INSTRUMENT CLUSTER**

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Disconnect the IC electrical connector, FC015.
4. Measure the resistance between FC001, pin 002 (Y) and FC014, pin 014 of the IC.

Yes
- GO to H16.

No
- Possible intermittent fault. Recheck DTCs.
- INSTALL a new IC.
- REFER to Section 413-01 Instrument Cluster.
- CLEAR the DTC. TEST the system for normal operation.

**PINPOINT TEST J : THE MODULE DOES NOT RESPOND TO THE JAGUAR APPROVED DIAGNOSTIC TESTER — ACTIVE DAMPING CONTROL MODULE (ADCM)**

**TEST CONDITIONS**

**DETAILS/RESULTS/ACTIONS**

**J1: CHECK ADCM FOR DAMAGE**

1. Disconnect the ADCM electrical connector CA011.
INSPECT the ADCM for damage.

Does the ADCM indicate any signs of damage?

Yes

INSTALL a new ADCM.
REFERR to Section 204-05 Vehicle Dynamic Suspension.
CLEAR the DTC. TEST the system for normal operation.

No

GO to J2.

J2: CHECK THE SCP + FOR SHORT CIRCUIT TO GROUND

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Measure the resistance between the diagnostic connector FC001 pin 2, (Y) and GROUND.

Is the resistance less than 5 ohms?

Yes

REPAIR the SCP + circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No

GO to J3.

J3: CHECK THE SCP + FOR SHORT CIRCUIT TO BATTERY

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Measure the resistance between the diagnostic connector FC001 pin 2, (Y) and pin 016, BATTERY.

Is the resistance less than 5 ohms?

Yes

REPAIR the SCP + circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No

GO to J4.

J4: CHECK THE SCP - FOR SHORT CIRCUIT TO GROUND

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Measure the resistance between the diagnostic connector FC001 pin 10, (U) and GROUND.

Is the resistance less than 5 ohms?

Yes

REPAIR the SCP - circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No

GO to J5.

J5: CHECK THE SCP - FOR SHORT CIRCUIT TO BATTERY

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Measure the resistance between the diagnostic connector FC001 pin 10, (U) and pin 016, BATTERY (OY).

Is the resistance less than 5 ohms?

Yes

REPAIR the SCP - circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No

GO to J6.

J6: CHECK FOR SHORT CIRCUIT BETWEEN SCP + AND SCP -

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Measure the resistance between the diagnostic connector FC001 pin 10, (U) and pin 2, (Y).

Is the resistance less than 5 ohms?

Yes

REPAIR the SCP + and/or SCP - circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No

GO to J7.

J7: CHECK FOR OPEN CIRCUIT ON SCP + BETWEEN THE DIAGNOSTIC CONNECTOR AND THE ADCM

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Measure the resistance between the diagnostic connector FC001, pin 2 (Y) and GROUND.

Is the resistance less than 5 ohms?

Yes

REPAIR the SCP + circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No

GO to J8.

J8: CHECK FOR OPEN CIRCUIT ON SCP - BETWEEN THE DIAGNOSTIC CONNECTOR AND THE ADCM

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Measure the resistance between the diagnostic connector FC001, pin 10 (U) and pin 013 (U).

Is the resistance less than 5 ohms?

Yes

REPAIR the SCP - circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No

GO to J9.

J9: CHECK FOR CORRECT BUS TERMINATION ON SCP +

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Reconnect the ADCM electrical connector, CA011.
4. Measure the resistance between the diagnostic connector FC001, pin 2 (Y) and GROUND.
Is the resistance 90 to 150 ohms?
Yes
INSTALL a new ADCM.
REFER to Section 204-05 Vehicle Dynamic Suspension.
CLEAR the DTC. TEST the system for normal operation.
No
GO to J10.

J10: CHECK THE CONTINUITY OF THE FRONT ELECTRONIC MODULE (FEM) SCP + CIRCUIT

1 Turn the ignition switch to the OFF position.
2 Disconnect the battery negative terminal.
3 Disconnect the FEM electrical connector, FH059.
4 Measure the resistance between FC001, pin 2 (Y) and FH059, pin 7 (Y).

Is the resistance less than 5 ohms?
Yes
GO to J11.
No
REPAIR the circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

J11: CHECK FOR LOSS OF SCP + TERMINATION WITHIN THE FEM

1 Turn the ignition switch to the OFF position.
2 Disconnect the battery negative terminal.
3 Disconnect the FEM electrical connectors, FH059, and FH060.
4 Measure the resistance between FH059, pin 007 (Y), and FH060, pin 011 (Y) of the FEM. (Reconnect the FEM following completion of the test).

Is the resistance 140 to 220 ohms?
No
INSTALL a new FEM.
REFER to Section 419-10 Multifunction Electronic Modules.
Yes
GO to J12.

J12: CHECK THE CONTINUITY OF THE REAR ELECTRONIC MODULE (REM) SCP + CIRCUIT

1 Turn the ignition switch to the OFF position.
2 Disconnect the battery negative terminal.
3 Disconnect the REM electrical connector, CA102.
4 Measure the resistance between FC001, pin 2 (Y) and CA102, pin 001 (Y).

Is the resistance less than 5 ohms?
Yes
GO to J13.
No
REPAIR the circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

J13: CHECK FOR LOSS OF SCP + TERMINATION WITHIN THE REM

1 Turn the ignition switch to the OFF position.
2 Disconnect the battery negative terminal.
3 Disconnect the REM electrical connector, CA102.
4 Measure the resistance between CA102, pin 001 (Y), and CA102, pin 012 (B) of the REM. (Reconnect the REM following completion of the test).

Is the resistance 140 to 220 ohms?
No
INSTALL a new REM.
REFER to Section 419-10 Multifunction Electronic Modules.
Yes
GO to J14.

J14: CHECK CONTINUITY OF THE INSTRUMENT CLUSTER (IC) SCP + CIRCUIT

1 Turn the ignition switch to the OFF position.
2 Disconnect the battery negative terminal.
3 Disconnect the IC electrical connector, FC015.
4 Measure the resistance between FC001, pin 002 (Y) and FC015, pin 020 (Y).

Is the resistance less than 5 ohms?
Yes
GO to J15.
No
REPAIR the circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

J15: CHECK FOR LOSS OF SCP + TERMINATION WITHIN THE INSTRUMENT CLUSTER

1 Turn the ignition switch to the OFF position.
2 Disconnect the battery negative terminal.
3 Disconnect the IC electrical connector, FC015.
4 Measure the resistance between FC015, pin 020 (Y) and FC014, pin 014 of the IC.

Is the resistance 140 to 220 ohms?
Yes
Possible intermittent fault. Recheck DTCs.
No
INSTALL a new IC.
REFER to Section 413-01 Instrument Cluster.
CLEAR the DTC. TEST the system for normal operation.

PINPOINT TEST K: THE MODULE DOES NOT RESPOND TO THE JAGUAR APPROVED DIAGNOSTIC TESTER — DRIVER’S DOOR MODULE (DDM)

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>K1: CHECK FOR DAMAGE</td>
<td></td>
</tr>
<tr>
<td>1 Disconnect the DDM electrical connector CA085.</td>
<td></td>
</tr>
<tr>
<td>2 INSPECT the DDM for damage.</td>
<td></td>
</tr>
</tbody>
</table>
Does the DDM indicate any signs of damage?
Yes
INSTALL a new DDM.
REFER to Section 419-10 Multifunction Electronic Modules.
CLEAR the DTC. TEST the system for normal operation.
No
GO to K2.

K2: CHECK THE SCP + FOR SHORT CIRCUIT TO GROUND
1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Measure the resistance between the diagnostic connector FC001 pin 2, (Y) and GROUND.

Is the resistance less than 5 ohms?
Yes
REPAIR the SCP + circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
No
GO to K3.

K3: CHECK THE SCP + FOR SHORT CIRCUIT TO BATTERY
1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Measure the resistance between the diagnostic connector FC001 pin 2, (Y) and pin 016, BATTERY.

Is the resistance less than 5 ohms?
Yes
REPAIR the SCP + circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
No
GO to K4.

K4: CHECK THE SCP - FOR SHORT CIRCUIT TO GROUND
1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Measure the resistance between the diagnostic connector FC001 pin 10, (U) and GROUND.

Is the resistance less than 5 ohms?
Yes
REPAIR the SCP - circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
No
GO to K5.

K5: CHECK THE SCP - FOR SHORT CIRCUIT TO BATTERY
1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Measure the resistance between the diagnostic connector FC001 pin 10, (U) and pin 016, BATTERY (OY).

Is the resistance less than 5 ohms?
Yes
REPAIR the SCP - circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
No
GO to K6.

K6: CHECK FOR SHORT CIRCUIT BETWEEN SCP + AND SCP -
1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Measure the resistance between the diagnostic connector FC001 pin 10, (U) and pin 2, (Y).

Is the resistance less than 5 ohms?
Yes
REPAIR the SCP + and/or SCP - circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
No
GO to K7.

K7: CHECK FOR OPEN CIRCUIT ON SCP + BETWEEN THE DIAGNOSTIC CONNECTOR AND THE DDM
1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Disconnect the DDM electrical connector, CA085.
4. Measure the resistance between the diagnostic connector FC001, pin 2 (Y) and CA085, pin 014 (Y).

Is the resistance less than 5 ohms?
Yes
GO to K8.
No
REPAIR the SCP + circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

K8: CHECK FOR OPEN CIRCUIT ON SCP - BETWEEN THE DIAGNOSTIC CONNECTOR AND THE DDM
1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Disconnect the DDM electrical connector, CA085.
4. Measure the resistance between the diagnostic connector FC001, pin 10 (U) and CA085, pin 004 (U).

Is the resistance less than 5 ohms?
Yes
GO to K9.
No
REPAIR the SCP - circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

K9: CHECK FOR CORRECT BUS TERMINATION ON SCP +
1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Reconnect the DDM electrical connector, CA085.
4. Measure the resistance between the diagnostic connector FC001, pin 2 (Y) and GROUND.
Is the resistance 90 to 150 ohms?
Yes
INSTALL a new DDM. REFER to Section 419-10 Multifunction Electronic Modules.
CLEAR the DTC. TEST the system for normal operation.

No
GO to K10.

K10: CHECK THE CONTINUITY OF THE FRONT ELECTRONIC MODULE (FEM) SCP + CIRCUIT
1 Turn the ignition switch to the OFF position.
2 Disconnect the battery negative terminal.
3 Disconnect the FEM electrical connector, FH059.
4 Measure the resistance between FC001, pin 2 (Y) and FH059, pin 7 (Y).

Is the resistance less than 5 ohms?
Yes
GO to K11.

No
REPAIR the circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

K11: CHECK FOR LOSS OF SCP + TERMINATION WITHIN THE FEM
1 Turn the ignition switch to the OFF position.
2 Disconnect the battery negative terminal.
3 Disconnect the FEM electrical connectors, FH059, and FH060.
4 Measure the resistance between FH059, pin 007 (Y), and FH060, pin 011 (Y) of the FEM. (Reconnect the FEM following completion of the test).

Is the resistance 140 to 220 ohms?
No
GO to K12.

Yes
INSTALL a new FEM. REFER to Section 419-10 Multifunction Electronic Modules.

K12: CHECK THE CONTINUITY OF THE REAR ELECTRONIC MODULE (REM) SCP + CIRCUIT
1 Turn the ignition switch to the OFF position.
2 Disconnect the battery negative terminal.
3 Disconnect the REM electrical connector, CA102.
4 Measure the resistance between FC001, pin 2 (Y) and CA102, pin 001 (Y).

Is the resistance less than 5 ohms?
Yes
GO to K13.

No
REPAIR the circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

K13: CHECK FOR LOSS OF SCP + TERMINATION WITHIN THE REM
1 Turn the ignition switch to the OFF position.
2 Disconnect the battery negative terminal.
3 Disconnect the REM electrical connector, CA102.
4 Measure the resistance between CA102, pin 001 (Y), and CA102, pin 012 (B) of the REM. (Reconnect the REM following completion of the test).

Is the resistance 140 to 220 ohms?
No
GO to K14.

Yes
INSTALL a new REM. REFER to Section 419-10 Multifunction Electronic Modules.

K14: CHECK CONTINUITY OF THE INSTRUMENT CLUSTER (IC) SCP + CIRCUIT
1 Turn the ignition switch to the OFF position.
2 Disconnect the battery negative terminal.
3 Disconnect the IC electrical connector, FC015.
4 Measure the resistance between FC001, pin 002 (Y) and FC015, pin 020 (Y).

Is the resistance less than 5 ohms?
Yes
GO to K15.

No
REPAIR the circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

K15: CHECK FOR LOSS OF SCP + TERMINATION WITHIN THE INSTRUMENT CLUSTER
1 Turn the ignition switch to the OFF position.
2 Disconnect the battery negative terminal.
3 Disconnect the IC electrical connector, FC015.
4 Measure the resistance between FC015, pin 020 (Y) and FC014, pin 014 of the IC.

Is the resistance 140 to 220 ohms?
Yes
Possible intermittent fault. Recheck DTCs.

No
INSTALL a new IC. REFER to Section 413-01 Instrument Cluster.
CLEAR the DTC. TEST the system for normal operation.

PINPOINT TEST L : THE MODULE DOES NOT RESPOND TO THE JAGUAR APPROVED DIAGNOSTIC TESTER — DYNAMIC STABILITY CONTROL MODULE (DSM)

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>L1: CHECK FOR DAMAGE</td>
<td></td>
</tr>
<tr>
<td>1 Disconnect the DSM electrical connector DM034.</td>
<td></td>
</tr>
<tr>
<td>2 INSPECT the DSM for damage.</td>
<td></td>
</tr>
</tbody>
</table>
Does the DSM indicate any signs of damage?
Yes
INSTALL a new DSM. REFER to Section 419-10 Multifunction Electronic Modules. CLEAR the DTC. TEST the system for normal operation.
No
GO to L2.

L2: CHECK THE SCP + FOR SHORT CIRCUIT TO GROUND
1 Turn the ignition switch to the OFF position.
2 Disconnect the battery negative terminal.
3 Measure the resistance between the diagnostic connector FC001 pin 2, (Y) and GROUND.

Is the resistance less than 5 ohms?
Yes
REPAIR the SCP + circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
No
GO to L3.

L3: CHECK THE SCP + FOR SHORT CIRCUIT TO BATTERY
1 Turn the ignition switch to the OFF position.
2 Disconnect the battery negative terminal.
3 Measure the resistance between the diagnostic connector FC001 pin 2, (Y) and pin 016, BATTERY.

Is the resistance less than 5 ohms?
Yes
REPAIR the SCP + circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
No
GO to L4.

L4: CHECK THE SCP - FOR SHORT CIRCUIT TO GROUND
1 Turn the ignition switch to the OFF position.
2 Disconnect the battery negative terminal.
3 Measure the resistance between the diagnostic connector FC001 pin 10, (U) and GROUND.

Is the resistance less than 5 ohms?
Yes
REPAIR the SCP - circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
No
GO to L5.

L5: CHECK THE SCP - FOR SHORT CIRCUIT TO BATTERY
1 Turn the ignition switch to the OFF position.
2 Disconnect the battery negative terminal.
3 Measure the resistance between the diagnostic connector FC001 pin 10, (U) and pin 016, BATTERY (OY).

Is the resistance less than 5 ohms?
Yes
REPAIR the SCP - circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
No
GO to L6.

L6: CHECK FOR SHORT CIRCUIT BETWEEN SCP + AND SCP -
1 Turn the ignition switch to the OFF position.
2 Disconnect the battery negative terminal.
3 Measure the resistance between the diagnostic connector FC001 pin 10, (U) and pin 2, (Y).

Is the resistance less than 5 ohms?
Yes
REPAIR the SCP + and/or SCP - circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
No
GO to L7.

L7: CHECK FOR OPEN CIRCUIT ON SCP + BETWEEN THE DIAGNOSTIC CONNECTOR AND THE DSM
1 Turn the ignition switch to the OFF position.
2 Disconnect the battery negative terminal.
3 Disconnect the DSM electrical connector, DM034.
4 Measure the resistance between the diagnostic connector FC001, pin 2 (Y) and DM034, pin 001 (Y).

Is the resistance less than 5 ohms?
Yes
GO to L8.
No
REPAIR the SCP + circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

L8: CHECK FOR OPEN CIRCUIT ON SCP - BETWEEN THE DIAGNOSTIC CONNECTOR AND THE DSM
1 Turn the ignition switch to the OFF position.
2 Disconnect the battery negative terminal.
3 Disconnect the DSM electrical connector, DM034.
4 Measure the resistance between the diagnostic connector FC001, pin 10 (U) and DM034, pin 012 (U).

Is the resistance less than 5 ohms?
Yes
GO to L9.
No
REPAIR the SCP - circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

L9: CHECK FOR CORRECT BUS TERMINATION ON SCP +
1 Turn the ignition switch to the OFF position.
2 Disconnect the battery negative terminal.
3 Reconnect the DSM electrical connector, DM034.
4 Measure the resistance between the diagnostic connector FC001, pin 2 (Y) and GROUND.
Is the resistance 90 to 150 ohms?
Yes
INSTALL a new DSM.
REFER to Section 419-10 Multifunction Electronic Modules.
CLEAR the DTC. TEST the system for normal operation.
No
GO to L10.

L10: CHECK THE CONTINUITY OF THE FRONT ELECTRONIC MODULE (FEM) SCP + CIRCUIT

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Disconnect the FEM electrical connector, FH059.
4. Measure the resistance between FC001, pin 2 (Y) and FH059, pin 7 (Y).

Is the resistance less than 5 ohms?
Yes
INSTALL a new DSM.
REFER to Section 419-10 Multifunction Electronic Modules.
No
GO to L11.

L11: CHECK FOR LOSS OF SCP + TERMINATION WITHIN THE FEM

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Disconnect the FEM electrical connectors, FH059, and FH060.
4. Measure the resistance between FC001, pin 2 (Y) and CA102, pin 001 (Y).

Is the resistance less than 5 ohms?
Yes
GO to L12.
No
REPAIR the circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

L12: CHECK THE CONTINUITY OF THE REAR ELECTRONIC MODULE (REM) SCP + CIRCUIT

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Disconnect the REM electrical connector, CA102.
4. Measure the resistance between FC001, pin 2 (Y) and CA102, pin 001 (Y).

Is the resistance less than 5 ohms?
Yes
GO to L13.
No
REPAIR the circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

L13: CHECK FOR LOSS OF SCP + TERMINATION WITHIN THE REM

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Disconnect the REM electrical connector, CA102.
4. Measure the resistance between CA102, pin 001 (Y), and CA102, pin 012 (B) of the REM. (Reconnect the REM following completion of the test).

Is the resistance 140 to 220 ohms?
No
GO to L14.
Yes
INSTALL a new REM.
REFER to Section 419-10 Multifunction Electronic Modules.

L14: CHECK CONTINUITY OF THE INSTRUMENT CLUSTER (IC) SCP + CIRCUIT

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Disconnect the IC electrical connector, FC015.
4. Measure the resistance between FC001, pin 002 (Y) and FC015, pin 020 (Y).

Is the resistance less than 5 ohms?
Yes
GO to L15.
No
REPAIR the circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

L15: CHECK FOR LOSS OF SCP + TERMINATION WITHIN THE INSTRUMENT CLUSTER

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Disconnect the IC electrical connector, FC015.
4. Measure the resistance between FC015, pin 020 (Y) and FC014, pin 014 of the IC.

Is the resistance 140 to 220 ohms?
Yes
Possible intermittent fault. Recheck DTCs.
No
INSTALL a new IC.
REFER to Section 413-01 Instrument Cluster.
CLEAR the DTC. TEST the system for normal operation.

PINPOINT TEST M: THE MODULE DOES NOT RESPOND TO THE JAGUAR APPROVED DIAGNOSTIC TESTER — IN CAR ENTERTAINMENT (ICE) HEAD

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>M1: CHECK ICE FOR DAMAGE</td>
<td></td>
</tr>
<tr>
<td>1. Disconnect the ICE head electrical connector FC094.</td>
<td></td>
</tr>
<tr>
<td>2. INSPECT the ICE head for damage.</td>
<td></td>
</tr>
</tbody>
</table>
Does the ICE head indicate any signs of damage?
Yes
INSTALL a new ICE head.
REFER to Section 415-01 Audio Unit.
CLEAR the DTC. TEST the system for normal operation.
No
GO to M2.

M2: CHECK THE SCP + FOR SHORT CIRCUIT TO GROUND

<p>| | | |</p>

</tr>
</tbody>
</table>
Is the resistance 90 to 150 ohms?
Yes
INSTALL a new ICE head unit.
REFER to Section 415-01 Audio Unit.
CLEAR the DTC. TEST the system for normal operation.
No
GO to M10.

M10: CHECK THE CONTINUITY OF THE FRONT ELECTRONIC MODULE (FEM) SCP + CIRCUIT

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Disconnect the FEM electrical connector, FH059.
4. Measure the resistance between FC001, pin 2 (Y) and FH059, pin 7 (Y).

Is the resistance less than 5 ohms?
Yes
GO to M11.
No
REPAIR the circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

M11: CHECK FOR LOSS OF SCP + TERMINATION WITHIN THE FEM

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Disconnect the FEM electrical connectors, FH059, and FH060.
4. Measure the resistance between FH059, pin 007 (Y), and FH060, pin 011 (Y) of the FEM. (Reconnect the FEM following completion of the test).

Is the resistance 140 to 220 ohms?
No
INSTALL a new FEM.
REFER to Section 419-10 Multifunction Electronic Modules.
Yes
GO to M12.

M12: CHECK THE CONTINUITY OF THE REAR ELECTRONIC MODULE (REM) SCP + CIRCUIT

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Disconnect the REM electrical connector, CA102.
4. Measure the resistance between FC001, pin 2 (Y) and CA102, pin 001 (Y).

Is the resistance less than 5 ohms?
Yes
GO to M13.
No
REPAIR the circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

M13: CHECK FOR LOSS OF SCP + TERMINATION WITHIN THE REM

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Disconnect the REM electrical connector, CA102.
4. Measure the resistance between CA102, pin 001 (Y), and CA102, pin 012 (B) of the REM. (Reconnect the REM following completion of the test).

Is the resistance 140 to 220 ohms?
No
INSTALL a new REM.
REFER to Section 419-10 Multifunction Electronic Modules.
Yes
GO to M14.

M14: CHECK CONTINUITY OF THE INSTRUMENT CLUSTER (IC) SCP + CIRCUIT

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Disconnect the IC electrical connector, FC015.
4. Measure the resistance between FC001, pin 002 (Y) and FC015, pin 020 (Y).

Is the resistance less than 5 ohms?
Yes
GO to M15.
No
REPAIR the circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

M15: CHECK FOR LOSS OF SCP + TERMINATION WITHIN THE INSTRUMENT CLUSTER

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Disconnect the IC electrical connector, FC015.
4. Measure the resistance between FC015, pin 020 (Y) and FC014, pin 014 of the IC.

Is the resistance 140 to 220 ohms?
Yes
Possible intermittent fault. Recheck DTCs.
No
INSTALL a new IC.
REFER to Section 413-01 Instrument Cluster.
CLEAR the DTC. TEST the system for normal operation.

PINPOINT TEST N: THE MODULE DOES NOT RESPOND TO THE JAGUAR APPROVED DIAGNOSTIC TESTER — FRONT ELECTRONIC MODULE (FEM)

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>N1: CHECK FEM FOR DAMAGE</td>
<td>Disconnect the FEM electrical connector FH059.</td>
</tr>
<tr>
<td></td>
<td>INSPECT the FEM for damage.</td>
</tr>
</tbody>
</table>
Does the FEM indicate any signs of damage?

Yes
INSTALLED a new FEM.
REFER to Section 419-10 Multifunction Electronic Modules.
CLEAR the DTC. TEST the system for normal operation.

No
GO to N2.

N2: CHECK THE SCP + FOR SHORT CIRCUIT TO GROUND

1 Turn the ignition switch to the OFF position.
2 Disconnect the battery negative terminal.
3 Measure the resistance between the diagnostic connector FC001 pin 2, (Y) and GROUND.

Is the resistance less than 5 ohms?

Yes
REPAIR the SCP + circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No
GO to N3.

N3: CHECK THE SCP + FOR SHORT CIRCUIT TO BATTERY

1 Turn the ignition switch to the OFF position.
2 Disconnect the battery negative terminal.
3 Measure the resistance between the diagnostic connector FC001 pin 2, (Y) and pin 016, BATTERY.

Is the resistance less than 5 ohms?

Yes
REPAIR the SCP + circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No
GO to N4.

N4: CHECK THE SCP - FOR SHORT CIRCUIT TO GROUND

1 Turn the ignition switch to the OFF position.
2 Disconnect the battery negative terminal.
3 Measure the resistance between the diagnostic connector FC001 pin 10, (U) and GROUND.

Is the resistance less than 5 ohms?

Yes
REPAIR the SCP - circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No
GO to N5.

N5: CHECK THE SCP - FOR SHORT CIRCUIT TO BATTERY

1 Turn the ignition switch to the OFF position.
2 Disconnect the battery negative terminal.
3 Measure the resistance between the diagnostic connector FC001 pin 10, (U) and pin 016, BATTERY (OY).

Is the resistance less than 5 ohms?

Yes
REPAIR the SCP - circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No
GO to N6.

N6: CHECK FOR SHORT CIRCUIT BETWEEN SCP + AND SCP -

1 Turn the ignition switch to the OFF position.
2 Disconnect the battery negative terminal.
3 Measure the resistance between the diagnostic connector FC001 pin 10, (U) and pin 2, (Y)

Is the resistance less than 5 ohms?

Yes
REPAIR the SCP + and/or SCP - circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No
GO to N7.

N7: CHECK FOR OPEN CIRCUIT ON SCP + BETWEEN THE DIAGNOSTIC CONNECTOR AND THE FEM

1 Turn the ignition switch to the OFF position.
2 Disconnect the battery negative terminal.
3 Disconnect the FEM electrical connector, FH059.
4 Measure the resistance between the diagnostic connector FC001, pin 2 (Y) and FH059, pin 7 (Y).

Is the resistance less than 5 ohms?

Yes
GO to N8.

No
REPAIR the SCP + circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

N8: CHECK FOR OPEN CIRCUIT ON SCP - BETWEEN THE DIAGNOSTIC CONNECTOR AND THE FEM

1 Turn the ignition switch to the OFF position.
2 Disconnect the battery negative terminal.
3 Disconnect the FEM electrical connector, FH059.
4 Measure the resistance between the diagnostic connector FC001, pin 10 (U) and FH059, pin 001 (U).

Is the resistance less than 5 ohms?

Yes
GO to N9.

No
REPAIR the SCP - circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

N9: CHECK FOR CORRECT BUS TERMINATION ON SCP +

1 Turn the ignition switch to the OFF position.
2 Disconnect the battery negative terminal.
3 Reconnect the FEM electrical connector, FH059.
4 Measure the resistance between the diagnostic connector FC001, pin 2 (Y) and GROUND.
Is the resistance 80 to 160 ohms?
Yes
INSTALL a new FEM.
REFER to Section 419-10 Multifunction Electronic Modules.
CLEAR the DTC. TEST the system for normal operation.
No
GO to N10.

N10: CHECK THE CONTINUITY OF THE FRONT ELECTRONIC MODULE (FEM) SCP + CIRCUIT

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Disconnect the FEM electrical connector, FH059.
4. Measure the resistance between FC001, pin 2 (Y) and FH059, pin 7 (Y).

Is the resistance less than 5 ohms?
Yes
No
GO to N11.

N11: CHECK FOR LOSS OF SCP + TERMINATION WITHIN THE FEM

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Disconnect the FEM electrical connectors, FH059, and FH060
4. Measure the resistance between FH059, pin 007, and FH060, pin 11 of the FEM.

Is the resistance 140 to 220 ohms?
Yes
INSTALL a new FEM.
REFER to Section 419-10 Multifunction Electronic Modules.
CLEAR the DTC. TEST the system for normal operation.
No
GO to N12.

N12: CHECK THE CONTINUITY OF THE REAR ELECTRONIC MODULE (REM) SCP + CIRCUIT

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Disconnect the REM electrical connector, CA102.
4. Measure the resistance between FC001, pin 2 (Y) and CA102, pin 001 (Y).

Is the resistance less than 5 ohms?
Yes
No
GO to R1.

N13: CHECK FOR LOSS OF SCP + TERMINATION WITHIN THE REM

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Disconnect the REM electrical connector, CA102.
4. Measure the resistance between CA102, pin 001 (Y) and CA102, pin 012 (B) of the REM.

Is the resistance 140 to 220 ohms?
Yes
INSTALL a new FEM.
REFER to Section 419-10 Multifunction Electronic Modules.
CLEAR the DTC. TEST the system for normal operation.
No
GO to N14.

N14: CHECK CONTINUITY OF THE INSTRUMENT CLUSTER (IC) SCP + CIRCUIT

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Disconnect the IC electrical connector, FC015.
4. Measure the resistance between FC001, pin 2 (Y) and FC015, pin 20 (Y).

Is the resistance less than 5 ohms?
Yes
No
GO to N15.

N15: CHECK FOR LOSS OF SCP + TERMINATION WITHIN THE INSTRUMENT CLUSTER

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Disconnect the IC electrical connector, FC015.
4. Measure the resistance between FC015, pin 20 (Y) and FC14, pin 014 of the IC.

Is the resistance 320 to 400 ohms?
Yes
Possible intermittent fault. Recheck DTCs.
No
INSTALL a new IC.
REFER to Section 413-01 Instrument Cluster.
CLEAR the DTC. TEST the system for normal operation.

PINPOINT TEST O : THE MODULE DOES NOT RESPOND TO THE JAGUAR APPROVED DIAGNOSTICS TESTER — NAVIGATION COMPUTER (NC)

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>O1: CHECK THE NAVIGATION COMPUTER (NC) FOR DAMAGE</td>
<td></td>
</tr>
</tbody>
</table>
1. Disconnect the NC electrical connector, CA258.
2. INSPECT the NC for damage. |
Does the NC indicate signs of damage?

Yes
INSTALL a new NC.
REFER to Section 419-07 Navigation System.
CLEAR the DTC. TEST the system for normal operation.

No
GO to O2.

O2: CHECK THE SCP + FOR SHORT CIRCUIT TO GROUND

1) Turn the ignition switch to the OFF position.
2) Disconnect the battery negative terminal.
3) Measure the resistance between the diagnostic connector FC001 pin 2 (Y) and GROUND.

Is the resistance less than 5 ohms?

Yes
REPAIR the SCP + circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No
GO to O3.

O3: CHECK THE SCP + FOR SHORT CIRCUIT TO BATTERY

1) Turn the ignition switch to the OFF position.
2) Disconnect the battery negative terminal.
3) Measure the resistance between the diagnostic connector FC001 pin 2 (Y) and pin 016, BATTERY.

Is the resistance less than 5 ohms?

Yes
REPAIR the SCP + circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No
GO to O4.

O4: CHECK THE SCP - FOR SHORT CIRCUIT TO GROUND

1) Turn the ignition switch to the OFF position.
2) Disconnect the battery negative terminal.
3) Measure the resistance between the diagnostic connector FC001 pin 10 (U) and GROUND.

Is the resistance less than 5 ohms?

Yes
REPAIR the SCP - circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No
GO to O5.

O5: CHECK THE SCP - FOR SHORT CIRCUIT TO BATTERY

1) Turn the ignition switch to the OFF position.
2) Disconnect the battery negative terminal.
3) Measure the resistance between the diagnostic connector FC001 pin 10 (U) and pin 016, (OY).

Is the resistance less than 5 ohms?

Yes
REPAIR the SCP - circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No
GO to O6.

O6: CHECK FOR SHORT CIRCUIT BETWEEN SCP + AND SCP -

1) Turn the ignition switch to the OFF position.
2) Disconnect the battery negative terminal.
3) Measure the resistance between the diagnostic connector FC001 pin 10 (U) and pin 2, (Y).

Is the resistance less than 5 ohms?

Yes
REPAIR the SCP + and/or SCP - circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No
GO to O7.

O7: CHECK FOR OPEN CIRCUIT ON SCP + BETWEEN THE DIAGNOSTIC CONNECTOR AND THE NAVIGATION COMPUTER (NC)

1) Turn the ignition switch to the OFF position.
2) Disconnect the battery negative terminal.
3) Measure the resistance between the diagnostic connector FC001 pin 2 (Y) and GROUND.

Is the resistance less than 5 ohms?

Yes
GO to O8.

No
REPAIR the SCP + circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

O8: CHECK FOR OPEN CIRCUIT ON SCP - BETWEEN THE DIAGNOSTIC CONNECTOR AND THE NAVIGATION COMPUTER (NC)

1) Turn the ignition switch to the OFF position.
2) Disconnect the battery negative terminal.
3) Measure the resistance between the diagnostic connector FC001 pin 10 (U) and pin 014 (U).

Is the resistance less than 5 ohms?

Yes
GO to O9.

No
REPAIR the SCP - circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

O9: CHECK FOR CORRECT BUS TERMINATION ON SCP +

1) Turn the ignition switch to the OFF position.
2) Disconnect the battery negative terminal.
3) Reconnect the NC electrical connector, CA258.
4) Measure the resistance between the diagnostic connector FC001, pin 2 (Y) and GROUND.
Is the resistance 150 to 210 ohms?

Yes
INSTALL a new NC.  
REFER to Section 419-07 Navigation System.  
CLEAR the DTC.  TEST the system for normal operation.

No
GO to O10.

O10: CHECK THE CONTINUITY OF THE FRONT ELECTRONIC MODULE (FEM) SCP + CIRCUIT

1 Turn the ignition switch to the OFF position.
2 Disconnect the battery negative terminal.
3 Disconnect the FEM electrical connector, FH059.
4 Measure the resistance between FC001, pin 2 (Y) and FH059, pin 019 (Y).

Is the resistance less than 5 ohms?

Yes
GO to O11.

No
REPAIR the circuit.  For additional information, refer to wiring diagrams.  CLEAR the DTC.  TEST the system for normal operation.

O11: CHECK FOR LOSS OF SCP + TERMINATION WITHIN THE FEM

1 Turn the ignition switch to the OFF position.
2 Disconnect the battery negative terminal.
3 Disconnect the FEM electrical connectors, FH059, and FH060.
4 Measure the resistance between FH059, pin 019, and FH060, pin 11.

Is the resistance 320 to 400 ohms?

Yes
GO to O12.

No
INSTALL a new FEM.  
REFER to Section 419-10 Multifunction Electronic Modules.  
CLEAR the DTC.  TEST the system for normal operation.

O12: CHECK THE CONTINUITY OF THE REAR ELECTRONIC MODULE (REM) SCP + CIRCUIT

1 Turn the ignition switch to the OFF position.
2 Disconnect the battery negative terminal.
3 Disconnect the REM electrical connector, CA102.
4 Measure the resistance between FC001, pin 2 (Y) and CA102, pin 001 (Y).

Is the resistance less than 5 ohms?

Yes
GO to O13.

No
REPAIR the circuit.  For additional information, refer to wiring diagrams.  CLEAR the DTC.  TEST the system for normal operation.

O13: CHECK FOR LOSS OF SCP + TERMINATION WITHIN THE REM

1 Turn the ignition switch to the OFF position.
2 Disconnect the battery negative terminal.
3 Disconnect the REM electrical connector, CA102.
4 Measure the resistance between CA102, pin 001 (Y) and CA102, pin 012 (B) of the REM.

Is the resistance 140 to 220 ohms?

No
GO to O14.

Yes
INSTALL a new FEM.  
REFER to Section 419-10 Multifunction Electronic Modules.  
CLEAR the DTC.  TEST the system for normal operation.

O14: CHECK CONTINUITY OF THE INSTRUMENT CLUSTER (IC) SCP + CIRCUIT

1 Turn the ignition switch to the OFF position.
2 Disconnect the battery negative terminal.
3 Disconnect the IC electrical connector, FC015.
4 Measure the resistance between FC001, pin 2 (Y) and FC015, pin 20 (Y).

Is the resistance less than 5 ohms?

Yes
GO to O15.

No
REPAIR the circuit.  For additional information, refer to wiring diagrams.  CLEAR the DTC.  TEST the system for normal operation.

O15: CHECK FOR LOSS OF SCP + TERMINATION WITHIN THE INSTRUMENT CLUSTER (IC)

1 Turn the ignition switch to the OFF position.
2 Disconnect the battery negative terminal.
3 Disconnect the IC electrical connector, FC015.
4 Measure the resistance between FC015, pin 20 (Y) and FC14, pin 014 of the IC.

Is the resistance 320 to 400 ohms?

Yes
Possible intermittent fault.  Recheck DTCs.

No
INSTALL a new IC.  
REFER to Section 413-01 Instrument Cluster.  
CLEAR the DTC.  TEST the system for normal operation.

PINPOINT TEST P : THE MODULE DOES NOT RESPOND TO THE JAGUAR APPROVED DIAGNOSTIC TESTER — RERAINTS CONTROL MODULE (RCM)

TEST CONDITIONS

DETAILS/RESULTS/ACTIONS

P1: CHECK RERAINTS CONTROL MODULE FOR DAMAGE

1 INSPECT the RCM for damage.
Does the RCM indicate signs of damage?
Yes
   INSTALL a new RCM. REFER to Section 501-20A Safety Belt System / 501-20B Supplemental Restraint System.
   CLEAR the DTC. TEST the system for normal operation.
No
   GO to P2.

P2: CHECK K-LINE FOR SHORT CIRCUIT TO GROUND
1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Measure the resistance between diagnostic connector FC001 pin 7 (K-line) and GROUND.
Is the resistance less than 5 ohms?
   Yes
      REPAIR the circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
   No
      GO to P3.

P3: CHECK K-LINE FOR SHORT CIRCUIT TO BATTERY
1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Measure the resistance between diagnostic connector FC001 pin 7 (K-line) and pin 016, BATTERY.
Is the resistance less than 5 ohms?
   Yes
      REPAIR the circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
   No
      GO to P4.

P4: CHECK FOR OPEN CIRCUIT ON K-LINE BETWEEN DIAGNOSTIC CONNECTOR AND RESTRAINTS CONTROL MODULE (RCM)
1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Disconnect the RCM electrical connector, CA114.
4. Measure the resistance between diagnostic connector FC001 pin 7 (K-line) and CA114, pin 11 (W).
Is the resistance less than 5 ohms?
   Yes
      INSTALL a new RCM. REFER to Section 501-20A Safety Belt System / 501-20B Supplemental Restraint System.
      CLEAR the DTC. TEST the system for normal operation.
   No
      REPAIR the circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

PINPOINT TEST Q: THE MODULE DOES NOT RESPOND TO THE JAGUAR APPROVED DIAGNOSTIC TESTER — HEADLAMP LEVELLING MODULE (ADHLS)

TEST CONDITIONS | DETAILS/RESULTS/ACTIONS
Q1: CHECK HEADLAMP LEVELLING MODULE FOR DAMAGE
1. INSPECT the ADHLS module for damage.
Does the ADHLS module indicate signs of damage?
   Yes
      INSTALL a new ADHLS module.
      REFER to Section 417-01 Exterior Lighting.
      CLEAR the DTC. TEST the system for normal operation.
   No
      GO to Q2.

Q2: CHECK K-LINE FOR SHORT CIRCUIT TO GROUND
1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Measure the resistance between diagnostic connector FC001 pin 7 (K-line) and GROUND.
Is the resistance less than 5 ohms?
   Yes
      REPAIR the circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
   No
      GO to Q3.

Q3: CHECK K-LINE FOR SHORT CIRCUIT TO BATTERY
1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Measure the resistance between diagnostic connector FC001 pin 7 (K-line) and pin 016, BATTERY.
Is the resistance less than 5 ohms?
   Yes
      REPAIR the circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
   No
      GO to Q4.

Q4: CHECK FOR OPEN CIRCUIT ON K-LINE BETWEEN DIAGNOSTIC CONNECTOR AND HID MODULE
1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Disconnect the ADHLS module electrical connector, FH012.
4. Measure the resistance between diagnostic connector FC001 pin 7 (W), (K-line) and FH12, pin 5 (W).
Is the resistance less than 5 ohms?
   Yes
      INSTALL a new ADHLS module.
      REFER to Section 417-01 Exterior Lighting.
      CLEAR the DTC. TEST the system for normal operation.
   No
      REPAIR the circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

PINPOINT TEST R: THE MODULE DOES NOT RESPOND TO THE JAGUAR APPROVED DIAGNOSTIC TESTER — HEADLAMP LEVELLING MODULE (ADHLS)
R1: CHECK REVERSE PARK AID MODULE FOR DAMAGE

<table>
<thead>
<tr>

</tr>
<tr>
<td>3. Disconnect the intrusion sensor module electrical connector, CA250.</td>
<td></td>
</tr>
<tr>
<td>4. Measure the resistance between diagnostic connector FC001, pin 7 (K-line) and CA250, pin 008</td>
<td></td>
</tr>
</tbody>
</table>
Is the resistance less than 5 ohms?

Yes
   INSTALL a new intrusion sensor module. CLEAR the DTC. TEST the system for normal operation.

No
   REPAIR the circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

## PINPOINT TEST T: THE MODULE DOES NOT RESPOND TO THE JAGUAR APPROVED DIAGNOSTIC TESTER — ECM

**NOTE:** These pinpoint tests apply only to OBD2 diagnostics. The ECM does most of its diagnostics via CAN. See pinpoint tests “A” in this section.

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>T1: CHECK ECM FOR DAMAGE</strong></td>
<td></td>
</tr>
<tr>
<td>1</td>
<td>INSPECT the ECM for damage.</td>
</tr>
<tr>
<td>Does the ECM indicate signs of damage?</td>
<td></td>
</tr>
<tr>
<td>Yes</td>
<td>INSTALL a new ECM. REFER to Section 303-14A Electronic Engine Controls / 303-14B Electronic Engine Controls / 303-14C Electronic Engine Controls, or REFER to Section 303-14A Electronic Engine Controls / 303-14B Electronic Engine Controls / 303-14C Electronic Engine Controls. CLEAR the DTC. TEST the system for normal operation.</td>
</tr>
<tr>
<td>No</td>
<td>GO to T2.</td>
</tr>
</tbody>
</table>

| **T2: CHECK K-LINE FOR SHORT CIRCUIT TO GROUND** | |
| 1 | Turn the ignition switch to the OFF position. |
| 2 | Disconnect the battery negative terminal. |
| 3 | Measure the resistance between diagnostic connector FC001, pin 7 (K-line) and GROUND. |
| Is the resistance less than 5 ohms? | |
| Yes | REPAIR the circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation. |
| No | GO to T3. |

| **T3: CHECK K-LINE FOR SHORT CIRCUIT TO BATTERY** | |
| 1 | Turn the ignition switch to the OFF position. |
| 2 | Disconnect the battery negative terminal. |
| 3 | Measure the resistance between diagnostic connector FC001, pin 7 (K-line) and pin 016, BATTERY. |
| Is the resistance less than 5 ohms? | |
| Yes | REPAIR the circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation. |
| No | GO to T4. |

| **T4: CHECK FOR OPEN CIRCUIT ON K-LINE BETWEEN DIAGNOSTIC CONNECTOR AND ECM** | |
| 1 | Turn the ignition switch to the OFF position. |
| 2 | Disconnect the battery negative terminal. |
| 3 | Disconnect the ECM electrical connector, PI001. |
| 4 | Measure the resistance between diagnostic connector FC001, pin 7 (K-line) and PI001, pin 105. |
| Is the resistance less than 5 ohms? | |
| Yes | INSTALL a new ECM. REFER to Section 303-14A Electronic Engine Controls / 303-14B Electronic Engine Controls / 303-14C Electronic Engine Controls, or REFER to Section 303-14A Electronic Engine Controls / 303-14B Electronic Engine Controls / 303-14C Electronic Engine Controls. CLEAR the DTC. TEST the system for normal operation. |
| No | REPAIR the circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation. |

## PINPOINT TEST U: THE MODULE DOES NOT RESPOND TO THE JAGUAR APPROVED DIAGNOSTIC TESTER — VOICE ACTIVATED CONTROL MODULE (VACM)

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>U1: CHECK THE VACM FOR DAMAGE</strong></td>
<td></td>
</tr>
<tr>
<td>1</td>
<td>INSPECT the VACM for damage.</td>
</tr>
<tr>
<td>Does the VACM indicate any signs of damage?</td>
<td></td>
</tr>
<tr>
<td>Yes</td>
<td>INSTALL a new VACM. REFER to Section 419-08 Cellular Phone. CLEAR the DTC. TEST the system for normal operation.</td>
</tr>
<tr>
<td>No</td>
<td>GO to U2.</td>
</tr>
</tbody>
</table>

| **U2: CHECK THAT THE TESTER IS COMMUNICATING WITH THE ICE HEAD UNIT** | |
| 1 | Turn the ignition switch to the ON position. |
| 2 | Attempt to connect to the ICE head unit using the Jaguar approved diagnostic system. (Where available) |
| Can the tester connect to the ICE head unit? | |
| Yes | GO to P1. |
| No | Carry out the SCP test for the ICE head unit. (Pinpoint test G in this section). |

| **U3: CHECK THAT THE VACM IS COMMUNICATING WITH THE ICE HEAD UNIT** | |
| 1 | Turn the ignition switch to the ON position. |
| 2 | Press the PTT button. |
| Are the voice listening beeps heard? | |
| Yes | GO to U4. |
| No | Carry out the D2B diagnostic test procedure. (Pinpoint test R in this section). |

| **U4: CHECK THAT THE VACM IS RESPONDING TO DIAGNOSTIC COMMANDS** | |
| 1 | Turn the ignition switch to the ON position. |
| 2 | INSTALL a new VACM. |
ATTEMPT TO COMMunicATE WITH THE VACM.

**Can the tester communicate with the VACM?**

- **Yes**
  - CLEAR the DTC. TEST the system for normal operation with the substitute VACM.
  - INSTALL a new ICE head unit.
  - REFER to Section **415-01 Audio Unit**.
  - Refit the original VACM. CLEAR the DTC. TEST the system for normal operation.

- **No**

**PINPOINT TEST V: THE MODULE DOES NOT RESPOND TO THE JAGUAR APPROVED DIAGNOSTIC SYSTEM — 'PHONE MODULE**

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>V1: CHECK THE 'PHONE MODULE FOR DAMAGE</strong></td>
<td></td>
</tr>
<tr>
<td>1. INSPECT the 'phone module for damage.</td>
<td></td>
</tr>
<tr>
<td>Does the 'phone module indicate any signs of damage?</td>
<td></td>
</tr>
<tr>
<td><strong>Yes</strong></td>
<td>INSTALL a new 'phone module. REFER to Section <strong>419-08 Cellular Phone</strong>. CLEAR the DTC. TEST the system for normal operation.</td>
</tr>
<tr>
<td><strong>No</strong></td>
<td>GO to V2.</td>
</tr>
</tbody>
</table>

**V2: CHECK THAT THE TESTER IS COMMUNICATING WITH THE ICE HEAD UNIT**

1. Turn the ignition switch to the ON position.
2. Attempt to connect to the ICE head unit using the Jaguar approved diagnostic system (where available).

**Can the tester connect to the ICE head unit?**

- **Yes**
  - GO to V3.

- **No**
  - Carry out the SCP test for the ICE head unit. (Pinpoint test G in this section).

**V3: CHECK THAT THE 'PHONE MODULE IS COMMUNICATING WITH THE ICE HEAD UNIT**

1. Turn the ignition switch to the ON position.
2. Press the 'phone hard key.
3. High-line vehicles - Is the 'phone screen displayed? Low-line vehicles - Is the 'phone icon displayed?

**Yes**
- GO to V4.

**No**
- Carry out the D2B diagnostic test procedure. (Pinpoint test S in this section).

**V4: CHECK THAT THE 'PHONE MODULE IS RESPONDING TO DIAGNOSTIC COMMANDS**

1. INSTALL a new 'phone module.
2. REFER to Section **419-08 Cellular Phone**.
3. Turn the ignition switch to the ON position.
4. Attempt to communicate with the 'phone module.

**Can the tester communicate with the 'phone module?**

- **Yes**
  - CLEAR the DTC. TEST the system for normal operation with the substitute 'phone module.
  - INSTALL a new ICE head unit.
  - REFER to Section **415-01 Audio Unit**.
  - Refit the original 'phone module. CLEAR the DTC. TEST the system for normal operation

**PINPOINT TEST W: P1573, P1777, P1696, P1609. SYMPATHETIC CODES FROM MODULES IN CAN NETWORK**

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>W1: REFER TO MODULE SETTING ORIGINAL DTC.</strong></td>
<td></td>
</tr>
<tr>
<td>Should any of these DTCs be set, refer to the module in the CAN network which originally set the DTC. This can be determined from the DTC itself, eg P1573 is set by throttle angle error, P1777, by torque reduction error. DTCs can be cleared in the usual manner.</td>
<td></td>
</tr>
<tr>
<td>Are any of these DTCs set?</td>
<td></td>
</tr>
<tr>
<td><strong>Yes</strong></td>
<td>Refer to the module or sensor concerned.</td>
</tr>
<tr>
<td><strong>No</strong></td>
<td>Recheck DTCs.</td>
</tr>
</tbody>
</table>

**PINPOINT TEST X: U2003: COMPACT DISC CHANGER NOT RESPONDING**

⚠️ CAUTION: The following tests involve disconnection of the fibre optic harnesses. The harness connectors must be protected by suitable dust caps as soon as they are disconnected, or damage may result. The use of tools to un latch connectors must be avoided, or the connector locking function may be lost.

- **NOTE:** The following test sequence is based on a six node network. Refer to the electrical guide for network configuration for networks with less nodes. (All possible network combinations are shown in the electrical guide).
- **NOTE:** Should a break occur in the D2B ring, then codes, U2602, or U2603 will be set, depending on the location of the break. U2602 will set if the break is in the optical harness FROM the ICE head unit, (the transmitter signal) U2603 will set if the break is in the optical harness TO the ICE head unit, (the receiver signal). See Pinpoint tests V and W for D2B ring fault diagnosis.

</tbody>
</table>

Are light pulses visible?
- **Yes**  
  **GO to AD2.**
- **No**  
  INSTALL a new telematic harness between RA001 and RA006. For additional information, refer to the electrical guide. CLEAR the DTC. TEST the system for normal operation.

**AD2: CHECK CABIN FIBRE OPTIC HARNESS**

1. Disconnect the fibre optic connector, FC107.
2. Disconnect the fibre optic connector, RA01.
3. Connect the Optical Bus Tester to RA01 using adaptor lead, if required.
4. Set the Optical Bus Tester to TX.
5. Set the Optical Bus Tester to ON.
6. Check for light pulses at the receiver pin of disconnected D2B connector, FC107.

Are light pulses visible?
- **Yes**  
  **GO to AD3.**
- **No**  
  INSTALL a new cabin optical harness between RA01 and FC107. For additional information, refer to the electrical guide. CLEAR the DTC. TEST the system for normal operation.

**AD3: CHECK FIBRE OPTIC LEAD BETWEEN ASHTRAY AND ICE HEAD UNIT**

1. Disconnect the fibre optic connector, FC108.
2. Disconnect the fibre optic connector, FC107.
3. Connect the Optical Bus Tester to FC107.
4. Set the Optical Bus Tester to TX.
5. Set the Optical Bus Tester to ON.
6. Check for light pulses at the receiver pin of disconnected D2B connector, FC108.

Are light pulses visible?
- **Yes**  
  **GO to AD4.**
- **No**  
  INSTALL a new instrument optical harness between FC107 and FC094. For additional information, refer to the electrical guide. CLEAR the DTC. TEST the system for normal operation.

**AD4: CHECK THE ICE HEAD UNIT**

1. Connect the optical short link between the receiver and transmitter of the ICE head unit.
2. Turn the ignition switch to the ACC position.
3. Wait for 10 seconds.
4. Check for DTC.

Is U2603 logged?
- **Yes**  
  INSTALL a new ICE head unit,  
  REFER to Section 415-01 Audio Unit.  
  CLEAR the DTC. TEST the system for normal operation.
- **No**  
  Recheck DTCs. No fault found in D2B system.

### PINPOINT TEST AE : ONE OR MORE D2B MODULES NOT RESPONDING. "WAKE-UP" SIGNAL FAULT

- **NOTE:** The D2B "wake-up" signal is not a constant, but will generate a pulse at each cycle of the ignition key. The ignition key must be  
  turned to the OFF position following each step of the tests, and turned to the position indicated by the test step for each module. To avoid  
  missing the signal, use an assistant to operate the key while reading the oscilloscope. The "wake-up" line is battery voltage, switching to 0  
  volts for between 50 milliseconds and 110 milliseconds as the ICE head unit sends its signal.
AE1: CHECK THE "WAKE-UP" SIGNAL TO THE CD CHANGER
1. Disconnect the CD changer electrical connector, CA267.
2. Turn the ignition switch to the ACC position.
3. Measure the voltage between CA267, pin 3 (OG) and ground, using an oscilloscope. (See note above).

Does the oscilloscope show a "wake-up" signal as described?
Yes
  NO to AF1.
No
  Repair the circuit between CA267, pin 3 and ICE head unit electrical connector, FC094, pin 019. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

AE2: CHECK THE "WAKE-UP" SIGNAL TO THE 'PHONE MODULE
1. Disconnect the 'Phone module electrical connector, CA261.
2. Turn the ignition switch to the ACC position.
3. Measure the voltage between CA261, pin 23 (OG) and ground, using an oscilloscope. (See note above).

Does the oscilloscope show a "wake-up" signal as described?
Yes
  NO to AF3.
No
  Repair the circuit between CA261, pin 23 and ICE head unit electrical connector, FC094, pin 019. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

AE3: CHECK THE "WAKE-UP" SIGNAL TO THE VOICE ACTIVATED CONTROL MODULE
1. Disconnect the Voice activated control module electrical connector, CA300.
2. Turn the ignition switch to the ACC position.
3. Measure the voltage between CA300, pin 014 (OG) and ground, using an oscilloscope. (See note above).

Does the oscilloscope show a "wake-up" signal as described?
Yes
  NO to AF2.
No
  Repair the circuit between VJ01, pin 014 and ICE head unit electrical connector, FC094, pin 019. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

AE4: CHECK THE "WAKE-UP" SIGNAL TO THE NAVIGATION COMPUTER
1. Disconnect the Navigation computer electrical connector, CA258.
2. Turn the ignition switch to the ACC position.
3. Measure the voltage between CA258, pin 3 (OG) and ground, using an oscilloscope. (See note above).

Does the oscilloscope show a "wake-up" signal as described?
Yes
  NO to AF4.
No
  Repair the circuit between CA258, pin 3 and ICE head unit electrical connector, FC094, pin 019. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

AE5: CHECK THE "WAKE-UP" SIGNAL TO THE AMP
1. Disconnect the AMP electrical connector, CA263.
2. Turn the ignition switch to the ACC position.
3. Measure the voltage between CA263, pin 5 (OG) and ground, using an oscilloscope. (See note above).

Does the oscilloscope show a "wake-up" signal as described?
Yes
  NO to AF5.
No
  Repair the circuit between CA263, pin 5 and ICE head unit electrical connector, FC094, pin 019. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

PINPOINT TEST AF : ONE OR MORE D2B MODULES NOT RESPONDING. PERMANENT SUPPLY FAULT
TEST CONDITIONS
AF1: CHECK THE PERMANENT SUPPLY TO THE CD CHANGER
1. Disconnect the CD changer electrical connector, CA267.
2. Measure the voltage between CA267, pin 2 (NG) and ground.

Is the voltage greater than 10 volts?
Yes
  Check the module for ground. INSTALL a new CD Changer.
  REFER to Section 415-01 Audio Unit.
  CLEAR the DTC. TEST the system for normal operation.
No
  Repair the circuit between the CD changer electrical connector, CA267, pin 2, and fuse 29 of the rear power distribution box. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

AF2: CHECK THE PERMANENT SUPPLY TO THE VOICE ACTIVATED CONTROL MODULE
1. Disconnect the voice activated control module electrical connector, CA300.
2. Measure the voltage between CA300, pin 22 (NR) and ground.

Is the voltage greater than 10 volts?
Yes
  GO to AG1.
No
  Repair the circuit between the voice activated control module electrical connector, CA300, and pin 22, fuse 29 of the rear power distribution box. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

AF3: CHECK THE PERMANENT SUPPLY TO THE 'PHONE MODULE
1. Disconnect the 'phone module electrical connector, CA261.
2. Measure the voltage between CA261, pins 012(NW) and 13 (NR) and ground.

Is the voltage greater than 10 volts?
Yes
  GO to AG2.
No
  Repair the circuit between the 'phone module electrical connector, CA261, pins 012 and 13 and fuse 29 of the rear power distribution box. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
AF4: CHECK THE PERMANENT SUPPLY TO THE NAVIGATION COMPUTER

1. Disconnect the Navigation computer electrical connector, CA258.
2. Measure the voltage between CA258, pin 001 (NW) and ground.

Is the voltage greater than 10 volts?

Yes  
GO to AG3.

No  
Repair the circuit between the navigation computer electrical connector, CA258, pin 001 and fuse 29 of the rear power distribution box. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

AF5: CHECK THE PERMANENT SUPPLY TO THE AMP

1. Disconnect the amp electrical connector, CA258.
2. Measure the voltage between CA263, pin 3 (NG) and pin 9 (NG) and ground.

Is the voltage greater than 10 volts?

Yes  
GO to AG4.

No  
Repair the circuit between the amp electrical connector, CA263, pin 3 (NG) and pin 9 (NG) and fuse 30 of the rear power distribution box. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

PINPOINT TEST AG : ONE OR MORE D2B MODULES NOT RESPONDING. ACCESSORY SWITCHED SUPPLY FAULT

TEST CONDITIONS

DETAILS/RESULTS/ACTIONS

AG1: CHECK THE ACCESSORY SWITCHED SUPPLY TO THE VOICE ACTIVATED CONTROL MODULE

1. Disconnect the voice activated control module electrical connector, CA300.
2. Turn the ignition switch to the ACC position.
3. Measure the voltage between CA300, pin 8 (WR) and ground.

Is the voltage greater than 10 volts?

Yes  
GO to AH1.

No  
Repair the circuit between the voice activated control module electrical connector, CA300, pin 8 and the ignition switch. CLEAR the DTC. TEST the system for normal operation.
(This circuit includes the power distribution box, fuse 27.)

AG2: CHECK THE ACCESSORY SWITCHED SUPPLY TO THE 'PHONE MODULE

1. Disconnect the 'phone module electrical connector, CA261.
2. Turn the ignition switch to the ACC position.
3. Measure the voltage between CA261, pin 014 (WG) and ground.

Is the voltage greater than 10 volts?

Yes  
GO to AH2.

No  
Repair the circuit between the 'phone module electrical connector, CA261, pin 014 and the ignition switch. CLEAR the DTC. TEST the system for normal operation.
(This circuit includes the power distribution box, fuse 27.)

AG3: CHECK THE ACCESSORY SWITCHED SUPPLY TO THE NAVIGATION COMPUTER

1. Disconnect the navigation computer electrical connector.
2. Turn the ignition switch to the ACC position.
3. Measure the voltage between CA258, pin 11 (WU) and ground.

Is the voltage greater than 10 volts?

Yes  
Check the module for ground. INSTALL a new navigation computer. REFER to Section 419-07 Navigation System. CLEAR the DTC. TEST the system for normal operation.

No  
Repair the circuit between the navigation computer electrical connector, CA258, pin 11 and the ignition switch. CLEAR the DTC. TEST the system for normal operation.
(This circuit includes the power distribution box, fuse 27.)

AG4: CHECK THE ACCESSORY SWITCHED SUPPLY TO THE AMP

1. Disconnect the amp electrical connector.
2. Turn the ignition switch to the ACC position.
3. Measure the voltage between CA263, pin 001 (WR) and ground.

Is the voltage greater than 10 volts?

Yes  
Check the module for ground. INSTALL a new amp. REFER to Section 415-01 Audio Unit. CLEAR the DTC. TEST the system for normal operation.

No  
Repair the circuit between the amp electrical connector, CA263, pin 001 (WR) and the ignition switch. CLEAR the DTC. TEST the system for normal operation.
(This circuit includes the power distribution box, fuse 27.)

PINPOINT TEST AH : ONE OR MORE D2B MODULES NOT RESPONDING. IGNITION SWITCHED SUPPLY FAULT

TEST CONDITIONS

DETAILS/RESULTS/ACTIONS

AH1: CHECK THE IGNITION SWITCHED SUPPLY TO THE VOICE ACTIVATED CONTROL MODULE

1. Disconnect the voice control module electrical connector, CA300.
2. Turn the ignition switch to the ON position.
3. Measure the voltage between CA300, pin 006 (WU) and ground.
Is the voltage greater than 10 volts?

**Yes**
- Check the module for ground. INSTALL a new voice activated control module.
- REFER to Section 419-10 Multifunction Electronic Modules.
- CLEAR the DTC. TEST the system for normal operation.

**No**
- Repair the circuit between the voice activated control module electrical connector, CA300, pin 006 and the power distribution box fuse 29. CLEAR the DTC. TEST the system for normal operation.

**AH2: CHECK THE IGNITION SWITCHED SUPPLY TO THE 'PHONE MODULE**

1. Disconnect the ‘phone module electrical connector, CA261.
2. Turn the ignition switch to the ON position.
3. Measure the voltage between CA261, pin 29 (WU) and ground.

Is the voltage greater than 10 volts?

**Yes**
- Check the module for ground. INSTALL a new ‘phone module.
- REFER to Section 419-08 Cellular Phone.
- CLEAR the DTC. TEST the system for normal operation.

**No**
- Repair the circuit between the ‘phone module electrical connector, CA261, pin 29 and the power distribution box fuse 29. CLEAR the DTC. TEST the system for normal operation.
Module Configuration

Principles of Operation

Module Configuration

There are two modes of configuration data. The first type requires configuration information so that the module can interact with the vehicle correctly. This information will be transferred to the new module using the Jaguar Approved Diagnostic System, so that it will contain the same settings as the old module.

Modules which require configuration when installing a replacement module are:

- Engine control module (ECM)
- Transmission control module (TCM)
- Audio unit
- Drivers door module (DDM)
- Rear electronic module (REM)
- Front electronic module (FEM)
- Amplifier
- Intrusion sensor module
- Multifunction voice activated control module
- Headlamp levelling module (ADHLS)
- Electronic park brake (EPB) module
- Instrument cluster and message centre
- Climate control module

Customer Driven Preferences

The second type of configuration data is customer preference driven. These are items that the customer may or may not want to have enabled. Typically, customer preference items can be toggled on or off by the use of a compatible scan tool. You may need to ask the customer which preferences they had enabled prior to installation of the new module, although after installation they will automatically learn the settings by receiving information from existing modules.

To carry out the customer configuration process, use the Jaguar Approved Diagnostic System. Refer to the Dealer Options Index for modules on the vehicle that have customer preference items. Configure the items as needed.

Modules which can be configured with dealer options are:

- The FEM.
- The instrument cluster and message centre.
- TCM (market configuration).
- ECM (market configuration).
- Intrusion sensor module.
- Multifunction voice activated control module (market configuration).
- Audio unit (market configuration)
Wiring Harnesses - Wiring Harness
Description and Operation

Introduction

**CAUTION:** Do not use any other heat shrink sleeve other than the approved glue lined heat shrink sleeve mentioned in the repair procedure.

The purpose of this document is to promote quick and efficient minor repair to harness connectors or cables using approved methods and the wiring harness repair kit. Repairs may only be made to cables and connectors which have been mechanically, not electrically damaged. It also applies where the whole extent of the damage can be clearly identified and rectified.

Care and neatness are essential requirements in making a perfect repair.

**Caution:**

At the time of this first issue of the Harness Repair Guide, do not approve repairs to any of the following circuits:

- Any media orientated system transport network harnesses.
- Supplement restraint system (SRS) firing circuits (Air bags).
- Link lead assembles, which are unique to safety critical circuits such as anti-lock brake system (ABS) and thermocouple circuits. An example of this is the ABS wheel speed sensors with moulded connectors.
- 4. Screened cables, leads and wiring harness(s).

If any harness(s) with defective electrical connector terminals or wires from the above circuits are a concern, new components must be installed.

**Repair Kit**

**CAUTION:** Where the repair procedure indicates that a glue lined heat shrink sleeve should be applied, apply sufficient heat to the glue lined heat shrink to melt the glue in order to provide a water tight seal. Do not over heat the glue lined heat shrink sleeve so that the wiring harness insulation becomes damaged.

The wiring harness repair kit has been produced which comprises:

- Pre-terminated wiring harness(s) of different sizes and types
- Three sizes of butt splice connectors
- A selection of colored cable identification sleeves
- Two sizes of glue lined heat shrink sleeves
- Crimping pliers
- A wire cutter and insulation stripper
- An electrical connector terminal extraction handle and tips

A suitable heat source, for shrinking heat shrink sleeves will be required.

The pre-insulated diamond grip range of electrical connector terminals and in-line, butt splice connectors contained within the wiring harness repair kit are the only acceptable product for the repairs of wiring harnesses. The butt connectors not only grip the wire but also the insulation, making a very secure joint.

If an electrical connector terminal is not included in the wiring harness repair kit then approval for the repair is NOT given and in these circumstances a new wiring harness must be installed.

**Pre-Terminated Wiring Harness(s) and Butt Splice Connectors**

All pre-terminated wiring harness(s) and butt splice connectors in the wiring harness repair kit are contained in bags which can be resealed after use. Each bag is marked with the part number of the items stored within the bag. Each storage compartment in the wiring harness repair kit is identified with the corresponding part number. Make sure that pre-terminated wiring harness(s) and connectors are not mixed up it is advisable to only open one bag at a time and to reseal the bag securely before opening another bag. Also, replace the bag in its mating part number compartment within the case.

The pre-terminated wiring harness(s) are supplied with the insulation in one of three colors, red, blue or yellow. The colors do not apply to any particular circuit but to the harness wire size. See the Relationship Table in the Repair Method section.

Butt splice connectors are also supplied with red, blue or yellow coverings, which must be matched to the pre-terminated wiring harness insulation color.

**Pre-Terminated Wiring Harness(s)**
The illustration shows:
- The pre-terminated wiring harness(s) which are included in the wiring harness repair kit
- The part number of the pre-terminated wiring harness
- The letter showing the extractor tip which must be used to remove this type of electrical connector terminal
- Those electrical connector terminals which are gold

Some of the pre-terminated wiring harness(s) have seals installed to the insulation for sealed connector applications. It is essential for prevention of moisture ingress that a sealed pre-terminated wiring harness must be used where a sealed terminal was removed.

**CAUTION:** Where the repair procedure indicates that a glue lined heat shrink sleeve should be applied, apply sufficient heat to the glue lined heat shrink to melt the glue in order to provide a water tight seal. Do **not** over heat the glue lined heat shrink sleeve so that the wiring harness insulation becomes damaged.

Two sizes of heat shrink sleeving are supplied in the wiring harness repair kit. Each heat shrink sleeve contains a sealant glue. These must be used when connecting wiring harness(s) or electrical connector terminal(s) at all times. The smaller diameter heat shrink sleeve is to be used with the red and blue butt splice connectors and the larger diameter sleeve with the yellow butt splice connectors.

For ease and speed, some of the pre-terminated wiring harness(s) may already have the insulation partly stripped at the splice end. If the repair requires insulation to be stripped from the cable, refer to the Relationship Table for the correct length of insulation to be stripped.
The Pre-Terminated Wiring Harness(s) illustration shows the electrical connector terminal type, the part number of the pre-terminated wiring harness and the letter of the extractor tip which must be used to extract the electrical connector terminal from the connector housing. Additionally, those electrical connector terminal(s) which are gold are identified, all others are therefore, tinned and not gold.

Wiring Harness Cable Identification Sleeves

A selection of colored sleeves are contained in the wiring harness repair kit for maintaining the wiring harness cable identification on the pre-terminated wiring harness. Place the correct colored sleeve(s) over the pre-terminated wiring harness insulation as near to the electrical connector as possible with the main wiring harness cable color nearest to the electrical connector.

For example, if the original wiring harness cable color is pink with a black trace put the pink wiring harness cable identification sleeve on the pre-terminated wiring harness first followed by a black sleeve, and slide both along the wiring harness cable to the electrical connector terminal.

Extraction Handle and Tips

The extraction handle, in conjunction with the correct tip, is used to remove a terminal from an electrical connector. Each tip contained in the wiring harness repair kit is marked with an identification letter, A to K inclusive. Each tip has been specially designed to extract a particular type of electrical connector terminal. The use of any other tool is not recommended and is liable to cause damage to the electrical connector. The tip is fastened to the handle by a screw which holds the tip firmly yet allows it to be easily replaced.

Extraction Handle and Tips

Insulation Stripper

The moving jaw has an adjuster wheel which has a series of holes in it. Turning the wheel and placing the cable in the matching size hole will automatically adjust the jaw to the correct pressure. Note that some wiring harness(s) may have a harder insulation and slight adjustment of the wheel may be needed to make a clean strip but exercise care not to damage the wire.

Insulation Stripper
By pressing the outer edges of the wiring harness cable length stop together the adjuster can be slid up or down the jaw. This decreases or increases the length by which the wiring harness cable insulation will be stripped from the pre-terminated wiring harness or wiring harness wire. The adjuster has a position indicator to align with a graduated scale and this sets the correct length in millimetres, of insulation to be stripped. The amount of insulation to be stripped is shown in the Relationship Table.

The illustration shows the insulation stripper tool and a wiring harness correctly gripped in the jaws. A wire cutter is provided on the outer side of the fixed jaw.

Cable Correctly Gripped in Stripper Blades

Crimping Pliers

Crimping Pliers
The crimping pliers have a moving jaw and a stationary jaw, with three different sized crimping enclosures. Each of the enclosures is identified by a red, blue or yellow coloured dot which corresponds to the three colours of the pre-terminated wiring harness(s) and butt splice connector colors.

**Repair Methods**
CAUTION: Several different types and sizes of terminal may be found in a single electrical connector housing.

It is necessary to identify:

- The conductor (wire) size of the affected wiring harness
- The electrical connector range from which the damaged wiring harness is to be removed
- The terminal type

Use of the approved diagnostic tool will greatly assist in the quick identification of electrical connectors and faulty pin terminal(s).

Reference can also be made to the vehicle Electrical Guides, held by Dealers, to identify wiring harness(s) and electrical connector(s).

By using the Relationship Table, the wiring harness conductor (wire) size can be related to a suitable pre-terminated wiring harness by the color of the insulation. Also, the correct length of insulation to be stripped from the wiring harness lead is identified.

**Electrical Connector Terminal Extraction**

It must be noted that some electrical connector(s) have anti-backout devices which prevent the terminals from being removed from the electrical connector. Some examples of these are shown in following illustrations. The anti-backout device must be released before attempting to remove the terminal from the electrical connector. Some anti-backout devices require a special tip to release the device and these have been included in the kit. Most can be released by carefully using a suitable small screwdriver.

Various types of electrical connector have seals installed internally or externally to prevent moisture ingress. These normally do not have to be removed but make sure that they are installed when the electrical connectors are connected.

The illustrations show examples of each tip used on different types of electrical connector(s). There are a large number of different types of electrical connector used on vehicles therefore only one example using each tip is shown. Technicians experience and judgement will dictate which type of tip should be used for those electrical connector(s) which are not shown. Care should be exercised to avoid further damage when removing the terminals from the electrical connector.

*NOTE: Examples of the extraction tips and anti-backout tips.*

**Repair Procedure**

- **CAUTIONS:**

⚠️ Do not use crimping pliers, insulation strippers, butt splice connectors, heat shrink sleeves or pre-terminated wiring harness(s) that are not supplied with the Jaguar wiring harness repair kit. Each part has been designed to be used only with the other parts in this wiring harness repair kit.

⚠️ Where the repair procedure indicates that a glue lined heat shrink sleeve should be applied, apply sufficient heat to the glue lined heat shrink to melt the glue in order to provide a water tight seal. Do **not** over heat the glue lined heat shrink sleeve so that the wiring harness insulation becomes damaged.

It is not correct to make more than five repair joints on the wiring harness to any electrical connector and if more damage is found at the same electrical connector then a new wiring harness must be installed.

- Remove the faulty terminal from the electrical connector using the extractor tool and correct tip. Make sure that any anti-backout device is released before trying to remove the terminal.
CAUTION: A number of electrical connector terminals are gold plated or gold flashed. When defective, they must be installed with a gold pre-terminated wiring harness(s) from the wiring harness repair kit. It is not always easy to identify the female as gold but the male pins are visually easier, therefore always check both male and female terminals to identify those which are gold. Under no circumstances are gold and tin terminals to be mixed as this will lead to early failure of the electrical contact.

- **NOTE:** Never use a harness lead with a smaller diameter than the original harness lead.

Select the correct size and type of pre-terminated wiring harness and butt splice connector from the wiring harness repair kit.

- **NOTE:** Using the wire cutter on the stripping tool, cut the pre-terminated wiring harness and the harness cable to the required length.

- **NOTE:** See illustration: Stripping Insulation

From the Relationship Table, find the correct length of insulation to be stripped from the pre-terminated wiring harness and set the adjustable cable length stop to the correct length. Place the pre-terminated wiring harness in the wire stripper and remove the insulation.

- Put the cable identification sleeve(s) on to the wiring harness with the main cable colour nearest to the terminal.

During this next step do not overtighten. Place the selected butt splice connector in the crimping tool, matching the aperture and the butt connector colours. Make sure that the window indentation in the butt connector is resting over the guide bar on the lower jaw. Partially close the grip until the butt connector is securely held in the aperture. This will give support to the butt connector while the pre-terminated wiring harness is inserted into it.

- **NOTE:** See illustration: Splice Correctly Located

Insert the pre-terminated wiring harness into the butt connector and make sure that the wire is against the wire stop. Close the grip firmly, crimping the lead to the butt connector. When the handles have been completely closed the butt connector will be freed from the tool as the handles are released. If the handles have not been completely closed then the jaws will hold the butt connector and it cannot be removed from the tool until the crimp is fully made by closing the handles completely.

- Make sure that the harness cable has been squarely cut and the correct length of insulation removed. If more than one splice is needed the butt connectors must be not be crimped to the wiring harness at the same distance from the connector. The splices must be staggered to prevent a bulk of splices in the same area of the wiring harness.

- It is preferable to cover the butt splice joint with heat shrink sleeve. This is desirable not essential, except where the electrical connector is a sealed electrical connector. Use the smaller diameter sleeve for red and blue pre-terminated wiring harness(s) and the large diameter sleeve for the yellow pre-terminated wiring harness(s). It is advisable to place the heat shrink over the completed joint but in some instances the sleeve will not pass over the terminal. Check, and if required, place the correct size sleeve onto the harness cable or pre-terminated wiring harness before crimping the butt splice to the wiring harness.

- Place the harness cable into the butt splice with the splice window over the guide bar. Make sure that the cable harness wire is against the stop in the butt splice, crimp the butt splice connector to the wiring harness.

- **WARNING:** Do not use a naked flame in areas where fuel or oil have been spilt. Clean the area of residual oil and fuel and wait until the fuel spill has fully evaporated.

- **CAUTIONS:**

When using a heat source make sure that it is localised and causes no damage to surrounding materials.

- Where the repair procedure indicates that a glue lined heat shrink sleeve should be applied, apply sufficient heat to the glue lined heat shrink to melt the glue in order to provide a water tight seal. Do **not** over heat the glue lined heat shrink sleeve so that the wiring harness insulation becomes damaged.

Using a suitable heat source, shrink the sleeve over the butt splice.

- If further pre-terminated wiring harness(s) are to be installed to the same electrical connector, make sure that the lead is cut at a different length to the previous joint. This makes sure that the splices will, where possible, be staggered on the wiring harness and prevent a bulk of splices in one area.

- When all of the splices have been made, fit the terminal(s) to the electrical connector, taking care that the terminals are correctly orientated.

- Install the wiring harness cover and secure with adhesive electrical tape. Do not cover the wiring harness right to the electrical connector as the terminals must have a little movement and not be firmly bound to the electrical connector or wiring harness. Make sure that the cable identification sleeve(s) are showing at the wiring harness electrical connector.

</table>
The anti-theft system provides protection from unauthorized entry into the vehicle. The security system functions are controlled by the front electronic module (FEM), driver door module (DDM), rear electronic module (REM), and the instrument cluster. When the alarm is triggered the system flashes the turn signal lamps, and sounds the alarm system horns, siren or a combination of both (Market dependant).

The base perimeter alarm consists of four doors, Hood and luggage compartment switches, radio sense, key sense, vehicle horn and separate anti-theft alarm horn (Rest of world) or anti theft alarm horn (battery backed - UK, Holland, France, Belgium, Luxemburg, Israel, Ireland, Malta), visual feedback from direction indicators on arm, disarm, alarm and error, security LED located in the instrument panel. Higher levels of alarm can be added for specific market requirements- ultrasonic scanning sensors located in the overhead console, inclination sensor (Dealer fit option only) located in the luggage compartment, anti theft alarm horn (battery backed) located in engine compartment.

Security System Arming

The system will be activated by the keyless entry remote transmitter when the following input sequence is followed:

1. Turn the ignition off and remove the key. 
2. Close all the doors (unlocked). 
3. Press the LOCK button on the transmitter to lock the doors. The turn signal lamps will flash once. 
4. Press the LOCK button twice the vehicle will double lock (if enabled). The turn signal lamps will provide a longer flash. 
5. If the turn signal lamps do not flash, the system is not activated. (If a door is open and a key is in the ignition, the remote lock function will be inhibited and the direction indicators will flash seven times). 

The system will also be activated when the following input sequence is followed:

6. Turn the ignition off and remove the ignition key. 
7. Close all the doors (unlocked). 
8. Lock all the doors via the driver door key barrel with the ignition key, turn signal lamps will flash once. To double lock, activate the drivers door key barrel to the unlock then lock position within three seconds with the ignition key. The vehicle will double lock (if enabled). The turn signal lamps will provide a longer flash. 
9. If the turn signal lamps do not flash, the system is not activated. 
10. If the turn signal lamps flash five times either the door, hood or trunk are open. 

Opening any of the doors or the hood will trigger the alarm after the alarm has been activated.

Disarming an Untriggered Alarm System

The system can be disarmed by carrying out one of the following procedures.

- Unlock the driver door with a key (NA, ROW).
- Press the UNLOCK button on the keyless entry remote transmitter.
- If unlocked from the drivers door when the key barrel disarm is disabled (EURO), ignition switched to position II within 15 seconds from door being opened.

Disarming a Triggered System

Carrying out either of the following steps will deactivate a triggered alarm system.

- Driver door is unlocked with the ignition key (NA, ROW only).
- Driver door is unlocked by pressing the UNLOCK button on the remote entry transmitter.
- The ignition key is cycled to ignition position II with a valid key.

Once the system has been triggered, the horns, siren or a combination of both (market dependant) and turn signal lamps will shut off automatically after 30 seconds (60 seconds NA). The system will then reset to an armed state and will trigger again if another trigger occurs.

PANIC Alarm Activation (North America/Rest Of The World)

1. Press the Headlamp convenience button on the keyless entry remote transmitter three times within three seconds. The turn signal lamps flash and the horns, siren or a combination of both (market dependant) sounds for approximately 30 or 60 seconds (market dependant) or until:

   1. The ignition switch lock cylinder switched to position II with a valid key.

The panic feature is controlled by the driver door module (DDM) and is independent of the anti-theft system.
Anti-Theft - Active - Anti-Theft - Active

Diagnosis and Testing

The complexity of the electronics involved with the anti-theft, of which the front electronic module (FEM), driver door module (DDM), rear electronic module (REM), and the instrument cluster are a part, and the multiplexed communication network which are connected to it preclude the use of workshop general electrical test equipment. Therefore, reference should be made to the Jaguar approved diagnostic system, for detailed instructions on testing the anti-theft.

The Jaguar approved diagnostic system systematically tests and analyses all functions and the various systems affected by it.

Where a fault is indicated, some basic diagnostic methods may be necessary to confirm that connections are good and that wiring is not damaged before installing a new component.
1. Detach the battery junction box (BJB).

2. Remove the battery junction box retaining bracket.

3. Remove the fender splash shield.
   For additional information, refer to Section 501-02 Front End Body Panels.

4. Detach the windshield washer reservoir.

5. Remove the anti theft alarm horn retaining bolt.
6. Remove the anti theft alarm horn.
   - Disconnect the anti theft alarm horn electrical connectors.

**Installation**

1. To install, reverse the removal procedure.
The passive anti-theft system (PATS) prevents the vehicle from being driven away by an unauthorized person. The PATS system consists of encrypted electronically coded keys, a transceiver, instrument cluster (IC), and an engine control module (ECM). When the key is inserted into the ignition barrel, the ECM uses a decoding process via the transceiver to validate the key transponder code. If the code matches one that is stored and the key is then turned to the run position, the ECM will enable the fuel injectors, ignition coils, fuel pump drive and starter.

If the key is invalid the control function will send a theft status message to the ECM, which will disable, which will disable the vehicle from starting. If the correct key is used without a transponder or used with a transponder with an incorrect code, the vehicle will be inhibited from starting. This will prevent vehicle theft even if a duplicate key is cut.

If a valid key is read by the instrument cluster, the front electronic module (FEM) and the rear electronic module (REM) will allow the steering column lock actuator to unlock.

A PATS indicator LED (located on the instrument panel) provides the driver with the status of the PATS system. When the ignition is switched to the run position, the PATS indicator LED will illuminate for three seconds and extinguish. If there is a fault with the PATS system after 60 seconds of continuous flashing, the PATS indicator LED will flash an error code.
Anti-Theft - Passive - Anti-Theft - Passive

Diagnosis and Testing

The best method to confirm the correct operation of PATS is to check the LED (located in the center of the instrument panel). The LED should illuminate solid for 3 seconds when the key is turned to the run position and then extinguish. This validates the PATS functions (the key transponder matches the key code stored, the challenge/response sequence between the instrument cluster (IC) and the engine control module (ECM) was successful resulting in the ECM being enabled).

The ECM will disable the fuel injectors, ignition coils, fuel pump drive and starter if any of the following conditions apply, a theft signal has been received from the IC (the key has not been authenticated), a challenge code has been transmitted to the IC but no response code has been received, a challenge code has been transmitted to the IC and an incorrect response received.

If any of the above cases apply, the ECM will log DTC P1260. This DTC is further defined by sub-codes. The sub-codes are accessed through mode 12 (freeze frame data). Additionally the IC will log DTC's if the failure was a result of the key read.

Engine fails to crank

If a PATS fault is detected, the LED will flash for 60 seconds at 4Hz with a 50% duty cycle. At the end of this period, the LED will flash a 2 digit code, this code is repeated 10 times. The meaning of this code along with the frequency of flashing is given in the accompanying table (as a general rule a fault code of 16 or less will cause the vehicle not to crank. Additionally, the Jaguar Approved Diagnostic System should be used to check the DTC stored in the IC.

The most regular occurrence for failing to crank is due to the park and neutral switches (gearshift not in park or neutral). The start circuit is as follows, low side of relay coil (Switched directly from the instrument cluster, if conditions correct), high side of relay of coil (from ignition start position through gearbox rotary start switches to relay).

Another likely cause maybe the CAN network is malfunctioning, (the CAN circuit is open/short). This means that the IC and ECM would be unable to communicate resulting in no challenge being performed to enable the ECM.

On US manual vehicles the addition of a clutch switch has been included in the starting circuit, this switch takes place of the park/neutral switch (auto transmission). The switch activates at end of travel (clutch fully depressed).

Engine cranks but will not start

If the engine is cranking it means that the ECM is enabled with respect to the PATS. If PATS was disabled the ECM would not engage the starter. This could be confirmed by verifying the PATS LED prove out (illuminated solid for 3 seconds) or by reading DTC's from the IC and ECM. In this case, the fuel pump circuit should be verified. A fuel pump module, which is controlled by the ECM supplies the fuel pump. In all cases of suspected PATS non-start issues, the most logical failure modes should be eliminated first. Check all relevant supplies and grounds to the IC and ECM, check that the starter relay has a permanent 12v supply, check that the relay has a 12v supply and ground across the coil whilst the ignition is in the crank position.

PATS Fault Codes

For the various PATS modes/faults listed in the table, the IC will store a DTC and indicate this to the customer during the detection period defined in the 'when logged' column, by illuminating the indicator as described for 60 seconds and then flashing the LED 10 times as appropriate. The indication will stop immediately the ignition is turned to off any time during the fault indication sequence. Up to 4 DTC's could be stored per key read (1-10 read attempts). No DTC's will be stored until all retry attempts are complete. Only the highest priority fault code will be flashed.

The PATS LED will be commanded on as shown under 'indication'. Normal PATS operations are complete within 400ms of the ignition switch transition from off to run or start, worst case for ECM communication problems will be less than 2 seconds. If PATS is not complete during the 2 seconds the ECM will terminate PATS and await the next ignition run/start event. PATS faults will be indicated via the LED as soon as possible and will terminate the LED prove out. At key off all previous flashing will cease and the perimeter anti theft system will control the LED when the vehicle is locked and armed.

1. The complexity of the electronics involved with the passive anti-theft system of which the security access is a part, and the multiplexed communication network which are connected to it preclude the use of workshop general electrical test equipment. Therefore, reference should be made to the Jaguar approved diagnostic system for detailed instructions on security access. The Jaguar approved diagnostic system systematically tests and analyses all functions and the various systems affected by it.
1. The complexity of the electronics involved with the anti-theft, of which the key programming is a part, and the multiplexed communication network which are connected to it preclude the use of workshop general electrical test equipment. Therefore, reference should be made to the Jaguar Approved Diagnostic System for detailed instructions on key programming. The Jaguar approved diagnostic system systematically tests and analyses all functions and the various systems affected by it.
1. To program additional PATS keys, a minimum of two valid keys must be available (if only one key is available, it will be erased and reprogrammed with the new key).

2. Key programming using two programmed keys.
   1. Insert the first valid key and turn to the run position for a maximum of five seconds, then turn to off and remove the key.
   2. Within ten seconds of removing the first key, insert the second valid key and turn to the run position for a maximum of five seconds, then turn to off and remove the key.
   3. To program the third (additional) key, insert the key and turn to the run position within twenty seconds of removing the second key, allow the PATS LED to prove out for three seconds to confirm storage of the additional key, then turn to off and remove the key.
   4. This method can be used to store up to a maximum of 8 ignition keys.
Anti-Theft - Passive - Passive Anti-Theft System (PATS) Transceiver

Removal

1. Remove the ignition switch lock cylinder. For additional information, refer to Section 211-04 Steering Column.
2. Remove the PATS transceiver.
   1. Detach the PATS transceiver retaining tang.
   2. Remove the PATS transceiver.

Installation

1. To install, reverse the removal procedure.
System / Component Description

The vehicle emergency message system (Jaguar Assist) allows a user to request emergency assistance (police, ambulance, fire) or roadside assistance. Also, if any of the vehicle's airbags are deployed while JaguarNet is operational, the system automatically issues a call for emergency assistance.

1. The JaguarNet consists of four components:
   - VEMS module.
   - Navigation display/base level audio unit display.
   - Global Positioning antenna.
   - The cellular phone system.

The VEMS module controls the system. It is connected to the vehicle's cellular phone system, audio unit, restraint control module (RCM), navigation system and GPS antenna. The VEMS module uses the cellular phone system to place calls to the response center. JaguarNet mutes the audio unit upon placing a call and re-instates the audio when the call is ended. The RCM monitors the air bag circuit to determine if an airbag has deployed and provides the user with visual feedback during an activation by displaying status messages on the navigation display/base level audio display.

Additional buttons (i) and (SOS) are also provided in the roof console.

The GPS antenna receives data from a group of GPS satellites and is used by the VEMS module to determine the location of the vehicle when the system is activated.
Initialization

After the unit is fitted the following procedure must be carried out to allow the system to operate:

- **Initialization**
  - Make sure the transit relay has been removed.
  - Turn the ignition switch to the 'ACC' or 'RUN' position.
  - Make sure the cellular phone handset is powered 'ON'.
  - Turn the ignition switch to the 'Off' position.
  - Press the cellular phone handset power button. The cellular phone handset will power off and the 'i' and 'SOS' button LED's should illuminate after approximately thirty seconds.
  - Wait for the 'i' and 'SOS' button LED's to extinguish, then turn the ignition switch to the 'ACC' or 'RUN' position.
  - Make the call to the operator by pressing and holding the 'i' button for two seconds.

Pressing 'i', SOS and Airbag Deployment

When info, emergency/roadside assistance is selected, or one of the air bags is deployed, JaguarNet will take control of the cellular phone and inform the user that an activation is in progress by displaying INFO REQUEST/SOS REQUEST on the navigation display/base level audio display. JaguarNet will also mute the audio unit causing PHONE to be displayed on the audio unit.

If JaguarNet determines that the cellular phone is not correctly connected, the navigation unit will display CELLULAR PHONE REMOVED followed by ASSIST FEATURE DISABLED then UNABLE TO PLACE CALL and INSTALL PHONE TO CONTINUE (US ONLY).

If a cellular phone is connected, but JaguarNet determines that the phone is not JaguarNet compatible, NON-ASSIST PHONE will be displayed on the navigation display (US ONLY).

Upon determining that the cellular phone is connected and communication with it can be established, JaguarNet checks to see if cellular service is available (a cellular signal is sensed by the vehicle's cellular phone).

If cellular service is not available, JaguarNet will continue to check for service for up to two minutes. During this time, NO CELLULAR SIGNAL followed by WAITING TO ACQUIRE are continually displayed in rotation on the navigation display. If service is still not available after two minutes, UNABLE TO PLACE CALL is displayed on the navigation display and the activation is terminated.

If service is available, JaguarNet places a data call to the response center and CALL IN PROGRESS is displayed on the navigation display.

Once the data call is answered by the response center, JaguarNet sends an electronic data message. This message includes: the type of activation (emergency/roadside or air bag), a customer identification number (CID), the mostly recorded location (latitude and longitude), speed and direction of travel of the vehicle, the time at which the location and speed data was taken, and the systems cellular phone number. While this data is being transmitted the system updates the navigation display with SENDING LOCATION DATA (US ONLY).

After the data has been received by the response center, DATA RECEIVED will be displayed on the navigation display (US ONLY). The call will then be displayed on the navigation display. The call will then be forwarded to the response center operator switchboard.

If the data call fails to go through, JaguarNet will carry out a voice call redial to the response center operator switchboard. While this call is being placed, REDIAL IN PROGRESS will be displayed on the navigation display. While the system is waiting for an operator to answer, WAITING FOR OPERATOR will be displayed on the navigation display.

Upon answering the call, the operator will attempt to talk with the caller to determine the level of assistance required. The operator will contact the appropriate emergency service provider if required.

Throughout the rest of the call CID..., LAT..., and LON... data that was sent to the response center will be continually displayed in rotation on the navigation display.

If the call is initiated by the deployment of an airbag, the caller has no control of the phone and all communication with the response center operator will occur hands-free. If the call is initiated by pressing the navigation display i button, communication with the response center operator defaults to hands-free but may be switched to private mode (using the phone's internal speaker and microphone) by removing the phone from its holder.

When the call is ended, the navigation display will return to displaying vehicle information and the audio unit will return to its previous operating mode.

Powering Down

When the ignition switch is in the OFF position, JaguarNet will be powered off, so no status messages will be displayed. If the ignition is switched from RUN to OFF or ACC while the JaguarNet is in a call, the call will continue, but the navigation display will be switched off.

Initialization

After the unit is fitted the following procedure must be carried out to allow the system to operate:

- Make sure the transit relay has been removed.
- Turn the ignition switch to the 'ACC' or 'RUN' position.
- Make sure the cellular phone handset is powered 'ON'.
- Turn the ignition switch to the 'Off' position.
- Press the cellular phone handset power button. The cellular phone handset will power off and the 'i' and 'SOS' button LED's should illuminate after approximately thirty seconds.
- Wait for the 'i' and 'SOS' button LED's to extinguish, then turn the ignition switch to the 'ACC' or 'RUN' position.
- Make the call to the operator by pressing and holding the 'i' button for two seconds.
The complexity of the electronics involved with the JaguarNet system, of which the GPS antenna and navigation display are parts, and the multiplexed communication network which are connected to it preclude the use of workshop general electrical test equipment. Therefore, reference should be made to the approved Jaguar diagnostic system for detailed instructions on testing the VEMS unit.

The approved Jaguar diagnostic system tests and analyses all functions of the VEMS and the various systems affected by it.

Where a fault is indicated, some basic diagnostic methods may be necessary to confirm that connections are good and that wiring is not damaged before installing a new component.
Telematics - Global Positioning System (GPS) Antenna
Removal and Installation

Removal

1. Remove the parcel shelf. For additional information, refer to Section 501-05 Interior Trim and Ornamentation.
2. Remove the GPS antenna.

Installation

1. To install, reverse the removal procedure.
Removal

1. ☢️ CAUTION: Electronic modules are sensitive to static electrical charges. If exposed to these charges, damage may result.

   Disconnect the battery ground cable.
   For additional information, refer to Section 414-01 Battery, Mounting and Cables.

2. Detach the luggage compartment side trim panel.
   1. Remove the luggage compartment side trim panel retaining clip.
   2. Detach the luggage compartment side trim panel.

3. Disconnect the electrical connectors.

4. Detach the module mounting bracket.

5. Remove the module mounting bracket.
   - Disconnect the electrical connectors.
6. Detach the module mounting bracket.

7. Disconnect the electrical and optic fibre connectors.

8. Remove the module.

**Installation**

1. To install, reverse the removal procedure.
Navigation System - Navigation System

Description and Operation

</tbody>
</table>

The navigation system utilizes the following functions:

- Voice guidance volume controlled via audio head unit
- Screen brightness controlled via on screen menus
- Key illumination controlled via vehicle dimmer switch
- Any key turns system "ON"
- Language choice controlled via on screen menus

The navigation head unit comprises of a 7' full color screen which also provides control of the phone, audio system, climate control, vehicle emergency messaging system (VEMS), voice control, and TV. The navigation module is situated in the luggage compartment on the left-hand side and is covered by a protective trim panel. The Global Positioning System (GPS) antenna is located beneath the parcel shelf trim.

The system utilizes signals from the GPS antenna, the ABS unit and the GYRO sensors signals to enable the navigation module to calculate, with the aid of DVD map data, the position of the vehicle. After entering the required destination, the driver is guided along by both visual guidance and voice instructions. Even, if the driver strays off the route, the system calculates a new route showing the easiest way back to the original destination. On route, it can also point out useful landmarks such as, petrol stations, restaurants, hotels, Jaguar dealers, and car parks.

The system also provides system interfaces such as TV and VEMS.

Japanese market vehicles only have a navigation module with integrated voice recognition for control of the navigation system. The Japanese system also has the addition of VICS which provides real time traffic information.
Navigation System - Navigation System
Diagnosis and Testing

Principle of Operation

For a detailed description of the navigation system, refer to the relevant Description and Operation sections in the workshop manual. REFER to: Navigation System (419-07, Description and Operation).

Inspection and Verification

1.  Verify the customer concern.
2.  Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

<table>
<thead>
<tr>
<th>Mechanical</th>

</tr>
<tr>
<td>• Satellite navigation system module - traffic master module fault</td>
<td>• Wiring harness for damage and corrosion</td>
</tr>
</tbody>
</table>

3.  If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4.  If the cause is not visually evident, check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

DTC Index

**CAUTION:** When probing connectors to take measurements in the course of pinpoint tests, use the adapter kit, part number 3548-1358-00

- **NOTE:** If the control module/component is suspect and the vehicle remains under manufacturer warranty, refer to the warranty policy and procedures manual (section B1.2), or determine if any prior approval program is in operation, prior to the installation of a new component.
- **NOTE:** When performing voltage or resistance tests, always use a digital multimeter (DMM) accurate to three decimal places and with a current calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.
- **NOTE:** Check and rectify basic faults before beginning diagnostic routines that involve pinpoint tests.
- **NOTE:** Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.
- **NOTE:** If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

</table>
Navigation System - Navigation System Antenna

Removal

1. Remove the parcel shelf. For additional information, refer to Section 501-05 Interior Trim and Ornamentation.
2. Remove the navigation system antenna.

Installation

1. To install, reverse the removal procedure.
Navigation System - Navigation System Display Module

Removal

1. Remove the instrument panel console. For additional information, refer to Section 501-12 Instrument Panel and Console.
2. Remove the navigation system display module.
   - 1. Remove the navigation system display module retaining bolts.
   - 2. Remove the navigation system display module.

Installation

1. To install, reverse the removal procedure.
**Navigation System - Navigation System Module**

**Removal**

1. **NOTE:** Make sure the navigation CD has been removed before disconnecting the battery ground cable.

   Disconnect the battery ground cable. For additional information, refer to Section [414-01 Battery, Mounting and Cables](#).

2. Detach the luggage compartment side trim panel.
   
   1. Remove the luggage compartment side trim panel retaining clip.
   
   2. Detach the luggage compartment side trim panel.

3. Detach the module retaining bracket.

4. Disconnect the navigation system module electrical connectors and fibre optic connector.

5. Remove the navigation system module.

**Installation**

1. To install, reverse the removal procedure.
Description and Operation

The portable cellular phone system consists of:

- Cellular phone handset (GSM).
- Cradle (GSM).
- Cellular portable (US Only).
- Handset battery (US Only).
- Hang up cup (US Only).
- Roof console mounted microphone.
- Steering wheel switch controls.
- Portable support electronics (PSE) module (US Only).
- Transceiver (GSM).
- In-bumper cellular phone antenna.
- Antenna cable.
- Audio unit controls.

The cellular phone handset is located within the center console armrest. The audio control unit and the steering wheel controls are utilized to operate the system.

The vehicle utilizes two unique cellular phones systems:

- GSM
- US CDMA/TDMA digital and AMPS analogue systems

The voice activation control module provides the handsfree operation for cellular phone.

To activate the handsfree function:

1. Switch the ignition to the RUN position. After 4-6 seconds the system will be initialized and "VOICE READY" will be displayed in the message center.

2. Operate the VOICE/PHONE switch on the steering wheel.

3. Clearly state the command when "LISTENING" is displayed in the message center.

4. Operate the VOICE/PHONE switch on the steering wheel or remain silent for 1 second. If speech is detected "PROCESSING" will be displayed in the message center. Operating the VOICE/PHONE switch again will cancel the voice session.

Refer to the Cellular Phone user guide for complete operating instructions.

For additional information on the voice activation control module, refer to Section 419-10 Multifunction Electronic Modules.
Cellular Phone - Cellular Phone VIN Range: N52048->N99999

Bluetooth

2006 model year (MY) sees the introduction of a Bluetooth® communications network system.

Note: In common with previous cellular phones it is the driver’s responsibility to comply with local legislation regarding cellular phone use.

Bluetooth is a way of communicating with various electronic devices that are equipped with specialized chips using a short-range radio link. It allows most devices to communicate with one another by creating a universal language. The devices then form a private network known as a ‘personal area network’.

Interaction between Bluetooth devices can take place without direct human intervention whenever two or more Bluetooth devices are within each other's range. This enables the Bluetooth transceiver chip to trigger an automatic connection to deliver and accept a flow of data.

Bluetooth devices operate on a radio frequency band known as the Industrial, Scientific, and Medical frequency. The Industrial, Scientific, and Medical radio frequency band is 2.40 GigaHertz (GHz) to 2.48 GHz which is divided into 79 channels, each carrying a bandwidth of 1 MegaHertz (MHz).

The devices use the 79 individual randomly chosen channels within the frequency band, changing from one to another on a regular basis. The Bluetooth transmitters change frequencies approximately 1,600 times every second, meaning that more devices can utilize the limited slice of the radio frequency.

Since every Bluetooth transmitter uses this technique automatically, it’s most unlikely that two transmitters will be on the same frequency at the same time. This technique minimizes the risk of disruption to Bluetooth devices, as any interference on a particular frequency will last only a fraction of a second.

The Bluetooth system consists of:

- A Bluetooth upgrade module
- A Portable Support Electronics (PSE) module
- A voice activated control module
- A microphone
- Steering wheel telematics control switches
- An audio unit

The Bluetooth upgrade module allows the driver to integrate their personal cellular phone to the vehicle. When a cellular phone is paired to the vehicle, it allows the storage of up to 500 individual phone numbers and 40 related voice tags to the voice activated control module. These stored phone numbers can then be accessed using the audio unit control buttons, the audio unit touch screen (if equipped) or steering wheel telematics control switches. The voice tags can be accessed by using the steering wheel telematics control switches when utilizing the voice activation facility.

If a cellular phone has been matched/programmed to the vehicle and a second cellular phone is added, the stored phone numbers and voice tags from the second cellular phone will overwrite the original phones' stored data.
Phone numbers stored to the PSE and voice tags stored to the voice activated control module need to be manually updated should alterations be required. If a new phone number has been added to the cellular phone memory, it will need to be added manually to the vehicle memory.

Once stored to the vehicle, the phone numbers can be viewed on the audio unit screen. The audio unit and touch-screen operate as previous models.

For vehicles fitted with a touch-screen controlled audio unit it is possible to redial the last 10 dialed phone numbers from the vehicle. For vehicles without a touch-screen controlled audio unit it is only possible to redial the last dialed phone number from the vehicle. These dialed phone numbers are stored in the PSE module memory and not from the cellular phone’s memory.

The Bluetooth system does not include a phone cradle or its own individual vehicle antenna. As a consequence of this, there is no cellular phone signal amplification and no in-car charging facilities.

In-car charging can be achieved using a suitable lead to the cigar lighter or auxiliary power socket.

**Portable Support Electronics (PSE) Module**

The Portable Support Electronics (PSE) module is located in the left-hand side of the luggage compartment.

![Portable Support Electronics (PSE) Module](image1)

The PSE module is fixed to a bracket which also supports the Voice Activation Control Module (VACM) and the navigation control module. The PSE module has one electrical connector and one optical connector. The module is unique to Jaguar, but utilizes carry over hardware. The PSE module stores up to 500 phone numbers and the last 10 dialed phone numbers from the vehicle.

**Bluetooth Upgrade Module**

The Bluetooth upgrade module is located under the center console and is attached to the center console using velcro.

![Bluetooth Upgrade Module](image2)

The Bluetooth upgrade module communicates with the drivers cellular phone and integrates it into the vehicle system transferring information such as call status and phonebook information to the PSE.

**Voice Activated Control Module**

The voice activated control module is located in the left-hand side of the luggage compartment.

![Voice Activated Control Module](image3)

The voice activated control module is fixed to a bracket which also supports the PSE and the navigation control module.
The voice activated control module stores up to 40 voice tags.

Microphone

The microphone is located above the driver and is attached to the headliner.

Steering Wheel Telematics Control Switches

To ensure minimum disruption to concentration when driving, limited control of audio, telephone and voice activation systems is possible using the steering wheel telematics control switches.

The control switches provide the following phone functionality:

- Answer phone call/end handsfree calls.
- Increase or decrease volume.
- Cycle through phone memory.

Refer to the Cellular Phone user guide for complete operating instructions.
Cellular Phone - Cellular Phone
Diagnosis and Testing

Inspection and Verification

The complexity of the electronics involved with the cellular phone preclude the use of workshop general electrical test equipment. Therefore, reference should be made to the Jaguar Approved Diagnostic System for detailed instructions on testing the cellular phone.

The Jaguar Approved Diagnostic System tests and analyses, in detail, all functions of the cellular phone.

Where a fault involving the cellular phone is indicated by the Jaguar Approved Diagnostic System, some basic diagnostic methods may be necessary to confirm that connections are good and that the wiring is not damaged, before installing new components.

1. Verify the customer concern by operating the portable cellular phone both in portable mode and while connected to the vehicle.
2. Make sure the portable convertible phone (US Only) is switched ON. With the power button ON, the system should be on while the ignition switch is in ACC or RUN.
3. Make sure the customer is calling within the coverage area. No Svc will appear in the display if the customer is calling from outside the coverage area.
4. Check to see if the Roam indicator is on. If so, follow the roaming instructions in the Cellular Phone User Guide.
5. Check to see if the display reads Locked CDMA/TDMA or pin for GSM. If so, press Clr and enter the customer three-digit unlock code for CDMA/TDMA or the customer pin number on the phone handset for GSM.
6. Make sure the portable cellular phone (US Only) is securely seated in the holder.
7. Make sure the GSM handset coil cord connector is correctly fitted to the armrest connector.
8. Check the portable cellular phone (US Only) antenna connections.
9. Check the portable cellular phone system registration (US Only). Also, check to make sure that the portable cellular phone is correctly programmed. Incorrect programming can result in single system scanning, loss of speed dialing, loss of hands-free audio, loss of auto redial, loss of dial tone multi-frequency tones, and the loss of other keypad/portable cellular phone functions.
10. Make sure that a valid SIM card is inserted in the handset SIM card reader (GSM Only)
11. Check the customer account status with the cellular carrier.

If the customer concern is still present, follow these steps to diagnose the concern:

12. Visually inspect for obvious signs of mechanical or electrical damage:

<table>
<thead>
<tr>
<th>Mechanical</th>
<th>Electrical</th>
</tr>
</thead>
<tbody>
<tr>
<td>Portable cellular phone (US only)</td>
<td>Electrical connectors</td>
</tr>
<tr>
<td>Microphone</td>
<td>Wiring harness for damage or corrosion</td>
</tr>
<tr>
<td>Portable cellular phone holder (US only)</td>
<td>Fuses</td>
</tr>
<tr>
<td>Coil cord</td>
<td></td>
</tr>
</tbody>
</table>

System/Carrier Concerns - All Systems

Dropped calls, bad connections, noisy audio and other intermittent symptoms usually indicate a system or cellular carrier concern, and are not the fault of the phone itself. Such symptoms may occur in situations such as the following:

- In certain geographic areas (for example: areas of excessive foliage or hills) or at the edge of coverage areas.
- At the same place each day.
- At the same time each day.
- Under bridges, tunnels, in lower freeways, or in congested downtown areas.

If the customer phone exhibits any of the above symptoms or symptoms occur under the above conditions, the customer or the dealer should contact customer assistance at their particular cellular provider/carrier or call the assistance number provided in the Jaguar Cellular System Dealer kit.

Other Possible Concerns - All Systems

1. If, for some reason, the customer's electronic serial number was incorrectly recorded in the carrier switch, the phone will not work. Call the assistance number provided in the Jaguar Cellular System Dealer kit to check the electronic serial number CDMA/TDMA only.
2. A customer initial call must be made in his/her home coverage area for correct activation of the Jaguar Cellular System.
3. A customer may have to wait until after 24 hours of the coverage activation before making a call from outside of his/her home coverage area or the phone might be reported stolen and coverage stopped.
4. There may be a slight delay in activation after leaving the dealership from initial delivery.

If, after checking these possibilities, the phone still does not function, do not attempt to repair the phone. Call the cellular phone distributor.
Removal

1. Remove the floor console cup holder.

2. NOTE: Disconnect the auxiliary power point electrical connector if equipped.

Remove the floor console stowage compartment.

1. Remove the floor console stowage compartment retaining screws.

2. Remove the floor console stowage compartment.

3. Disconnect the Bluetooth module electrical connector.

4. Remove the Bluetooth module.

Installation

1. To install, reverse the removal procedure.
Cellular Phone - Cellular Phone
Vehicles With: Bluetooth

Diagnosis and Testing

Overview

This section covers the components of the Bluetooth cellular phone system.

For information on the description and operation of the Bluetooth cellular phone system:
REFER to: Cellular Phone - VIN Range: N52048->N99999 (419-08 Cellular Phone, Description and Operation).

For additional information on the Bluetooth cellular phone system: REFER to owner information - Bluetooth telephone system handbook.

Inspection and Verification

• NOTE: Only cellular phones and software versions featured in the Jaguar Bluetooth approved phones and software list can be guaranteed to operate correctly.

Check the D2B ring order and circuit integrity.

Before pairing a handset to the Bluetooth phone system make sure that the handbook for the specific handset is available.

1. Verify the customer concern by operating the system using the customers cellular phone.
2. Visually inspect for obvious signs of electrical damage.

Visual Inspection Chart

| fuse(s) | wiring harness | electrical connector(s) | Bluetooth cellular phone | microphone | steering wheel control | Bluetooth upgrade module | portable support electronics (PSE) module | voice module |

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. Use the approved diagnostic system or a scan tool to retrieve any DTCs before moving onto the symptom chart.

Pinpoint Tests

• NOTE: When performing voltage or resistance tests, always use a digital multimeter (DMM) accurate to three decimal places, and with an up-to-date calibration certificate. When testing resistance always take the resistance of the DMM leads into account.
• NOTE: Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.
• NOTE: If a control module or component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval program is in operation, before the replacement of a component.

### PINPOINT TEST A: "NO PHONE FITTED" (TOUCH-SCREEN) MESSAGE DISPLAYED CONTINUOUSLY OR "NO PHONE" MESSAGE DISPLAYED EVERY TIME THE PHONE MODE BUTTON IS PRESSED

| Are power, ignition and ground being supplied to the portable support electronics (PSE) module? | Yes → Refer to the warranty policy and procedures manual if the PSE module is suspect.  
                  | No → Rectify as necessary. Refer to the electrical guides. |

### PINPOINT TEST B: "HANDSET IN USE" (TOUCH-SCREEN) MESSAGE DISPLAYED FOR MORE THAN 2 MINUTES OR "HANDSET" MESSAGE DISPLAYED EVERY TIME THE PHONE MODE BUTTON IS PRESSED AND NEVER CHANGES TO "SIG*"

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>B1:</td>
<td></td>
</tr>
</tbody>
</table>
| Has the system been paired to a handset? | Yes → Key off ignition and wait 6 minutes for the portable support electronics (PSE) module to shut down. The Bluetooth upgrade module remains active for 6 minutes after the ignition has been switched off. It is important to wait this 6 minutes so that a clean boot-up of the Bluetooth upgrade module is achieved and the correct information is stored. Switch off the paired handset; remove the battery from the back of the handset. Replace the battery into the handset and switch on, make sure the Bluetooth function is on and the handset is within range. Key on ignition. Go to B2.  
                  | No → Go to B3. |
| B2:             |                         |
| Does the system still display "HANDSET IN USE" (touch-screen) message displayed for more than 2 minutes, or "HANDSET" message displayed every time the phone mode button is pressed and then drops out of phone mode? | Yes → Go to B3.  
                  | No → Problem may have been due to the Bluetooth link being disconnected. |
Is the connection between the Bluetooth upgrade module and the phone harness loose?
Yes
- Reconnect the Bluetooth upgrade module and check for normal operation.
No
- GO to B5.

B4:
Are any of the Bluetooth upgrade module pins damaged?
Yes
- Refer to the warranty policy and procedures manual if the Bluetooth upgrade module is suspect.
No
- Check harness to/from the Bluetooth upgrade module and the portable support electronics (PSE) module. GO to B5.

B5:
Is power being supplied to the Bluetooth upgrade module?
Yes
- Refer to the warranty policy and procedures manual if the Bluetooth upgrade module is suspect.
No
- GO to B6.

B6:
Are power, ignition, and ground being supplied to the portable support electronics (PSE) module?
Yes
- Refer to the warranty policy and procedures manual if the PSE module is suspect.
No
- Rectify as necessary. Refer to the electrical guides.

PINPOINT TEST C: UNABLE TO PAIR THE HANDSET TO TELEPHONE SYSTEM

TEST CONDITIONS

<table>
<thead>
<tr>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
</table>

C1:
Has another handset previously been paired to the system?
Yes
- GO to C2.
No
- GO to C3.

C2:
Is the "HANDSET IN USE" (touch-screen) or "HANDSET" message displayed, or does the system drop out of phone mode?
Yes
- Go to "HANDSET IN USE" or "HANDSET" message displayed - GO to Pinpoint Test B.
No
- GO to C3.

C3:
Does the touch-screen display "Discover Me" with 4 or 5 bars (The 5th bar will flash slowly) or does the audio head unit display "SIG****" or "SIG*****" (The 5th '*' will flash slowly)?
Yes
- Retry the pairing process following the 'quick guide information' for the specific handset. GO to C4.
No
- Enter the ##3##*# pairing key sequence. GO to C5.

C4:
Has the handset paired with the system successfully? "Phone connected" displayed (touch screen) or "SIG*" displayed (audio head unit display)?
Yes
- Problem may have been due to a faulty Bluetooth connection.
No
- Key off ignition and wait 6 minutes for the portable support electronics (PSE) module to shut down. The Bluetooth upgrade module remains active for 6 minutes after the ignition has been switched off. It is important to wait this 6 minutes so that a clean boot-up of the Bluetooth upgrade module is achieved and the correct information is stored. Switch off the paired handset; remove the battery from the back of the handset. Replace the battery into the handset and switch on, make sure the Bluetooth function is on and the handset is within range. Key on ignition. GO to C7.

C5:
Does the touch-screen display "Discover Me" with 4 or 5 bars (The 5th bar will flash slowly) or does the audio head unit display "SIG****" or "SIG*****" (The 5th '*' will flash slowly)?
Yes
- Retry the pairing process following the 'quick guide information' for the specific handset.
No
- Key off ignition and wait 6 minutes for the portable support electronics (PSE) module to shut down. Key on ignition. GO to C6.

C6:
Does the touch-screen display "Discover Me" with 4 or 5 bars (The 5th bar will flash slowly) or does the audio head unit display "SIG****" or "SIG*****" (The 5th '*' will flash slowly)?
Yes
- Retry the pairing process following the 'quick guide information' for the specific handset.
No
- GO to C9.

C7:
Has the handset paired with the system successfully ("Phone connected" displayed (touch screen) or "SIG*" displayed (audio head unit display))?  
Yes  
Problem may have been due to a faulty Bluetooth connection.  
No  
Pair and connect a different known 'good' handset to the vehicle phone system.  

C8: 

Has the handset paired with the system successfully ("Phone connected" displayed (touch screen) or "SIG*" displayed (audio head unit display))?  
Yes  
Problem may be an issue with the user's handset, consult the handset supplier.  
No  
GO to C9.

C9: 

Is the connection between the Bluetooth upgrade module and the phone harness loose?  
Yes  
Reconnect the Bluetooth upgrade module and check for normal operation.  
No  
GO to C10.

C10: 

Is power being supplied to the Bluetooth upgrade module?  
Yes  
Refer to the warranty policy and procedures manual if the Bluetooth upgrade module is suspect.  
No  
GO to C11.

C11: 

Are power, ignition, and ground being supplied to the portable support electronics (PSE) module?  
Yes  
Refer to the warranty policy and procedures manual if the PSE module is suspect.  
No  
Rectify as necessary. Refer to the electrical guides.

<td>No</td>
</tr>
</tbody>
</table>

### PINPOINT TEST F: UNABLE TO CONNECT THE HANDSET TO TELEPHONE SYSTEM

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>F1: Was the handset the last device to be connected to the vehicle?</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>No</td>
</tr>
<tr>
<td>F2:</td>
<td></td>
</tr>
</tbody>
</table>
In the handset Bluetooth menu, is "Jaguar" listed as a paired device?
Yes
   GO to F3.
No
   Follow pairing process for the specific handset. GO to F6.

F3:
Is the handset 'connected' to another Bluetooth device (i.e. not "Jaguar")?
   Yes
      Check "Active Devices" in the handset's Bluetooth menu and disconnect the handset from the other Bluetooth device. Follow the instructions for the specific handset to allow the handset to 'connect' to the vehicle. GO to F8.
   No
      GO to F4.

F4:
What message does the vehicle display show, "Connected" or "No BT Phone"?
   Yes
      Follow the vehicle un-pairing process, delete "Jaguar" from the handset device list and key off ignition for 6 minutes. Key on ignition. Follow the pairing process for the specific handset. GO to F6.
   No
      GO to F5.

F5:
Is the vehicle in "Discover Me" mode?
   Yes
      Follow pairing process for the specific handset. GO to F6.
   No
      Go to "HANDSET IN USE" or "HANDSET" message displayed - GO to Pinpoint Test B.

F6:
Has the handset paired successfully with the vehicle?
   Yes
      GO to F7.
   No
      Go to 'Unable to pair' - GO to Pinpoint Test C.

F7:
Has the handset automatically connected to the vehicle phone system?
   Yes
      Following the instructions for the specific handset to make sure that the Bluetooth settings are set for automatic connection, connection should now be complete.
   No
      Follow the instructions for the specific handset to allow the handset to 'connect' to the vehicle. GO to F8.

F8:
Has the handset connected to the vehicle phone system?
   Yes
      Following the instructions for the specific handset to make sure that the Bluetooth settings are set for automatic connection, connection should now be complete.
   No
      Key off ignition and wait 6 minutes for the portable support electronics (PSE) module to shut down. Switch off the handset; remove the battery from the back of the handset. Replace the battery into the handset and switch on. Key on ignition. Re-try pairing and connecting. GO to F9.

F9:
Has the handset connected to the vehicle phone system?
   Yes
      Following the instructions for the specific handset to make sure that the Bluetooth settings are set for automatic connection, connection should now be complete.
   No
      Pair and connect a different known 'good' handset to the vehicle phone system. GO to F10.

F10:
Does the handset 'connect' OK?
   Yes
      This is a handset issue, consult the handset supplier.
   No
      Refer to the warranty policy and procedures manual if the Bluetooth upgrade module is suspect.

PINPOINT TEST G : BLUETOOTH CONNECTION IS Dropped

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>G1:</td>
<td></td>
</tr>
<tr>
<td>Does the handset battery have a good level of charge?</td>
<td></td>
</tr>
</tbody>
</table>
   Yes
      GO to G2. |
   No
      Recharge the handset battery. Bluetooth performance cannot be guaranteed with low battery power. |
| G2:             |                         |
| Does the handset show good signal strength? | 
   Yes
      GO to G3. |
   No
      Without good signal strength, the vehicle display will show "SIG______" or "No BT Phone" or "No Service". Move into an area with good signal strength and check for normal operation. |
Check the handset menu. Has auto connect been turned on?

Yes
   GO to G4.

No
   Switch auto connect on and check for normal operation.

G4:

Has the user tried to transfer a call from hands free to handset?

Yes
   Check the handset guide info, some handsets will not auto reconnect Bluetooth after a handset call. GO to G5.

No

G5:

Does the handset display show that it is connected to the vehicle?

Yes
   GO to G7.

No
   GO to G6.

G6:

Does the vehicle display "SIG_____" or "No BT Phone"?

Yes
   Follow instructions for the specific handset to 'connect' the handset to vehicle. GO to G10.

No
   GO to G7.

G7:

Does the vehicle display "SIG**" or "Phone Connected"?

Yes
   Bluetooth connection has not been dropped, check for normal operation.

   Key off ignition and wait 6 minutes for the portable support electronics (PSE) module to shut down. Switch off the handset; remove the battery from the back of the handset. Replace the battery into the handset and switch on. Key on ignition. GO to G8.

No

G8:

Does the vehicle display "SIG**" or "Phone Connected"?

Yes
   Check for normal operation.

   Follow the vehicle un-pairing process, delete "Jaguar" from the handset device list and key off ignition for 6 minutes. Key on ignition. Follow pairing process for the specific handset. GO to G9.

No

G9:

Has the handset paired successfully with the vehicle?

Yes
   Follow instructions for the specific handset to 'connect' the handset to vehicle. GO to G10.

   Go to 'Unable to pair' - GO to Pinpoint Test C.

No

G10:

Does the handset 'connect'?

Yes
   GO to G11.

   Go to 'Unable to connect' - GO to Pinpoint Test F.

No

G11:

Does the vehicle display show that it is 'connected'?

Yes
   Check for normal operation.

No
   Refer to the warranty policy and procedures manual if the Bluetooth upgrade module is suspect.

PINPOINT TEST H : INCORRECT OR NO PHONEBOOK ENTRIES

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>H1:</td>
<td></td>
</tr>
<tr>
<td>Check the Jaguar Bluetooth approved phone list guide: Does the handset support phonebook download?</td>
<td></td>
</tr>
<tr>
<td>Yes</td>
<td>GO to H2.</td>
</tr>
<tr>
<td>No</td>
<td>Advise user that the handset does not support phonebook download.</td>
</tr>
<tr>
<td>H2:</td>
<td></td>
</tr>
<tr>
<td>Is the Bluetooth system paired and connected to a phone handset?</td>
<td></td>
</tr>
<tr>
<td>Yes</td>
<td>GO to H3.</td>

<tr>
<td>No</td>
<td>Pair and connect an approved handset to the vehicle phone system. GO to H2.</td>
</tr>
</tbody>
</table>
Has the user followed vehicle and handset instructions for downloading phonebook?
Yes
  GO to H4.
No
  Refer to the vehicle handbooks/handset 'quick guide information' regarding phonebook download. Check for normal operation.

H4:

After "Downloading the phonebook" has the ignition been switched off for 6 minutes?
Yes
  GO to H7.
No
  Make sure that the ignition has been switched off for 6 minutes after following process for downloading phonebook. The Bluetooth upgrade module remains active for 6 minutes after the ignition has been switched off. It is important to wait this 6 minutes so that a clean boot-up of the Bluetooth upgrade module is achieved and the correct information is stored. Switch ignition on to prompt the portable support electronics (PSE) module to pull phonebook entries from the Bluetooth upgrade module. GO to H5.

H5:

Can the user view the phonebook entries on the vehicle display?
Yes
  End.
No
  GO to H6.

H6:

Have two or more handsets been tried?
Yes
  GO to H9.
No
  Pair and connect a different known 'good' handset which will automatically download the phonebook to the vehicle phone system. GO to H9.

H7:

After switching the ignition back on, does the handset connect to the vehicle phone system?
Yes
  GO to H8.
No
  Reconnect the handset and make sure auto-reconnect is set to on. GO to H7.

H8:

Is the phonebook available on the vehicle display?
Yes
  End.
No
  Pair and connect a different known 'good' handset which will automatically download the phonebook to the vehicle phone system. GO to H9.

H9:

Is the phonebook available on the vehicle display?
Yes
  This is an issue with the user's handset, consult the handset supplier.
No
  Refer to the warranty policy and procedures manual if a module is suspect.

PINPOINT TEST I : NO THIRD PARTY AUDIO

<table>
<thead>
<tr>

<td></td>
</tr>
</tbody>
</table>
I5: Is there any 3rd party audio?
   Yes: End. Disconnect the Bluetooth link between the handset and vehicle phone system and re-try the call. GO to I6.
   No: Disconnect the Bluetooth link between the handset and vehicle phone system and re-try the call. GO to I6.

I6: Does the 3rd party call audio work with the mobile phone disconnected from the vehicle?
   Yes: Re-connect the Bluetooth link between the handset and the vehicle phone system and re-try the call. GO to I8.
   No: Switch off the handset, remove the battery from the back of the handset. Replace the battery into the handset and switch on. Make sure the Bluetooth link is disconnected and re-try the call. GO to I7.

I7: Does the 3rd party call audio work with the mobile phone disconnected from the vehicle?
   Yes: Problem may be due to a faulty Bluetooth connection.
   No: This may be a handset issue, consult the handset supplier.

I8: Does the 3rd party call audio work with the Bluetooth system?
   Yes: Problem may be due to a faulty Bluetooth connection.
   No: GO to I9.

I9: Does the 3rd party call audio work with the mobile phone in 'handset' mode?
   Yes: GO to I10.
   No: Key off ignition and wait 6 minutes for the portable support electronics (PSE) module to shut down. Key on ignition. Make sure the Bluetooth link is re-connected and re-try the call pairing and connecting. GO to I14.

I10: Does the vehicle have voice control fitted?
   Yes: GO to I11.
   No: GO to I12.

I11: Does the voice control pick up commands from the user?
   Yes: Check harness connections between the microphone and the portable support electronics (PSE) module are not loose or damaged. GO to I16.
   No: Refer to the warranty policy and procedures manual if the voice control module is suspect.

I12: Is the vehicle a USA/Canada/Mexico vehicle?
   Yes: GO to I13.
   No: Check harness connections between the microphone and the portable support electronics (PSE) module are not loose or damaged. GO to I16.

I13: Does the vehicle have the voice control shorting loop fitted?
   Yes: Check harness connections between the microphone and the portable support electronics (PSE) module are not loose or damaged. GO to I16.
   No: Fit the voice control shorting loop and check for normal operation.

I14: Does the 3rd party call audio work with the Bluetooth system?
   Yes: Problem may be due to a faulty Bluetooth connection.
   No: Pair and connect a different known 'good' handset to the vehicle phone system and make an incoming call. GO to I15.

I15: Does the 3rd party call audio work with the Bluetooth system?
   Yes: This may be a handset issue, consult the handset supplier.
   No: Check harness connections between the microphone and the portable support electronics (PSE) module are not loose or damaged. GO to I16.

I16:
Are the microphone harness connections damaged?
Yes
- Rectify as necessary. Refer to the electrical guides.
No
- Replace the microphone and re-try the call. GO to I17.

Does the 3rd party call audio work with the Bluetooth system?
Yes
- Problem may have been due to a faulty microphone.
No
- Refer to the warranty policy and procedures manual if a module is suspect.

</table>
Can any ringing be heard through the vehicle speakers?
Yes
   Problem due to a faulty Bluetooth link.
   GO to K4.
No

Has the handset "profile" been set to "silent"?
Yes
   Change settings within profile, make an incoming call and check for normal operation.
   GO to K15.
No

Has the handset volume been set to minimum?
Yes
   Increase volume setting, make an incoming call and check for normal operation.
   Check Bluetooth connection between the handset and vehicle is OK. GO to K16.
No

Is the Bluetooth connection OK?
Yes
   Disconnect the Bluetooth connection. Make sure that the handset is NOT set to silent, then make an incoming call. GO to K17.
No
   Follow the handset instructions for 'connecting' the Bluetooth link, then make an incoming call and check for normal operation.

Is there any ringing heard on the handset?
Yes
   Reconnect Bluetooth link between the handset and vehicle. GO to K18.
No
   Un-pair the current handset and pair/connect a known good handset with the vehicle. Make an incoming call. GO to K9.

Can any ringing be heard through the vehicle speakers?
Yes
   Change settings within profile, make an incoming call and check for normal operation.
   Check harness connections between the Bluetooth upgrade module and the portable support electronics (PSE) module. GO to K19.
No

Are any of the harness connections damaged?
Yes
   Rectify as necessary. Refer to the electrical guides.
No
   Refer to the warranty policy and procedures manual if a module is suspect.

PINPOINT TEST L : LOW AUDIO VOLUME

|   GO to L4.     |                         |
| No              | Call Technical Helpline. |

| L4:             |                         |
| Is Bluetooth link between the handset and vehicle still connected? |                         |
| Yes             |                         |
|   GO to L5.     |                         |
| No              | Re-connect the Bluetooth link and re-try the call. GO to L1. |
Is call volume still low when call transferred to 'handset' mode?
Yes  \(\text{GO to L6.}\)
No  Key off ignition and wait 6 minutes for the portable support electronics (PSE) module to shut down. Key on ignition and re-try the call.  \(\text{GO to L16.}\)

L6:

Is the call volume still low with the handset disconnected from the Bluetooth system?
Yes  \(\text{GO to L7.}\)
No  Try calling another 3rd party from the handset.  \(\text{GO to L8.}\)

L7:

Is the handset volume setting low?
Yes  Increase the handset volume setting and re-try the call.  \(\text{GO to L6.}\)
No  Low audio issue due to the handset, consult the handset supplier.

L8:

Is the call volume still low with the handset disconnected from the Bluetooth system?
Yes  Low audio issue due to the handset, consult the handset supplier.
No  Initial audio problem may be due to a fault at the 3rd party end. Check by calling them on another number.

L9:

Check that handset volume setting and signal strength are not low. Is call volume still low when call transferred to 'handset' mode?
Yes  \(\text{GO to L14.}\)
No  \(\text{GO to L10.}\)

L10:

Is the microphone fitted OK? Check DTCs using the approved diagnostic system.
Yes  \(\text{GO to L12.}\)
No  Rectify as necessary.  \(\text{GO to L11.}\)

L11:

Is volume still low?
Yes  \(\text{GO to L12.}\)
No  Issue caused by faulty microphone or microphone circuit.

L12:

Is voice control fitted to vehicle?
Yes  Disconnect the voice control module and fit the voice control shorting loop to the wiring harness.  \(\text{GO to L13.}\)
No  \(\text{GO to L14.}\)

L13:

Is volume still low?
Yes  \(\text{GO to L14.}\)
No  Refer to voice control diagnostics.

L14:

Is the 3rd party call audio still low with the handset disconnected from the Bluetooth system?
Yes  \(\text{Pair and connect a different known 'good' handset to the vehicle phone system and make a call to a 3rd party. GO to L17.}\)
No  Re-connect Bluetooth link and re-try the call.  \(\text{GO to L15.}\)

L15:

Is volume still low?
Yes  Key off ignition and wait 6 minutes for the portable support electronics (PSE) module to shut down. Key on ignition and re-try the call.  \(\text{GO to L16.}\)
No  Issue caused by a faulty Bluetooth connection.

L16:

Is volume still low?
Yes  Refer to the warranty policy and procedures manual if a module is suspect.
No  Issue caused by a faulty Bluetooth connection.

L17:
Is volume still low?
Yes: Refer to the warranty policy and procedures manual if a module is suspect.
No: Low audio issue caused by the handset, consult the handset supplier.

| Yes         | Problem may have been caused by the Bluetooth link being disconnected. |
| No          | Pair and connect a different known 'good' handset to the vehicle phone system and make an incoming call. **GO to Q4.** |

**Q4:**

Can the call be transferred between hands free and handset?

| Yes         | This is a handset issue, consult the handset supplier. |
| No          | Refer to the warranty policy and procedures manual if a module is suspect. |
Removal

1. Reposition the luggage compartment floor covering.
   1. Detach the luggage compartment floor covering.
   2. Reposition the luggage compartment floor covering.

2. Detach the luggage compartment side trim panel.
   1. Remove the luggage compartment side trim panel retaining clip.
   2. Detach the luggage compartment side trim panel.

3. Detach the module mounting bracket.

4. Disconnect the cellular phone antenna connector.

5. Remove the rear bumper cover.
   For additional information, refer to Section 501-19 Bumpers.
6. Detach the grommet.

7. Remove the cellular phone antenna.

Installation

1. To install, reverse the removal procedure.
## Multifunction Electronic Modules -

Multifunction Electronic Modules - Module Controlled Functions

Description and Operation

<table>
<thead>
<tr>
<th>Item</th>
<th>Part Number</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td></td>
<td>Driver seat module (DSM)</td>
</tr>
<tr>
<td>2</td>
<td></td>
<td>Rear electronics module (REM)</td>
</tr>
<tr>
<td>3</td>
<td></td>
<td>Multifunction voice activated module</td>
</tr>
<tr>
<td>4</td>
<td></td>
<td>Driver door module (DDM)</td>
</tr>
<tr>
<td>5</td>
<td></td>
<td>Front electronic module (FEM)</td>
</tr>
</tbody>
</table>

**Driver Seat Module (DSM)**

The DSM is located under the driver seat. The DSM controls the seat memory recall positions and seat functionality. For additional information, refer to Section 501-10 Seating.

**Driver Door Module (DDM)**

The DDM is located in the driver door behind the trim panel.

The DDM is involved with the following operations:

- Door window motor and regulator
- Exterior rear view mirror movement
- Keyless entry
- Global closing
- Drivers door locking/unlocking

**Front Electronic Module (FEM)**

The FEM module is located behind the driver side cowl side trim panel.

The FEM is involved with the following operations:
- Front exterior lighting
- Direction indicators
- Adjustable pedals
- Daytime running lamps
- Courtesy lighting
- Low brake fluid reservoir level
- Low windshield washer reservoir fluid level
- Low oil pressure
- Windshield wipers

**Rear Electronic Module (REM)**

The REM module is located in the passenger side luggage compartment behind the luggage compartment side trim panel.

The REM module is involved with the following operations:

- Fuel pump
- Heated rear windshield
- Rear exterior lighting
- Rear view mirrors electro chromic function
- Luggage compartment lid release
- Inertia fuel cut off switch
- Passenger door locks

**Multifunction Voice Control Module**

The multifunction voice control module is located in the driver side luggage compartment behind the luggage compartment side trim panel. The multifunction voice activated module controls and processes all the voice commands given by the driver, then delivers this information to the audio unit, cellular phone, navigation and the climate control modules which then carry out these commands.

**Microphone**

The microphone is used for the cellular phone and to receive voice commands for the audio unit and climate control functions. The microphone supplies the information to the multifunction voice control module which processes the commands and supplies the necessary information to the correct modules.

**Visual Feedback Message Center Display**

This display keeps the driver informed of the function which is being selected or processed.

**Audible Feedback Instrument Cluster**

This audible tone informs the driver when the system is able to receive commands for processing.

**Verbal Feedback Speakers**

These speakers are utilized to confirm to the driver that his verbal command has been accepted and is being proceeded.

**Steering Wheel Controls VOICE/PHONE Buttons**

This button is automatically configured by the audio unit depending on which systems are equipped on the vehicle. For additional information, refer to the Owner Guide.
Inspection and Verification

1. **1.** Verify the customer concern.

2. **2.** Visually inspect for obvious signs of electrical damage.

### Visual Inspection Chart

<table>
<thead>
<tr>
<th><strong>Electrical</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>• Fuse(s)</td>
</tr>
<tr>
<td>• Electrical connector(s)</td>
</tr>
<tr>
<td>• Wiring Harness</td>
</tr>
</tbody>
</table>

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **4.** If the cause is not visually evident, verify the symptom and refer to the Jaguar Approved Diagnostic System.
Multifunction Electronic Modules - Driver Door Module (DDM)

Removal

1. **CAUTIONS:**

   - Prior to removal of the module, it is necessary to upload module configuration information to the Jaguar approved diagnostic system. This information needs to be downloaded into the new module once installed. For additional information, refer to Section [418-01 Module Configuration](#).

   - Electronic modules are sensitive to static electrical charges. If exposed to these charges, damage may result.

   - Disconnect the battery ground cable. For additional information, refer to Section [414-01 Battery, Mounting and Cables](#).

2. Remove the front door trim panel. For additional information, refer to Section [501-05 Interior Trim and Ornamentation](#).

3. Disconnect the driver door module (DDM) electrical connectors.

4. Remove the DDM.

Installation

1. To install, reverse the removal procedure.
Multifunction Electronic Modules - Driver Seat Module (DSM)
Removal and Installation

Removal

CAUTION: Electronic modules are sensitive to static electrical charges. If exposed to these charges, damage may result.

1. Remove the front seat.
   For additional information, refer to Section 501-10 Seating.
2. Disconnect the electrical connectors.
3. Remove the driver seat module (DSM).
   - Release the DSM retaining tang

Installation

1. To install, reverse the removal procedure.
Multifunction Electronic Modules - Front Electronic Module (FEM)

Removal

1. **CAUTIONS:**
   - Prior to removal of the module, it is necessary to upload module configuration information to the Jaguar approved diagnostic system. This information needs to be downloaded into the new module once installed. For additional information, refer to Section 418-01 Module Configuration.
   - Electronic modules are sensitive to static electrical charges. If exposed to these charges, damage may result.

   Disconnect the battery ground cable. For additional information, refer to Section 414-01 Battery, Mounting and Cables.

   2. Remove the left-hand side trim panel. For additional information, refer to Section 501-05 Interior Trim and Ornamentation.

   3. Reposition the floor covering.

   4. Disconnect the electrical connectors.

   5. Remove the front electronic module (FEM).

Installation
1. To install, reverse the removal procedure.
   - Tighten to 10 Nm.
Removal

1. CAUTIONS:

⚠️ Prior to removal of the module, it is necessary to upload module configuration information to the Jaguar approved diagnostic system. This information needs to be downloaded into the new module once installed. For additional information, refer to Section 418-01 Module Configuration.

⚠️ Electronic modules are sensitive to static electrical charges. If exposed to these charges, damage may result.

Disconnect the battery ground cable.
For additional information, refer to Section 414-01 Battery, Mounting and Cables.

2. Detach the luggage compartment side trim panel.
   1. Remove the luggage compartment side trim panel retaining clip.
   2. Detach the luggage compartment side trim panel.

3. Disconnect the electrical connectors.

4. Detach the module mounting bracket.
5. Remove the module mounting bracket.
   - Disconnect the electrical connectors.

6. Detach the multifunction voice control module mounting bracket.

7. Remove the electrical connectors.

8. Remove the multifunction voice module.

Installation
1. To install, reverse the removal procedure.
   - Tighten to 10 Nm.
Removal

1. CAUTIONS:

⚠️ Prior to removal of the module, it is necessary to upload module configuration information to the Jaguar approved diagnostic system. This information needs to be downloaded into the new module once installed. For additional information, refer to Section 418-01 Module Configuration.

⚠️ Electronic modules are sensitive to static electrical charges. If exposed to these charges, damage may result.

Disconnect the battery ground cable. For additional information, refer to Section 414-01 Battery, Mounting and Cables.

2. Detach the luggage compartment side trim panel.
   1. Remove the luggage compartment side trim panel retaining clip.
   2. Detach the luggage compartment side trim panel.

3. Detach the rear electronic module (REM) mounting bracket.

4. Disconnect the electrical connectors.
5. Remove the REM.

Installation

1. To install, reverse the removal procedure.
   - Tighten to 10 Nm.

Fender Splash Shield

Protective injection moulded plastic liners are fitted to the inside of the fenders, these help prevent dirt and water ingress into the vehicle body.

Air Deflector

An air deflector is retained to the front subframe. The air deflector assists the flow of air under the vehicle, it also gives protection to the engine bay from dirt and water ingress. On top of the air deflector an acoustic pad is fitted which is covered by a heat shield, this is designed to reduce engine and road noise.

Radiator Splash Shield

The radiator splash shield is fitted to assist air flow through the cooling pack. It is retained to the bottom of the front bumper cover, both front fender splash shields, and to the front subframe.

Radiator Closing Panel

The radiator closing panel is fitted to the body by retaining clips and is easily removed to give access to the rear of the headlamps.

Cowl Vent Screen

An injection molded plastic cowl vent screen is retained to the bodywork by retaining clips and screws. The cowl vent screen allows easy access to the wiper components and the ventilation system odor filter.
Front End Body Panels - Air Deflector

Removal

1. Raise and support the vehicle.
   For additional information, refer to Section 100-02 Jacking and Lifting.
2. Remove the air deflector.

Installation

1. To install, reverse the removal procedure.
Removal

Vehicles built 02/2004 onwards

1. Detach the washer hose.

All vehicles

2. Remove both wiper pivot arms.
   For additional information, refer to: Wiper Pivot Arm - Vehicles Built Up To: 01/2004 (501-16 Wipers and Washers, Removal and Installation).

3. Remove the cowl panel grille retaining screw covers.

4. Remove the cowl panel grille.

Installation

1. To install, reverse the removal procedure.
Front End Body Panels - Fender Splash Shield
Removal and Installation

Removal

All vehicles

1. Remove the front wheel and tire assembly.
   For additional information, refer to: Wheel and Tire (204-04 Wheels and Tires, Removal and Installation).

Vehicles built up to 01/2004

2. Remove the fender splash shield.

Vehicles built 02/2004 onwards

3. Remove the fender splash shield.

Installation

1. To install, reverse the removal procedure.

Body Closures - Body Closures
Description and Operation

Doors
All doors comprise of an inner and outer panel, clinched and bonded together to form a door assembly. Both panels incorporate extensions spot welded together to form a cheater assembly and a sealant is applied in cosmetic bead form to all clinch.

The doors are conventional latch to striker plate design with the strikers located on the body pillars.

A joint-less single profile bulb seal is installed on each door together with a water shedder and separate vacuum formed speaker cup. Upper and lower door hinges and multi-stage check arms require no lubrication throughout the vehicle life.

Luggage Compartment Lid
The luggage compartment lid comprises of an inner and outer panel clinched and bonded together to form a complete assembly.

The luggage compartment lid is a conventional lock to striker plate design with the striker located centrally on the edge of the load space floor.

Hood
The hood assembly consists of a one piece inner and outer panel, clinched and bonded together with a bead of sealant applied to each clinch joint. The hood opens from the front and is secured by two hood latches and a secondary safety catch.
### Body Closures - Hood Alignment

#### General Procedures

1. **NOTE:** Left-hand shown, right-hand similar.  
   Remove both hood latches.

2. **NOTE:** Left-hand shown, right-hand similar.  
   Remove both hood struts.

3. **NOTE:** Left-hand shown, right-hand similar.  
   Loosen both hood hinge retaining bolts.

4. Pull up/push down on the hood.

5. **NOTE:** Make sure the spacing between the grille to hood, headlamps to hood and fenders to hood are equal.  
   Set the alignment to nominal.
6. Tighten the hood hinge retaining bolts.
   - Tighten to 25 Nm.

7. **NOTE:** Left-hand shown, right-hand similar.
   Adjust the hood bump stops to obtain the correct profile between the hood and fender.

8. Install the hood struts.

9. Install the hood latches.
   - Tighten to 11 Nm.
Body Closures - Luggage Compartment Lid Alignment

General Procedures

1. Reposition the luggage compartment floor covering.
   1. Detach the luggage compartment floor covering.
   2. Reposition the luggage compartment floor covering.

2. Remove the luggage compartment trim panel.

3. Remove the luggage compartment aperture seal.

4. Remove the luggage compartment lid striker.
5. Remove the luggage compartment lid latch trim panel retaining screw covers.

6. Detach the luggage compartment lid latch trim panel.

7. Remove the luggage compartment lid latch trim panel.
   - Disconnect the luggage compartment lamp electrical connector.

8. Remove the luggage compartment lid liner.

9. NOTE: Left-hand shown, right-hand similar.
   Detach both luggage compartment lid springs.
10. NOTE: Left-hand shown, right-hand similar.
   Loosen the luggage compartment lid hinge bolts.

11. Pull up/push down on the luggage compartment lid.

12. NOTE: Set the alignment to 1.5 mm (0.06 in) lower and 3 mm (0.12 in) forward of nominal.
   Set the luggage compartment lid alignment.
13. Tighten the luggage compartment lid hinge bolts.
    • Tighten to 15 Nm.

14. Attach both luggage compartment lid springs.
15. Install the luggage compartment lid liner.

16. Install the luggage compartment lid latch trim panel.
   - Connect the luggage compartment lamp electrical connector.

17. Attach the luggage compartment lid latch trim panel.

18. Install the luggage compartment lid latch trim panel retaining screw covers.

19. Install the luggage compartment lid striker.
   - Tighten to 9 Nm.
20. Install the luggage compartment aperture seal.

21. Install the luggage compartment trim panel.

22. Reposition the luggage compartment floor covering.
1. Remove the rear door aperture seal.

2. Remove the rear door striker.

3. Remove the B-pillar lower trim panel. For additional information, refer to Section 501-05 Interior Trim and Ornamentation.

4. Detach the front safety belt retractor.
5. Loosen the rear door upper and lower hinge retaining nuts.

6. NOTE: Initial door fitting for the rear door should be set to 1 mm (0.04 in) higher than nominal at the rear, top edge of the door.

   Set the rear door to the correct alignment.

7. Tighten the rear door upper and lower hinge retaining nuts.
   - Tighten to 35 Nm.
8. Attach the front safety belt retractor.
   - Tighten to 40 Nm.

9. Install the B-pillar lower trim panel.  
   For additional information, refer to Section 501-05 Interior Trim and Ornamentation.

10. Install the rear door striker.  
    - Tighten to 28 Nm.

11. Install the rear door aperture seal.
Body Closures - Front Door Opening Weatherstrip

Removal

1. NOTE: Front door shown, rear door similar.
   Detach the door check arm.

2. Remove the window frame interior trim.

3. Remove the weatherstrip.

Installation

1. To install, reverse the removal procedure.
   • Tighten to 15 Nm.
Body Closures - Hood
Removal and Installation

Removal

Vehicles built up to 01/2004

1. Remove the hood insulation.

2. Detach the windshield washer supply hose.

3. Guide the windshield washer supply hose through the hood aperture.

All vehicles

4. NOTE: Left-hand shown, right-hand similar.

Remove both hood struts.
5. **CAUTION:** Make sure the hood does not contact the vehicle body while removing. Failure to carry out these instructions may cause damage to the vehicle.

- **NOTE:** Left-hand shown, right-hand similar.

Remove the hood.

- Remove the hood retaining bolts.

### Installation

1. To install, reverse the removal procedure.
   - Tighten to 25 Nm.

2. Align the hood.
   For additional information, refer to: [Hood Alignment](501-03 Body Closures, General Procedures).

Interior Trim and Ornamentation - Interior Trim

Description and Operation

This section covers removal and installation of the interior mouldings and trim panels. In many instances, one component overlaps another component. If this condition is found, it will be necessary to loosen or remove the overlapping component before removal, to prevent damage to either component. The pillar trims and the headliner are safety critical assemblies as they mount the occupant sensors and interface with the side airbag curtains (to make sure correct deployment is achieved), and as such, correct alignment and installation are necessary for safety reasons.

The headliner is a one-piece design covering the entire interior of the roof and is made of a moulded composite with cloth covering. Finger depressions give pull-down access for the sun visors and passenger assist handles are provided.

There is an interior lamp fitted into the front of the overhead console.
Interior Trim and Ornamentation - A-Pillar Trim Panel
Removal and Installation

**Removal**

1. Detach the door aperture weatherstrip.

2. Detach the A-pillar trim panel.

3. Cut the A-pillar trim panel retaining strap.

4. Remove the A-pillar trim panel.
   - Disconnect the occupancy sensor electrical connector.

**Installation**

1. **WARNING**: The retaining strap is a safety critical item and must be replaced to prevent the trim detaching in the event of the side curtain airbag deployment.

   - **NOTE**: When installing the new retaining strap and rivet make sure the old clip has been removed from the body before pressing the trim into place.

   To install, reverse the removal procedure.
Removal

1. Remove both front and rear scuff plate trim panels.
   For additional information, refer to Scuff Plate Trim Panel in this section.
2. NOTE: Locally detach the rear door aperture weatherstrip.
   Remove the B-pillar lower trim panel.

Installation

1. To install, reverse the removal procedure.
Removal

1. Remove the B-pillar lower trim panel. For additional information, refer to B-Pillar Lower Trim Panel in this section.

2. Locally detach the door aperture weatherstrip.

3. Remove the front safety belt shoulder height adjuster retaining nut cover.

4. Detach the front safety belt shoulder height adjuster.

5. Remove the B-pillar upper trim panel.

Installation
1. **WARNING:** Make sure the side airbag bracket located above the B-pillar upper trim is located into the B-pillar trim housing, as this retains the trim in the event of side airbag deployment.

To install, reverse the removal procedure.
- Tighten to 40 Nm.
Interior Trim and Ornamentation - Cowl Side Trim Panel
Removal and Installation

Removal

1. Remove the cowl side trim panel.
   1. Detach the door aperture weather strip.
   2. Detach the scuff panel trim.
   3. Remove the cowl side trim panel.

Installation

1. To install reverse the removal procedure.
Interior Trim and Ornamentation - C-Pillar Trim Panel

Removal

1. Remove the rear seat bolster.
   For additional information, refer to Section 501-10 Seating.
2. Detach the rear safety belt.
3. Locally detach the door aperture weatherstrip.
4. Detach the C-pillar trim panel.
5. Remove the C-pillar trim panel.
   - Cut the C-pillar trim panel retaining strap.

Installation

1. \textbf{WARNING}: The retaining strap is a safety critical item and must be replaced to prevent the trim detaching in the event of the side curtain airbag deployment.
   - \textbf{NOTE}: When installing the new retaining strap and rivet make sure the old clip has been removed from the body before pressing the trim into place

   To install, reverse the removal procedure.
**Interior Trim and Ornamentation - Front Door Trim Panel**

**Removal**

1. Remove the front door interior handle bezel.

2. Remove the front door trim panel retaining screw cover.

3. Remove the front door trim panel retaining screws.

4. Detach the front door door trim panel.
   - To aid removal release clip A by lowering the glass and pressing the panel inward.
5. Disconnect the front door trim panel harness electrical connector.

6. Remove the front door trim panel.
   - Disconnect the driver door module electrical connector.

**Installation**

1. To install, reverse the removal procedure.
Removal

1. Remove the front windshield. For additional information, refer to Section [501-11 Glass, Frames and Mechanisms].

2. Remove both B-pillar upper trim panels. For additional information, refer to B-Pillar Upper Trim Panel in this section.

3. NOTE: Right-hand shown, left-hand similar.
Detach the front passenger assist handle screw cover.

4. Remove the front passenger assist handle.

5. NOTE: Right-hand shown, left-hand similar.
Detach the rear passenger assist handle screw covers.

6. Detach the rear passenger assist handle.
   - Remove the rear passenger assist handle retaining screws.
7. Remove the rear passenger assist handle.
   • Disconnect the electrical connector.

8. Remove the parcel shelf.
   For additional information, refer to Parcel Shelf in this section.

9. Disconnect the cabin harness electrical connector.

10. Detach the headliner.

11. Remove the headliner through the front windshield aperture.

**Installation**

1. To install, reverse the removal procedure.
Removal

1. Remove both C-pillar trim panels. For additional information, refer to C-Pillar Trim Panel in this section.

2. **NOTE:** Left-hand shown, right-hand similar.
   Disconnect the antenna isolator module electrical connector.

3. **NOTE:** Left-hand shown, right-hand similar.
   Remove the antenna isolator module retaining bracket.

4. Disconnect the rear window blind electrical connector.

5. Disconnect the high mounted stoplamp electrical connector.
6. Remove the parcel shelf.
   1. Remove both seat latch covers.
   2. Remove the child safety belt retaining bolts.
   3. Remove the center safety belt trim cover.
   4. Remove the parcel shelf.
   • Remove the parcel shelf retaining clips.

**Installation**

1. To install, reverse the removal procedure.
**Interior Trim and Ornamentation - Rear Door Trim Panel**

**Removal**

1. Remove the rear door interior handle bezel.

2. Remove the rear door trim panel retaining screw cover.

3. Remove the rear door trim panel retaining screws.
4. Detach the rear door trim panel.

5. Remove the rear door trim panel.
   - Disconnect the window control switch electrical connector.

**Installation**

1. To install, reverse the removal procedure.
Interior Trim and Ornamentation - Rear Window Blind
Removal and Installation

Removal

1. NOTE: Prior to removing the parcel shelf, power up the rear window blind to the deployed position.
   Remove the parcel shelf.
   For additional information, refer to Parcel Shelf in this section.

2. NOTE: Locally remove the insulation on the back of the parcel shelf to gain access to the rear window blind retaining screws.
   Remove the rear window blind.

Installation

1. To install, reverse the removal procedure.
**Interior Trim and Ornamentation - Rear Window Blind Arm**

**Removal**

1. **CAUTION:** Lower the rear window blind to the rest position. Failure to carry out this procedure may result in damage to the vehicle.

   Lower the rear window blind to the rest position.

2. Remove the parcel shelf.

   For additional information, refer to: Parcel Shelf (501-05 Interior Trim and Ornamentation, Removal and Installation).

3. **NOTE:** Locally remove the insulation on the back of the parcel shelf to gain access to the rear window blind retaining screws.

   • **NOTE:** Note the fitted position of the washers.

   Remove the rear window blind.

   • Release the blind from the parcel shelf aperture.

4. **NOTE:** Left-hand shown, right-hand similar.

   Remove the rear window blind arm securing screw.

5. **NOTE:** Left-hand shown, right-hand similar.

   Remove the rear window blind end caps.

6. **NOTE:** Left-hand shown, right-hand similar.

   Release the arm sliders from the rear window blind guide and remove the arms.

**Installation**
1. To install, reverse the removal procedure.
2. Tighten to 5 Nm.
Interior Trim and Ornamentation - Rear Window Blind Motor
Removal

• NOTE: The rear window blind motors cannot be serviced separately and must be renewed in pairs.

1. **CAUTION:** Lower the rear window blind to the rest position. Failure to carry out this procedure may result in damage to the vehicle.
   - Lower the rear window blind to the rest position.

2. Remove the parcel shelf.
   - For additional information, refer to: Parcel Shelf (501-05 Interior Trim and Ornamentation, Removal and Installation).

3. **NOTE:** Locally remove the insulation on the back of the parcel shelf to gain access to the rear window blind retaining screws.
   - **NOTE:** Note the fitted position of the washers.
   - Remove the rear window blind.
     - Release the blind from the parcel shelf aperture.

4. **NOTE:** Left-hand shown, right-hand similar.
   - Remove the rear window blind motors.
     - Disconnect the electrical connector.
     - Remove the single screw securing each arm to the motors and release both arms.
     - Remove the 4 securing screws.

Installation

1. To install, reverse the removal procedure.
2. Tighten to 5 Nm.
**Interior Trim and Ornamentation - Scuff Plate Trim Panel**

**Removal**

1. **NOTE:** Front shown, rear similar.

   Remove the scuff plate trim panel.

**Installation**

1. To install, reverse the removal procedure.
**Interior Trim and Ornamentation - Sun Visor**

**Removal**

1. Remove the sun visor trim.

2. Detach the sun visor trim retaining screws.

3. Remove the sun visor.
   - Disconnect the vanity mirror electrical connector.

**Installation**

1. To install, reverse the removal procedure.

Rear View Mirrors - Rear View Mirrors

Description and Operation

The manual dipping mirror is a prismatic unit with mirror dipping achieved by pulling the lever forward. Where fitted, electrochromic mirrors automatically darken to prevent glare from following vehicle lights. The mirrors are equipped with a reflecting surface light sensor to enable this feature.

During daytime driving, the ambient light sensor will detect high ambient light levels and control the electrochromic rear view mirrors to provide a full, clear reflection. During night driving, the ambient light sensor will detect low ambient light levels and automatic glare reduction will occur.

A switch on the interior rear view mirror allows the driver to select the automatic glare reduction function "AUTO" or to de-select all automatic glare reduction functions "OFF".

The exterior mirrors are cheater mounted, color-coded, remote electrically adjustable and heated. Adjustment of both mirrors is carried out from the driver door switch pack. A rocker switch selects the mirror to be adjusted, and a toggle switch adjusts the selected mirror to the required position.

Automatic dipping of the exterior mirrors when reversing is fitted as part of the memory pack. With the ignition switch in position II and the reverse gear selected, automatic dipping will be initiated.

Where fitted, power fold back mirrors can be operated by the exterior mirror fold back switch incorporated in the window switch. The power fold back mirrors only operate when the mirror select switch is in the middle position, and the vehicle speed is below 19 km/h (12 mile/h).
Rear View Mirrors - Rear View Mirrors
Diagnosis and Testing

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

<table>
<thead>
<tr>
<th>Mechanical</th>

</tr>
<tr>
<td></td>
<td>● Switch</td>
</tr>
</tbody>
</table>

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. If the cause is not visually evident, verify the symptom and refer to the Jaguar Approved Diagnostic System.
Rear View Mirrors - Auto-Dimming Interior Mirror
Removal and Installation

**Removal**

1. Remove the auto-dimming interior mirror trim panel.

2. Disconnect the electrical connector.

3. Remove the auto-dimming interior mirror.

**Installation**

1. To install, reverse the removal procedure.
**Removal**

1. Remove the front door trim panel. For additional information, refer to Section 501-05 Interior Trim and Ornamentation.

2. Disconnect the exterior mirror electrical connector.

3. Detach the front door window glass interior trim panel.

4. Remove the exterior mirror retaining nut covers.

5. Detach the wiring harness grommet.
6. NOTE: Hold the exterior mirror while removing the retaining nuts.
Remove the exterior mirror.

**Installation**

1. To install, reverse the removal procedure.
   - Tighten to 6 Nm.
Rear View Mirrors - Exterior Mirror Cover
Removal and Installation

Removal

1. Remove the exterior mirror glass. For additional information, refer to Exterior Mirror Glass in this section.
2. Detach the inner edge of the exterior mirror cover.
3. Detach the outer edge of the exterior mirror cover.
4. Remove the exterior mirror cover.

Installation

1. To install, reverse the removal procedure.
**Rear View Mirrors - Exterior Mirror Glass**

**Removal**

1. Apply light pressure to the exterior mirror glass.

2. Detach the mirror glass.
   - 1. Apply light pressure to the inner edge of the mirror glass.
   - 2. Pull the outer edge of the mirror glass to detach the mirror glass.

3. Remove the exterior mirror glass.
   - Disconnect the electrical connectors.

**Installation**

1. To install, reverse the removal procedure.
Removal

1. Remove the exterior mirror glass. For additional information, refer to Exterior Mirror Glass in this section.
2. Detach the exterior mirror motor.
   • 1. Remove the exterior mirror motor retaining screws.
   • 2. Detach the exterior mirror motor.
3. Remove the exterior mirror motor.
   • Disconnect the electrical connector.

Installation

1. To install, reverse the removal procedure.
   • Tighten to 1 Nm.

</table>
Each front seat has a handed seat cushion, a common backrest frame and seat adjuster mechanism. Both the driver and passenger seats are retained to the vehicle floorpan at four points.

The driver and passenger seats, although almost identical, have some unique components fitted. The driver seat has a seat track position sensor and the passenger seat has an occupant weight sensing system, both components form an integral part of the occupant restraints system.

The front seats have a side airbag module fitted to the outer side of the front seat backrest and the front seat backrest cover has an integral chute to aid in the deployment of the side airbag.

An anti-whiplash system (if equipped) is fitted to both front seats, the system has no serviceable components and after it has been activated the complete front seat backrest must be replaced.

The standard 8 way front seat is equipped with seat up and down height adjustment, forward and rearward adjustment and seat backrest recliner adjustment. The standard front seat also incorporates a two way lumbar support assembly that is fitted to the seat backrest and inflates an air filled bladder to give the required support. The electrical functions can be utilized by operating the front seat control switch and then the driver seat position can be stored by the driver seat module (DSM). The driver seat can be programmed for up to two different driver seat configurations and the seat memory switch located in the driver door switch pack, can be used to retrieve the programmed configurations.

In addition to the standard front seat functionality the 12 way front seat incorporates:

- front seat front height adjustment.
- head restraint adjustment.

In addition to the 12 way front seat functionality the 16 way high level front seat incorporates:

- four way lumbar support adjustment.
- extendible seat cushion adjustment.

Rear Seats
The standard rear seat is of a bench type with full width removable seat cushion. The rear seat backrest is available as a split 60/40 to allow larger loads to be accommodated.
Seating - Seats
Diagnosis and Testing

Principle of Operation

For a detailed description of the seats and seat operation, refer to the relevant Description and Operation section in the workshop manual. REFER to: Seats (501-10, Description and Operation).

Inspection and Verification

**CAUTION:** Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

• **NOTE:** Prior to carrying out any diagnosis, ensure the vehicle battery is in a good serviceable condition, refer to the battery care manual.

1. Verify the customer concern.
2. Visually inspect for obvious signs of damage and system integrity.

### Visual Inspection

<table>
<thead>
<tr>
<th>Mechanical</th>
<th>Electrical</th>
</tr>
</thead>
<tbody>
<tr>
<td>● Security, condition and correct installation of seat components and fixings</td>
<td>● Fuses</td>
</tr>
<tr>
<td></td>
<td>● Harnesses for damage/corrosion</td>
</tr>
<tr>
<td></td>
<td>● Electrical connectors</td>
</tr>
<tr>
<td></td>
<td>● Damaged/corroded pins</td>
</tr>
</tbody>
</table>

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. If the cause is not visually evident, verify the concern and refer to the Symptom Chart, alternatively, check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index/Summaries.

### Symptom Chart

### Pinpoint Tests

**PINPOINT TEST A : FRONT SEAT FORE/AFT MOVEMENT NOT FUNCTIONING**

**TEST CONDITIONS**

1. **WARNING:** Before work is carried out, make the air bag supplemental restraint system safe. For additional information, refer to Standard Workshop Practices section of workshop manual.
2. Set ignition status to 'ON'.
3. From the switch pack, operate the front seat forward-rearward seat motor switch and listen for evidence of the motor operating.
4. Does the motor operate?
   - Yes: **GO to A2.**
   - No: **GO to A3.**

**DETAILS/RESULTS/ ACTIONS**

A2: CHECK FRONT SEAT FORWARD-REARWARD SEAT MOTOR DRIVE BAR

1. Check front seat drive bar correctly installed and condition
2. Is the front seat drive bar correctly installed and in a serviceable condition?
   - Yes: Re-check for correct front seat forward-rearward movement. Remove seat to allow for further investigation if required.
   - No: Correctly install front seat forward-rearward seat motor drive bar, or replace if required.

A3: CHECK FRONT SEAT FORWARD-REARWARD SEAT MOTOR

**WARNING:** When carrying out the following steps, stand clear of all moving parts and ensure link harness is routed accordingly.

1. Set ignition status to 'OFF'.
2. Disconnect front seat forward-rearward seat motor connector.
• NOTE: It may be that the seat has been driven to the limit of travel along the relevant axis, and when the link harness is connected, the seat will remain in the same position. If this is the case, a jolt may be felt from the motor. To confirm the motor operation, swap the link harness to alternate motor pin connections and the seat should travel in the opposite direction.

<table>

<tr>
<th>Battery positive terminal</th>
<th>Battery negative terminal</th>
</tr>
</thead>
<tbody>
<tr>
<td>forward-rearward seat motor pin 1</td>
<td>forward-rearward seat motor pin 2</td>
</tr>
</tbody>
</table>

Does the motor operate?
- Yes
  - Using manufacturer approved diagnostic system, check for related Diagnostic Trouble Codes (DTCs) and carry out the repair operations specified. Alternatively, refer to the electrical circuit diagrams and check front seat forward-rearward seat motor circuits.
- No
  - Replace front seat forward-rearward seat motor. Refer to relevant section of workshop manual.

**PINPOINT TEST B : FRONT SEAT EXCESSIVE FORWARD-REARWARD FREE PLAY**

**TEST CONDITIONS**

<table>
<thead>
<tr>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>B1: CHECK FRONT SEAT FOR EXCESSIVE FORWARD-REARWARD FREE PLAY</td>
</tr>
</tbody>
</table>

**WARNING:** Before work is carried out, make the air bag supplemental restraint system safe. For additional information, refer to Standard Workshop Practices section of workshop manual.

1. Check all accessible front seat frame fixings are installed and to the correct torque.
   - Yes
   - GO to B2.
   - No
   - Install and tighten all accessible front seat frame fixings to correct torque and re-check for excessive free play.

2. Compare the front seat forward-rearward free play against a similar seat.
   - Yes
   - GO to B3.
   - No
   - The front seat frame is operating correctly. Submit Electronic Product Quality Report (EPQR) with any further query.

3. CHECK REMAINING FRONT SEAT FRAME FIXINGS

**TEST CONDITIONS**

<table>

<td>C1: COMPARE FRONT SEAT FORWARD-REARWARD MOVEMENT NOISE TO OTHER FRONT SEAT</td>
</tr>
</tbody>
</table>

**WARNING:** Before work is carried out, make the air bag supplemental restraint system safe. For additional information, refer to Standard Workshop Practices section of workshop manual.

1. Compare the front seat forward-rearward movement noise to other front seat.
   - Is the front seat forward-rearward movement noise excessive when compared to other front seat?
     - Yes
     - GO to C2.
     - No
     - GO to C3.

2. COMPARE FRONT SEAT FORWARD-REARWARD MOVEMENT NOISE TO FRONT SEAT IN OTHER VEHICLE

3. CHECK FOR DEBRIS OBSTRUCTING SEAT MOVEMENT

4. RE-ALIGN FRONT SEAT FRAME

5. CHECK FRONT SEAT FORWARD-REARWARD SEAT MOTOR DRIVE BAR
PINPOINT TEST D : FRONT SEAT HEIGHT, TILT AND/OR SEAT EXTENSION MOTOR MOVEMENT NOT FUNCTIONING

Removal
All vehicles

1. Remove the front safety belt retaining bolt access panel.

Vehicles built up to 01/2004

2. Detach the front safety belt anchor retaining bolt.

Vehicles built 02/2004 onwards

3. Detach the front safety belt anchor retaining bolt.
   1. Disconnect the electrical connector
   2. Detach the front safety belt anchor retaining bolt.
4. Reposition the front seat fully rearwards.
5. Remove both seat runner front retaining bolts.

6. Reposition the front seat fully forwards.
7. Remove both front seat runner trim covers.
   1. Detach the front of the front seat runner trim covers.
   2. Detach the rear of the front seat runner trim covers.
   3. Remove both front seat runner trim covers.

8. Remove both seat runner rear retaining bolts.

9. Disconnect the battery ground cable.
   For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).
10. Disconnect the front seat electrical connectors.
    - Tilt the seat rearwards to aid disconnecting the front seat electrical connectors.
11. CAUTIONS:

⚠️ Make sure not to snag or damage the seat or the trim panels when the seat is removed.

⚠️ When lifting the seat care must be taken not to load/damage the fore/aft travel track located below the seat cushion.

Remove the front seat.

Installation

1. NOTE: Replace the front seat runner trim covers if the retaining tangs are damaged.

   Tighten to 47 Nm.

2. Tighten to 40 Nm.

3. NOTE: Replace the front safety belt retaining bolt access panel if the retaining tangs are damaged.

   To install, reverse the removal procedure.
   • Tighten to 35 Nm.
Removal

• CAUTIONS:

- Do not remove or carry out any repairs to the anti-whiplash system (AWS) on the front seat back.
- In the event of the AWS operating, there are no serviceable components.

1. Remove the front seat recliner motor. For additional information, refer to: Front Seat Recliner Motor (501-10 Seating, Removal and Installation).

2. Disconnect the lumbar support electrical connector.

3. Remove the lumbar support assembly.
   - Remove and discard the lumbar motor retaining clips.

4. Disconnect the front seat head restraint motor electrical connector (if equipped).

5. Remove the front seat head restraint motor (if equipped).
6. Detach the front seat harness.

7. NOTE: Left-hand shown, right-hand similar.
   Remove the front seat recliner motor trim cover.

8. NOTE: Left-hand shown, right-hand similar.
   Remove the front seat backrest.
   • Remove the front seat backrest retaining bolts.

**Installation**

1. NOTE: Left-hand shown, right-hand similar.
   • NOTE: Install new lumbar motor retaining clips.

   To install, reverse the removal procedure.
   • Tighten to 35 Nm.
Removal

- **CAUTIONS:**
  - Do not remove or carry out any repairs to the anti-whiplash system (AWS) on the front seat back.
  - In the event of the AWS operating, there are no serviceable components.

1. Remove the front seat recliner motor. For additional information, refer to: Front Seat Recliner Motor (501-10 Seating, Removal and Installation).

2. **CAUTION:** Make sure that all trim panels are protected when the seat is removed from the vehicle.
   - Disconnect the front seat lumbar motor electrical connectors.

3. Remove the lumbar motor.
   - Remove and discard the front seat lumbar motor retaining clips.

4. Disconnect the front seat head restraint motor electrical connector.

5. Remove the front seat head restraint motor.
6. Detach the front seat harness.

7. NOTE: Left-hand shown, right-hand similar.
   Remove the front seat backrest.
   - Remove the front seat backrest retaining bolts.

**Installation**

1. NOTE: Left-hand shown, right-hand similar.
   To install, reverse the removal procedure.
   - Tighten to 35 Nm.
Removal

All vehicles

1. WARNINGS:

![Warning symbol]
A restraints control module (RCM) only requires replacement if the system has incurred five separate deployments. At no time change the RCM for less than five separate deployments.

![Warning symbol]
Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module. Failure to follow this instruction may result in personal injury.

![Warning symbol]
Carry a live air bag module with the air bag and trim cover pointed away from your body. This will reduce the risk of injury in the event of an accidental deployment. Failure to follow this instruction may result in personal injury.

![Warning symbol]
Do not set a live air bag module down with the trim cover face down. Failure to follow this instruction may result in personal injury.

![Warning symbol]
After deployment, the air bag surface can contain deposits of sodium hydroxide, a product of the gas generant combustion that is irritating to the skin. Wash your hands with soap and water afterwards. Failure to follow this instruction may result in personal injury.

![Warning symbol]
Never probe the connectors on the air bag module. Doing so may result in air bag deployment. Failure to follow this instruction may result in personal injury.

![Warning symbol]
Vehicle sensor orientation is critical for correct system operation. If a vehicle equipped with an air bag SRS is involved in a collision, inspect the sensor mounting bracket and wiring pigtail for deformation. If damaged, replace the sensor whether or not the air bag is deployed.

![Warning symbol]
To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any air bag SRS components. To deplete the backup power supply energy, disconnect the battery ground cable and wait one minute. Failure to follow this instruction may result in personal injury.

• NOTE: Repair is made by replacement only. If a part is replaced and the new part does not correct the condition, install the original part and carry out the diagnostic procedure again.

• NOTE: When installing a new air bag module, a prepaid return postcard is provided with the replacement air bag module. The serial number for the new part and the vehicle identification number (VIN) must be recorded and sent to Jaguar Cars Ltd.

Remove the front seat.
For additional information, refer to: Front Seat (501-10 Seating, Removal and Installation).

2. Remove the front seat head restraint.
3. Detach the front seat backrest trim panel.
   1. Detach the top edge of the front seat backrest trim panel.
   2. Detach the front seat backrest trim panel.

4. Detach the front seat backrest trim panel retaining strap.

5. Remove the front seat backrest trim panel.
   • Pass the front seat backrest trim panel retaining strap through the front seat backrest.

6. Detach the front seat backrest cover.

Vehicles built 02/2004 onwards
7. Detach the front seat backrest cover retaining strap.

8. Detach the front seat backrest cover.

9. Detach the front seat backrest cover.

All vehicles

10. NOTE: Left-hand shown, right-hand similar.

Remove the head restraint retaining post.

1. Release the retaining tang.

2. Remove the head restraint retaining post.
11. Disconnect the front seat backrest heater electrical connector (if equipped).

12. Remove the side air bag module retaining nuts.

13. Detach the seat backrest cover and cushion.
   1. Reposition the seat backrest cover and cushion.
   2. Detach the seat backrest cover and cushion.

14. Disconnect the side air bag module electrical connector.

15. Remove the side air bag module.
16. Cut the hog rings.

17. Remove the front seat backrest cover.

Installation

1. NOTE: Install new hog rings. Use hog ring pliers to close the hog rings. Do not use any other tool. The hog rings must be closed to overlap as illustrated.

To install, reverse the removal procedure.

2. Tighten to 7 Nm.
Removal

1. Remove the seat control switch. For additional information, refer to: Seat Control Switch (501-10 Seating, Removal and Installation).

2. Detach the front seat backrest cover retaining cords.

3. Disconnect the front seat cushion heater electrical connector (if equipped).

4. Remove the front seat cushion and cushion cover.
   - Detach the front seat cushion cover retaining clips.

5. Remove the front seat cushion cover.
   - Cut the hog rings.

Installation
1. NOTE: Install new hog rings. Use hog ring pliers to close the hog rings. Do not use any other tool. The hog rings must be closed to overlap as illustrated. To install, reverse the removal procedure.

Removal

1. Remove the front seat.
   For additional information, refer to: Front Seat (501-10 Seating, Removal and Installation).
2. Detach the front seat cushion cover retaining hooks.
3. Remove the retaining screws.
4. Detach the front seat track motor.
5. Remove the front seat track motor.
   1. Disconnect the electrical connector.
   2. Remove the front seat track motor.
Installation

1. Install the front seat track motor drive bar.

2. Connect the electrical connector.
   1. Install the front seat track motor.
   2. Connect the electrical connector.

3. **CAUTION**: Make sure that the front seat track motor drive bar is correctly aligned.
   
   Attach the front seat track motor.
4. Install the retaining screws.
   - Tighten to 5 Nm.

5. Attach the front seat cushion cover retaining hooks.

6. Install the front seat.
   For additional information, refer to: Front Seat (501-10 Seating, Removal and Installation).
Removal

1. WARNINGS:

A restraints control module (RCM) only requires replacement if the system has incurred five separate deployments. At no time change the RCM for less than five separate deployments.

Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module. Failure to follow this instruction may result in personal injury.

Carry a live air bag module with the air bag and trim cover pointed away from your body. This will reduce the risk of injury in the event of an accidental deployment. Failure to follow this instruction may result in personal injury.

Do not set a live air bag module down with the trim cover face down. Failure to follow this instruction may result in personal injury.

After deployment, the air bag surface can contain deposits of sodium hydroxide, a product of the gas generant combustion that is irritating to the skin. Wash your hands with soap and water afterwards. Failure to follow this instruction may result in personal injury.

Never probe the connectors on the air bag module. Doing so may result in air bag deployment. Failure to follow this instruction may result in personal injury.

Vehicle sensor orientation is critical for correct system operation. If a vehicle equipped with an air bag SRS is involved in a collision, inspect the sensor mounting bracket and wiring pigtail for deformation. If damaged, replace the sensor whether or not the air bag is deployed.

To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any air bag SRS components. To deplete the backup power supply energy, disconnect the battery ground cable and wait one minute. Failure to follow this instruction may result in personal injury.

• NOTE: Repair is made by replacement only. If a part is replaced and the new part does not correct the condition, install the original part and carry out the diagnostic procedure again.

• NOTE: When installing a new air bag module, a prepaid return postcard is provided with the replacement air bag module. The serial number for the new part and the vehicle identification number (VIN) must be recorded and sent to Jaguar Cars Ltd.

Remove the front seat.
For additional information, refer to: Front Seat (501-10 Seating, Removal and Installation).

2. Remove the front seat head restraint.
1. Release the retaining tang.
2. Remove the head restraint retaining post.

3. Detach the front seat backrest cover retaining strap.

4. Detach the front seat backrest cover.

5. Detach the front seat backrest cover.

6. **NOTE: left-hand shown, right-hand similar.**
   Remove the head restraint retaining post.
   1. Release the retaining tang.
   2. Remove the head restraint retaining post.

7. Disconnect the front seat backrest heater electrical connector (if equipped).
8. Remove the side air bag module retaining nuts.

9. Detach the seat backrest cover and cushion.
   1. Reposition the seat backrest cover and cushion.
   2. Detach the seat backrest cover and cushion.

10. Disconnect the side air bag module electrical connector.

11. Remove the side air bag module.

12. Disconnect the lumbar support electrical connector.
13. Remove the lumbar support assembly.
   - Remove and discard the front seat lumbar motor retaining clips.

**Installation**

1. **NOTE:** Install new front seat backrest cover retaining clips.

To install, reverse the removal procedure.

   1. Tighten to 7 Nm.
All vehicles

1. WARNINGS:

⚠️ A restraints control module (RCM) only requires replacement if the system has incurred five separate deployments. At no time change the RCM for less than five separate deployments.

• NOTE: When installing a new air bag module, a prepaid return postcard is provided with the replacement air bag module. The serial number for the new part and the vehicle identification number (VIN) must be recorded and sent to Jaguar Cars Ltd.

Remove the front seat.
For additional information, refer to Section 501-10 Seating.

2. Remove the head restraint.
3. Detach the front seat backrest trim panel.
   1. Detach the top edge of the front seat backrest trim panel.
   2. Detach the front seat backrest trim panel.

4. Detach the front seat backrest trim panel retaining strap.

5. Remove the front seat backrest trim panel.
   - Pass the front seat backrest trim panel retaining strap through the front seat backrest.

6. Detach the seat backrest cover.

7. **NOTE**: left-hand shown, right-hand similar.
   Remove the head restraint retaining post.
   1. Release the retaining tang.
   2. Remove the head restraint retaining post.
8. Remove the side air bag module retaining nuts.

9. Detach the seat backrest cover and cushion.
   1. Reposition the seat backrest cover and cushion.
   2. Detach the seat backrest cover and cushion.

10. Disconnect the side air bag module electrical connector.

11. Remove the side air bag module.

Vehicles with heated seats
12. Remove the front seat backrest cover and cushion.
   1. Disconnect the front seat cushion heater electrical connector.

All vehicles

13. **CAUTION:** Make sure that all trim panels are protected when the seat is removed from the vehicle.

   Disconnect the front seat lumbar motor electrical connectors.

14. Remove the lumbar motor.
   - Remove and discard the front seat lumbar motor retaining clips.

**Installation**

1. **NOTE:** Install new front seat backrest cover retaining clips.

To install, reverse the removal procedure.

   1. Tighten to 7 Nm.
Removal

1. Remove both rear seat bolsters. For additional information, refer to: Rear Seat Bolster (501-10 Seating, Removal and Installation).

2. Remove the rear seat backrest.

3. CAUTION: Make sure that all trim panels are protected when the seat backrest is removed from the vehicle.

   Detach the rear seat backrest cover.

4. Remove the rear seat backrest hinge.

   1. Detach the rear seat hinge retaining clip.
   2. Remove the rear seat backrest hinge.

5. NOTE: Install new rear seat head restraint retaining posts if retaining tangs are damaged.

   Remove the rear seat head restraint.
   • Detach the rear seat head restraint retaining posts.
6. Remove the rear seat armrest retaining bolt covers.

7. Remove the rear seat armrest retaining bolts.

8. Remove the rear seat armrest.

9. Remove the rear seat backrest cover.
10. Remove the rear seat backrest.

11. Remove the rear seat backrest cover.
   - Remove and discard the rear seat backrest cover retaining clips.

**Installation**

1. **NOTE:** Install new rear seat backrest cover retaining clips.

To install, reverse the removal procedure.
Removal

1. Remove the rear seat cushion.  
   For additional information, refer to: Rear Seat Cushion (501-10 Seating, Removal and Installation).

2. Remove the rear seat bolster.
   - 1. Release the rear seat bolster retaining tang.
   - 2. Remove the rear seat bolster.
   - Detach the rear seat bolster from the retaining bracket.

Installation

1. NOTE: Make sure the safety belt webbing and safety belt buckles are not twisted when installed.
   
   To install, reverse the removal procedure.
Seating - Rear Seat Cushion
Removal and Installation

**Removal**

1. Detach the center rear safety belt.

2. Detach the rear seat cushion.
   1. Release the rear seat cushion retaining clips.
   2. Detach the rear seat cushion.

3. Remove the rear seat cushion.
   1. Guide the safety belt buckles through the rear seat cushion aperture.
   2. Remove the rear seat cushion.

**Installation**

1. To install, reverse the removal procedure.
Removal

Driver and passenger seat

1. Remove the front seat backrest. For additional information, refer to: Front Seat Backrest - Vehicles Built From: 02/2004 (501-10 Seating, Removal and Installation).

2. Disconnect the safety belt buckle and pretensioner electrical connector.

3. Remove the safety belt buckle and pretensioner.

4. Disconnect the seat control switch electrical connectors.

5. Remove the seat outer trim panel.
6. Disconnect the seat cushion heater electrical connector (if equipped).

7. Remove the front seat cushion cover.

8. Reposition the front passenger seat occupant classification sensor and detach the front passenger seat occupant classification sensor electrical connector from the seat base.

9. Disconnect the front passenger seat occupant classification sensor electrical connector.
10. Remove the front passenger seat occupant classification sensor.

Driver and passenger seat

11. Remove the seat pan.

12. NOTE: Driver seat shown, passenger seat similar.
Detach the seat module retaining bracket and wiring harness.
1. Remove the seat module retaining bracket retaining screws.
2. Remove the seat module retaining bracket tie straps.
3. Detach the seat module retaining bracket and wiring harness.

13. NOTE: Driver seat shown, passenger seat similar.
Disconnect the seat height adjustment motor and seat track motor electrical connectors.
14. Remove the front seat base.
   - Disconnect the front seat front height adjustment motor and front seat track motor electrical connectors.

**Installation**

1. To install, reverse the removal procedure.
Removal

All Vehicles

1. Remove the front seat backrest. For additional information, refer to Front Seat Backrest in this section.
2. Disconnect the front safety belt buckle electrical connector.

3. NOTE: The front safety belt buckle retaining bolt is part of the safety belt buckle and should not be separated. Remove the front safety belt buckle.

4. CAUTION: Make sure that all trim panels are protected when the seat is removed from the vehicle. Disconnect the seat control switch electrical connectors.

5. Remove the front seat outer trim panel.
   - Remove the front seat outer trim panel retaining screws.
6. Disconnect the front seat cushion heater electrical connector.

7. Remove the front seat cushion cover.

All Vehicles

8. Detach the driver seat module (DSM) retaining bracket and wiring harness.
   1. Remove the DSM bracket retaining screws.
   2. Remove the DSM bracket tie straps.
   3. Detach the driver seat module (DSM) retaining bracket and wiring harness.

9. Disconnect the front seat rear height adjustment motor and front seat track motor electrical connectors.

10. Remove the front seat base.
    - Disconnect the front seat front height adjustment motor and front seat motor electrical connectors.

**Installation**

1. To install, reverse the removal procedure.
Removal

All vehicles

1. Remove the front seat. For additional information, refer to: Front Seat (501-10 Seating, Removal and Installation).

2. **CAUTION:** Make sure that all trim panels are protected when the seat is removed from the vehicle.

   Disconnect the seat control switch electrical connectors.

   Vehicles built up to 01/2004

3. Detach the front seat outer trim panel.
   - Remove the front seat outer trim panel retaining screws.

   Vehicles built 02/2004 onwards

4. Detach the front seat outer trim panel.
   - Remove the front seat outer trim panel retaining screws.

   All vehicles

5. Remove the seat control switch.

Installation

1. To install, reverse the removal procedure.

Glass, Frames and Mechanisms - Glass, Frames and Mechanisms

Description and Operation

The vehicle has a fully bonded, laminated windshield glass glazed directly to the body. The windshield glass is available in four versions:

- Non heated with electrochromic mirror.
- Heated with electrochromic mirror.
- Non heated with prismatic mirror.
- Heated with prismatic mirror.

The heated windshield glass is controlled by the dual automatic temperature control module when the ignition is in the RUN position and the heated windshield glass switch has been activated. Four minutes after activation, the heated windshield glass will automatically switch off. The function is also switched off if the switch is operated before the four minute time has elapsed.

The rear windshield is available in four versions:

- AM/FM
- AM/FM Diversity
- AM/FM and TV
- AM/FM Diversity and TV

The rear window is a fully bonded toughened glass that combines the rear defrost grid, antenna for the audio unit, TV and VICS. The heated rear window is controlled by the dual automatic temperature control when the rear window defrost button is depressed. When the switch is depressed an indicator in the switch will illuminate indicating that the system is operative. Ten minutes after activation, the heated rear window will automatically turn off. The function is also turned off if the customer deselects before the ten minute time has elapsed.

The front and rear door glass windows are electrically operated. All windows can be operated individually, or by the driver window control switch. The operation of the windows is proportional to the switch activation. The driver window can be controlled by "one touch" in the upwards or downwards direction. When the "one touch" operation is activated in the upwards direction an anti-pinch sensor is automatically checked prior to the window closing. If the anti-pinch sensor is inoperative the window will not close. When the anti-pinch sensor detects an obstacle in the windows path the upward travel of the window will automatically cease. Downward travel of the window will begin until a total of seven seconds has elapsed.
Inspection and Verification

1. Verify the customer concern by operating the system.
2. Visually inspect for obvious signs of mechanical and electrical damage.

<table>
<thead>

</tbody>
</table>

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the concern is not visually evident, verify the symptom and refer to the Jaguar Approved Diagnostic System.
1. **NOTE:** After the battery has been disconnected it is necessary to initialize each door window motor separately to operate the "one-touch" up function.

   Operate the window control switch until the door window glass is in the fully closed position, continue to operate the window control switch for a further two seconds.

2. Release the window control switch.

3. Operate the window control switch in the closed position and continue to operate the window control switch for a further two seconds.

4. Operate the window control switch until the door window glass is in the fully open position ("one-touch" down).

5. **NOTE:** If the door window motor initialization has been completed correctly, when the window control switch is operated, the door window glass should move to the fully closed position ("one-touch" up) automatically.

   - **NOTE:** If the door window glass does not fully close automatically ("one-touch" up), repeat the complete procedure.

   Operate the window control switch once to the close position.

6. Repeat the door window motor initialization for each door window motor.
Removal

1. Lower the front door window glass approximately 290 mm (11.6 in).

2. Remove the front door trim panel. For additional information, refer to Section 501-05 Interior Trim and Ornamentation.

3. **CAUTION:** Do not bend or deform the weatherstrip. Remove the front door interior weatherstrip.

4. Disconnect the front door exterior mirror electrical connector.

5. Detach the front door speaker module.
6. Remove the front door window glass.

Installation

1. NOTE: The window glass should be placed in the clamps then inserted into the B post seal. The window glass should then be moved forwards 2mm to obtain correct alignment.

   To install, reverse the removal procedure.
Removal

1. Remove the front door window glass. For additional information, refer to Front Door Window Glass in this section.

2. Detach the front door window regulator and motor.

3. Detach the front door window regulator and motor.

4. Remove the front door window regulator and motor.
   - Disconnect the front door window regulator and motor electrical connector.

Installation

1. NOTE: Make sure the cable from the motor is the outermost cable.
   
   To install, reverse the removal procedure.

2. Tighten to 6 Nm.
Removal

1. Remove the rear door trim panel. For additional information, refer to Section 501-05 Interior Trim and Ornamentation.

2. Remove the rear door aperture cover.

3. Remove the rear door window glass run retaining bracket.

4. Remove the rear door window glass interior trim panel.

5. **CAUTION:** Do not damage the rear door window glass interior weatherstrip.
   Remove the rear door window glass interior weatherstrip.

6. Lower the rear door window glass.
7. Detach the rear door window glass run weatherstrip.

8. Remove the rear door window glass exterior moulding retaining nut.

9. Remove the rear door window glass exterior moulding.

10. Remove the rear door window glass run retaining nut and the rear quarter window glass retaining nut.

11. Remove the rear door window glass exterior weatherstrip.
12. Remove the rear quarter window glass.
   1. Detach the rear quarter window glass.
   2. Remove the rear quarter window glass.

**Installation**

1. **NOTE:** Apply a new bead of butyl adhesive to the rear quarter window glass.

   To install, reverse the removal procedure.

2. Tighten to 4 Nm.

3. Tighten to 4 Nm.

4. Tighten to 4 Nm.
**Removal**

1. Remove the rear quarter window glass.
   For additional information, refer to Rear Quarter Window Glass in this section.
2. Remove the rear door window glass access hole cover.
3. Lower the rear door window glass until the pin is visible through the access hole.
4. Detach the rear door window glass from the regulator.
   1. Remove the pin.
   2. Remove the sleeve.
   3. Detach the window glass from the regulator.
5. Remove the rear door window glass.

**Installation**

1. **CAUTION:** Take care when installing the sleeve and pin into the window glass. Failure to follow these instructions may result in damage to the window glass.
2. **CAUTION:** Make sure the sleeve is fitted central in the window glass.
   1. Install the sleeve.
3. **CAUTION:** Make sure the sleeve stays central in the window glass.
   2. Install the pin.
2. Install the rear door window glass.

3. NOTE: When the window glass is to be installed, the spacer bracket pin should be repositioned in the spacer bracket and tapped into place with a soft mallet. Insert the glass into the regulator glass clamp and firmly push down. Check both sides have snapped over the spacer bracket pin.

   Attach the rear door window glass into the regulator clamp.

4. Install the rear quarter window glass.
   For additional information, refer to Rear Quarter Window Glass in this section.
Glass, Frames and Mechanisms - Rear Door Window Regulator and Motor

Removal

1. Remove the rear door window glass. For additional information, refer to Rear Door Window Glass in this section.
2. Detach the rear door window regulator and motor.
3. Remove the rear door window regulator and motor.
   - Disconnect the rear door window regulator and motor electrical connector.

Installation

1. To install, reverse the removal procedure.
2. Tighten to 6 Nm.

Removal

1. Remove the parcel shelf.
   For additional information, refer to Section 501-05 Interior Trim and Ornamentation.

2. NOTE: Left-hand shown, right-hand similar.
   Disconnect the electrical connectors.

3. Apply protective tape around rear windshield glass aperture.

4. Place a protective sheet over the parcel shelf and place a protective board over the sheet.
5. Apply suitable protective tape to inner edge of the roof panel.

6. Prepare cheese wire and cutting handle.
   - Position cutting handle central tube fully upwards in handle.
   - Cut a suitable length of cheese wire and pass one end through handle tube and locating aperture.
   - Move cutting handle central tube downwards to secure cheese wire.

7. Using a suitable long bladed tool, penetrate rear window.

8. Remove tool, pass free end of cheese wire through penetration and install second cutting handle.

9. With assistance, use the cheese wire to cut around the rear windshield glass exercising particular care at the corners to avoid damage to paint.
10. Install the lifting handles to the windshield glass, with assistance carefully remove the rear windshield glass from the vehicle and place on bench.

11. Remove the lifting handles from the rear windshield glass.

12. Remove cheese wire cutting tool from the vehicle, separate handles by moving centre tubes upwards and discard cheese wire.

13. Apply protective tape to the windshield glass aperture.

Installation

1. WARNINGS:

⚠️ If the windshield glass is being installed at a temperature of 23 degrees (Centigrade), 73 degrees (Farenheit) or above make sure the vehicle is not driven for at least 1 hour after installation.

⚠️ If the windshield glass is being installed at a temperature of 11 degrees (Centigrade), 23 degrees (Farenheit) make sure the vehicle is not driven for at least 1.5 hours after installation.

⚠️ If the windshield glass is being installed at a temperature of 5 degrees (Centigrade), 11 degrees (Farenheit) make sure the vehicle is not driven for at least 2 hours after installation.

⚠️ If the windshield glass is being installed at a temperature below 5 degrees (Centigrade), 41 degrees (Farenheit) use heat and make sure the windshield glass adhesive has set before the vehicle is driven.

• CAUTIONS:

⚠️ When installing the windshield glass, do not strike it in any way as this will crack the glass.

⚠️ Make sure the windshield glass does not move out of position in the windshield glass aperture.

• NOTE: To aid bonding of a new windshield glass, make sure at least 1 mm (0.04 in) of residual adhesive remains on the body flange.

• NOTE: If the original windshield glass is to be installed remove the residual adhesive from windshield glass mating surface using a suitable scraper.

Using the special tool, remove any residual adhesive from the body.
2. Thoroughly clean windshield glass surface using Betawipe spirit.

3. Apply primer to mating face of rear windshield glass.

4. Cut Betaseal nozzle to achieve a triangular section bead 8mm (0.32 in) wide by 10mm (0.4 in) high.

5. Using a suitable pneumatic application gun, apply a uniform bead of adhesive to the windshield glass edge commencing at bottom center and overlapping the ends approximately 14 mm (0.56 in).

6. **CAUTION:** When installing the windshield glass, do not strike it in any way as this will crack the windshield glass.

   With assistance carefully install windshield glass into the aperture. Aligning the windshield glass with the body markings and press firmly into place.

7. Remove the lifting handles.

8. Remove protective tape from rear edge of headlining.

9. **CAUTION:** Do not connect the electrical connectors for at least 1 hour after installation of the windshield glass. Failure to follow these instructions may result in damage to the windshield glass adhesive.

   • **NOTE:** Left-hand shown, right-hand similar.

   Connect the electrical connectors.

10. Install the parcel shelf.

    For additional information, refer to Section _501-05 Interior Trim and Ornamentation._
Glass, Frames and Mechanisms - Window Control Switch

Removal

1. Remove the front door trim panel.
   For additional information, refer to Section 501-05 Interior Trim and Ornamentation.

2. Disconnect the window control switch electrical connector.
   1. Remove the electrical harness retaining screw.
   2. Disconnect the window control switch electrical connector.

3. Remove the front door trim panel armrest.

4. Remove the front door window control switch.

Installation

1. To install, reverse the removal procedure.

## Removal

1. Remove the interior mirror.  
   For additional information, refer to Section [501-09 Rear View Mirrors.](#)

2. Remove both A-pillar trim panels.  
   For additional information, refer to Section [501-05 Interior Trim and Ornamentation.](#)

3. Remove both sun visors.  
   For additional information, refer to Section [501-05 Interior Trim and Ornamentation.](#)

4. Remove the overhead console.  
   For additional information, refer to Section [501-12 Instrument Panel and Console.](#)

5. **NOTE:** Left-hand shown, right-hand similar.  
   Disconnect the heated windshield electrical connector.
6. **NOTE:** Right-hand shown, left-hand similar.
   Apply protective tape to the heated windshield electrical harness.

7. Remove the A-pillar windshield moulding.

8. Remove the cowl vent screen.
   For additional information, refer to Section [501-02 Front End Body Panels](#).

9. **NOTE:** Left-hand shown, right hand similar.
   Remove both cowl vent screen finish panels.

10. Apply protective tape around windshield glass aperture to protect paintwork.
11. Apply suitable protective tape around leading edge of headlining.

12. Place a suitable protective sheet over fascia and place a protecting board over sheet

13. Prepare cheese wire and cutting handle.
   - Position cutting handle central tube fully upwards in handle.
   - Cut a suitable length of cheese wire and pass one end through handle tube and locating aperture.
   - Move cutting handle central tube downwards to secure cheese wire.

14. Using a suitable long bladed tool, penetrate Betaseal approximately 150mm from the top of one A pillar.

15. Remove tool, pass free end cheese wire through penetration and install second cutting handle.

16. **CAUTION:** When cutting, do not allow cheese wire to contact edge of windshield glass as this will crack the windshield glass.

   With assistance and exercising care at the corners to avoid damaging paintwork, cut around windshield glass commencing downwards and along the bottom.
17. With assistance and exercising care, remove the windshield glass.
   1. Attach lifting handles to windshield glass.
   2. Remove the windshield glass.

18. Remove lifting handles from windshield glass.

19. Remove cheese wire cutter from windshield glass aperture, remove cutting handles and discard cheese wire.

### Installation

1. **WARNINGS:**

   - If the windshield glass is being installed at a temperature of 23 degrees (Centigrade), 73 degrees (Farenheit) or above make sure the vehicle is not driven for at least 1 hour after installation.
   - If the windshield glass is being installed at a temperature of 11 degrees (Centigrade), 23 degrees (Farenheit) make sure the vehicle is not driven for at least 1.5 hours after installation.
   - If the windshield glass is being installed at a temperature of 5 degrees (Centigrade), 11 degrees (Farenheit) make sure the vehicle is not driven for at least 2 hours after installation.
   - If the windshield glass is being installed at a temperature below 5 degrees (Centigrade), 41 degrees (Farenheit) use heat and make sure the windshield glass adhesive has set before the vehicle is driven.

2. **CAUTIONS:**

   - When installing the windshield glass, do not strike it in any way as this will crack the glass.
   - Make sure the windshield glass does not move out of position in the windshield glass aperture.

3. **NOTE:** If the original windshield glass is to be installed remove the residual adhesive from windshield glass mating surface using the special tool.

   Using the special tool, remove any residual adhesive from the body.

2. Thoroughly clean windshield glass surface using Betawipe spirit.

3. Apply primer to mating face of windshield glass.
4. Cut Betaseal nozzle to achieve a triangular section bead 8mm (0.32 in) wide by 10mm (0.4 in) high.

5. Using a suitable pneumatic application gun, apply a uniform bead of adhesive to the windshield glass edge commencing at bottom center and overlapping the ends approximately 14 mm (0.56 in).

6. **CAUTION:** When installing the windshield glass, do not strike it in any way as this will crack the windshield glass.

With assistance carefully install windshield glass into the aperture. Aligning the windshield glass with the body markings and press firmly into place.

7. Remove the lifting handles.

8. **CAUTION:** Make sure the windshield glass does not move out of position in the windshield glass aperture.

Apply suitable protective tape to the top of the windshield glass.

9. Remove protective tape from leading edge of headlining.

10. Remove the protective sheet and the protective board from the fascia.
11. NOTE: Left-hand shown, right hand similar.
   Install both cowl vent screen finish panels.

12. Install the cowl vent screen.
    For additional information, refer to Section 501-02 Front End Body Panels.

13. Install both A-pillar windshield mouldings.

14. NOTE: Left-hand shown, right-hand similar.
    Reconnect the heated windshield electrical connector.

15. Install the overhead console.
    For additional information, refer to Section 501-12 Instrument Panel and Console.

16. Install both sunvisors.
    For additional information, refer to Section 501-05 Interior Trim and Ornamentation.

17. Install both A-pillar trim panels.
    For additional information, refer to Section 501-05 Interior Trim and Ornamentation.

18. Install the interior mirror.
    For additional information, refer to Section 501-09 Rear View Mirrors.
## Glass, Frames and Mechanisms - Windshield Glass Using Cutting Tool

Removal

1. Remove the interior mirror.  
For additional information, refer to Section [501-09 Rear View Mirrors](#).

2. Remove both A-pillar trim panels.  
For additional information, refer to Section [501-05 Interior Trim and Ornamentation](#).

3. Remove both sun visors.  
For additional information, refer to Section [501-05 Interior Trim and Ornamentation](#).

4. Remove the overhead console.  
For additional information, refer to Section [501-12 Instrument Panel and Console](#).

5. NOTE: Left-hand electrical connector shown, right-hand similar.  
Disconnect the heated windshield electrical connector.
6. NOTE: Right-hand shown, left-hand similar.
Apply protective tape to the heated windshield electrical harness.

7. Remove the A-pillar windshield moulding.

8. Remove the cowl vent screen.
For additional information, refer to Section 501-02 Front End Body Panels.

9. NOTE: Left-hand shown, right hand similar.
Remove both cowl vent screen finish panels.

10. Apply protective tape around windshield glass aperture to protect paintwork.

11. Apply suitable protective tape around leading edge of headlining.

12. Place a suitable protective sheet over fascia and place a protecting board over sheet.

13. Dispense 20ml of WK9L lubricant into the WK9 spray bottle, fill the spray bottle with water and mix.

14. Apply cutting lubricant to the lower windshield glass adhesive and approximately 150 mm (6 in) up the A-pillar.

15. Install the cutting tool blade BTB-WK1SC to the cutting tool BTB-WK10HD.
16. Using the special tool cut through the lower windshield glass adhesive and approximately 150 mm (6 in) up the A-pillar.

17. Apply cutting lubricant to both sides of the A-pillar glass adhesive.

18. NOTE: Remove the cutting tool blade BTB-WK1SC from the cutting tool BTB-WK10HD.

Install the cutting tool side cutting blade BTB-WK24ZS and the cutting tool controller arm BTB-WK11B to the cutting tool BTB-WK10HD.

Set the cutting tool controller arm to 20 mm.

19. NOTE: Right-hand shown, left-hand similar.

• NOTE: Start cutting the windshield glass adhesive from the top of the A-pillar downwards.

Using the special tool cut through the A-pillar windshield glass adhesive.

20. Apply cutting lubricant to the top of the windshield glass.

21. Apply protective tape to the top of the windshield glass.

22. NOTE: Start cutting from either corner into the centre and continue the cut all the way through to the other corner. DO NOT cut from each corner into the centre as the pressure on the centre of the windshield glass could cause breakage.

Using the special tool cut through the top of the windshield glass adhesive.
23. Using the special tool cut through the right-hand side A-pillar remaining adhesive.

24. Using the special tool cut through the left-hand side A-pillar remaining adhesive.

25. With assistance and exercising care, remove the windshield glass.
   1. Attach lifting handles to the windshield glass.
   2. Remove the windshield glass.

26. Remove lifting handles from the windshield glass.

Installation

1. WARNINGS:

   - If the windshield glass is being installed at a temperature of 23 degrees (Centigrade), 73 degrees (Farenheit) or above make sure the vehicle is not driven for at least 1 hour after installation.

   - If the windshield glass is being installed at a temperature of 11 degrees (Centigrade), 23 degrees (Farenheit) make sure the vehicle is not driven for at least 1.5 hours after installation.

   - If the windshield glass is being installed at a temperature of 5 degrees (Centigrade), 11 degrees (Farenheit) make sure the vehicle is not driven for at least 2 hours after installation.

   - If the windshield glass is being installed at a temperature below 5 degrees (Centigrade), 41 degrees (Farenheit) use heat and make sure the windshield glass adhesive has set before the vehicle is driven.

2. CAUTIONS:

   - When installing the windshield glass, do not strike it in any way as this will crack the glass.

   - Make sure the windshield glass does not move out of position in the windshield glass aperture.

3. NOTE: If the original windshield glass is to be installed remove the residual adhesive from windshield glass mating surface using the special tool.

   Using the special tool, remove any residual adhesive from the body.
2. Thoroughly clean windshield glass surface using Betawipe spirit.

3. Apply primer to the mating face of the body.

4. Cut adhesive nozzle to achieve a triangular section bead 8 mm (0.32 in) wide by 10 mm (0.4 in) high.

5. Using a suitable pneumatic application gun, apply a uniform bead of adhesive to the windshield glass edge commencing at the bottom center and overlapping the ends approximately 14 mm (0.56 in).

6. **CAUTION:** When installing the windshield glass, do not strike it in any way as this will crack the windshield glass.

   With assistance carefully install the windshield glass into the aperture. Aligning the windshield glass with the body markings and press firmly into place.

7. Remove the lifting handles.
8. **CAUTION:** Make sure the windshield glass does not move out of position in the windshield glass aperture.
   
   Apply suitable protective tape to the top of the windshield glass.

9. Remove protective tape from around the leading edge of the headlining.

10. Remove the protective sheet and the protective board from the fascia.

11. Install the lower A-pillar drainage channels.

12. Install the cowl vent screen.
   
   For additional information, refer to Section 501-02 Front End Body Panels.

13. Install both A-pillar windshield mouldings.
14. NOTE: Right-hand shown, left-hand similar.
Reconnect the heated windshield electrical connector.

15. Install the overhead console.
For additional information, refer to Section 501-12 Instrument Panel and Console.

16. Install the sunvisors.
For additional information, refer to Section 501-05 Interior Trim and Ornamentation.

17. Install both A-pillar trim panels.
For additional information, refer to Section 501-12 Instrument Panel and Console.

18. Install the interior mirror.
For additional information, refer to Section 501-09 Rear View Mirrors.

Instrument Panel and Console - Instrument Panel

Description and Operation

The instrument panel assembly houses the instrument cluster, passenger air bag module, glove compartment, message centre/headlamp leveling switch, luggage compartment lid/fuel flap release switch, in-vehicle temperature sensor, ignition switch, driver stowage box, remote climate control module (vehicles fitted with telematics), instrument panel lower trim panel, instrument panel finish panel and air distribution registers, all of which can be removed without removing the instrument panel. The instrument panel wiring harness is attached to the instrument panel to assist in easy removal and installation of the instrument panel. The instrument panel must be removed from the vehicle to gain access the wiring harness.

Console

The floor console is located between the front seats and consists of the ashtray, cigar lighter and armrest. The optional telephone is incorporated within the center console if the vehicle is equipped with satellite navigation. Alternatively the center section of the console forms a deep stowage box with a secondary cupholder. In both cases the center console utilizes a rear hinged lid which is padded to form a central arm rest. Situated in the rear of the center console are further air distribution registers.

The roof console is located between the sun visors and, depending upon the vehicle options, consists of the front overhead courtesy light, two reading/map lights, remote convenience buttons, sun glasses holder and intrusion sensors.

The instrument panel console is located in the centre of the instrument panel. The instrument panel console consists of: The climate control assembly

For additional information, refer to Section [412-04 Control Components].
Vehicles fitted with telematics have a touch screen telematics control module taking place of the climate control assembly.
For additional information, refer to Section [419-05 Telematics].
The occupancy sensor For additional information, refer to Section [501-20A Safety Belt System / 501-20B Supplemental Restraint System].
The audio system
For additional information, refer to Section [415-01 Audio Unit].
The multi-switch pack consisting of, depending upon the vehicle options, heated seat switches, single point door locking switch, hazard warning switch and dynamic stability control switch.
Remove the floor console cup holder.

2. **NOTE:** Disconnect the auxiliary power point electrical connector if equipped.

Remove the floor console stowage compartment.

1. Remove the floor console stowage compartment retaining screws.
2. Remove the floor console stowage compartment.

Vehicles with cordless cellular phone

3. Disconnect the Bluetooth module electrical connector.

Vehicles with automatic transmission

4. Remove the gearshift lever selector trim panel.

Vehicles with manual transmission
5. Remove the gearshift lever handle.

6. Remove the gear shift lever selector trim panel.

7. Remove the instrument panel console bezel
   • Release the retaining tangs.

8. Remove the floor console rear stowage compartment.
   • Release the retaining tangs.
9. Remove the floor console rear retaining nuts.

10. Remove the floor console.
   1. Slide the floor console rearward.
   2. Remove the floor console from the retaining tangs.

**Installation**

1. To install, reverse the removal procedure.
   - Tighten to 7 Nm.
**Instrument Panel and Console - Glove Compartment**

**Removal**

1. Loosen the glove compartment upper retaining screws.

2. Detach the passenger side instrument panel lower trim panel.

3. Remove the right-hand footwell duct retaining bolt.

4. Remove the right-hand footwell duct.
   1. Detach the footwell lamp from the right-hand footwell duct.
   2. Remove the right-hand footwell duct.
5. Detach the glove compartment.
   - Remove the glove compartment lower retaining screws

6. Remove the glove compartment.
   - Disconnect the glove box electrical connector.

**Installation**

1. To install, reverse the removal procedure.
Removal

1. Remove the steering column. For additional information, refer to Section 211-04 Steering Column.
2. Remove the floor console register duct. For additional information, refer to Section 412-01 Air Distribution and Filtering.
3. Detach the instrument panel console multi-switch pack.
   1. Remove the retaining screws.
   2. Detach the instrument panel console multi-switch pack.
4. Remove the instrument panel console multi-switch pack.
   1. Disconnect the instrument panel console multi-switch pack electrical connectors.
   2. Remove the instrument panel console multi-switch pack.
5. Open the ash tray.
6. Remove the ashtray retaining screw covers.
7. Remove the ashtray retaining screws.
8. Detach the ashtray.
   1. Release the ashtray from retaining tangs.
   2. Detach the ashtray.

9. Remove the ashtray.
   - Disconnect the electrical connector.
   - Remove the ashtray.

10. Disconnect the parking brake switch.

11. **CAUTION:** Make sure damage does not occur to the interior trim.
    Reposition the floor console retaining bracket.

12. Disconnect the electrical connectors.
    - Detach the electrical connectors from instrument panel support bracket.
    - Disconnect the electrical connectors.
13. Remove the instrument panel support brackets.

14. Detach the hood release handle.
   - Remove the hood release handle retaining screws.
   - Detach the hood release handle.

15. Remove both A-pillar trim panels
    For additional information, refer to Section 501-05 Interior Trim and Ornamentation.

16. CAUTION: Make sure damage does not occur to the instrument panel.
    - NOTE: Left-hand side shown, right-hand side similar.
      Remove the instrument panel end panels.
      - Detach the front door opening weather strips.
      - Remove the instrument panel end panels.
17. NOTE: Left-hand side shown, right-hand side similar.
Disconnect the electrical connectors.

18. NOTE: Left-hand shown, right-hand similar.
Detach the instrument panel defroster vent trim panel retaining clips in the order shown.

19. Remove the instrument panel defroster vent trim panel and sunload sensor wiring harness.

20. Remove the passenger side instrument panel lower trim panel.
21. Remove the passenger side cowl side trim panel.
   1. Detach the front door aperture seal
   2. Remove the passenger side cowl side trim panel.

22. Disconnect the instrument panel electrical connector.
   1. Loosen the instrument panel electrical connector retaining bolt.
   2. Disconnect the instrument panel electrical connector.

23. NOTE: The passenger side instrument panel electrical connector is located on the plenum.
    Disconnect the passenger side instrument panel electrical connector.

24. Remove the instrument panel center retaining screw
25. NOTE: Left-hand shown, right-hand similar.
Remove the instrument panel upper retaining bolt covers.

26. Remove the instrument panel driver side upper retaining bolts.

27. Remove the instrument panel passenger side upper retaining bolt.

28. NOTE: Left-hand shown, right-hand similar.
Remove the instrument panel side retaining bolts.
29. **CAUTION:** Make sure damage does not occur to the instrument panel and interior trim on removal of the instrument panel.

Remove the instrument panel.

### Installation

**CAUTION:** Make sure damage does not occur to the instrument panel and interior trim on installation of the instrument panel.

1. To install, reverse the removal procedure.
2. **NOTE:** Left-hand shown, right-hand similar.
   
   Tighten to 20 Nm.

3. **NOTE:** Left-hand shown, right-hand similar.
   
   Tighten to 20 Nm.

4. Tighten to 20 Nm.
5. Tighten to 2 Nm.

6. Tighten to 5 Nm.
**Removal**

**All vehicles**

1. Remove the floor console cup holder.

2. Remove the floor console stowage compartment.
   1. Remove the floor console stowage compartment retaining screws.
   2. Remove the floor console stowage compartment.

**Vehicles with automatic transmission**

3. Remove the gearshift lever selector trim panel.

**Vehicles with manual transmission**

4. Remove the gearshift lever handle.
5. Remove the gearshift lever selector trim panel.

All vehicles

6. Remove the instrument panel console bezel
   - Release the retaining tangs.

7. Detach the instrument panel console.

8. Remove the instrument panel console.
   - Disconnect the electrical connectors.

Installation

1. To install, reverse the removal procedure.
**Removal**

1. Detach the overhead console.
   - Remove the screw.

2. **CAUTION:** Make sure the overhead console retaining tangs are released in the order shown. Failure to follow this instruction may result in damage to the component.
   - Detach the overhead console.
     1. Release the overhead console front retaining tangs.
     2. Release the overhead console center retaining tangs.
     3. Detach the overhead console.

3. Remove the overhead console.
   - Disconnect the electrical connector.

**Installation**

1. To install, reverse the removal procedure.
Removal

• NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

1. Remove the overhead console.
   For additional information, refer to: Overhead Console (501-12 Instrument Panel and Console, Removal and Installation).

2. NOTE: Where installed.
   Remove the front intrusion sensor.

3. NOTE: Where installed.
   Remove the garage door opener module.
4. **CAUTION:** Make sure that only the head of the fixing is removed. Do not drill any deeper than necessary. Failure to follow this instruction may result in damage to the component.

   Remove the printed circuit board (PCB) cover.
   - Using a 5mm drill bit, carefully drill out and remove the 4 plastic fixing heads.

5. Remove the PCB.

6. Remove the two switch mouldings.
7. Remove the foam pad.

8. Carefully remove sunroof rocker switch for reuse in the new rear switch moulding.

**Installation**

1. Select the correct switch moulding for the vehicle from the parts kit.
2. Remove any unnecessary switch buttons from the rear moulding using a suitable sharp knife. Take care not to remove any required switches.
3. Install the sunroof rocker switch.
4. Install the front switch moulding.
5. Install the foam pad.
6. Install the rear switch moulding.
7. Install the PCB.
8. Install the cover.
   - Install the 4 Torx screws
   - Tighten to 1.5 Nm.

9. Install the garage door opener module.
10. Install the front intrusion sensor.
11. Install the overhead console.
    For additional information, refer to: Overhead Console (501-12 Instrument Panel and Console, Removal and Installation).

Vehicles built 02/2004 onwards
For most markets excluding North America and Japan, the remote central locking system incorporates a double locking facility for optimum security. All locks use the Tibbe key system, using six elements and four cuts. The keys include ‘in-key’ transponders which are programmed to the vehicle engine immobilization system by using the Jaguar approved diagnostic system.

The central locking system employs single key access to the driver door, luggage compartment and ignition switch/steering column lock.

When the vehicle is not locked, each door catch can be externally released by the corresponding exterior door handle which is operated by a single rod. When unlocked, or central locked, the door latches can also be released by the interior handles, each of which are operated by a single cable. Operation of the front door interior handles will also unlock the rear doors. Use of the key in the driver door lock cylinder operates the lock by a short rod to provide locking of the door latch. This in turn locks all other doors and the luggage compartment through...
the central locking system. These locking functions can also be achieved by use of the remote transmitter.

For most markets, a 'drive-away door locking' feature automatically locks all doors and the luggage compartment when the vehicle exceeds 7 km/h (4 mile/h).

**Key operation**

To central lock or unlock the vehicle, the key is inserted in the driver door lock cylinder, turned clockwise or counter clockwise respectively, and released. Holding the key in the lock position for one and half seconds will close all windows. Releasing the key stops all operations. Central locking of the vehicle locks all the doors, the luggage compartment, and sets the alarm system. In addition to all of the above functions, double locking prevents the doors opening from the interior. To ‘double lock’ the vehicle, the key is inserted in the driver door lock cylinder and turned to the unlock position, then within three seconds, turned to the lock position and released. The same procedure is required to unlock a ‘double locked’ vehicle as with a central locked vehicle. The key is inserted in the driver door lock cylinder and turned to the unlock position. This function can also be activated using the remote transmitter.

If an attempt is made to lock the doors through either the driver or passenger door interior handle, when that door is ajar, all doors will lock temporarily. If the lock signal was received at the driver door it will unlock, if the lock signal was received at the passenger door all three passenger doors will unlock.

The fuel filler flap switch is used to allow the driver to release the fuel filler flap from inside the vehicle. This function can be used at all times providing the vehicle is not locked.

**Keyless Entry**

The Integrated key remote transmitter operates the following functions:

- unlocking the driver door
- unlocking/locking all doors
- releasing the luggage compartment lid
- activate/deactivate the double locking
- arms/disarms the anti-theft alarm system, interior scanning system and the inclination sensor (if equipped)
- activates global closing
- deactivates a triggered alarm

**Inputs and Outputs**

The keyless entry/computer operated lock system receives inputs from the following:

- ignition switch (positions I and II)
- door ajar switches
- hood switch
- luggage compartment switch
- remote transmitter

The Front electronic module (FEM) distributes outputs to the following:

- door lock actuators
- double locking motors
- turn signals
- alarm horn
- luggage compartment latch
- power window motors for global closing

**Transmitter, Keyless Entry Remote**

The keyless entry/remote operated lock system is completely independent in function but fully integrated within the FEM. The remote control system consists of a transmitter and an antenna (radio frequency system).

The remote control transmitter for the radio frequency system will operate without the transmitter being directed at the vehicle. The normal range between the transmitter and the antenna will be up to 10 meters for the USA, Canada and the rest of the world. The normal range between transmitter and antenna will be up to five meters for the UK and Europe and three meters for Japan.

Before the remote control system can be used, each transmitter must be initialized to the vehicle. A maximum number of four transmitters can be initialized to any vehicle. All remote transmitters must be initialized at the same time.

The keyless entry/remote operated locks will not operate when the ignition key is in the ignition switch.

**Locking and Unlocking**

The remote transmitter is integrated into the key and contains four buttons (lock, unlock, trunk release, headlamp convenience). To operate the system:

Press the lock button once to activate the central locking system and the alarm system.

Press the lock button twice within three seconds to activate the central locking system, double locking system, alarm system and the interior scanning system (if equipped).

Press the unlock button once to deactivate the double locking, the alarm system is deactivated and only the driver door is fully unlocked (this is programmable using the approved Jaguar diagnostic system).

Press the unlock button twice within three seconds, will unlock the remaining doors (this is programmable using the Jaguar approved diagnostic system).

Press the luggage compartment release button once releases the luggage compartment lid. The vehicle must be unlocked and at vehicle speeds below 7 km/h (4 mile/h).

Press the headlamp convenience button once to activate the headlamp main beam function, press the headlamp convenience button again to deactivate the headlamp main beam function. This function will automatically deactivate after 30 seconds.

Press the headlamp convenience button three times within three seconds to activate the alarm, press the headlamp convenience button again three times within three seconds to deactivate the alarm.

**Double Locking**
Double locking prevents the interior door handles from unlocking the doors.

Double locking is activated by turning the key, using the driver door lock cylinder to the unlock position and then to the lock position within three seconds or by pressing the lock button twice within three seconds on the remote transmitter.

Successful double locking is indicated by the turn signals flashing twice, one short flash followed by a long flash.

Double locking will be inhibited if the FEM senses the hood, a door or the luggage compartment is ajar or open. The FEM receives its input from the door ajar switches.

If the vehicle battery becomes discharged after the double locking has been activated, opening the drivers door with the key will mechanically deactivate the double locking on the drivers door only.
## Inspection and Verification

1. **1.** Verify the customer concern.

2. **2.** Visually inspect for obvious signs of mechanical or electrical damage.

<table>
<thead>
<tr>
<th>Visual Inspection Chart</th>

</tbody>
</table>

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **4.** If the cause is not visually evident, verify the symptom and refer to the Jaguar Approved Diagnostic System.
1. NOTE: All remote transmitters are programmable and must be set at the same time.

- NOTE: If an attempt is made to program a fifth remote entry device after four remote entry devices have already been programmed, the attempt shall erase all remote entry device associations and start a new set of four remote entry device associations.

- NOTE: To program (or reprogram) the remote transmitters into the remote keyless entry driver door module (DDM) carry out the following step:

  The complexity of the electronics involved with the remote keyless entry, of which the DDM is a part, and the multiplexed communication network which are connected to it preclude the use of workshop general electrical test equipment. Therefore, reference should be made to the Jaguar approved diagnostic system for detailed instructions on programming the remote transmitters.
Removal

1. Remove the front door actuator. For additional information, refer to Front Door Lock Actuator in this section.

2. Remove the exterior front door handle mounting bracket.
   1. Release the tangs.
   2. Remove the exterior front door handle mounting bracket.

3. Remove the exterior front door handle.
   • Detach the connecting rods.

Installation

1. To install, reverse the removal procedure.
Removal

1. Remove the rear quarter window glass. For additional information, refer to Section 501-11 Glass, Frames and Mechanisms.
2. Raise the rear door window glass.
3. Detach the interior door handle.
4. Release the actuator remote cable from the interior door handle.
5. Remove the interior door handle.
6. Remove the exterior door handle bezel retaining screw.
7. Remove the exterior door handle bezel.
   1. Release the retaining clip.
   2. Remove the exterior door handle bezel.

8. **CAUTION:** Apply suitable protective tape to the exterior door handle to prevent damage.
   Remove the exterior door handle retaining screw.

9. Remove the door actuator retaining screws.

10. Reposition the rear door actuator and exterior door handle.
11. Remove the rear door actuator and exterior door handle.
   • Disconnect the rear door actuator electrical connector.

12. Remove the exterior door handle.
   1. Detach the exterior door handle.
   2. Remove the exterior door handle.

**Installation**
1. To install, reverse the removal procedure.
   - Tighten to 12 Nm.
Removal

1. Remove the door window glass. For additional information, refer to Section 501-11 Glass, Frames and Mechanisms.
2. Detach the interior door handle.
3. Detach the actuator remote cable from the interior door handle.
4. Remove the interior door handle.
5. Detach the door window glass run.
6. Remove the exterior door handle retaining screws.

7. Remove the front door actuator retaining screws.

8. **CAUTION:** Apply suitable protective tape to the exterior door handle to prevent damage.

   Reposition the front door actuator and exterior handle.

9. Remove the front door actuator and exterior handle.

10. Disconnect the front door actuator remote cable.
11. Remove the front door actuator.
   1. Detach the door lock cylinder connecting rod.
   2. Detach the exterior door handle connecting rod.
   3. Remove the front door actuator.

Installation

1. To install, reverse the removal procedure.
   - Tighten to 12 Nm.

2. Tighten to 7 Nm.

3. Tighten to 6 Nm.
Removal

1. Remove the front door lock actuator.
   For additional information, refer to Front Door Lock Actuator in this section.
2. Remove the front door lock cylinder connecting rod.
3. Remove the front door lock cylinder operating lever.
4. Remove the front door lock cylinder.
   1. Release the tang.
   2. Remove the front door lock cylinder.

Installation

1. To install, reverse the removal procedure.
Removal

1. Remove the interior front door trim panel. For additional information, refer to Section 501-05 Interior Trim and Ornamentation.
2. Detach the interior door handle.

3. Release the actuator remote cable from the interior door handle.

4. Remove the interior door handle.

Installation

1. To install, reverse the removal procedure.
   - Tighten to 7 Nm.
Removal

• NOTE: Federal market vehicles, refer to steps 1,2,3,4,5,6,7,9,10,12 and 13.
• NOTE: Non federal market vehicles, refer to steps 2,3,4,5,7,8 and 11.

1. NOTE: Federal market vehicles only.
   Detach the luggage compartment emergency release handle.

2. NOTE: All vehicles.
   Remove the luggage compartment lid latch actuator trim panel.

3. NOTE: All vehicles.
   Remove the luggage compartment lid latch trim panel retaining bolt covers.

4. NOTE: All vehicles.
   Detach the luggage compartment lid latch trim panel.
5. **NOTE: All vehicles.**
   Remove the luggage compartment lid latch trim panel.
   - Disconnect the electrical connector.

6. **NOTE: Federal market vehicles only.**
   Remove the luggage compartment lid liner.

7. **NOTE: All vehicles.**
   Detach the luggage compartment lid latch actuator.

8. **NOTE: Non federal market vehicles only.**
   Detach the luggage compartment lid latch actuator release cable.

9. **NOTE: Federal market vehicles only.**
   Detach the luggage compartment emergency release cable from tape.
10. NOTE: Federal market vehicles only.
Detach the luggage compartment lid latch actuator release cable.

11. NOTE: Non federal market vehicles only.
Remove the luggage compartment lid latch actuator.
- Disconnect the electrical connector.

12. NOTE: Federal market vehicles only.
Remove the luggage compartment lid latch actuator.
- Disconnect the electrical connector.

13. NOTE: Federal market vehicles only.
Detach the luggage compartment lid latch actuator release cable.

Installation
1. To install, reverse the removal procedure.
   - Tighten to 9 Nm.
Handles, Locks, Latches and Entry Systems - Luggage Compartment Lid Latch
Actuator
Vehicles Built Up To: 01/2004

Removal

1. Remove the luggage compartment lid latch trim panel retaining screw covers.

2. Detach the luggage compartment lid latch trim panel.

3. Remove the luggage compartment lid latch trim cover.
   - Disconnect the luggage compartment lamp electrical connector.

4. Remove the luggage compartment lid liner.
5. Disconnect the luggage compartment lid latch actuator release cable.

6. Disconnect the electrical connector.

7. Remove the luggage compartment lid latch actuator.

**Installation**

1. To install, reverse the removal procedure.
   - Tighten to 9 Nm.
Removal

1. Remove the luggage compartment lid latch actuator trim panel.

2. Remove the luggage compartment lid latch trim panel retaining bolt covers.

3. Detach the luggage compartment lid latch trim panel.

4. Remove the luggage compartment lid latch trim panel.
   - Disconnect the electrical connector.
5. Remove the luggage compartment lid liner.

6. **CAUTION:** Make sure that the luggage compartment lid lock cylinder release cable is not damaged. Failure to follow these instructions may result in damage to the vehicle.

   Detach the luggage compartment lid lock cylinder release cable.

7. Remove the luggage compartment lid lock cylinder.
   1. Remove the luggage compartment lid lock cylinder retaining bolt.
   2. Remove the luggage compartment lid lock cylinder.
      1. Rotate the luggage compartment lid lock cylinder clockwise.

**Installation**

1. To install, reverse the removal procedure.
   - Tighten to 7 Nm.
Removal

1. Remove the luggage compartment lid latch trim panel retaining screw covers.

2. Detach the luggage compartment lid latch trim panel.

3. Remove the luggage compartment lid latch trim cover.
   - Disconnect the luggage compartment lamp electrical connector.

4. Remove the luggage compartment lid liner.
5. Disconnect the luggage compartment lid latch actuator release cable.

6. Remove the luggage compartment lid lock cylinder.

**Installation**

1. To install, reverse the removal procedure.
   - Tighten to 7 Nm.
Removal

1. Remove the rear quarter window glass. For additional information, refer to Section 501-11 Glass, Frames and Mechanisms.
2. Raise the rear door window glass.
3. Detach the interior door handle.
4. Release the actuator remote cable from the interior door handle.
5. Remove the interior door handle.
6. Remove the exterior door handle bezel retaining screw.
7. Remove the exterior door handle bezel.
   1. Release the retaining clip.
   2. Remove the exterior door handle bezel.

8. **CAUTION:** Apply suitable protective tape to the exterior door handle to prevent damage.
   Remove the exterior door handle retaining screw.

9. Remove the door actuator retaining screws.

10. Reposition the rear door actuator and exterior door handle assembly.
11. Remove the rear door actuator and exterior handle assembly.
    - Disconnect the rear door actuator electrical connector.

12. Disconnect the exterior door handle rod from the rear door actuator.
    1. Release the tangs.
    2. Disconnect the exterior door handle rod from the rear door actuator.
13. Remove the rear door actuator.

**Installation**

1. To install, reverse the removal procedure.
   - Tighten to 4 Nm.

2. Tighten to 12 Nm.

3. Tighten to 7 Nm.

4. Tighten to 7 Nm.

The wipers and washers system consists of the following components: wipers and washers, mounting arm and pivot shaft, wiper motor, washer reservoir and washer pump, a headlamp washing system is available as an additional option.

The wipers have two speed control, low and high, and an intermittent wipe mode. The wipers will park automatically irrespective of their position when the OFF position of the ignition or control switch is selected.

Within the wiper and washer system the following features can be attained, adjustable interval intermittent wiping, programmable wash and wipe sequencing, autolamp activation and moisture sensitive wiping. The system and features are centrally controlled by the Front electronic module (FEM).

The intermittent wiping has seven speed settings, 3, 6, 9, 12, 15, 18 seconds and speed dependant. The driver also has the capacity to select these via a switch with seven settings.

The programmable wash and wipe sequence is driver controlled. With a depression of the wash/wipe switch between 40 milliseconds and 1.2 seconds the wash pump will be activated for a duration of 1.2 seconds. When the wash/wipe switch is depressed for longer than 1.2 seconds the wash pump will be activated for the duration of switch depression, a 10 second duration is the maximum available. The wiping system is automatically activated with the depression of the wash switch.

Where fitted, moisture sensitive wiping will be initiated when the vehicle is running and not in the PARK or NEUTRAL gear selection (gear engaged on manual vehicles). The wiper switch must be in the AUTO position.

Removal

1. Remove the headlamp assembly.
   For additional information, refer to Section 417-01 Exterior Lighting.
2. Disconnect the headlamp washer jet supply hose.
   1. Remove the headlamp washer jet supply hose retaining clip.
   2. Disconnect the headlamp washer jet supply hose.
3. Remove the headlamp washer jet.

Installation

1. To install, reverse the removal procedure.
Wipers and Washers - Headlamp Washer Pump
Removal and Installation

Removal

1. Remove the radiator splash shield.
   For additional information, refer to Section 501-02 Front End Body Panels.
2. Disconnect the headlamp washer pump supply hose.
   1. Remove the headlamp washer supply hose retaining clip.
   2. Disconnect the headlamp washer pump supply hose.
3. Disconnect the headlamp washer pump electrical connector.
4. Remove the headlamp washer pump.

Installation

1. To install, reverse the removal procedure.
Removal

1. Remove the interior rear view mirror.
   For additional information, refer to Section 501-09 Rear View Mirrors.
2. Remove the rain sensor.
   1. Disconnect the rain sensor electrical connector.
   2. Remove the rain sensor.

Installation

1. To install, reverse the removal procedure.
Wipers and Washers - Rain Sensor Module
Removal and Installation

Removal

1. Remove the parcel shelf.
   For additional information, refer to Section 501-05 Interior Trim and Ornamentation.
2. Disconnect the rain sensor module electrical connector.
3. Remove the rain sensor module.

Installation

1. To install, reverse the removal procedure.
**Removal**

1. Remove the radiator splash shield. For additional information, refer to Section 501-02 Front End Body Panels.
2. Disconnect the windshield washer pump supply hose.
3. Disconnect the windshield washer pump electrical connector.
4. Remove the windshield washer pump.

**Installation**

1. To install, reverse the removal procedure.
Wipers and Washers - Windshield Washer Reservoir
Removal and Installation

Removal

1. Remove the radiator splash shield.
   For additional information, refer to Section 501-02 Front End Body Panels.
2. Remove the front fender splash shield.
   For additional information, refer to Section 501-02 Front End Body Panels.
3. Detach the washer fluid warning indicator electrical connector.
4. Disconnect the windshield washer pump supply hose.
5. Disconnect the windshield washer pump electrical connector.
6. Disconnect the headlamp washer pump supply hose.
   1. Remove the headlamp washer pump supply hose retaining clip.
   2. Disconnect the headlamp washer pump supply hose.
7. Disconnect the headlamp washer pump electrical connector.

8. Detach the fog lamp cover.

9. Detach the wiring harness.

10. Remove the windshield washer reservoir.

**Installation**

1. To install, reverse the removal procedure.
Wipers and Washers - Wiper Mounting Arm and Pivot Shaft

Removal

All vehicles

1. Disconnect the battery.
   For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

2. Remove the cowl panel grille.
   For additional information, refer to: Cowl Panel Grille (501-02 Front End Body Panels, Removal and Installation).

Vehicles with diesel engine

3. Remove the brake booster.
   For additional information, refer to: Brake Booster (206-07 Power Brake Actuation, Removal and Installation).

All vehicles

4. Remove the drain tube.

5. Detach the mounting arm, wiper motor and pivot shaft assembly.

6. Remove the mounting arm, wiper motor and pivot shaft assembly.
   • Disconnect the wiper motor electrical connector.

Installation
1. To install, reverse the removal procedure.
   - Tighten to 12 Nm.
**Removal**

1. **NOTE:** Left-hand shown, right-hand similar.
   Disconnect the washer pipe.

2. **NOTE:** Left-hand shown, right-hand similar.
   Remove the wiper pivot arm retaining nut cover.

3. **NOTE:** Left-hand shown, right-hand similar.
   Remove the wiper pivot arm retaining nut.

4. **NOTE:** Left-hand shown, right-hand similar.
   Using the special tool, remove the wiper pivot arm.
Installation

1. **NOTE:** Measure the distance between the tip of the wiper blade and the upper edge of the cowl vent screen.
   
   Install the driver side wiper pivot arm.

2. **NOTE:** Measure the distance between the tip of the wiper blade and the upper edge of the cowl vent screen.
   
   Install the passenger side wiper pivot arm.

3. **NOTE:** Left-hand shown, right-hand similar.
   
   Install the wiper pivot arm retaining nut.
   
   - Tighten to 17 Nm.

4. **NOTE:** Left-hand shown, right-hand similar.
   
   Install the wiper pivot arm retaining nut cover.
5. NOTE: Left-hand shown, right-hand similar.

Connect the washer pipe.
Wipers and Washers - Wiper Pivot Arm
Vehicles Built Up To: 01/2004

Removal and Installation

Removal

1. Remove the wiper pivot arm retaining nut cover.

2. Remove the wiper pivot arm retaining nut.

3. NOTE: Left-hand shown, right-hand similar.
Using the special tool, remove the wiper pivot arm.

Installation
1. NOTE: Make sure the wiper pivot arm is correctly aligned with the alignment mark on the windshield.

To install, reverse the removal procedure.

1. Tighten to 17 Nm.

The roof opening panel is available as an option. The roof opening panel control module controls the roof opening panel. The roof opening panel motor and module are not available separately. The roof opening panel may be operated from the roof opening panel switch or the global close function.

**Roof Opening Panel Control Switch Operation**

The system operates as follows from the roof opening panel switch:

- Press the rear of the switch to the first detent with the roof opening panel glass in the closed position.
  - The roof opening panel glass opens rearward until the roof opening panel switch is released or the roof opening panel glass reaches the fully open position.
- Press the front of the switch to the first detent with the roof opening panel glass in the closed position.
  - The roof opening panel glass will vent up until the roof opening panel switch is released or the roof opening panel glass reaches the fully vent up position.
- Press the rear of the switch to the second detent with the roof opening panel glass in the closed position.
  - The roof opening panel glass will slide rearward until the roof opening panel switch is pressed in any direction or the roof opening panel glass reaches the fully open position.
- Press the front of the switch to the second detent with the roof opening panel glass in the closed position.
  - The roof opening panel glass will vent up until the roof opening panel switch is released or the roof opening panel glass reaches the full vent up position or the switch is pressed in any direction.
Press the front of the switch to the first detent with the roof opening panel glass in the fully open position.
- The roof opening panel glass will slide forward until the roof opening panel glass reaches the fully closed position or the switch is released.

Press the front of the switch to the second detent with the roof opening panel glass in the fully open position.
- The roof opening panel glass will close until the roof opening panel switch is pressed in any direction or the roof opening panel glass reaches the fully closed position.

Press the rear of the switch to the first detent with the roof opening panel glass in the vent up position.
- The roof opening panel glass will close until the roof opening panel switch is released or the roof opening panel glass reaches the full closed position.

Press the rear of the switch to the second detent with the roof opening panel glass in the vent up position.
- The roof opening panel glass will close until the roof opening panel switch is pressed in any direction or the roof opening panel glass reaches the fully closed position.

Global Opening And Closing Operation

The roof opening panel is included in the global open and close operation. This function opens or closes the power windows and the roof opening panel automatically. For additional information on the global open and close feature for the power windows, refer to Section 501-11 Glass, Frames and Mechanisms. The global open function is activated by:

- unlocking the drivers door using the remote keyless entry transmitter. Within five seconds, press and hold the unlock button.
- unlocking the drivers door using the driver door lock cylinder and the key. Hold the key in the unlock position.

The global close function is activated by:

- turning the driver door lock cylinder to the lock position and holding.

Global open and close operation is only available with the ignition in the OFF position and the ignition key removed.

When the global open or close operation is selected, the roof opening panel switch is not recognized by the roof opening panel control module throughout the operation and five seconds after the operation is completed.

Global open and close will operate as follows:

- With the roof opening glass in the closed position, activating global open will operate the roof opening panel glass to the fully open position.
- With the roof opening panel glass in the fully open position, activating global close will operate the roof opening panel glass to the closed position.
- If a global open is commanded within five seconds of a completed global operation, the roof opening panel glass will reverse the previous completed global operation. If the roof opening glass was globally closed from the vent position, a global open within five seconds would tilt the roof opening panel glass back to the vent position.
- If the roof opening panel glass was globally closed from the fully open position, a global open within five seconds would slide the roof opening glass back to the fully open position.
Principles of operation

Roof Opening Panel Control Module

Battery power is continuously supplied to the roof opening panel control module. However, the roof opening panel will only operate from the roof opening panel switch with the ignition switch in the RUN or ACC position. The global open and close feature is controlled by two circuits from the REM. The two circuits must be at ground potential before the roof opening panel control module will acknowledge the roof opening panel switch. When the ignition switch is turned to RUN or ACC, the REM provides ground to these circuits.

The roof opening panel control module incorporates soft stops at the end of all travel positions. The roof opening panel control module monitors the internal switches to determine the roof opening glass position and the soft stops. The internal switches are activated by the roof opening panel motor rotation.

The roof opening panel control module supplies the power and ground to the roof opening panel motor depending on the ordered function. Power is supplied to the roof opening panel for a maximum of 12 seconds. Under normal operation, position is monitored by the roof opening panel control module and power is removed from the roof opening panel motor as soon as the roof opening panel reaches the commanded position.

Roof Opening Panel Switch

Four circuits connect the roof opening panel switch to the roof opening panel control module. One circuit is the common return. The other three are control circuits open, close and tilt. The roof opening panel control module monitors these lines for voltage fluctuation to determine which function was selected.

With the ignition switch in the RUN or ACC position, the roof opening panel supplies a five volt reference voltage to three control lines. Activation of the roof opening panel switch connects one or more of these lines to the common return which pulls the line low. The roof opening panel control module will sense the line or lines being connected to the common line and carry out the appropriate function.

The express open function connects the open and tilt circuits to the common return when the roof opening panel switch is moved rearward to the second detent position. The operator-controlled open function connects the open circuit to the common return. The close function connects the close circuit to the common causing the roof opening panel to close from a slide or vent position.

Global Open and Close

Two circuits connect the rear electronics module (REM) to the roof opening panel control module for these functions. Global open and close operation for the roof opening panel is controlled by one of these two circuits being grounded by the REM.

When the ignition switch is in the RUN or ACC position, the REM grounds both of these circuits allowing normal operation of the roof opening panel from the roof opening panel switch. Global open and close operation is only available with the ignition in the OFF position and the ignition key removed.

When global open or close operation is selected, the roof opening panel switch is not recognized by the roof opening panel control module throughout the operation and five seconds after the operation is completed.

With the ignition switch in the OFF position, the roof opening panel control module supplies a constant voltage to these two circuits. The roof opening panel control module monitors these lines for a low state, caused by the REM grounding the line, to determine the ordered global function by the REM.

Global open is commanded by the REM grounding control line two. Line one will remain at previous voltage.

Global close is commanded by the REM grounding control line one. Line two will remain at previous voltage.

If both lines have voltage, the roof opening panel will be inoperative.

Inspection and Verification

1. Verify the customer concern by operating the system.
2. Visually inspect for obvious signs of mechanical and electrical damage.

**C2: CHECK FOR OBSTRUCTIONS***
C3: CHECK THE ROOF OPENING PANEL MOTOR

Cycle the roof opening panel glass from the fully open to the fully closed position.

Does the roof opening panel motor make excessive noise?

Yes

CHECK the roof opening panel motor for correct mounting. If necessary, INSTALL a new roof opening panel motor. REFER to Motor in this section. TEST the system for normal operation.

No

REFER to Roof Opening Panel Alignment in this section. ADJUST the roof opening panel glass as necessary. TEST the system for normal operation.

Roof Opening Panel Motor Synchronization Procedure

1. **NOTE:** If the is battery is disconnected when the roof opening panel is not operating, the roof opening panel will retain its memory and the synchronization procedure will not be required.
   - Operate the roof opening panel switch in the tilt position until the roof opening panel is in the fully tilted position.

2. Release the roof opening panel switch.

3. **NOTE:** This operation must be done within five seconds of the previous step.
   - Operate the roof opening panel switch in the tilt position and hold.

4. Release the roof opening panel switch after the roof opening panel has reached the fully closed position.

5. **NOTE:** If the roof opening panel motor synchronization has been completed correctly, when the roof opening panel switch is operated in the fully open position the roof opening panel should move to the fully open position automatically.
   - **NOTE:** If the roof opening panel does not move to the fully open position, repeat the roof opening panel motor synchronization procedure.
   - Operate the roof opening panel switch to check the roof opening panel motor operation.

Roof Opening Panel Motor Synchronization De-activation Procedure.

1. Operate the roof opening panel control switch in the tilt position until the roof opening panel is in the fully tilted position and release. Then hold the roof opening panel control switch in the tilt position for at least twenty seconds, there will be a small movement from the roof opening panel to indicate it has been de-activated.
Roof Opening Panel - Roof Opening Panel Alignment

General Procedures

**Short wheelbase**

1. **NOTE:** Left-hand shown, right-hand similar.

   Detach the sight shield at the front of the roof and swing inwards towards the rear of vehicle.

**Long wheelbase**

2. **CAUTIONS:**

   - Make sure the air deflector is only detached from the roof opening panel using the 20mm (0.78 inches) area at the end of the air deflector as defined in step 1 of the illustration and text below. Failure to follow this instruction will result in damage to the component.
   - Do not pull on the air deflector rubber pleat. Failure to follow this instruction will result in damage to the component.

   • **NOTE:** Right-hand shown, left-hand similar.

   Detach the air deflector.
   1. Detach the rear of the air deflector.
   2. Detach the air deflector upper retainer.
   3. Swing the front of the air deflector inwards towards the rear of the vehicle.

**All vehicles**

3. **NOTE:** Left-hand shown, right-hand similar.

   Loosen the roof opening panel glass retaining screws.

4. Adjust the front edge of the roof opening panel glass to between flush and 1 mm (0.04 in) low.
5. Adjust the rear glass edge to between flush and 1 mm (0.04 in) low.

6. NOTE: Left-hand shown, right-hand similar.
   Tighten to 4 Nm.

Long wheelbase

7. NOTE: Right-hand shown, left-hand similar.
   Reposition the air deflector to the roof opening panel runner.

Short wheelbase

8. NOTE: Right-hand shown, left-hand similar.
   Install the air deflector.
   1. Make sure the air deflector is fully seated to the rear retaining clip.
   2. Attach the air deflector upper retainer.
9. NOTE: Left-hand shown, right-hand similar.

Install the sight shields.
Roof Opening Panel - Air Deflector
Removal and Installation

Removal

1. Reposition the roof opening glass fully rearward.
2. NOTE: Right-hand shown, left-hand similar.
   Remove the air deflector retaining screws.
3. Remove the air deflector.

Installation

1. CAUTION: Do not over tighten the air deflector retaining screws when installing.
   To install, reverse the removal procedure.
Roof Opening Panel - Roof Opening Panel Frame

Removal

1. Remove the roof opening panel shield. For additional information, refer to Roof Opening Panel Shield in this section.

2. Remove both A-pillar trim panels. For additional information, refer to 501-05 Interior Trim and Ornamentation.

3. Remove both B-pillar upper trim panels. For additional information, refer to 501-05 Interior Trim and Ornamentation.

4. Remove both C-pillar trims. For additional information, refer to 501-05 Interior Trim and Ornamentation.

5. Remove both sun visors. For additional information, refer to 501-05 Interior Trim and Ornamentation.

6. NOTE: Left-hand shown, right-hand similar.
   Remove the sun visor retaining clip.

7. Remove the overhead console. For additional information, refer to 501-12 Instrument Panel and Console.

8. NOTE: Left-hand shown, right-hand similar.
   Detach the rear passenger assist handle retaining screw covers.

9. NOTE: Left-hand shown, right-hand similar.
   Detach the rear passenger assist handle.
10. NOTE: Left-hand shown, right-hand similar.
   Remove the rear passenger assist handle.
   - Disconnect the electrical connector.

11. NOTE: Left-hand shown, right-hand similar.
   Detach the front passenger assist handle retaining screw covers.

12. NOTE: Left-hand shown, right-hand similar.
   Remove the front passenger assist handle.

13. Detach the headliner.

14. Disconnect the electrical connector
15. NOTE: Left-hand shown, right-hand similar.
Detach the front drain hose.

16. NOTE: Left-hand shown, right-hand similar.
Detach the rear drain hose.

17. Remove the roof opening panel frame front retaining bolts.

18. NOTE: Left-hand shown, right-hand similar.
Remove the roof opening panel frame retaining bolts.

19. Remove the roof opening panel frame.
1. Install the roof opening panel frame.

2. **NOTE:** Left-hand shown, right-hand similar.
Loosely install the roof opening panel frame bolts.

3. Loosely install the roof opening panel front frame bolts.

4. Align the roof opening panel frame using a 12 mm drill bit.

5. **NOTE:** Left-hand shown, right-hand similar.
Tighten to 9 Nm.
6. NOTE: Left-hand shown, right-hand similar.
   Install the rear drain hose.

7. NOTE: Left-hand shown, right-hand similar.
   Install the front drain hose.

8. Install the roof opening panel motor.
   • Tighten to 3 Nm.

9. Connect the electrical connector

10. Install the headliner.
11. NOTE: Left-hand shown, right-hand similar.
   Install the front passenger assist handle.

12. NOTE: Left-hand shown, right-hand similar.
   Install the front passenger assist handle retaining screw covers.

13. NOTE: Left-hand shown, right-hand similar.
   Install the rear passenger assist handle.
   - Connect the electrical connector.

14. NOTE: Left-hand shown, right-hand similar.
   Install the rear passenger assist handle retaining screws.

15. NOTE: Left-hand shown, right-hand similar.
   Install the rear passenger assist handle retaining screw covers.

16. Install the overhead console.
   For additional information, refer to Section 501-12 Instrument Panel and Console.
17. NOTE: Left-hand shown, right-hand similar.
   Install the sun visor retaining clip.

18. Install both sun visors.
    For additional information, refer to Section 501-05 Interior Trim and Ornamentation.

19. Install both C-pillar trims.
    For additional information, refer to Section 501-05 Interior Trim and Ornamentation.

20. Install both B-pillar upper trim panels.
    For additional information, refer to Section 501-05 Interior Trim and Ornamentation.

21. Install both A-pillar trim panels.
    For additional information, refer to Section 501-05 Interior Trim and Ornamentation.

22. Install the roof opening panel shield.
    For additional information, refer to Roof Opening Panel Shield in this section.
Roof Opening Panel - Roof Opening Panel Front Drain Hose

Removal

1. Remove the fender splash shield.
   For additional information, refer to Section 501-02 Front End Body Panels.
2. Remove the roof opening panel front drain hose.

3. Remove both A-pillar trim panels.
   For additional information, refer to Section 501-05 Interior Trim and Ornamentation.
4. Remove both B-pillar upper trim panels.
   For additional information, refer to Section 501-05 Interior Trim and Ornamentation.
5. Remove both C-pillar trims.
   For additional information, refer to Section 501-05 Interior Trim and Ornamentation.
6. Remove both sun visors.
   For additional information, refer to Section 501-05 Interior Trim and Ornamentation.
7. NOTE: Left-hand shown, right-hand similar.
   Remove the sun visor retaining clip.
8. Remove the overhead console.
   For additional information, refer to Section 501-12 Instrument Panel and Console.
9. NOTE: Left-hand shown, right-hand similar.
   Detach the rear passenger assist handle retaining screw covers.
10. **NOTE**: Left-hand shown, right-hand similar.
Detach the rear passenger assist handle.

11. **NOTE**: Left-hand shown, right-hand similar.
Remove the rear passenger assist handle.
- Disconnect the electrical connector.

12. **NOTE**: Left-hand shown, right-hand similar.
Detach the front passenger assist handle retaining screw covers.

13. **NOTE**: Left-hand shown, right-hand similar.
Remove the front passenger assist handle.

14. Detach the headliner.
15. Detach the roof opening panel front drain hose.

16. Remove the roof opening panel front drain hose.

**Installation**

1. To install, reverse the removal procedure.
**Removal**

**Short wheelbase**

1. **NOTE:** Make sure the roof opening glass assembly is in the closed position.
   - **NOTE:** Left-hand shown, right-hand similar.

Detach the sight shield at the front of the roof and swing inwards towards the rear of vehicle.

**Long wheelbase**

2. **CAUTIONS:**

   - Make sure the air deflector is only detached from the roof opening panel using the 20mm (0.78 inches) area at the end of the air deflector as defined in step 1 of the illustration and text below. Failure to follow this instruction will result in damage to the component.

   - Do not pull on the air deflector rubber pleat. Failure to follow this instruction will result in damage to the component.
   - **NOTE:** Right-hand shown, left-hand similar.

Detach the air deflector.

   1. Detach the rear of the air deflector.
   2. Detach the air deflector upper retainer.
   3. Swing the front of the air deflector inwards towards the rear of the vehicle.

**All vehicles**

3. **NOTE:** Left-hand shown, right-hand similar.

Remove the roof opening panel glass retaining screws.

4. **CAUTION:** Do not operate the roof opening panel when the roof opening glass is removed.

Remove the roof opening panel glass.
Installation

All vehicles

1. To install, reverse the removal procedure.
   - Tighten to 4 Nm.

Long wheelbase

2. **NOTE: Right-hand shown, left-hand similar.**
   Reposition the air deflector to the roof opening panel runner.

3. **NOTE: Right-hand shown, left-hand similar.**
   Install the air deflector.
   1. Make sure the air deflector is fully seated to the rear retaining clip.
   2. Attach the air deflector upper retainer.

Short wheelbase

4. **NOTE: Left-hand shown, right-hand similar.**
   Install the sight shields.

All vehicles

5. Align the roof opening panel glass.
   For additional information, refer to: [Roof Opening Panel Glass](501-17) (501-17 Roof Opening Panel, Removal and Installation).
Roof Opening Panel - Roof Opening Panel Motor
Removal and Installation

**Removal**

1. **NOTE:** Make sure the roof opening panel is in the closed position.

   Remove the overhead console.
   For additional information, refer to Section 501-12 Instrument Panel and Console.

2. Detach the roof open panel motor.

3. Remove the roof opening panel motor.

**Installation**

1. To install, reverse the removal procedure.
   - Tighten to 3 Nm.
Roof Opening Panel - Roof Opening Panel Rear Drain Hose

Removal

1. Remove the rear bumper cover.
   For additional information, refer to Section 501-19 Bumpers.

2. Remove the roof opening rear drain hose grommet.

3. Reposition the luggage compartment floor covering.
   1. Detach the luggage compartment floor covering.
   2. Reposition the luggage compartment floor covering.

4. Detach the luggage compartment side trim panel.
   1. Remove the luggage compartment side trim panel retaining clip.
   2. Detach the luggage compartment side trim panel.

5. Detach the roof opening panel rear drain hose retaining clip.

6. Remove the parcel shelf.
   For additional information, refer to Section 501-05 Interior Trim and Ornamentation.

7. Remove both A-pillar trim panels.
   For additional information, refer to Section 501-05 Interior Trim and Ornamentation.

8. Remove both B-pillar upper trim panels.
   For additional information, refer to Section 501-05 Interior Trim and Ornamentation.
9. Remove both sun visors. For additional information, refer to Section 501-05 Interior Trim and Ornamentation.

10. NOTE: Left-hand shown, right-hand similar.

Remove the sun visor retaining clip.

11. Remove the overhead console. For additional information, refer to Section 501-12 Instrument Panel and Console.

12. NOTE: Left-hand shown, right-hand similar.

Detach the rear passenger assist handle retaining screw covers.

13. NOTE: Left-hand shown, right-hand similar.

Detach the rear passenger assist handle.

14. NOTE: Left-hand shown, right-hand similar.

Remove the rear passenger assist handle.

- Disconnect the electrical connector.

15. NOTE: Left-hand shown, right-hand similar.

Detach the front passenger assist handle retaining screw covers.
16. **NOTE:** Left-hand shown, right-hand similar.
   Remove the front passenger assist handle.

17. Detach the headliner.

18. Detach the roof opening panel rear drain hose retaining clips.

19. Remove the roof opening panel rear drain hose.

**Installation**

1. To install, reverse the removal procedure.
Roof Opening Panel - Roof Opening Panel Shield
Removal and Installation

Removal

1. Remove the trough assembly.
   For additional information, refer to Trough Assembly in this section.
2. Remove the roof opening panel shield.

Installation

1. **CAUTION:** Make sure the roof opening panel shield lining is not damaged on installation.

   To install, reverse the removal procedure.
Roof Opening Panel - Roof Opening Panel Weatherstrip
Removal and Installation

Removal

1. **CAUTION**: Do not operate the roof opening panel when the roof opening panel glass is removed.

   Remove the roof opening panel glass. For additional information, refer to: **Roof Opening Panel Glass** (501-17 Roof Opening Panel, Removal and Installation).

2. Remove the roof opening panel weatherstrip.

Installation

1. **NOTE**: Make sure that this component is installed to the noted removal position.

   To install, reverse the removal procedure.
   
   - Position the roof opening glass seal seam in the center of the rear facing side of the roof opening panel glass.
**Roof Opening Panel - Trough Assembly**

**Removal**

1. **CAUTION:** Do not operate the roof opening panel when the roof opening glass is removed.
   
   Remove the roof opening panel glass. For additional information, refer to **Roof Opening Panel Glass** in this section.

2. **NOTE:** Right-shown, left-hand similar.
   
   Remove the trough retaining screws.

3. Remove the trough assembly.

**Installation**

1. **CAUTION:** Do not overtighten the trough assembly screws.
   
   • **NOTE:** Make sure the trough assembly is correctly seated in the guide clip.

   To install, reverse the removal procedure.

Bumpers - Bumpers
Description and Operation

Vehicles built up to 01/2004

Front Bumper
The vehicle is fitted with a chassis mounted aluminium beam and is covered by a one piece color co-ordinated front bumper cover. The front bumper cover includes air management and brake cooling ducts. There is provision for fog lamps if fitted, which are mounted via brackets to the bumper covers. Inserts, side marker lamps/reflectors, and a color co-ordinated splitter vane are fitted as standard. Telescopic headlamp washers are optional.

Rear Bumper
The rear bumper is of aluminium construction and is covered by a one piece color co-ordinated rear bumper cover. Inserts and side marker lamps/reflectors are fitted as standard. The parking aid sensors are mounted in the bumper cover and are fitted if the vehicle is equipped with a parking aid system.

Vehicles built 02/2004 onwards

Front Bumper
The vehicle is fitted with a chassis mounted aluminium or steel beam and is covered by a one piece color co-ordinated front bumper cover. The front bumper cover includes air management and provision for fog lamps if fitted. The fog lamps are mounted directly to the bumper cover by three retaining screws per lamp. Inserts, side marker lamps/reflectors, fog lamp covers and a splitter vane are fitted as standard. Telescopic headlamp washers are optional. The parking aid sensors are mounted in the bumper cover and are fitted if the vehicle is equipped with a parking aid system.

Rear Bumper
The rear bumper can be constructed from aluminium or steel and is covered by a one piece color co-ordinated rear bumper cover. Inserts and side marker lamps/reflectors are fitted as standard. The parking aid sensors are mounted in the bumper cover and are fitted if the vehicle is equipped with a parking aid system.
Bumpers - Front Bumper Cover
Removal and Installation

Removal

All vehicles

1. Remove the radiator splash shield.
   For additional information, refer to: Radiator Splash Shield (501-02 Front End Body Panels, Removal and Installation).

Vehicles built up to 01/2004

2. Disconnect the front fog lamp electrical connectors and detach the wiring harness.

3. NOTE: Left-hand shown, right-hand similar.
   Detach the front fender splash shield.
   1. Remove the front fender splash shield retaining screw.
   2. Detach the front fender splash shield.

Vehicles built 02/2004 onwards

4. NOTE: Left-hand shown, right-hand similar.
   Detach the front fender splash shield.
   1. Remove the front fender splash shield retaining screw.
   2. Detach the front fender splash shield.

5. Disconnect the front bumper cover harness electrical connector.
All vehicles

6. NOTE: Left-hand shown, right-hand similar.
Remove the left-hand front bumper cover retaining bolt.

7. Lower the vehicle.

Vehicles with headlamp washers

8. NOTE: Right-hand shown, left-hand similar.
Reposition the headlamp washer jet.
  • Apply suitable tape to the bumper cover to prevent damage to the bumper cover.

9. NOTE: Right-hand shown, left-hand similar.
Remove the headlamp washer jet trim.

All vehicles

10. NOTE: Left-hand shown, right-hand similar.
Remove the bumper cover left retaining bolt.
11. Remove the front bumper cover.

**Installation**

Vehicles built up to 01/2004

1. To install, reverse the removal procedure.
   - Tighten to 7 Nm.

2. Tighten to 7 Nm.

3. Tighten to 7 Nm.

Vehicles built 02/2004 onwards
4. To install, reverse the removal procedure.
   - Tighten to 5 Nm.

5. Tighten to 5 Nm.

6. Tighten to 5 Nm.
Removal

1. Remove the front bumper cover. For additional information, refer to: Front Bumper Cover (501-19 Bumpers, Removal and Installation).

2. Disconnect the sidemarker lamp electrical connector (if equipped).

3. Remove the sidemarker lamp (if equipped).
   - Release the retaining tangs

4. Remove the reflector.
   - Release the retaining tangs

5. Detach the wiring harness.
6. Disconnect the parking aid sensor electrical connector.

7. Remove the energy absorbing foam.

8. Remove the front bumper cover insert.
   - Remove the retaining clips.

**Installation**

1. To install, reverse the removal procedure.
Removal

1. Remove the front bumper cover.
   For additional information, refer to Front Bumper Cover— in this section.
2. NOTE: Release the bumper cover insert clips on the inside of the bumper cover.

   Using a suitable tool to avoid damaging the paintwork, progressively ease the bumper cover insert away from the front bumper cover.

Installation

1. To install, reverse the removal procedure.
**Removal**

1. Remove the rear bumper cover. For additional information, refer to [Rear Bumper Cover—](#) in this section.

2. **NOTE:** Left-hand shown, right-hand similar.

   Detach the exhaust hanger insulator.

3. **NOTE:** Left-hand shown, right-hand similar.

   Remove the exhaust hanger.

4. Remove the rear bumper.

**Installation**

1. To install, reverse the removal procedure.
   - Tighten to 18 Nm.
Removal

All vehicles

1. Raise and support the vehicle.
   For additional information, refer to: Lifting (100-02 Jacking and Lifting, Description and Operation).

Vehicles built up to 01/2004

2. NOTE: Left-hand shown, right-hand similar.
   Remove the rear bumper cover lower retaining screws.

3. NOTE: Left-hand shown, right-hand similar.
   Remove the rear fender splash shield retaining screws.

4. NOTE: Left-hand shown, right-hand similar.
   Detach the rear fender splash shield.

5. NOTE: Left-hand shown, right-hand similar.
   Remove the rear bumper cover retaining bolt.

Vehicles built 02/2004 onwards
6. NOTE: Right-hand shown, left-hand similar.
   Remove the rear fender splash shield retaining screws.
   1. Remove the rear fender splash shield retaining nut.
   2. Remove the rear fender splash shield retaining screws.

7. NOTE: Right-hand shown, left-hand similar.
   Detach the rear fender splash shield.

8. Detach the hose.

9. NOTE: Right-hand shown, left-hand similar.
   Remove the rear bumper cover retaining bolts.

All vehicles
10. Reposition the luggage compartment floor covering.
   1. Detach the luggage compartment floor covering.
   2. Reposition the luggage compartment floor covering.

Vehicles built up to 01/2004

11. Remove the luggage compartment trim panel.

12. NOTE: Left-hand shown, right-hand similar.
   Detach the luggage compartment side trim panel.
   1. Remove the luggage compartment side trim panel retaining clip.
   2. Detach the luggage compartment side trim panel.

13. Remove the rear bulb holder assembly.
   1. Disconnect the electrical connector.
   2. Release the retaining tangs.
   3. Remove the rear bulb holder assembly.

Vehicles built 02/2004 onwards
14. NOTE: Left-hand shown, right-hand similar.
Detach the luggage compartment side trim panel.
   1. Remove the luggage compartment side trim panel retaining clip.
   2. Detach the luggage compartment side trim panel.

15. Remove the luggage compartment trim panel.

All vehicles
16. Detach the rear electronic module (REM) mounting bracket.

17. Disconnect the electrical connector.
18. Disconnect the electrical connectors.

19. Detach the module mounting bracket.

20. Remove the module mounting bracket.
   - Disconnect the electrical connectors.

21. Detach the module mounting bracket.

Vehicles built up to 01/2004
22. NOTE: Left-hand shown, right-hand similar.
Remove the rear bumper cover retaining bolts.

23. NOTE: Left-hand shown, right-hand similar.
Release the rear bumper cover alignment tang.
   1. Remove the rear bumper cover retaining bolts.
   2. Release the rear bumper cover alignment tang.

24. Remove the rear bumper cover retaining bolts.

25. Detach the rear bumper cover.
26. Remove the rear bumper cover.
   • Detach the rear bumper cover wiring harness.

Vehicles built up to 01/2004

27. Disconnect the parking aid sensor electrical connectors (if equipped).

28. Detach the parking aid wiring harness from the rear bumper cover. (if equipped).

**Installation**

Vehicles built up to 01/2004

1. To install, reverse the removal procedure.
   • Tighten to 7 Nm.

2. **NOTE:** Left-hand shown, right-hand similar.
   Tighten to 7 Nm.
3. Tighten to 7 Nm.

Vehicles built 0/2004 onwards

4. To install, reverse the removal procedure.
   - Tighten to 5 Nm.

5. NOTE: Left-hand shown, right-hand similar.
   Tighten to 5 Nm.

6. Tighten to 5 Nm.
Removal

1. Remove the rear bumper cover. For additional information, refer to: Rear Bumper Cover (501-19 Bumpers, Removal and Installation).

2. Disconnect the sidemarker lamp electrical connector (if equipped).

3. Remove the sidemarker lamp (if equipped).
   - Release the retaining tangs

4. Remove the reflector.
   - Release the retaining tangs

5. Detach the wiring harness.
6. Disconnect the parking aid sensor electrical connector.

7. Remove the energy absorbing foam.
   - Release the retaining tangs.

8. Remove the rear bumper cover insert.
   - Remove the retaining tangs.

9. Remove the rear bumper cover insert.
   - Remove the retaining tangs.

**Installation**

1. To install, reverse the removal procedure.

Safety Belt System - Safety Belt System
Description and Operation

⚠️ CAUTION: Electronic modules are sensitive to static electrical charges. If exposed to these charges, damage may result.

• NOTE: Repair is made by replacement only. If apart is replaced and the new part does not correct the condition, install the original part and carry out the diagnostic procedure again.

The safety belt system fitted to the vehicle utilizes the conventional lap and diagonal three point fixing. The front and rear safety belts use a conventional static type buckle which is attached to the seat frame of each front seat and directly to the floor pan underneath the rear seats.

The front safety belt buckles and rear safety belt retractors incorporate pretensioners.

Each front safety belt buckle is fitted with a switch, which is connected through a wiring harness to a warning indicator which is housed within the instrument cluster. When the ignition is first turned on the warning indicator will illuminate only if the safety belt is not fastened. If the safety belt is fastened before the ignition is turned on the circuit is broken and the indicator will remain off. The safety belt retractors which are mounted within the base of the B pillars, incorporate a torsion bar load limiting device. This device consists of a retractor reel which is mounted onto a spindle (torsion bar) which once the sensor has locked the retractor reel and a predetermined load is applied, twists and additional webbing into the system. It should be considered that during any event that utilizes the full capability of the safety belts, the webbing may have been elongated and the torsion bar may have twisted. For this reason, if a vehicle is involved in an accident which results in the deployment of the airbag(s), all the safety belts that were in use at the time of the accident MUST NOT be reused, NEW safety belts MUST be installed.

Emergency Locking Retractor (ELR)

The retractors in all seat positions feature ELR. During any period of sudden deceleration, or under torsional load when cornering at speed, a sensor weight within the safety belt retractor moves a locking pawl against the teeth on the retractor reel, which then locks the retractor preventing any further release of webbing. As soon as the load applied onto the retractor through the safety belt webbing is removed the locking pawl releases the retractor reel and normal movement is returned to the retractor.

Automatic Locking Retractor (ALR)

Automatic locking retractors (ALR) are installed in all passenger seat positions. The safety belt webbing on these are clearly marked with a label to show their operating feature. The ALR feature is initiated by pulling all of the webbing from the retractor with the buckle fastened, when the webbing is then released as it retracts the retractor locks allowing travel only back into the retractor preventing the safety belt from introducing slack, and making any child seat it may be restraining more secure. The ALR mode of the retractor is disengaged by allowing the unfastened webbing to fully retract on to the reel.
Safety Belt System - Safety Belt System
Diagnosis and Testing

Inspection and Verification

1. Verify the customer concern by operating the safety belt.
2. Visually inspect for obvious signs of mechanical and electrical damage.

Poor Retraction

WARNING: In the event of an accident in which the air bags have been deployed, ALL safety belts that were in use at the time of the accident must be removed and NEW safety belts MUST be installed. Failure to follow this instruction will result in personal injury and component failure.

If a safety belt does not retract correctly, check that the anchor covers and trim bezels are correctly installed and not rubbing against the safety belt webbing. Where necessary, check the safety belt webbing is not rubbing at one end of the retractor cover slot and if so, correct by loosening the retaining bolt, aligning the retractor to centralize the safety belt webbing and retighten the bolt.

The vehicle is equipped with two front and three rear inertia reel safety belts. These safety belts are “dual sensitive” which means that they have:

- A vehicle motion sensor, which lock the safety belt webbing under braking, cornering, on steep hills and in adverse camber conditions.
- A webbing motion sensor, which locks when the safety belt webbing is quickly extracted.

Both systems should be fully operational and can be checked by the tests below:

Vehicle Motion Sensor Test

Either of the following two procedures may be used to check correct operation of the vehicle motion sensor. Both methods require two people but note that people of larger than normal should not be asked to conduct these tests. This is to avoid the possibility of a fully unrolled safety belt webbing being mistaken for a correctly locked safety belt retractor.

Test Method 1 (braking)

WARNING: It is important that during this test, the wearer allows the safety belt to provide the restraint, the wearer should not attempt to anticipate the sudden deceleration and the driver should not brace themselves against the steering wheel. However, both the driver and the passenger must prepare themselves for the possibility that the safety belt will not lock. The passenger should hold their hands in front of him, just clear of the instrument panel or front seat backrest. Depending on which belt is being tested. Failure to follow these procedures will result in personal injury.

Select for this test a quiet or private stretch of road. Make sure that the road is clear and that full visibility is maintained at all times.

- Both driver and passenger should adopt normal, comfortable seating position. Both occupants should wear the safety belts and the safety belt webbing must be correctly adjusted, with no slack.
- Proceed at a speed of approximately 6 miles/hour (10 km/h), do not exceed 6 miles/hour (10 km/h) for this test.
- Apply the foot brake sharply to stop the vehicle. If the vehicle motion sensitive lock mechanism is operating correctly, the safety belt webbing will lock and restrain the wearer.
- Conduct the test twice in each front and rear passenger seat position.
- Any safety belt retractor which does not restrain the wearer during this test must not be reused. A NEW safety belt must be installed.

Test Method 2 (Turning circle)

This method requires a flat open area of private road, sufficient for the vehicle to be driven in a continuous circle on full lock.

- The driver should wear the safety belt provided and the belt webbing must be correctly adjusted, with no slack.
- The passenger should occupy a rear seat with the safety belt correctly adjusted.
- Start the engine and, with the steering on full right-hand lock, drive the vehicle in a continuous circle at 10 miles/hour (16 km/h), do not exceed 10 miles/hour (16 km/h).
- When the speed is stable, the passenger should attempt to slowly extract the safety belt webbing from each safety belt retractor in turn. If the vehicle motion sensitive lock mechanism is operating correctly, it will not be possible to extract the webbing.
- Any safety belt retractor from which it is possible to extract the webbing during this test must not be reused. A NEW safety belt must be installed.
Safety Belt Webbing Sensor Test

With the vehicle stationary and on level ground take firm hold of the safety belt webbing (on the tongue side of the upper safety belt anchor) and pull out quickly. The retractor should lock within 0.25 metre (10 inches), preventing further webbing payout. Any safety belt retractor from which it is possible to extract further webbing must not be used. A new safety belt must be installed.

Component Test

Service installation of Safety belts

It is possible that the safety belt assemblies installed in service may have been damaged during handling or installation to the vehicle. The damage is contained within the inner workings of the retractor and is therefore, not visible. However, the damage usually causes the retractor to stick or jam. The damage can only occur before installation is completed and is usually in one of the following ways:

- The safety belt webbing is allowed to retract onto the spindle until it jams the locking mechanism in a way that cannot occur when the safety belt is installed in the car. The safety belt webbing prevents the correct locking action and if the safety belt webbing is snatched or jerked out of the retractor, the loads are not taken on this high strength locking mechanism.
- The webbing is snatch loaded by attempted fast extraction or manual testing with the safety belt held in the hand. This can result in deceleration which are much higher than those occurring in accident situations and there is a risk of damage to the mechanism.

When handling safety belt assemblies, adopt the following procedures:

⚠️ WARNING: If the following procedures are not successful, reject the safety belt assembly. Do not try to jerk or snatch the webbing out of the retractor as this may cause damage. Failure to follow these procedures could and may cause damage or personal injury.

- If the safety belt webbing retracts and will not extract under low webbing tension, install the retractor onto its mounting in the car, which will set it at its correct angle, and the safety belt webbing should extract easily.
- If it does not, feed 5-10 mm (3/16 - 3/8 inch) more safety belt webbing onto the spindle (rotate the spindle using finger pressure if necessary) and the safety belt webbing should then extract.
Safety Belt System - Front Safety Belt Buckle

Removal

1. Remove the front seat. For additional information, refer to Section 501-10 Seating.
2. Disconnect the front safety belt buckle electrical connector.

3. NOTE: The front safety belt buckle retaining bolt is part of the safety belt buckle and should not be separated.
   
   Remove the front safety belt buckle.

Installation

1. **CAUTION:** Make sure all retaining bolts and retaining nuts are hand started and hand tightened prior to final tightening. Failure to follow this instruction may result in component damage.

   To install, reverse the removal procedure.
   
   • Tighten to 35 Nm.
Safety Belt System - Front Safety Belt Retractor

Removal

1. Reposition the front seat to the forward position.
2. Detach the front safety belt anchor retaining bolt.

3. Remove the b-pillar lower and upper trim panels. For additional information, refer to Section 501-05 Interior Trim and Ornamentation
4. Detach the front safety belt retractor retaining clip.

5. Remove the front safety belt retractor.

Installation

1. CAUTION: Make sure all retaining bolts and retaining nuts are hand started and hand tightened prior to final tightening. Failure to follow this instruction may result in component damage.

To install, reverse the removal procedure.

- Tighten to 35 Nm.
2. Tighten to 40 Nm.
Safety Belt System - Front Safety Belt Shoulder Height Adjuster

Removal

1. Remove the B-pillar upper trim. For additional information, refer to Section 501-05 Interior Trim and Ornamentation.
2. Remove the front safety belt shoulder height adjuster.

Installation

CAUTION: Make sure all retaining bolts and retaining nuts are hand started and hand tightened prior to final tightening. Failure to follow this instruction may result in component damage.

To install, reverse the removal procedure.

- Tighten to 40 Nm.
Safety Belt System - Rear Center Safety Belt Retractor
Removal and Installation

Removal

1. **WARNING:** To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any air bag supplemental restraint system (SRS) components. To deplete the backup power supply energy, disconnect the battery ground cable and wait for one minute. Failure to follow this instruction may result in personal injury.

   Disconnect the battery ground cable, For additional information, refer to Section 414-01 Battery, Mounting and Cables.

2. Detach the rear center safety belt retractor from the right-hand rear safety belt buckle.

3. Remove the rear parcel shelf. For additional information, refer to Section 501-05 Interior Trim and Ornamentation

4. Disconnect the rear center safety belt retractor electrical connector.

5. Remove the rear center safety belt retractor.

Installation
1. **CAUTION:** Make sure all retaining bolts and retaining nuts are hand started and hand tightened prior to final tightening. Failure to follow this instruction may result in component damage.

To install, reverse the removal procedure.

- Tighten to 40 Nm.
Safety Belt System - Rear Safety Belt Buckle
Removal and Installation

Removal

1. Remove the rear seat cushion.
   For additional information, refer to Section _501-10 Seating_.
2. Remove the rear safety belt buckle.

Installation

1. **CAUTION:** Make sure all retaining bolts and retaining nuts are hand started and hand tightened prior to final tightening. Failure to follow this instruction may result in component damage.

To install, reverse the removal procedure.

- Tighten to 40 Nm.
Safety Belt System - Rear Safety Belt Retractor
Removal and Installation

Removal

1. **WARNING:** To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any air bag supplemental restraint system (SRS) components. To deplete the backup power supply energy, disconnect the battery ground cable and wait for one minute. Failure to follow this instruction may result in personal injury.

   Disconnect the battery ground cable,
   For additional information, refer to Section 414-01 Battery, Mounting and Cables.

2. Remove the C-pillar interior trim panel.
   For additional information, refer to Section 501-05 Interior Trim and Ornamentation.

3. Detach the rear safety belt anchor retaining bolt.

4. Disconnect the rear safety belt retractor electrical connector.

5. Remove the rear safety belt retractor.
   1. Detach the rear safety belt upper mounting bracket.
   2. Remove the rear safety belt retractor.

Installation
1. **CAUTION:** Make sure all retaining bolts and retaining nuts are hand started and hand tightened prior to final tightening. Failure to follow this instruction may result in component damage.

   To install, reverse the removal procedure.
   - Tighten to 40 Nm.

2. Tighten to 40 Nm.

Supplemental Restraint System - Air Bag Supplemental Restraint System (SRS)

Description and Operation

The air bag supplemental restraint system (SRS) is designed to provide increased collision protection for vehicle occupants in addition to that provided by the three-point safety belt system. Safety belt use is necessary to obtain the best occupant protection and to receive the full advantages of the SRS.

The air bag supplemental restraint system (SRS) components are shown in the following illustrations.

### Sensors

**WARNING:** Prior to the removal of any SRS sensors and before disconnecting any SRS sensor electrical connectors, the battery ground cable must be disconnected and a period of one minute allowed to elapse.

- **NOTE:** The SRS sensors do not contain any serviceable components.

The SRS consists of the following sensors:

**Occupant Position Sensors**

The four sensors are strategically placed to detect the presence and movement of the passenger front seat occupant.

The occupant position sensor system uses ultrasound at an operating frequency of 40 kilohertz to monitor the passenger front seat occupant. The SRS uses four ultrasonic sensors, one in the A-pillar, one at the top of the instrument panel console and two in the headliner. The sensors determine the presence and position of the passenger front seat occupant with respect to the passenger air bag deployment door. The sensors determine passenger airbag module deployment decisions by classifying occupants as either 'in position' or 'out of position' according to the predetermined 'keep out zone'. The sensors are part of a system that is sophisticated enough to be unaffected by body extremities (hands and feet) and respond only to head or body movements.

**Crash Sensor**

The crash sensor is attached to the body behind the radiator grille. The restraints control module (RCM) processes the crash data sent by the crash sensor against stored data, and deploys the front air bags.

The RCM controls air bag deployment decisions by using signals from its internal accelerometer and the following:

- Restraints Control Module (RCM)
- Side impact sensors
- Occupant position sensors
- Front safety belt buckle sensor
- Seat position sensor
- Front passenger seat occupant classification system

Internally, the RCM has two areas that determine which elements of the SRS are to be deployed:

- Crash severity evaluation — This area evaluates crash severity by using data from the RCM internal accelerometer, the crash sensor and the safety belt buckle sensor. Based on this data, the RCM decides which level of air bag module deployment is required and forwards the information to the second area, the deployment handler.
- Deployment handler — The status of the seat track position sensor, occupant position sensors, front passenger seat occupant classification sensor and safety belt buckle sensors are examined before a decision is made about which restraints should finally be deployed. For instance, if the occupant position sensors and front passenger seat occupant classification sensor indicate that the front passenger seat is empty, then no restraint deployment will take place on the passenger side, even if full deployment takes place on the driver side.

Data from the side crash sensors is used by the RCM in conjunction with acceleration data from the RCM internal accelerometer to make a deployment decision. The RCM processes the acceleration data and subject to an impact being of high enough severity, decides whether the side air bag module should be deployed. The decision is forwarded to the deployment handler (within the RCM) which responds appropriately. For example, in the case that the front passenger seat occupant classification sensor calculates that the seat is empty, or occupied by a small person, the passenger side air bag module will be disabled.
On board testing of the air bag modules, front safety belt pretensioner firing circuits, warning indicator circuits and module status (the crash and side impact sensors perform basic self-tests) is performed by the RCM together with the storing of fault codes.

The RCM drives the SRS indicator on the instrument pack. If the warning lamp fails, a fault code is recorded and a warning tone is sounded. It also provides a temporary back-up power supply to operate the air bag modules in the event that in crash conditions, the battery supply is lost. In the event of a crash, it records certain data such as deceleration information, firing delay and fault codes for subsequent access via the diagnostic connector.

**Driver Air Bag Module**

- **NOTE:** Variation in the driver air bag module deployment is determined by the timing of the first and second stage ignition signals. This facilitates adaptation of the stiffness and timing of the air bag module to optimize occupant protection.

The driver air bag module is controlled by the RCM which chooses between first or second stage deployment, depending on the occupant position and the crash severity. To reduce the risk of an air bag module induced injury to a driver that is positioned close to the steering wheel, the air bag module deploys radially. It has a non-azide propellant that reduces particulates and effluents. It consists of a two stage inflator with separate chambers for the two inflation stages, each being independently activated by the RCM. It has two electrical connectors that are color coded to the respective connector on the inflator.

**Passenger Air Bag Module**

- **NOTE:** Variation in the passenger air bag module deployment is determined by the timing of the first and second stage ignition signals. This facilitates adaptation of the stiffness and timing of the air bag module to optimize occupant protection.

The passenger air bag module is controlled by the RCM which chooses between first or second stage deployment, depending on the occupant status and the crash severity. It consists of a two stage inflator with two air bag electrical connectors to accommodate the two stage inflation.

The heated gas inflator consists of a high-pressure mix of clean air and hydrogen gas, triggered by two separate ignition squibs. It produces a controlled generation of clean gas to rapidly fill the air bag. It is classified as a stored flammable gas (not as an explosive) and as such, has less restrictive storage and transportation requirements. It produces a very clean burn and almost no particulates and is almost free of any toxins, making disposal or recycling much easier.

**Side Air Bag Module**

- **NOTE:** In the event of a side impact that is sufficient to deploy the side air bag module, it will be necessary to replace the complete seat.

The side air bag module does not contain any serviceable components.

The side air bag module is mounted in the outboard bolster of each front seat and uses compressed argon to inflate. It provides protection for the thorax (the part of the trunk between the neck and the abdomen). In an air bag deployment situation, it deploys through the stitch seam in the side bolster. To ensure the air bag always emerges at the same point, a chute is attached to the inside of the trim cover and wrapped around the air bag module.

**Side Air Curtain Module**

- **NOTE:** In the event of a side impact that is sufficient to deploy the side air curtain module, it will be necessary to replace the headliner, A-pillar and C-pillar trim panels and the B-pillar upper trim panel will require thorough examination for visible damage or deformation before it can be used again on the vehicle.

- **NOTE:** The side air bag module does not contain any serviceable components.

The side air curtain modules are located under the headliner between the A and C-pillar and deploy at the same time as the corresponding side air bag module. If the passenger air bag module is deactivated the corresponding side air bag module is also deactivated, however the side air curtain module will still deploy to afford protection to any corresponding rear occupant. When deployed, the side air curtain extends down to approximately shoulder height to protect both the front and rear occupants heads. Both the front and rear of the side air curtain modules are retained to the A and C-pillar respectively by tethers.

**Pretensioners**

**WARNING:** Prior to the removal of any SRS pretensioners and before disconnecting any SRS pretensioner electrical connectors, the battery ground cable must be disconnected and a period of one minute allowed to elapse.

- **NOTE:** The SRS pretensioners do not contain any serviceable components.

The SRS consists of the following pretensioners:

**Safety Belt Buckle Pretensioners**

The front safety belt buckle and pretensioners are seat mounted and incorporate a safety buckle switch. In the event of a front or side impact the RCM will deploy the pretensioners provided the safety belt buckles are fastened. The safety belt buckle pretensioners have a lower deployment threshold than that required by the air bags. Hence it is possible during a minor collision, which exceeds the deployment threshold, that only the safety belt buckle pretensioners will deploy. The RCM receives information on the status of the safety belt buckles from a switch contained in the buckle. For additional information, refer to Section 501-20A Safety Belt System / 501-20B Supplemental Restraint System.

**Rear Safety Belt Pretensioners**

Each rear safety belt incorporates a pretensioner device. In the event of low/high speed frontal impact, these provide additional occupant protection by removing any excess slack from the safety belts. Safety belt pretensioners activate when a frontal impact of sufficient force occurs. Under such an impact, the restraints control module installed on the transmission tunnel sends a firing signal to each pretensioner. Receipt of this signal by each pretensioner directly triggers a pyrotechnic igniter unit. The resulting detonation propels a train of steel balls through a tube and directed onto an impeller mounted on the reel spindle. Rapid rotation of the impeller simultaneously rotates the seat belt reel, retracting any slack. The seat belt retractors and pretensioners are not serviceable components and dismantling must not be attempted as active pretensioning components contain a solid, flammable material. For additional information, refer to Section 501-20A Safety Belt System / 501-20B Supplemental Restraint System.

**Indicators**

**WARNING:** Prior to the removal of any SRS Indicators and before disconnecting any SRS indicator electrical connectors, the battery ground cable must be disconnected and a period of one minute allowed to elapse.
The SRS consists of the following indicators:

**SRS Indicator**

The SRS indicator is located in the instrument cluster and is driven by the RCM. Malfunction of SRS components or associated circuits will cause the SRS indicator to illuminate. If the warning lamp fails, a fault code is recorded and a warning tone is sounded.

**Passenger Air Bag Module Deactivation (PAD) Indicator**

The passenger air bag deployment door has a built-in lens that displays the passenger air bag module deactivated symbol. The symbol is backlit by the PAD indicator, which is attached to the instrument panel. The illumination of the symbol informs the front seat occupants whether or not the passenger air bag module has been deactivated by the occupancy sensing system.

**Clockspring**

**WARNING:** Prior to the removal of the SRS clockspring and before disconnecting any SRS clockspring electrical connectors, the battery ground cable must be disconnected and a period of one minute allowed to elapse.

**NOTE:** The SRS clockspring does not contain any serviceable components.

The clockspring is designed to carry signals between the RCM and the driver air bag module. The clockspring is fitted to the steering column, and consists of fixed and moving parts connected by a coiled tape with integral conducting tracks. The tape is able to 'wind up' and 'unwind' as the steering wheel (to which the moving part is attached) is turned, maintaining electrical contact at all times between the RCM and the driver air bag module.
Supplemental Restraint System - Air Bag Supplemental Restraint System (SRS)

Inspection and Verification

For a detailed description of the supplemental restraints system and operation, refer to the relevant Description and Operation section in the workshop manual. REFER to: Air Bag Supplemental Restraint System (SRS) (501-20B Supplemental Restraint System, Description and Operation).

**WARNINGS:**

- Ensure all safety procedures are followed before and during any work that is carried out on the SRS to avoid accidental deployment and possible personal injury. The backup power supply must be depleted before repairing or replacing any air bag supplemental restraint system (SRS) components. To deplete the backup power supply energy, disconnect the battery ground cable and wait one minute. Failure to follow this instruction may result in personal injury.

**CAUTIONS:**

- Diagnosis by substitution from a donor vehicle is not acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

- If the RCM has been identified as being faulty and requires replacement, any additional faults within the SRS system must be repaired and DTCs cleared before replacing the RCM. Replacing the RCM before rectifying other faults will cause the new RCM to remain in delivery mode. In this state, the module’s diagnostic features are not accessible.

- Only one Flash Code will be displayed at a time, however there may be multiple fault codes stored.

- The PID code, which is displayed on the IDS screen in brackets against the DTC, differs from the Flash Code. These codes must not be confused as incorrect diagnosis may occur.

- This document is to be used as a guide only. It supports the existing diagnostic equipment, circuit diagrams and workshop manual.

- If a fault is identified with the Occupancy Classification System (OCS) module, passenger seat weight sensor or passenger seat weight sensor harness, all of these components must be replaced as a complete kit.

- **NOTE:** Given the legal implications of a restraints system failure, harness repairs to airbag module circuits are not acceptable. Where the text refers to ‘repair the circuit’, this will normally mean the replacement of a harness.

Manufacturer approved diagnostic system

Given the complexity of the system and the potential for damage/injury, the preferred method of diagnosis is via the manufacturer approved diagnostic system.

1. **Verify the customer concern**
2. **Confirm the function of the warning lamp** (if the warning lamp is inoperative, system faults will be signaled by an audible chime)
3. **Visually inspect for obvious signs of electrical damage**

**Visual inspection chart**

<table>

4. **If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step**
5. **If the cause is not visually evident, verify the symptom and refer to the manufacturer approved diagnostic system**
6. **Determine any Flash Code(s) that may be stored from the SRS warning indicator displayed on the instrument cluster. Retrieve any logged Diagnostic Trouble Codes (DTCs) from the Restraint Control Module (RCM) using the manufacturer approved diagnostic. Using the Index, retrieved Flash Code, DTC and PID codes determine the correct fault description. Check the list of possible causes against that fault description for poor connections, backed-out/bent pins, visible damage, or trapped harness. Within the manufacturer approved diagnostic system datalogger function there is a facility to display airbag circuit resistance as seen by the restraints control module. Utilizing the restraints control module resistance read function provides an opportunity to observe circuit resistance stability when investigating harness/connector integrity. The manufacturer approved diagnostic airbag resistance read function can be accessed in the body system section of datalogger. Typical resistance values are between 1.6 – 2.9 Ohms with the exception of driver front airbag which is between 2.4 – 4.2 Ohms due to additional circuit length within clockspring**

Reading restraints flash codes

**Self-check**

Turn the ignition switch to the **ON** position

- Warning light **ON** solid for 6 seconds
- Warning light **OFF**

**Fault on system**
Turn the ignition switch to the **ON** position.

Warning light **ON** solid for 6 seconds

Warning light **OFF** for 2 seconds

Warning light flashes the appropriate number of times for the fault logged (see table)

Warning light **OFF** for 2 seconds

The sequence is repeated 5 times

Warning light **ON** until the ignition is turned **OFF**

**Example:** Flash code 16 would be shown as lamp **ON** for one occurrence of 0.5 second then lamp **OFF** for one second, then six occurrences of lamp **ON** for 0.5 seconds each (1-6).

\[\text{Diagram showing sequence} \]

---

**E40356**

- 1. Lamp **OFF**
- 2. Lamp **ON**
- 3. Time between first digit and second digit (1 second)
- 4. Time **ON** of each flash of the second digit (0.5 second)

**Priority**

Priority is not assigned to any of the flash codes. They are displayed depending on which code is identified first. If multiple faults are present only one will be flashed. That fault will need to be rectified before the next code will be made available.

If the driver warning lamp is inoperative and a fault occurs, an audible chime will be sounded 90 seconds after the ignition is turned **ON**.

**NOTE:** * = DTC used for more than one fault.

**Combination Faults**

**CAUTION:** If the RCM has been identified as being faulty and requires replacement, any additional faults within the SRS system MUST be repaired and DTCs cleared BEFORE replacing the RCM. Replacing the RCM before rectifying other faults will cause the new RCM to remain in delivery mode. In this state, the module’s diagnostic features are not accessible.

Supplemental Restraint System - Air Bag Disposal

General Procedures

Deployed Air Bag

1. **WARNING:** Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module. Failure to follow this instruction may result in personal injury.

   Deployed air bag modules are to be disposed of as special waste and must comply with local environmental requirements, if in doubt, contact Authority for disposal requirements.

2. **NOTE:** The storage, transportation, disposal, and/or recycling of air bag module components must be carried out in accordance with all applicable federal, state and local regulations including, but not limited to, those governing building and fire codes, environmental protection, occupational health and safety, and transportation.

   Modules removed and deployed by Jaguar service are to be returned to the importer for disposal.

Undeployed Air Bag — Inoperative

1. **WARNING:** Carry a live air bag module with the air bag and trim cover or deployment door pointed away from your body. This will reduce the risk of injury in the event of an accidental deployment. Failure to follow this instruction may result in personal injury.

   • **NOTE:** All inoperative air bag modules have been placed on the Mandatory Return List. All discolored or damaged air bag modules must be treated the same as any inoperative live air bag being returned. Failure to follow this instruction may result in personal injury.

   Remove the inoperative driver air bag module or passenger air bag module. For additional information [Driver Air Bag Module](#) or [Passenger Air Bag Module](#) in this section.

Undeployed Air Bag — Scrapped Vehicle

Remote Deployment

1. **WARNING:** Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module. Failure to follow this instruction may result in personal injury.

2. **WARNING:** Carry a live air bag module with the air bag and trim cover or deployment door pointed away from your body. This will reduce the risk of injury in the event of an accidental deployment. Failure to follow this instruction may result in personal injury.

   Remote deployment is to be carried out outdoors with all personnel at least 6.1 meters (20 feet) away to ensure personal safety. Due to the loud report which occurs when the air bag is deployed, hearing protection is required. Failure to follow this instruction may result in personal injury.

   Do not place the driver or passenger air bag module with the trim cover or deployment door facing down, as the forces of the deploying air bag can cause it to ricochet and cause personal injury. Failure to follow this instruction may result in personal injury.

   Equipment required: Universal deployment tool-Part N° 418-135 and 12V Battery.

2. The deployment procedure should be carried out outdoors away from other personnel.

3. Remove any loose debris from around air bag. Make sure that no flammable liquids are present.

4. Disconnect the battery ground and positive cables.

5. Disconnect the relevant air bag module electrical connector.

6. Connect the appropriate adaptor lead to the restraint device.

7. Connect the deployment lead to the adaptor lead. Pass wire of the deployment tool through window, close all doors, leave window with lead for deployment tool open.

8. **WARNING:** Before proceeding, make sure precautions have been taken to warn personnel of a possible loud noise upon activation. Do not allow anybody to approach closer to restraint device than six meters. Failure to follow this instruction may result in personal injury.
Move as far from restraint device as possible and connect the tool clips to a 12V vehicle battery.

9. **WARNING:** Do not handle the deployed device immediately after activation - it may be hot. Allow the unit to cool for at least 20 minutes. Cooling modules should be continuously monitored to make sure heat does not create a fire with spilled liquids or other debris. Failure to follow this instruction may result in personal injury.

Deploy the module by depressing both switches on the tool. If activation does not occur, disconnect battery from tool and seek advise from Jaguar Engineering and wait for further instructions.

10. Repeat procedure for all air bags in vehicle.

11. The vehicle is now to be scrapped in the normal manner with modules installed.

---

**Disposal of live air bag modules for all air bags, using tyres**

1. Equipment required: Deployment tool 418-S135, Battery (12V), Safety goggles to BS2092 grade 2, Rubber gloves to PrEN 374 class 2, Ear protectors that have been measured to BS.EN 24869, Particulate respirator to EN 149 grade FFP2S

2. The deployment procedure should be carried out outdoors, away from other personnel.

3. Stack four scrap tyres, securing together with heavy gauge wire or cable. While disconnected from any electrical power source, connect deployment harness and place air bag adaptor portion under tyre stack, ready for connection to air bag.

4. **WARNING:** Power must not be connected during this step. Failure to follow this instruction may result in personal injury.

**CAUTION:** Make sure the connector is not in contact with the inflator or it will be damaged during the test.

Connect air bag to air bag connector, make sure the locking sleeve is fully engaged. Position the air bag with the cover facing upwards.

5. Make sure battery connections of deployment harness are ten meters away from the tyre stack

6. Remove any loose from around the air bag. Make sure that no flammable liquids are present.

7. **WARNING:** Before proceeding, make sure precautions have been taken to warn personnel of a possible loud noise upon activation. Do not allow anybody to approach closer to restraint device than six meters. Failure to follow this instruction may result in personal injury.

Move as far from restraint device as possible and connect the tool clips to a 12V vehicle battery.

8. **WARNING:** Do not handle the deployed device immediately after activation - it may be hot. Allow the unit to cool for at least 20 minutes. Cooling modules should be continuously monitored to make sure heat does not create a fire with spilled liquids or other debris. Failure to follow this instruction may result in personal injury.

Deploy the module by depressing both switches on the tool. If activation does not occur, disconnect battery from tool and seek advise from Jaguar Engineering and wait for further instructions.

9. Allow the air bag to cool for at least 20 minutes. Cooling modules should be continuously monitored to make sure heat generated a fire with spilled liquids or other debris.

10. Remove the air bag from the tyre stack and seal in a plastic bag, ready for disposal.

11. In the event of any problems or queries arising from this procedure, contact Jaguar Engineering.
Removal

1. **WARNINGS:**

   - To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any air bag supplementary restraints system (SRS) components. To deplete the backup power supply energy, disconnect the battery ground cable and wait for one minute. Failure to follow this instruction may result in personal injury.

   - Never probe the electrical connectors of the air bag modules or any other SRS component. Failure to follow this instruction may result in personal injury.

   - Reposition the front seat to the maximum forward position.

2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 Battery, Mounting and Cables.

3. Remove the B-pillar lower trim panel. For additional information, refer to Section 501-05 Interior Trim and Ornamentation.

4. Detach the front seat belt retractor.

5. Disconnect the B-pillar side impact sensor electrical connector.

6. Remove the B-pillar side impact sensor.

Installation
1. WARNINGS:

⚠️ To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any air bag SRS components. To deplete the backup power supply energy, disconnect the battery ground cable and wait for one minute. Failure to follow this instruction may result in personal injury.

⚠️ Make sure the side impact sensor locating tangs are correctly located into the B-pillar. Failure to follow this instruction may result in personal injury.

⚠️ Never probe the electrical connectors of the air bag modules or any other SRS component. Failure to follow this instruction may result in personal injury.

To install, reverse the removal procedure.

- Tighten to 12 Nm.

2. Tighten to 40 Nm.
Removal

1. WARNINGS:

- Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module.

- Carry a live air bag module with the air bag and trim cover pointed away from your body. This will reduce the risk of injury in the event of an accidental deployment. Failure to follow this instruction may result in personal injury.

- Do not set a live air bag module down with the trim cover face down. Failure to follow this instruction may result in personal injury.

- After deployment, the air bag surface can contain deposits of sodium hydroxide, a product of the gas generant combustion that is irritating to the skin. Wash your hands with soap and water afterwards. Failure to follow this instruction may result in personal injury.

- Never probe the connectors on the air bag module. Doing so may result in air bag deployment, which may result in personal injury. Failure to follow this instruction may result in personal injury.

- Air bag modules with discolored or damaged trim covers must be replaced, not repainted.

- Vehicle sensor orientation is critical for correct system operation. If a vehicle equipped with an air bag supplemental restraint system (SRS) is involved in a collision, inspect the sensor mounting bracket and wiring pigtail for deformation. If damaged, replace the sensor whether or not the air bag is deployed.

- To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any air bag supplemental restraint system (SRS) components. To deplete the backup power supply energy, disconnect the battery ground cable and wait one minute. Failure to follow this instruction may result in personal injury.

- CAUTION: Make sure the wheels are in the straight-ahead position. Failure to follow this instruction may result in damage to the component.

- NOTE: Repair is made by replacement only. If a part is replaced and the new part does not correct the condition, install the original part and carry out the diagnostic procedure again.

2. Remove the steering wheel.
   For additional information, refer to Section 211-04 Steering Column.

3. Remove the steering column multifunction switch left-hand.
   For additional information, refer to Section 211-05 Steering Column Switches.

4. Remove the steering column multifunction switch right-hand.
   For additional information, refer to Section 211-05 Steering Column Switches.

5. Disconnect the electrical connector.
5. Remove the clockspring.

Installation

1. **WARNINGS:**

⚠️ Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module. Failure to follow this instruction may result in personal injury.

⚠️ Carry a live air bag module with the air bag and trim cover pointed away from your body. This will reduce the risk of injury in the event of an accidental deployment. Failure to follow this instruction may result in personal injury.

⚠️ Never probe the connectors on the air bag module. Doing so may result in air bag deployment. Failure to follow this instruction may result in personal injury.

• **CAUTIONS:**

⚠️ Make sure the locking tool is correctly installed to the clockspring. Failure to follow this instruction may result in damage to the component.

⚠️ Make sure the wheels are in the straight-ahead position. Failure to follow this instruction may result in damage to the component.

• **NOTE:** A repair is made by replacement only. If a part is replaced and the new part does not correct the condition, install the original part and carry out the diagnostic procedure again.

To install, reverse the removal procedure.

• Tighten to 5 Nm.
Supplemental Restraint System - C-Pillar Side Impact Sensor
Removal and Installation

Removal

1. WARNINGS:

⚠️ To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any air bag supplementary restraints system (SRS) components. To deplete the backup power supply energy, disconnect the battery ground cable and wait for one minute. Failure to follow this instruction may result in personal injury.

⚠️ Never probe the electrical connectors of the air bag modules or any other SRS component. Failure to follow this instruction may result in personal injury.

Disconnect the battery ground cable.
For additional information, refer to Section 414-01 Battery, Mounting and Cables.

2. Remove the rear seat bolster.
For additional information, refer to Section 501-10 Seating.

3. Disconnect the electrical connector.

4. Remove the C-pillar side impact sensor.

Installation

1. WARNINGS:

⚠️ To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any air bag SRS components. To deplete the backup power supply energy, disconnect the battery ground cable and wait for one minute. Failure to follow this instruction may result in personal injury.

⚠️ Make sure the side impact sensor locating tangs are correctly located into the C-pillar. Failure to follow this instruction may result in personal injury.

⚠️ Never probe the electrical connectors of the air bag modules or any other SRS component. Failure to follow this instruction may result in personal injury.

To install, reverse the removal procedure.

- Tighten to 12 Nm.
Supplemental Restraint System - Crash Sensor
Removal

1. WARNINGS:

⚠️ To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any airbag supplementary restraints system (SRS) components. To deplete the backup power supply energy, disconnect the battery ground cable and wait for one minute. Failure to follow this instruction may result in personal injury.

⚠️ Never probe the electrical connectors of the airbag modules or any other SRS component. Failure to follow this instruction may result in personal injury.

Disconnect the battery ground cable.
For additional information, refer to Section 414-01 Battery, Mounting and Cables.

2. Remove the radiator opening panel.
For additional information, refer to Section 501-02 Front End Body Panels.

3. Disconnect the crash sensor electrical connector.

4. Remove the crash sensor.

Installation

1. WARNINGS:

⚠️ To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any airbag SRS components. To deplete the backup power supply energy, disconnect the battery ground cable and wait for one minute. Failure to follow this instruction may result in personal injury.

⚠️ Make sure the crash sensor locating tangs are correctly located into the mounting bracket. Failure to follow this instruction may result in personal injury.

⚠️ Never probe the electrical connectors of the airbag modules or any other SRS component. Failure to follow this instruction may result in personal injury.

To install, reverse the removal procedure.

- Tighten to 12 Nm.
Removal

1. WARNINGS:

- ▶ A restraints control module (RCM) only requires replacement if the system has incurred five separate deployments. At no time change the RCM for less than five separate deployments.

- ▶ Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module. Failure to follow this instruction may result in personal injury.

- ▶ Carry a live air bag module with the air bag and trim cover pointed away from your body. This will reduce the risk of injury in the event of an accidental deployment. Failure to follow this instruction may result in personal injury.

- ▶ Do not set a live air bag module down with the trim cover face down. Failure to follow this instruction may result in personal injury.

- ▶ After deployment, the air bag surface can contain deposits of sodium hydroxide, a product of the gas generant combustion that is irritating to the skin. Wash your hands with soap and water afterwards. Failure to follow this instruction may result in personal injury.

- ▶ Never probe the connectors on the air bag module. Doing so may result in air bag deployment. Failure to follow this instruction may result in personal injury.

- ▶ Vehicle sensor orientation is critical for correct system operation. If a vehicle equipped with an air bag SRS is involved in a collision, inspect the sensor mounting bracket and wiring pigtail for deformation. If damaged, replace the sensor whether or not the air bag is deployed.

- ▶ To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any air bag SRS components. To deplete the backup power supply energy, disconnect the battery ground cable and wait one minute. Failure to follow this instruction may result in personal injury.

- • NOTE: Repair is made by replacement only. If a part is replaced and the new part does not correct the condition, install the original part and carry out the diagnostic procedure again.

- • NOTE: When installing a new air bag module, a prepaid return postcard is provided with the replacement air bag module. The serial number for the new part and the vehicle identification number (VIN) must be recorded and sent to Jaguar Cars Ltd.

Disconnect the battery ground cable.
For additional information, refer to Section 414-01 Battery, Mounting and Cables.

2. Remove the instrument panel lower trim panel.
3. Detach the steering column lower shroud.

4. Remove the steering column lower shroud.

5. **NOTE:** Left-hand shown, right-hand similar.
   Remove the driver air bag module retaining bolts.

6. Detach the driver air bag module.

7. Remove the driver air bag module.
1. WARNINGS:

- A restraints control module (RCM) only requires replacement if the system has incurred five separate deployments. At no time change the RCM for less than five separate deployments.

- Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module. Failure to follow this instruction may result in personal injury.

- Carry a live air bag module with the air bag and trim cover pointed away from your body. This will reduce the risk of injury in the event of an accidental deployment. Failure to follow this instruction may result in personal injury.

- Do not set a live air bag module down with the trim cover face down. Failure to follow this instruction may result in personal injury.

- After deployment, the air bag surface can contain deposits of sodium hydroxide, a product of the gas generant combustion that is irritating to the skin. Wash your hands with soap and water afterwards. Failure to follow this instruction may result in personal injury.

- Never probe the connectors on the air bag module. Doing so may result in air bag deployment. Failure to follow this instruction may result in personal injury.

- Vehicle sensor orientation is critical for correct system operation. If a vehicle equipped with an air bag SRS is involved in a collision, inspect the sensor mounting bracket and wiring pigtail for deformation. If damaged, replace the sensor whether or not the air bag is deployed.

- To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any air bag SRS components. To deplete the backup power supply energy, disconnect the battery ground cable and wait one minute. Failure to follow this instruction may result in personal injury.

- NOTE: Repair is made by replacement only. If a part is replaced and the new part does not correct the condition, install the original part and carry out the diagnostic procedure again.

- NOTE: When installing a new air bag module, a prepaid return postcard is provided with the replacement air bag module. The serial number for the new part and the vehicle identification number (VIN) must be recorded and sent to Jaguar Cars Ltd.

- NOTE: left-hand shown, right-hand similar.

To install, reverse the removal procedure.

- Tighten to 7 Nm.
Supplemental Restraint System - Front Passenger Seat Occupant Classification Sensor
Removal and Installation

Removal

• WARNINGS:

⚠️ To avoid accidental deployment and possible personal injury, the back up power supply must be depleted before repairing or replacing any air bag supplemental restraint system (SRS) component. To deplete the back up power supply energy, disconnect the battery ground cable and wait one minute. Failure to follow this instruction may result in personal injury.

⚠️ Never probe the electrical connectors of the air bag modules or any other SRS component. Failure to follow this instruction may result in personal injury.

⚠️ The front passenger seat occupant classification sensor is available only as a service kit. No attempt should be made to replace individual components. Failure to follow this instruction may result in personal injury.

⚠️ CAUTION: Electronic components in the seats are sensitive to impact. Handle seat with care or damage may result.

• NOTE: Repair is made by replacement only. If a part is replaced and the new part does not correct the condition, install the original part and carry out the diagnostic procedure again.

1. Remove the front seat cushion cover.
   For additional information, refer to Section 501-10 Seating.

2. Detach the front passenger seat occupant classification sensor bladder.

3. Detach the front passenger seat occupant classification sensor transducer.

4. NOTE: Make sure the unused electrical connector is secured to the seat base.
   Remove the front passenger seat occupant classification sensor bladder.
5. Remove the front passenger seat occupant classification sensor module shield.

6. Remove the front passenger seat occupant classification sensor module.

**Installation**

1. **NOTE:** The front passenger seat occupant classification sensor module must pass between the seat base and the first wire of the front seat suspension mat.

   Reposition the front passenger seat occupant classification sensor module through the seat base.

2. Install the front passenger seat occupant classification sensor bladder.
3. Attach the front passenger seat occupant classification sensor transducer.

4. Install the front passenger seat occupant classification sensor module and shield.

5. **CAUTION:** Make sure the front passenger seat occupant classification sensor wiring harness is loose enough to allow for the seat height adjustment. Failure to follow this instruction may result in damage to the component.

   Connect the front passenger seat occupant classification sensor module electrical connector.
   
   - Secure the front passenger seat occupant classification sensor wiring harness to the original seat wiring harness.

6. Install the front seat cushion cover.
   For additional information, refer to Section 501-10 Seating.

7. Initialize the system. For additional information, refer to the Jaguar approved diagnostic system.
Supplemental Restraint System - Passenger Air Bag Deactivation (PAD) Indicator

Removal

1. Detach the passenger air bag module finish panel.

2. Remove the instrument panel finish panel.

3. Detach the passenger air bag deactivation (PAD) indicator.

4. Remove the PAD indicator.
   - Disconnect the electrical connector.

Installation

1. To install, reverse the removal procedure.
Supplemental Restraint System - Passenger Air Bag Module
Removal and Installation

Removal

1. WARNINGS:

- A restraints control module (RCM) only requires replacement if the system has incurred five separate deployments. At no time change the RCM for less than five separate deployments.

- Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module. Failure to follow this instruction may result in personal injury.

- Carry a live air bag module with the air bag and trim cover pointed away from your body. This will reduce the risk of injury in the event of an accidental deployment. Failure to follow this instruction may result in personal injury.

- Do not set a live air bag module down with the trim cover face down. Failure to follow this instruction may result in personal injury.

- After deployment, the air bag surface can contain deposits of sodium hydroxide, a product of the gas generant combustion that is irritating to the skin. Wash your hands with soap and water afterwards. Failure to follow this instruction may result in personal injury.

- Never probe the connectors on the air bag module. Doing so may result in air bag deployment. Failure to follow this instruction may result in personal injury.

- Vehicle sensor orientation is critical for correct system operation. If a vehicle equipped with an air bag SRS is involved in a collision, inspect the sensor mounting bracket and wiring pigtail for deformation. If damaged, replace the sensor whether or not the air bag is deployed.

- To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any air bag SRS components. To deplete the backup power supply energy, disconnect the battery ground cable and wait one minute. Failure to follow this instruction may result in personal injury.

• NOTE: Repair is made by replacement only. If a part is replaced and the new part does not correct the condition, install the original part and carry out the diagnostic procedure again.

• NOTE: When installing a new air bag module, a prepaid return postcard is provided with the replacement air bag module. The serial number for the new part and the vehicle identification number (VIN) must be recorded and sent to Jaguar Cars Ltd.

Disconnect the battery ground cable.
For additional information, refer to Section 414-01 Battery, Mounting and Cables.

2. Detach the passenger air bag module finish panel.

3. Remove the glove compartment assembly.
For additional information, refer to Section 501-12 Instrument Panel and Console.
4. Remove the air bag chute lower retaining bolts.

5. Detach the air bag and chute assembly from the instrument panel.
   1. Remove the air bag chute retaining bolts.
   2. Detach the air bag and chute assembly from the instrument panel.

6. Detach the wiring harness.

7. **NOTE:** Right-hand shown, left-hand similar.
   Remove the passenger air bag and chute assembly.
   - Disconnect the passenger air bag electrical connectors.

8. Remove the passenger air bag from the chute.
1. **WARNINGS:**

- An RCM module only requires replacement if the system has incurred five separate deployments. At no time change an RCM for less than five separate deployments.

- Always wear safety glasses when repairing an air bag SRS vehicle and when handling an air bag module. Failure to follow this instruction may result in personal injury.

- Carry a live air bag module with the air bag and deployment door pointed away from your body. This will reduce the risk of injury in the event of an accidental deployment.

- Never probe the connectors on the air bag module. Doing so may result in air bag deployment. Failure to follow this instruction may result in personal injury.

- **NOTE:** Repair is made by replacement only. If a part is replaced and the new part does not correct the condition, install the original part and carry out the diagnostic procedure again.

- **NOTE:** Make sure to tighten the retaining bolts to the correct specification.

  To install, reverse the removal procedure.

  - Tighten to 12 Nm.

2. Tighten to 9 Nm.

3. Tighten to 9 Nm.
Removal

1. WARNINGS:

- To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any air bag supplemental restraint system (SRS) components. To deplete the backup power supply energy, disconnect the battery ground cable and wait one minute. Failure to follow this instruction may result in personal injury.

- A restraints control module (RCM) only requires replacement if the system has incurred five separate deployments. At no time change the RCM for less than five separate deployments.

- CAUTION: Electronic modules are sensitive to static electrical charges. If exposed to these charges, damage may result.

- NOTE: Repair is made by replacement only. If a part is replaced and the new part does not correct the condition, install the original part and carry out the diagnostic procedure again.

   Disconnect the battery ground cable.
   For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

2. Remove the floor console register duct.
   For additional information, refer to: Floor Console Register Duct (412-01 Air Distribution and Filtering, Removal and Installation).

3. Remove the floor console register duct connector retaining screw.

4. Remove the plenum to floor console register duct connector.
   1. Detach the plenum to floor console register duct connector.
   2. Remove the plenum to floor console register duct connector.

5. Disconnect the RCM electrical connectors.
6. Remove the RCM.

**Installation**

1. **WARNINGS:**

   - To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any airbag supplemental restraint system (SRS) components. To deplete the backup power supply energy, disconnect the battery ground cable and wait one minute. Failure to follow this instruction may result in personal injury.

   - A restraints control module (RCM) only requires replacement if the system has incurred five separate deployments. At no time change the RCM for less than five separate deployments.

   - CAUTION: Electronic modules are sensitive to static electrical charges. If exposed to these charges, damage may result.

   - NOTE: Repair is made by replacement only. If a part is replaced and the new part does not correct the condition, install the original part and carry out the diagnostic procedure again.

   To install, reverse the removal procedure.

   - Tighten to 12 Nm.
### Removal

1. **WARNINGS:**

   - To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any air bag supplementary restraints system (SRS) components. To deplete the backup power supply energy, disconnect the battery ground cable and wait for one minute. Failure to follow this instruction may result in personal injury.

   - Never probe the electrical connectors of the air bag modules or any other SRS component. Failure to follow this instruction may result in personal injury.

   • NOTE: Make sure the driver seat is adjusted to its maximum height before removal.

   Remove the driver seat.

   For additional information, refer to Section [501-10 Seating].

2. Disconnect the seat position sensor electrical connector.

3. Remove the seat position sensor.

### Installation

1. **WARNINGS:**

   - To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any air bag SRS components. To deplete the backup power supply energy, disconnect the battery ground cable and wait for one minute. Failure to follow this instruction may result in personal injury.

   - Never probe the electrical connectors of the air bag modules or any other SRS component. Failure to follow this instruction may result in personal injury.

   - Make sure the sensor is correctly located into the seat track. Failure to follow this instruction may result in personal injury.

   To install, reverse the removal procedure.

   • Tighten to 5 Nm.
Removal

1. WARNINGS:

⚠️ A restraints control module (RCM) only requires replacement if the system has incurred five separate deployments. At no time change the RCM for less than five separate deployments.

⚠️ Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module. Failure to follow this instruction may result in personal injury.

⚠️ Carry a live air bag module with the air bag and trim cover pointed away from your body. This will reduce the risk of injury in the event of an accidental deployment. Failure to follow this instruction may result in personal injury.

⚠️ Do not set a live air bag module down with the trim cover face down. Failure to follow this instruction may result in personal injury.

⚠️ After deployment, the air bag surface can contain deposits of sodium hydroxide, a product of the gas generant combustion that is irritating to the skin. Wash your hands with soap and water afterwards. Failure to follow this instruction may result in personal injury.

⚠️ Never probe the connectors on the air bag module. Doing so may result in air bag deployment. Failure to follow this instruction may result in personal injury.

⚠️ Vehicle sensor orientation is critical for correct system operation. If a vehicle equipped with an air bag SRS is involved in a collision, inspect the sensor mounting bracket and wiring pigtail for deformation. If damaged, replace the sensor whether or not the air bag is deployed.

⚠️ To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any air bag SRS components. To deplete the backup power supply energy, disconnect the battery ground cable and wait one minute. Failure to follow this instruction may result in personal injury.

• NOTE: Repair is made by replacement only. If a part is replaced and the new part does not correct the condition, install the original part and carry out the diagnostic procedure again.

• NOTE: When installing a new air bag module, a prepaid return postcard is provided with the replacement air bag module. The serial number for the new part and the vehicle identification number (VIN) must be recorded and sent to Jaguar Cars Ltd.

Remove the front seat.
For additional information, refer to Section 501-10 Seating.

2. Remove the head restraint.
3. Remove the front seat backrest trim panel.
   1. Detach the front seat backrest trim panel retaining clips.
   2. Remove the front seat backrest trim panel.

4. Detach the seat backrest cover.

5. Remove the side air bag module retaining nuts.

6. NOTE: Left-hand shown, right-hand similar.
   Remove the head restraint retaining post.
   1. Release the retaining tang.
   2. Remove the head restraint retaining post.

7. Detach the seat backrest cover and cushion.
   1. Reposition the seat backrest cover and cushion.
   2. Detach the seat backrest cover and cushion.
8. Disconnect the side air bag module electrical connector.

9. Remove the side air bag module.

Installation

1. WARNINGS:

- A restraints control module (RCM) only requires replacement if the system has incurred five separate deployments. At no time change the RCM for less than five separate deployments.

- Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module. Failure to follow this instruction may result in personal injury.

- Carry a live air bag module with the air bag and trim cover pointed away from your body. This will reduce the risk of injury in the event of an accidental deployment. Failure to follow this instruction may result in personal injury.

- Do not set a live air bag module down with the trim cover face down. Failure to follow this instruction may result in personal injury.

- After deployment, the air bag surface can contain deposits of sodium hydroxide, a product of the gas generant combustion that is irritating to the skin. Wash your hands with soap and water afterwards. Failure to follow this instruction may result in personal injury.

- Never probe the connectors on the air bag module. Doing so may result in air bag deployment. Failure to follow this instruction may result in personal injury.

- Vehicle sensor orientation is critical for correct system operation. If a vehicle equipped with an air bag SRS is involved in a collision, inspect the sensor mounting bracket and wiring pigtail for deformation. If damaged, replace the sensor whether or not the air bag is deployed.

- To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any air bag SRS components. To deplete the backup power supply energy, disconnect the battery ground cable and wait one minute. Failure to follow this instruction may result in personal injury.

- Make sure the side air bag module is correctly aligned in the deployment chute and the chute is correctly aligned within the seat assembly. Failure to follow this instruction may result in personal injury.

• NOTE: Repair is made by replacement only. If a part is replaced and the
new part does not correct the condition, install the original part and carry out the diagnostic procedure again.

To install, reverse the removal procedure.

- Tighten to 7 Nm.
Supplemental Restraint System - Side Air Curtain Module

Removal

1. WARNINGS:

⚠️ A restraints control module (RCM) only requires replacement if the system has incurred five separate deployments. At no time change the RCM for less than five separate deployments.

⚠️ Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module. Failure to follow this instruction may result in personal injury.

⚠️ Carry a live air bag module with the air bag and trim cover pointed away from your body. This will reduce the risk of injury in the event of an accidental deployment. Failure to follow this instruction may result in personal injury.

⚠️ Do not set a live air bag module down with the trim cover face down. Failure to follow this instruction may result in personal injury.

⚠️ After deployment, the air bag surface can contain deposits of sodium hydroxide, a product of the gas generant combustion that is irritating to the skin. Wash your hands with soap and water afterwards. Failure to follow this instruction may result in personal injury.

⚠️ Never probe the connectors on the air bag module. Doing so may result in air bag deployment. Failure to follow this instruction may result in personal injury.

⚠️ Air bags modules with discolored or damage trim covers must be replaced. Failure to follow this instruction may result in personal injury.

⚠️ Vehicle sensor orientation is critical for correct system operation. If a vehicle equipped with an air bag SRS is involved in a collision, inspect the sensor mounting bracket and wiring pigtail for deformation. If damaged, replace the sensor whether or not the air bag is deployed.

⚠️ To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any air bag SRS components. To deplete the backup power supply energy, disconnect the battery ground cable and wait one minute. Failure to follow this instruction may result in personal injury.

⚠️ Only carry out a system test with the air bag modules fully installed. Failure to follow this instruction may result in personal injury.

• NOTE: Repair is made by replacement only.

• NOTE: Once the side air curtain module retaining straps have been detached the side air curtain module must be replaced.

Reposition the front seat backs to the maximum reclined position.

2. Disconnect the battery ground cable.
For additional information, refer to Section 414-01 Battery, Mounting and Cables.

3. Remove both A-pillar trim panels.
For additional information, refer to Section 501-05 Interior Trim and Ornamentation.

4. Remove both B-pillar upper trim panels.
For additional information, refer to Section 501-05 Interior Trim and Ornamentation.

5. Remove both C-pillar trims.
For additional information, refer to Section 501-05 Interior Trim and Ornamentation.

6. Remove both sun visors.
For additional information, refer to Section 501-05 Interior Trim and Ornamentation.
7. NOTE: Left-hand shown, right-hand similar.
   Remove the sun visor retaining clip.

8. Remove the overhead console.
   For additional information, refer to Section 501-12 Instrument Panel and Console.

9. NOTE: Left-hand shown, right-hand similar.
   Detach the rear passenger assist handle retaining screw covers.

10. NOTE: Left-hand shown, right-hand similar.
    Detach the rear passenger assist handle.

11. NOTE: Left-hand shown, right-hand similar.
    Remove the rear passenger assist handle.
    ● Disconnect the electrical connector.

12. NOTE: Left-hand shown, right-hand similar.
    Detach the front passenger assist handle retaining screw covers.
13. **NOTE:** Left-hand shown, right-hand similar.
   Remove the front passenger assist handle.

14. Detach the head liner.

15. Disconnect the side air curtain module electrical connector.

16. **NOTE:** Make sure the retaining strap routing is noted before removal.
   Remove the front retaining strap retaining bolt.

17. **NOTE:** Make sure the retaining strap routing is noted before removal.
    Detach the front retaining strap.
18. NOTE: Make sure the retaining strap routing is noted before removal.
   Remove the rear retaining strap retaining bolt.

19. NOTE: Make sure the retaining strap routing is noted before removal.
   Detach the rear retaining strap.

20. Remove the side air curtain module retaining bolts.

21. Remove the side air curtain module.
    - Remove the side air curtain canister retaining bolts.

Installation
1. **WARNINGS:**

- A restraints control module (RCM) only requires replacement if the system has incurred five separate deployments. At no time change the RCM for less than five separate deployments.
- Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module. Failure to follow this instruction may result in personal injury.
- To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any air bag SRS components. To deplete the backup power supply energy, disconnect the battery ground cable and wait one minute. Failure to follow this instruction may result in personal injury.
- Carry a live air bag module with the air bag and trim cover pointed away from your body. This will reduce the risk of injury in the event of an accidental deployment. Failure to follow this instruction may result in personal injury.
- Never probe the connectors on the air bag module. Doing so may result in air bag deployment. Failure to follow this instruction may result in personal injury.
- New nylon thread forming inserts must be used ever time the screws are removed from the side air curtain. Failure to follow this instruction may result in personal injury.
- Only carry out a system test with the air bag modules fully installed. Failure to follow this instruction may result in personal injury.
  - **NOTE:** Repair is made by replacement only.
  - **NOTE:** When installing a new air bag module, a prepaid return postcard is provided with the replacement air bag module. The serial number for the new part and the vehicle identification number (VIN) must be recorded and sent to Jaguar Cars Limited.
  - **NOTE:** Once the side air curtain module retaining straps have been detached the side air curtain module must be replaced.
  - **NOTE:** Make sure the side air curtain module is correctly located.
  - **NOTE:** Ensure the fill tube between the canister and the side air curtain is not twisted.
  - **NOTE:** Make sure the tethers are correctly routed.

To install, reverse the removal procedure.
  - Tighten to 9 Nm.

Uni-Body, Subframe and Mounting System - Frame Assembly

Description and Operation

The front subframe is bolted to the body and aids in structural support. The subframe provides the mounting surface for the steering gear, the front suspension lower arms, the stabilizer bar and the engine mounts.

The rear subframe is bolted to the body and aids in structural support. The subframe provides the mounting surface for the rear suspension components, the exhaust hanger insulators and the rear drive differential.

**Removal**

1. **NOTE:** Right-hand shown left-hand similar. Support the radiator.

2. Reposition the dipstick tube.
   - Remove the dipstick tube retaining bolt.
3. **NOTE: Left-hand shown, right-hand similar.**
   Loosen the exhaust manifold retaining nut.

4. **NOTE: Left-hand shown, right-hand similar.**
   Install the special tool to the exhaust manifold.
   - Install the retaining bolt.

5. **NOTE: Left-hand shown, right-hand similar.**
   Install the retaining bolt.

6. Install the special tool support bars to the special tool.

7. Install the special tool.
8. Remove the radiator splash shield.

9. Remove both the front wheel and tires. For additional information, refer to: Wheel and Tire (204-04 Wheels and Tires, Removal and Installation).

10. Remove the air deflector.

11. NOTE: Left-hand shown, right-hand similar. Remove the stabilizer bar link retaining nut.

12. NOTE: Left-hand shown, right-hand similar. Remove the stabilizer bar link.

13. Detach the steering gear.
14. **NOTE:** Left-hand shown, right-hand similar.
    Detach the front lower arm.

15. **NOTE:** Left-hand shown, right-hand similar.
    Detach the rear lower arm.

16. **NOTE:** Left-hand shown, right-hand similar.
    Detach the engine mount.

17. Install the special tool.

18. **NOTE:** Left-hand shown, right-hand similar.
    Remove the front subframe front retaining bolt.
19. NOTE: Left-hand shown, right-hand similar.
Remove the front subframe rear retaining bolts.

20. Remove the front subframe.

**Installation**

1. Install the front subframe.

2. NOTE: Left-hand shown, right-hand similar.
Install the special tool.
3. NOTE: Left-hand shown, right-hand similar.
   Install the front subframe rear retaining bolts.
   - Tighten to 80 Nm + 240°.

4. Remove the special tool.

5. Install the front subframe front retaining bolt.
   - Tighten to 150 Nm + 240°.

6. Remove the special tool.

7. Install the front subframe front retaining bolt.
   - Tighten to 150 Nm + 240°.
8. Remove the special tool.

9. NOTE: Left-hand shown, right-hand similar.
   Install the engine mount.
   • Tighten to 63 Nm.

10. CAUTION: The final tightening of the rear lower arm inner retaining nut and bolt must be carried out with the vehicle on its wheels.
    • NOTE: Left-hand shown, right-hand similar.
    Install the rear lower arm.

11. CAUTION: The final tightening of the front lower arm inner retaining nut and bolt must be carried out with the vehicle on its wheels.
    • NOTE: Left-hand shown, right-hand similar.
    Install the front lower arm.

12. Install the steering gear.
    • Tighten to 100 Nm.
13. NOTE: Left-hand shown, right-hand similar.
Install the stabilizer bar link.

14. NOTE: Left-hand shown, right-hand similar.
Attach the stabilizer bar link.

- Tighten to 43 Nm.

15. Check the front subframe alignment.
16. Install both the front wheel and tires.
   For additional information, refer to: Wheel and Tire (204-04 Wheels and Tires, Removal and Installation).
17. Install the radiator splash shield.

18. Install the air deflector.
19. **CAUTION:** The final tightening of the rear lower arm inner retaining nut and bolt must be carried out with the vehicle on its wheels.
   • **NOTE:** Left-hand shown, right-hand similar.
   
   Tighten to 175 Nm.

20. **CAUTION:** The final tightening of the front lower arm inner retaining nut and bolt must be carried out with the vehicle on its wheels.
   
   • **NOTE:** Left-hand shown, right-hand similar.
   
   Tighten to 175 Nm.

21. **NOTE:** Left-hand shown, right-hand similar.

   
   Tighten to 70 Nm.

22. Remove the special tool.
   
   • Loosen the special tool adjustment bolts.

23. Remove the special tool support bars from the special tool.
24. **NOTE:** Left-hand shown, Right-hand similar.
Remove the retaining bolt.

25. **NOTE:** Left-hand shown, Right-hand similar.
Remove the special tool from the exhaust manifold.
- Remove the retaining bolt.

26. **NOTE:** Left-hand shown, Right-hand similar.
Tighten the exhaust manifold retaining nut.
- Tighten to 20 Nm.

27. Reposition the dipstick tube.
- Tighten to 10 Nm.

28. **NOTE:** Right-hand shown left-hand similar.
Remove the radiator support.
## Uni-Body, Subframe and Mounting System - Front Subframe 2.7L V6 - TdV6

### Removal

**All vehicles**

1. **NOTE: Right-hand shown, left-hand similar.**

   Using suitable tie strap(s), support the radiator.

2. Remove the intake air shutoff throttle.

   For additional information, refer to: [Intake Air Shutoff Throttle](#) (303-04C Fuel Charging and Controls - 2.7L V6 - TdV6, Removal and Installation).

3. Install the special tool.
4. Install the special tool.

5. Remove the air deflector.  
   For additional information, refer to: Air Deflector (501-02 Front End Body Panels, Removal and Installation).

6. Remove the radiator splash shield.  
   For additional information, refer to: Radiator Splash Shield (501-02 Front End Body Panels, Removal and Installation).

7. Remove both the front wheel and tires.  
   For additional information, refer to: Wheel and Tire (204-04 Wheels and Tires, Removal and Installation).

Vehicles with automatic transmission

8. Remove the transmission fluid cooler.  
   For additional information, refer to: Transmission Fluid Cooler (307-02 Transmission/Transaxle Cooling, Removal and Installation).

All vehicles

9. Remove the right-hand splash shield.

10. Detach the engine coolant inlet pipe from the front subframe.

11. Detach the power steering hose retaining clip from the front subframe.
12. NOTE: Left-hand shown, right-hand similar.
Remove the stabilizer bar link upper retaining nut.

13. NOTE: Left-hand shown, right-hand similar.
Remove the stabilizer bar link lower retaining bolt and nut and remove the stabilizer bar link.

14. CAUTION: The steering gear must be supported. Failure to follow this instruction may result in damage to the steering gear.
Detach the steering gear.

15. NOTE: Left-hand shown, right-hand similar.
Remove the front lower arm and position it to one side.

16. NOTE: Left-hand shown, right-hand similar.
Remove the rear lower arm and position it to one side.
17. NOTE: Left-hand shown, right-hand similar.
   Remove the engine mount retaining nut.

18. Install the special tool to the front subframe.

19. NOTE: Left-hand shown, right-hand similar.
   Remove the front subframe front retaining bolt.

20. NOTE: Left-hand shown, right-hand similar.
   Remove the front subframe rear retaining bolt.

21. CAUTION: When lowering the special tool care must be taken to manoeuvre the special tool so that the front subframe does not touch the air conditioning (A/C) pipes. Failure to follow this instruction may result in damage to the A/C pipes.
   Remove the front subframe.
1. **CAUTION:** When raising the special tool care must be taken to manoeuvre the special tool so that the front subframe does not touch the air conditioning (A/C) pipes. Failure to follow this instruction may result in damage to the A/C pipes.

   Install the front subframe.

2. **NOTE:** Left-hand shown, right-hand similar.

   Install the special tool.

3. **NOTE:** Left-hand shown, right-hand similar.

   Install the front subframe rear retaining bolt.
   - 80 Nm + 240°.

4. Remove the special tool.
5. Install the front subframe front retaining bolt.
   - Tighten to 150 Nm + 240°.

6. Remove the special tool.

7. Install the front subframe front retaining bolt.
   - Tighten to 150 Nm + 240°.

8. Remove the special tool.

9. NOTE: Left-hand shown, right-hand similar.
    Install the engine mount retaining nut.
    - Tighten to 63 Nm.
10. **CAUTION:** The final tightening of the rear lower arm inner retaining nut and bolt must be carried out with the vehicle on its wheels.

• **NOTE:** Left-hand shown, right-hand similar.

Install the rear lower arm.

11. **CAUTION:** The final tightening of the front lower arm inner retaining nut and bolt must be carried out with the vehicle on its wheels.

• **NOTE:** Left-hand shown, right-hand similar.

Install the front lower arm.

12. Install the steering gear.

• Tighten to 100 Nm.

13. Install the stabilizer bar link.

14. Attach the stabilizer bar link and install the stabilizer bar link retaining nut.

• Tighten to 43 Nm.
15. Attach the power steering hose retaining clip to the front subframe.

16. Attach the engine coolant inlet pipe to the front subframe.

17. Install the right-hand splash shield.

Vehicles with automatic transmission

18. Install the transmission fluid cooler.
   For additional information, refer to: Transmission Fluid Cooler (307-02 Transmission/Transaxle Cooling, Removal and Installation).

All vehicles

19. Install both the front wheel and tires.
   For additional information, refer to: Wheel and Tire (204-04 Wheels and Tires, Removal and Installation).

20. Install the radiator splash shield.
    For additional information, refer to: Radiator Splash Shield (501-02 Front End Body Panels, Removal and Installation).

21. Install the air deflector.
    For additional information, refer to: Air Deflector (501-02 Front End Body Panels, Removal and Installation).

22. **CAUTION:** The final tightening of the rear lower arm inner retaining nut and bolt must be carried out with the vehicle on its wheels.
    • NOTE: Left-hand shown, right-hand similar.
    Tighten to 175 Nm.
23. **CAUTION:** The final tightening of the front lower arm inner retaining nut and bolt must be carried out with the vehicle on its wheels.

- **NOTE:** Left-hand shown, right-hand similar.
  
  Tighten to 175 Nm.

24. **NOTE:** Left-hand shown, right-hand similar.
  
  Tighten to 70 Nm.

25. Remove the special tool.

26. Remove the special tool.

27. Install the intake air shutoff throttle.

For additional information, refer to: Intake Air Shutoff Throttle (303-04C Fuel Charging and Controls - 2.7L V6 - TdV6, Removal and Installation).
28. NOTE: Right-hand shown left-hand similar.
Remove the tie strap(s).

### Removal

**All vehicles**

1. **NOTE:** Right-hand shown left-hand similar.

   Support the radiator.

### Vehicles with 4.2L engine without supercharger

2. Remove the throttle body.

   For additional information, refer to: [Throttle Body - Vehicles With: Supercharger, VIN Range: M45255->N52047](303-04B Fuel Charging and Controls - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Removal and Installation).

**All vehicles**
3. NOTE: Vehicles with 4.2L engine without supercharger shown, Vehicles with 4.2L engine with supercharger similar.
   Install the special tools.

4. NOTE: Vehicles with 4.2L engine with supercharger shown, Vehicles with 4.2L engine without supercharger similar.
   • NOTE: Right-hand shown, Left-hand similar.
   Install the special tool.

5. Remove the radiator splash shield.

6. Remove both the front wheel and tires.
   For additional information, refer to: Wheel and Tire (204-04 Wheels and Tires, Removal and Installation).
7. Remove the air deflector.

8. NOTE: Left-hand shown, right-hand similar.
   Remove the stabilizer bar link retaining nut.

9. NOTE: Left-hand shown, right-hand similar.
   Remove the stabilizer bar link.

10. Detach the steering gear.

11. NOTE: Left-hand shown, right-hand similar.
    Detach the front lower arm.
12. NOTE: Left-hand shown, right-hand similar.
   Detach the rear lower arm.

13. NOTE: Left-hand shown, right-hand similar.
   Detach the engine mount.

14. Install the special tool.

15. NOTE: Left-hand shown, right-hand similar.
   Remove the front subframe front retaining bolt.

16. NOTE: Left-hand shown, right-hand similar.
   Remove the front subframe rear retaining bolts.
Installation
All vehicles

1. Install the front subframe.

2. NOTE: Left-hand shown, right-hand similar.
   Install the special tool.

3. NOTE: Left-hand shown, right-hand similar.
   Install the front subframe rear retaining bolts.
   - Tighten to 80 Nm + 240°.
4. Remove the special tool.

5. Install the front subframe front retaining bolt.
   • Tighten to 150 Nm + 240°.

6. Remove the special tool.

7. Install the front subframe front retaining bolt.
   • Tighten to 150 Nm + 240°.

8. Remove the special tool.
9. NOTE: Left-hand shown, right-hand similar.
   Install the engine mount.
   • Tighten to 63 Nm.

10. CAUTION: The final tightening of the rear lower arm inner retaining nut and bolt must be carried out with the vehicle on its wheels.
    • NOTE: Left-hand shown, right-hand similar.
    Install the rear lower arm.

11. CAUTION: The final tightening of the front lower arm inner retaining nut and bolt must be carried out with the vehicle on its wheels.
    • NOTE: Left-hand shown, right-hand similar.
    Install the front lower arm.

12. Install the steering gear.
    • Tighten to 100 Nm.

13. Install the stabilizer bar link.
14. Attach the stabilizer bar link.
   • Tighten to 43 Nm.

15. Check the front subframe alignment.

16. Install both the front wheel and tires.
    For additional information, refer to: Wheel and Tire (204-04 Wheels and
    Tires, Removal and Installation).

17. Install the radiator splash shield.

18. Install the air deflector.

19. CAUTION: The final tightening of the rear lower arm inner
    retaining nut and bolt must be carried out with the vehicle on its wheels.
    • NOTE: Left-hand shown, right-hand similar.
    Tighten to 175 Nm.
20. **CAUTION:** The final tightening of the front lower arm inner retaining nut and bolt must be carried out with the vehicle on its wheels.

- **NOTE:** Left-hand shown, right-hand similar.

  Tighten to 175 Nm.

21. **NOTE:** Left-hand shown, right-hand similar.

  Tighten to 70 Nm.

22. **NOTE:** Vehicles with 4.2L engine with supercharger shown, Vehicles with 4.2L engine without supercharger similar.

  - **NOTE:** Right-hand shown, Left-hand similar.

  Remove the special tool.

  - Loosen the special tool adjustment bolts.

23. **NOTE:** Vehicles with 4.2L engine without supercharger shown, Vehicles with 4.2L engine with supercharger similar.

  Remove the special tools.
Vehicles with 4.2L engine without supercharger

24. Install the throttle body.
   For additional information, refer to: Throttle Body - Vehicles With: Supercharger, VIN Range: M45255->N52047 (303-04B Fuel Charging and Controls - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Removal and Installation).

All vehicles

25. NOTE: Right-hand shown left-hand similar.

Remove the radiator support.

</thead>
<tbody>
<tr>
<td>HTJ1200-2</td>
</tr>
</tbody>
</table>

**Removal**

1. Drain the right-hand fuel tank saddle.  
   For additional information, refer to: **Fuel Tank Draining - VIN Range: N52048->N999999** (310-00 Fuel System - General Information, General Procedures).

2. Remove the exhaust system.  
   For additional information, refer to: **Exhaust System - V8 4.2L Petrol/V8 S/C 4.2L Petrol/2.5L NA V6 - AJV6/3.0L NA V6 - AJ27** (309-00 Exhaust System, Removal and Installation).

3. Remove the axle assembly.  
   For additional information, refer to: **Axle Assembly - Vehicles Without: Differential Drain Plug** (205-02 Rear Drive Axle/Differential, Removal and Installation).

4. Remove both the upper arms.  
   For additional information, refer to: **Upper Arm** (204-02 Rear Suspension, Removal and Installation).

5. Disconnect the electric parking brake electrical connector.

6. Detach the wiring harness.

7. Detach the fuel filler hose.
8. NOTE: Right-hand shown, left-hand similar.
   Detach the shock absorber.

9. NOTE: Left-hand shown, right-hand similar.
   Remove the rear subframe reinforcement plate retaining bolts.

10. Install the special tool to support the rear subframe.

11. NOTE: Left-hand shown, right-hand similar.
    Remove the rear subframe rear retaining bolt.

12. NOTE: Left-hand shown, right-hand similar.
    Remove the rear subframe front retaining bolt.
13. Remove the rear subframe.

**Installation**

1. Install the rear subframe.

2. **NOTE:** Left-hand shown, right-hand similar.
   Loosely install the rear subframe front bolt.

3. Loosely install the rear subframe reinforcement plate bolts

4. Tighten to 125 Nm.
5. NOTE: Left-hand shown, right-hand similar.
Install the rear subframe rear retaining bolt.
- Tighten to 125 Nm.

6. Remove the special tool.

7. NOTE: Left-hand shown, right-hand similar.
Install the rear subframe reinforcement plate retaining bolts.
- Tighten to 47 Nm.

8. NOTE: Right-hand shown, left-hand similar.
Install the shock absorber.
1. Tighten to 133 Nm.

9. Install the fuel filler hose.
10. Install the wiring harness.

11. Connect the electric parking brake electrical connector.

12. Install both upper arms. For additional information, refer to: Upper Arm (204-02 Rear Suspension, Removal and Installation).

13. Install the axle assembly. For additional information, refer to: Axle Assembly - Vehicles Without: Differential Drain Plug (205-02 Rear Drive Axle/Differential, Removal and Installation).

14. Install the exhaust system. For additional information, refer to: Exhaust System - V8 4.2L Petrol/V8 S/C 4.2L Petrol/2.5L NA V6 - AJV6/3.0L NA V6 - AJ27 (309-00 Exhaust System, Removal and Installation).

15. Refill the fuel tank.

16. Carry out rear toe adjustment. For additional information, refer to: Rear Toe Adjustment (204-00 Suspension System - General Information, General Procedures). Carry out front toe adjustment. For additional information, refer to: Front Toe Adjustment (204-00 Suspension System - General Information, General Procedures).
