TABLE OF CONTENTS

1: General Information

100: Service Information

100-00: General Information
  Description and Operation
    About This Manual
    Application and Use of Specifications
    General Service Information
    Health and Safety Precautions
    How To Use This Manual
    Important Safety Instructions
    Road/Roller Testing
    Solvents, Sealants and Adhesives
    Standard Workshop Practices

100-01: Identification Codes
  Description and Operation
    Identification Codes - VIN Range: M45255->N52047
    Identification Codes - VIN Range: N52048->N99999

100-02: Jacking and Lifting
  Description and Operation
    Jacking
    Lifting

100-04: Noise, Vibration and Harshness
  Description and Operation
    Noise, Vibration and Harshness (NVH)
  Diagnosis and Testing
    Noise, Vibration and Harshness (NVH)
  General Procedures
    Exhaust System Neutralizing
2: Chassis

204: Suspension

204-00: Suspension System - General Information

Specification

Description and Operation

Wheel Alignment Angles

Diagnosis and Testing

Suspension System

General Procedures

Camber and Caster Adjustment

Four-Wheel Alignment

Front Toe Adjustment (57.65.01)

Rear Toe Adjustment (57.65.08)

Wheel Bearing Inspection

204-01: Front Suspension

Specification

Description and Operation

Front Suspension

Diagnosis and Testing

Front Suspension

Removal and Installation

Front Lower Arm (60.35.53)

Rear Lower Arm (60.35.54)

Rear Lower Arm Bushing (60.35.56)

Shock Absorber and Spring Assembly (60.30.02)

Shock Absorber Bushing (60.30.16) (60.30.23)

Front Stabilizer Bar (60.10.01) - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27

Front Stabilizer Bar (60.10.01) - 2.7L V6 - TdV6

Front Stabilizer Bar (60.10.01) - V8 4.2L Petrol/V8 S/C 4.2L Petrol

Front Stabilizer Bar Link (60.10.02)

Stabilizer Bar Link Bushing (60.10.03)

Upper Arm LH (60.35.41)

Upper Arm RH (60.35.42)

Front Wheel Bearing and Wheel Hub (60.25.03)

Wheel Knuckle (60.25.23)
Disassembly and Assembly
Shock Absorber and Spring Assembly (60.30.21)

204-02: Rear Suspension

Specification
Description and Operation
Rear Suspension

Diagnosis and Testing
Rear Suspension

Removal and Installation
Lower Arm (64.35.43)
Shock Absorber and Spring Assembly
Shock Absorber Lower Bushing (64.30.39)
Rear Stabilizer Bar (64.35.08)
Upper Arm (64.25.31)
Rear Wheel Bearing (64.15.14)

Disassembly and Assembly
Shock Absorber and Spring Assembly

204-04: Wheels and Tires

Specification
Description and Operation
Wheels and Tires

Diagnosis and Testing
Wheels and Tires

Removal and Installation
Wheel and Tire (74.20.05)

204-05: Vehicle Dynamic Suspension

Description and Operation
Vehicle Dynamic Suspension

Diagnosis and Testing
Vehicle Dynamic Suspension

Removal and Installation
Accelerometer (86.56.54)
Adaptive Damping Module (86.56.35)
Front Vertical Accelerometer (86.56.53)
Rear Vertical Accelerometer (86.56.55)
205: Driveline

205-00: Driveline System - General Information
Description and Operation
Driveline System

Diagnosis and Testing
Driveline System

General Procedures
Driveline Angle Inspection

205-01: Driveshaft
Specification

Description and Operation
Driveshaft

Diagnosis and Testing
Driveshaft

General Procedures
Driveshaft Runout and Balancing

Removal and Installation
Driveshaft (47.15.01)

205-02: Rear Drive Axle/Differential
Specification

Description and Operation
Rear Drive Axle and Differential

Diagnosis and Testing
Rear Drive Axle and Differential

In-Vehicle Repair
Drive Pinion Seal (51.20.01)

Removal and Installation
Axle Assembly (51.25.13) - Vehicles Without: Differential Drain Plug
Axle Assembly (51.25.13) - Vehicles With: Differential Drain Plug
Axle Housing Bushing (64.25.30)
205-05: Rear Drive Halfshafts

Specification

Description and Operation
Rear Drive Halfshafts

Diagnosis and Testing
Rear Drive Halfshafts

Removal and Installation
Rear Halfshaft (47.10.13)
Inner Constant Velocity (CV) Joint Boot (47.10.33)
Outer Constant Velocity (CV) Joint Boot (47.10.32)

206: Brake System

206-00: Brake System - General Information

Specification - VIN Range: M45255->N52047
Specification - VIN Range: N52048->N99999

Description and Operation
Brake System - VIN Range: M45255->N52047
Brake System - VIN Range: N52048->N99999

Diagnosis and Testing
Brake System

General Procedures
Brake Disc Runout Check
Brake System Bleeding (70.25.03) - VIN Range: M45255->N52047
Brake System Bleeding (70.25.03) - VIN Range: N52048->N99999

206-03: Front Disc Brake

Specification - VIN Range: M45255->N52047
Specification - VIN Range: N52048->N99999

Description and Operation
Front Disc Brake - VIN Range: M45255->N52047
Front Disc Brake - VIN Range: N52048->N99999

Diagnosis and Testing
Front Disc Brake

Removal and Installation
Brake Disc Shield (70.10.18) - Vehicles With: Standard Brakes

206-04: Rear Disc Brake
Description and Operation

Rear Disc Brake - VIN Range: M45255->N52047
Rear Disc Brake - VIN Range: N52048->N99999

Diagnosis and Testing

Rear Disc Brake

Removal and Installation

Brake Caliper (70.55.03) (70.55.25) - VIN Range: N52048->N99999
Brake Disc (70.10.11) - VIN Range: N52048->N99999
Brake Disc Shield (70.10.19)
Brake Pads (70.40.03) - VIN Range: N52048->N99999

206-05: Parking Brake and Actuation

Specification

Description and Operation

Parking Brake

Diagnosis and Testing

Parking Brake - VIN Range: M45255->N13088
Parking Brake - VIN Range: N13089->N52047
Parking Brake - VIN Range: N52048->N99999

General Procedures

Parking Brake Cable Tension Release

Removal and Installation

Parking Brake Cable (70.35.29)
Parking Brake Module (70.35.47)
Parking Brake Pads (70.40.04) - Vehicles With: High Performance Brakes
Parking Brake Release Actuator (70.35.45)
Parking Brake Switch (70.35.46)

206-06: Hydraulic Brake Actuation

Specification

Description and Operation

Hydraulic Brake Actuation

Diagnosis and Testing

Hydraulic Brake Actuation

Removal and Installation
Brake Fluid Reservoir (70.30.16) - V8 4.2L Petrol/V8 S/C 4.2L Petrol/2.5L NA V6 – AJV6/3.0L NA V6 - AJ27
Brake Fluid Reservoir (70.30.16) - 2.7L V6 - TdV6
Brake Master Cylinder (70.30.08) - V8 4.2L Petrol/V8 S/C 4.2L Petrol/2.5L NA V6 – AJV6/3.0L NA V6 - AJ27
Brake Master Cylinder (70.30.08) - 2.7L V6 - TdV6

206-07: Power Brake Actuation
Specification
Description and Operation
  Brake Booster
Diagnosis and Testing
  Power Brake System
Removal and Installation
  Brake Booster (70.50.17)
  Brake Vacuum Pump - 2.7L V6 - TdV6

206-09: Anti-Lock Control - Stability Assist
Specification
Description and Operation
  Anti-Lock Control - Stability Assist - VIN Range: M45255->N52047
  Anti-Lock Control - Stability Assist - VIN Range: N52048->N99999
Diagnosis and Testing
  Anti-Lock Control - Stability Assist - VIN Range: M45255->N52206
  Anti-Lock Control - Stability Assist - VIN Range: N52207->N99999
Removal and Installation
  Anti-Lock Brake System (ABS) Module (70.60.02)
  Brake Master Cylinder Pressure Transducer
  Brake Pedal Travel Sensor - VIN Range: M45255->N52206
  Front Wheel Speed Sensor (70.60.03)
  Hydraulic Control Unit (HCU) (70.60.18) (70.60.19) - VIN Range: M45255->N52206
  Hydraulic Control Unit (HCU) (70.60.18) (70.60.19) - VIN Range: N52207->N99999
  Rear Wheel Speed Sensor (70.60.04)
  Steering Wheel Rotation Sensor (86.56.58)
  Yaw Rate Sensor and Accelerometer (86.56.64)
211: Steering System

211-00: Steering System - General Information

- Specification
- Description and Operation
  - Steering System
- Diagnosis and Testing
  - Steering System

General Procedures
  - Power Steering System Bleeding (57.15.02)
  - Power Steering System Flushing (57.15.08)

211-02: Power Steering

- Specification
- Description and Operation
  - Power Steering
- Diagnosis and Testing
  - Power Steering

Removal and Installation
  - Power Steering Control Valve Actuator (57.10.32) - Vehicles Built From: 02/2004
  - Power Steering Control Valve Actuator (57.10.32) - Vehicles Built Up To: 01/2004
  - Power Steering Fluid Cooler (57.15.11) - V8 4.2L Petrol/V8 S/C 4.2L Petrol/2.5L NA V6 - AJV6/3.0L NA V6 - AJ27
  - Power Steering Fluid Cooler (57.15.11) - 2.7L V6 - TdV6
  - Power Steering Fluid Reservoir (57.15.08)
  - Power Steering Pump (57.20.14) - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27
  - Power Steering Pump (57.20.14) - 2.7L V6 - TdV6
  - Power Steering Pump (57.20.14) - 2.7L V6 - TdV6
  - Power Steering Pump (57.20.14) - V8 4.2L Petrol/V8 S/C 4.2L Petrol
  - Steering Gear (57.10.01)
  - Steering Gear Bushing (57.10.30)

211-03: Steering Linkage

- Specification
- Description and Operation
  - Steering Linkage
- Diagnosis and Testing
  - Steering Linkage
Removal and Installation
  Steering Gear Boot (57.10.29)
  Tie Rod End (57.55.02)

211-04: Steering Column
  Specification
  Description and Operation
    Steering Column
  Diagnosis and Testing
    Steering Column
  Removal and Installation
    Ignition Switch Lock Cylinder (57.40.29)
    Steering Column (57.40.01)
    Steering Wheel (57.60.01)

Disassembly and Assembly
  Steering Column

211-05: Steering Column Switches
  Description and Operation
    Steering Column Switches
  Diagnosis and Testing
    Steering Column Switches
  Removal and Installation
    Steering Column Lock Actuator (57.40.41)
    Steering Column Multifunction Switch LH (86.65.78)
    Steering Column Multifunction Switch RH (86.65.41)
3: Powertrain

303: Engine

303-00: Engine System - General Information
   Diagnosis and Testing
   Engine - V8 4.2L Petrol/V8 S/C 4.2L Petrol/2.5L NA V6 - AJV6/3.0L NA V6 - AJ27
   Engine - 2.7L V6 - TdV6
   General Procedures
   Bearing Inspection
   Camshaft Bearing Journal Clearance
   Camshaft Bearing Journal Diameter
   Camshaft End Play
   Camshaft Lobe Lift
   Camshaft Surface Inspection
   Connecting Rod Cleaning
   Connecting Rod Large End Bore
   Crankshaft End Play
   Crankshaft Main Bearing Journal Clearance - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27
   Crankshaft Main Bearing Journal Clearance - V8 4.2L Petrol/V8 S/C 4.2L Petrol
   Cylinder Bore Out-of-Round
   Cylinder Head Distortion
   Exhaust Manifold Cleaning and Inspection
   Piston Inspection
   Piston Pin Diameter
   Piston Pin to Bore Diameter
   Piston Ring End Gap
   Piston Ring-to-Groove Clearance
   Valve Spring Free Length
   Valve Stem Diameter
   Leakage Test Using Smoke Test Equipment

**Removal and Installation**
- Exhaust Gas Recirculation (EGR) Valve (17.45.01)
- Exhaust Manifold to Exhaust Gas Recirculation (EGR) Valve Tube (17.45.11)
- Secondary Air Injection (AIR) Control Valve - 3.0L
- Secondary Air Injection (AIR) Control Valve - 4.2L, Vehicles Without: Supercharger
- Secondary Air Injection (AIR) Control Valve - 4.2L, Vehicles With: Supercharger
- Secondary Air Injection (AIR) Control Valve to Exhaust Manifold Tube LH - 3.0L
- Secondary Air Injection (AIR) Control Valve to Exhaust Manifold Tube RH - 3.0L
- Secondary Air Injection (AIR) Control Valve to Exhaust Manifold Tube - 4.2L, Vehicles Without: Supercharger
- Secondary Air Injection (AIR) Control Valve to Exhaust Manifold Tube - 4.2L, Vehicles With: Supercharger
- Secondary Air Injection (AIR) Pump

**303-08B: Engine Emission Control - 2.7L V6 - TdV6**

**Specification**

**Description and Operation**
- Engine Emission Control

**Diagnosis and Testing**
- Engine Emission Control

**Removal and Installation**
- Exhaust Gas Recirculation (EGR) Valve LH
- Exhaust Gas Recirculation (EGR) Valve Outlet Tube (17.45.11)
- Exhaust Gas Recirculation (EGR) Valve RH

**303-12A: Intake Air Distribution and Filtering - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27**

**Specification**

**Description and Operation**
- Intake Air Distribution and Filtering

**Diagnosis and Testing**
- Intake Air Distribution and Filtering - VIN Range: M45255->N13088
- Intake Air Distribution and Filtering - VIN Range: N13089->N52047
Intake Air Distribution and Filtering - VIN Range: N52048->N99999

Removal and Installation
Air Cleaner (19.10.05)
Air Cleaner Element (19.10.08)
Air Cleaner Outlet Pipe (19.10.31) - VIN Range: M45255->N52047
Air Cleaner Outlet Pipe (19.10.31) - VIN Range: N52048->N99999

303-12B: Intake Air Distribution and Filtering - V8 4.2L Petrol/V8 S/C 4.2L Petrol

Specification
Description and Operation
Intake Air Distribution and Filtering

Diagnosis and Testing
Intake Air Distribution and Filtering - VIN Range: M45255->N13088
Intake Air Distribution and Filtering - VIN Range: N13089->N52047
Intake Air Distribution and Filtering - VIN Range: N52048->N99999

Removal and Installation
Air Cleaner (19.10.05)
Air Cleaner Element (19.10.08)
Air Cleaner Outlet Pipe (19.10.31)
Charge Air Cooler
Supercharger (18.50.15) - VIN Range: M45255->N52047
Supercharger (18.50.15) - VIN Range: N52048->N99999
Supercharger Outlet Pipe (18.50.16)

303-12C: Intake Air Distribution and Filtering - 2.7L V6 - TdV6

Specification
Description and Operation
Intake Air Distribution and Filtering

Diagnosis and Testing
Intake Air Distribution and Filtering

Removal and Installation
Air Cleaner (19.10.05)
Air Cleaner Element (19.10.08)
Charge Air Cooler

303-13: Evaporative Emissions
Specification
Description and Operation
Evaporative Emissions - VIN Range: M45255->N52047
Evaporative Emissions - VIN Range: N52048->N99999

Diagnosis and Testing
Evaporative Emissions - VIN Range: M45255->N52047
Evaporative Emissions - VIN Range: N52048->N99999

Removal and Installation
Evaporative Emission Canister (17.15.13) - VIN Range: M45255->N52047
Evaporative Emission Canister (17.15.13) - VIN Range: N52048->N99999
Evaporative Emission Canister Purge Valve (17.15.30) - VIN Range: M45255->N52047
Evaporative Emission Canister Vent Solenoid (17.15.45)
Fuel Tank Pressure Sensor (19.55.31) - Vehicles Built Up To: 01/2004

303-14A: Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27

Specification

Description and Operation
Electronic Engine Controls

Diagnosis and Testing
Electronic Engine Controls - VIN Range: M45255->N52047
Electronic Engine Controls - VIN Range: N52048->N80180
Electronic Engine Controls - VIN Range: N80181->R99999

General Procedures
Powertrain Control Module (PCM) Long Drive Cycle Self-Test
Powertrain Control Module (PCM) Short Drive Cycle Self-Test

Removal and Installation
Brake Pedal Position (BPP) Switch
Camshaft Position (CMP) Sensor LH (18.31.12)
Camshaft Position (CMP) Sensor RH (18.31.11)
Catalyst Monitor Sensor (18.30.66)
Crankshaft Position (CKP) Sensor (18.30.12)
Engine Control Module (ECM) (18.30.01)
Engine Coolant Temperature (ECT) Sensor (18.30.10) - VIN Range: M45255->N52047
Engine Coolant Temperature (ECT) Sensor (18.30.10) - VIN Range: N52048->N99999
Fuel Temperature Sensor (18.30.99)
Heated Oxygen Sensor (HO2S)
Intake Manifold Tuning (IMT) Valve LH (19.70.30)
Knock Sensor (KS) LH (18.30.92)
Knock Sensor (KS) RH (18.30.93)
Manifold Absolute Pressure (MAP) Sensor (18.30.86)
Mass Air Flow (MAF) Sensor (18.30.15)
Oil Temperature Sensor (18.31.01)
Variable Camshaft Timing (VCT) Oil Control Solenoid (18.30.90)

303-14B: Electronic Engine Controls - V8 4.2L Petrol/V8 S/C 4.2L Petrol

Specification

Description and Operation
Electronic Engine Controls

Diagnosis and Testing
Electronic Engine Controls - VIN Range: M45255->N52047

Rear Subframe Rear Bushing (64.25.36)
Notes, Cautions and Warnings

Throughout this manual, important information is highlighted by the use of notes, cautions and warnings. NOTES give additional information on a topic or procedure, CAUTIONS are given to prevent damage to the vehicle, and WARNINGS are given to prevent personal injury.
Torque Specifications

Torque specifications are shown in the torque specifications chart located at the front of the relevant section.
Reparis and Replacements

When service parts are required, it is essential that only genuine Jaguar/Daimler replacements are used.

Attention is drawn to the following points concerning repairs and the fitting of replacement parts and accessories:

- Safety features embodied in the vehicle may be impaired if other than genuine parts are fitted. In certain territories, legislation prohibits the fitting of parts which are not produced to the vehicle manufacturer's specification.
- Torque wrench setting figures given in this manual must be strictly adhered to. Locking devices, where specified, must be fitted. If the efficiency of a locking device is impaired during removal it must be renewed.
- Owners purchasing accessories while travelling abroad should make sure that the accessory and its fitted location on the vehicle conform to mandatory requirements existing in their country of origin.
- The vehicle warranty may be invalidated by the fitting of other than genuine Jaguar/Daimler parts. All Jaguar/Daimler replacements have the full backing of the factory warranty.
- Jaguar/Daimler dealers are obliged to supply only genuine service parts.

Vehicle Specifications

Purchasers are advised that the specification details set out in this manual apply to a range of vehicles and not to any specific one. For the specification of a particular vehicle, purchasers should consult their dealer.

The Manufacturer reserves the right to vary the specifications, with or without notice, and at such times and in such manner as the Manufacturer thinks fit. Major as well as minor changes may be involved, in accordance with the Manufacturer's policy of continuous improvement.

Whilst every effort is made to make sure the accuracy of the particulars contained in this manual, neither the Manufacturer nor the Dealer, by whom the manual is supplied, shall in any circumstances be held liable for any inaccuracy or the consequences thereof.

Service Repair Operation Numbering

A master index of numbered operations has been compiled for universal application to all vehicles manufactured by Jaguar Cars Ltd.

Each operation is allocated a number from the master index and cross-refers with an identical number in the Repair Operation Times schedule. The number consists of six digits arranged in three pairs.

Each maintenance procedure in this manual is described in the sequence necessary to complete the operation in the minimum time, as specified in the Repair Operation Times schedule.

References to Bank-1 and Bank-2

References to Bank-1 and Bank-2 are made with regard to the engine. When viewed from the flywheel the right-hand bank will be Bank-1 and the left-hand bank will be Bank-2.

Special Tools

Any special tools and equipment required to perform a maintenance procedure, are shown at the beginning of each procedure. When possible, illustrations are given to assist in identifying the tool needed.

Disconnecting/Connecting the Battery

Always stop the engine before disconnecting the battery negative lead and make sure the battery positive lead is isolated i.e. wrapped in a suitable cloth.

WARNING: Radio code saving devices must not be used when conducting work on Air Bag or Fuel systems. It must be noted that, when using these devices, the vehicle electrical system is still live albeit with a reduced current flow.

• NOTE: Before disconnecting the battery make sure that the radio receiver/cassette player/mini disc player and compact disc player keycodes are known and, that no data is required from the engine control module (ECM) as battery disconnection will erase any fault codes and idle/drive values held in the Keep Alive Memory (KAM). It is not necessary to disconnect or remove electronic control modules. Always disconnect the battery before commencing repair operations which require:
  - The vehicle to be jacked up
  - Work on the engine
  - Work underneath the vehicle
  - Arc welding

Alternatively a Radio Code Saver may be used. With the battery disconnected, a Radio Code Saver will allow sufficient current to pass to maintain the radio receiver/cassette player/mini disc player and compact disc player memory, operate the clock and supply the door operated interior lights while isolating the battery in the event of a short circuit.

Reconnecting the Battery

WARNING: If the battery has been on bench charge the cells may be giving off explosive hydrogen gas. Avoid creating sparks, and if in doubt cover the vent plugs or covers with a damp cloth.

Always make sure that all electrical systems are switched OFF before reconnecting the battery to avoid causing sparks or damage to sensitive electrical equipment.

Always reconnect the battery positive lead first and the negative last, ensuring that there is a good electrical contact and the battery terminals are secure.

Restart the clock (where fitted) and set it to the correct time.
Re-enter the radio receiver/cassette player/mini disc player and compact disc player keycodes and preset frequencies, if known.

Following reconnection of the battery, the engine should be allowed to idle until it has reached normal operating temperature as the stored idle and drive values contained within the ECM have been lost. Allow the vehicle to idle for a further three minutes. Drive the vehicle at constant speeds of approximately 48 km/h (30 mph), 64 km/h (40 mph), 80 km/h (50 mph), 96 km/h (60 mph) and 112 km/h (70 mph) for three minutes each. This may cause a driveability concern if the procedure is not carried out. This will allow the ECM to relearn idle values.

Connecting a Slave Battery Using Jump Leads

**WARNING:** If the slave battery has recently been charged and is gassing, cover the vent plugs or covers with a damp cloth to reduce the risk of explosion should arcing occur when connecting the jump leads.

- **CAUTIONS:**
  - A flat battery condition may have been caused by an electrical short circuit. If this condition exists there will be an apparently live circuit on the vehicle even when all normal circuits are switched off. This can cause arcing when the jump leads are connected.
  - Whilst it is not recommended that the vehicle is jump started, it is recognized that this may occasionally be the only practical way to mobilize a vehicle. In such an instance the discharged battery must be recharged immediately after jump starting to avoid permanent damage.

  - Always make sure that the jump leads are adequate for the task. Heavy duty cables must be used.
  - Always make sure that the slave battery is of the same voltage as the vehicle battery. The batteries must be connected in parallel.
  - Always make sure that switchable electric circuits are switched off before connecting jump leads. This reduces the risk of sparks occurring when the final connection is made.

  **WARNING:** Make sure that the ends of the jump leads do not touch each other or ground against the vehicle body at any time while the leads are attached to the battery. A fully charged battery, if shorted through jump leads, can discharge at a rate well above 1000 amps causing violent arcing and very rapid heating of the jump leads and terminals, and can even cause the battery to explode.

Always connect the jump leads in the following sequence.

- Slave battery positive first then vehicle battery positive.
- Slave battery negative next and then vehicle ground at least, 300 mm (12 in) from the battery terminal e.g. engine lifting bracket.

Always reduce the engine speed to idle before disconnecting the jump leads.

Before removing the jump leads from the vehicle that had the discharged battery, switch on the heater blower (high) or the heated rear screen, to reduce the voltage peak when the leads are removed.

Always disconnect the jump leads in the reverse order to the connecting sequence and take great care not to short the ends of the leads.

Do not rely on the alternator to restore a discharged battery. For an alternator to recharge a battery, it would take in excess of 8 hours continuous driving with no additional loads placed on the battery.

Component Cleaning

To prevent ingress of dirt, accumulations of loose dirt and greasy deposits should be removed before disconnecting or dismantling components or assemblies.

Components should be thoroughly cleaned before inspection prior to reassembly.

**Cleaning Methods:**

- Dry Cleaning
- Removal of loose dirt with soft or wire brushes.
- Scraping dirt off with a piece of metal or wood.
- Wiping off with a rag.

**CAUTION:** Compressed air is sometimes wet so use with caution, especially on hydraulic systems.

- Blowing dirt off with compressed air. (Eye protection should be worn when using this method).
- Removal of dry dust using vacuum equipment. This method should always be used to remove friction lining material dust (asbestos particles).
- Steam Cleaning

Calibration of Essential Measuring Equipment

**WARNING:** Failure to comply may result in personal injury or damage to components.

Component Cleaning

To prevent ingress of dirt, accumulations of loose dirt and greasy deposits should be removed before disconnecting or dismantling components or assemblies.

Components should be thoroughly cleaned before inspection prior to reassembly.

**Cleaning Methods:**

- Dry Cleaning
- Removal of loose dirt with soft or wire brushes.
- Scraping dirt off with a piece of metal or wood.
- Wiping off with a rag.

- Removal of dry dust using vacuum equipment. This method should always be used to remove friction lining material dust (asbestos particles).
- Steam Cleaning

Calibration of Essential Measuring Equipment

**WARNING:** Failure to comply may result in personal injury or damage to components.
Use of Control Modules

Control modules may only be used on the vehicle to which they were originally fitted. Do not attempt to use or test a control module on any other vehicle.

Functional Test

On completion of a maintenance procedure, a thorough test should be carried out, to make sure that the relevant vehicle systems are working correctly.

Preparation

Before disassembly, clean the surrounding area as thoroughly as possible. When components have been removed, blank off any exposed openings using grease-proof paper and masking tape. Immediately seal fuel, oil and hydraulic lines when separated, using plastic caps or plugs, to prevent loss of fluid and the entry of dirt. Close the open ends of oilways, exposed by component removal, with tapered hardwood plugs or readily visible plastic plugs. Immediately a component is removed, place it in a suitable container; use a separate container for each component and its associated parts. Before dismantling a component, clean it thoroughly with a recommended cleaning agent; check that the agent will not damage any of the materials within the component. Clean the bench and obtain marking materials, labels, containers and locking wire before dismantling a component.

Dismantling

Observe scrupulous cleanliness when dismantling components, particularly when parts of the brake, fuel or hydraulic systems are being worked on. A particle of dirt or a fragment of cloth could cause a dangerous malfunction if trapped in these systems. Clean all tapped holes, crevices, oilways and fluid passages with compressed air. Do not permit compressed air to enter an open wound. Always use eye protection when using compressed air.

Make sure that any O-rings used for sealing are correctly refitted or renewed if disturbed. Mark mating parts to make sure that they are replaced as dismantled. Whenever possible use marking materials which avoid the possibilities of causing distortion or the initiation of cracks, which could occur if a center punch or scriber were used. Wire together mating parts where necessary to prevent accidental interchange (e.g. roller bearing components). Tie labels on to all parts to be renewed and to parts requiring further inspection before being passed for reassembly. Place labelled parts and other parts for rebuild in separate containers. Do not discard a part which is due for renewal until it has been compared with the new part, to make sure that the correct part has been obtained.

Inspection

Before inspecting a component for wear or performing a dimensional check, make sure that it is absolutely clean; a slight smear of grease can conceal an incipient failure. When a component is to be checked dimensionally against figures quoted for it, use the correct equipment (surface plates, micrometers, dial gauges etc.) in serviceable condition. The use of makeshift equipment can be dangerous. Reject a component if its dimensions are outside the limits quoted, or if damage is apparent. A part may be refitted if its critical dimension is bearable shell to crank journal. Instructions for the use of Plastigauge and a scale giving bearing clearances in steps of 0.0025 mm (0.0001 in) are supplied with the package.

On-Board Diagnostics (OBD)

This vehicle uses programmed electronic control systems to provide engine management and emission regulation, automatic transmission operation and anti-lock braking control. These control systems are integral with the On-Board Diagnostics (OBD) facility which is used in conjunction with either the Jaguar approved diagnostic system or the more restricted scan tools.

The OBD information in this manual provides diagnostic and rectification procedures for emission related electrical and mechanical systems. The information is intended to facilitate fault diagnosis and the subsequent rectification of the vehicle without recourse to the Jaguar approved diagnostic system.

The manual covers the following OBD topics:

- General Information
- Engine Management System
- Automatic Transmission
- Anti-lock Braking System

Each section comprises one or more of the following sub-sections as required.

The Description and Operation sub-section includes:

- A general illustration and parts list to help the identification of the particular system or component.
- A brief description of the system operating characteristics and monitoring procedure accompanied by a component illustration.
- Additional information, where appropriate, is provided in the form of component calibrations, characteristics and cross sectional views.
- A localized circuit diagram is included to provide circuit identification, connectors, splices, fuses, wire gauge and colors. See Circuit Diagrams.

The Diagnosis and Testing sub-section is dedicated to fault analysis and rectification, and includes:

- Recommended special tools.
- Symptom chart: a chart containing all relevant Diagnostic Trouble Codes (DTC), their possible causes and an indication of the appropriate test.
- Specific pinpoint test(s), designed so that fault diagnosis can be carried out in a logical and efficient manner.

The Removal and Installation sub-section covers:

- Removal procedure(s), formatted in the recommended sequence.
- Illustrated guide to the use of special tools.
- Illustrations to support the relevant text.
- Installation procedure as above and including special recommendations for processes, lubricants and tightening torques.

Circuit Diagrams

To understand the relationship between the vehicle electrical system and the system circuit diagrams, Refer to the Electrical Guide.
In the interest of clarity, single lines may represent multiple wires. Refer to the color code (1st alpha) followed by the wire reference (numeric/alpha/numeric) to trace origin and destination.

E.g. BW 647B002. BW (black with white trace) 647 (wire reference) B002 (stage from origin).

**Glossary of Terms**

This glossary of terms is intended to cover mainly emissions-related (to SAE J 1930) terminology, and other abbreviations that may be used in this manual.

The required term may be looked-up in the left-hand column, and subsequent columns give the standard acronym, unit or abbreviation, and definition.

</table>
General Information - Health and Safety Precautions

Prolonged and repeated contact with mineral oil will result in the removal of natural oils from the skin, leading to dryness, irritation and dermatitis. In addition, used engine oil contains potentially harmful contaminants which may cause skin cancer. Washing facilities and adequate means of skin protection should be provided.

Observe these recommendations:

- Wear protective clothing, including impervious gloves where practicable.
- Do not put oily rags in pockets. Avoid contaminating clothes, particularly underwear, with oil.
- Overalls must be cleaned regularly. Discard oil impregnated clothing and footwear which cannot be washed or cleaned.
- First Aid treatment should be obtained immediately for open cuts or wounds.
- Use barrier creams, applying before each work period, to enable easier removal of dirty oil and grease from the skin.
- Wash with soap and water to make sure that all oil is removed (skin cleaner and a nail brush will help). The use of preparations containing lanolin will help to replace the natural skin oils which have been removed.
- Do not use petrol, kerosene, gas oil, thinners or solvents for washing skin.
- If skin disorders develop, obtain medical advice immediately.
- Where practical, degrease components prior to handling.

The Health and Safety Precautions subsection refers to some commonly used chemicals and materials, hazards associated with their use, and safety measures to be taken. Some of these chemicals may be included in the following list either in their own right or as an ingredient in a sealer or adhesive.

**Acids and Alkalis**

See also Battery Acids.

E.g. caustic soda, sulphuric acid.

Used in batteries and cleaning materials.

Irritant and corrosive to the skin, eyes, nose and throat. Cause burns. Can destroy ordinary protective clothing.

Avoid splashes to the skin, eyes and clothing. Wear suitable protective impervious apron, gloves and goggles. Do not breathe mists.

Ensure access to eye wash bottles, shower and soap are readily available for splashing accidents.

Display Eye Hazard sign.

**Air Bags**

See also Fire, Chemical Materials - General

Highly flammable, explosive – observe No Smoking policy.

Used as a safety restraint system mounted in the steering wheel.

The inflator contains a high - energetic propellant which, when ignited, produces a VERY HOT GAS (2500º C).

The gas generator used in air bags is Sodium Azide. This material is hermetically sealed in the module and is completely consumed during deployment. No attempt should be made to open an air bag inflator as this will lead to the risk of exposure to Sodium Azide. If a gas generator is ruptured, full protective clothing should be worn when dealing with the spillage.

After normal deployment, gloves and safety goggles should be worn during the handling process.

Deployed air bags should be disposed of in a plastic bag in accordance with local regulations at an approved chemical waste site.

Following any direct contact with gas generant.

- Wash affected areas thoroughly with water.
- Seek medical assistance if necessary.

**Air Bags - Do's**

- Do store in an airbag safe when not fitted to the vehicle.
- Do store modules in an upright position.
- Do keep modules dry.
- Do carry modules with the cover side pointing away from the body.
- Do place modules with their cover side upwards.
- Do carefully inspect modules for damage.
- Do stand to one side when connecting modules.
- Do make sure all test equipment is properly calibrated and maintained.
- Do wash you hands after handling deployed air bags.

**Air Bags - Do Nots**

- Do not store highly flammable material together with modules or gas generators.
- Do not store gas generators at temperatures exceeding 80º C.
- Do not store modules upside down.
- Do not attempt to open a gas generator housing.
- Do not expose gas generators to open flame or sources of heat.
- Do not place anything on top of a module cover.
- Do not use damaged modules.
- Do not touch a fired module or gas generator for at least 10 minutes.
- Do not use any electrical probes on the wiring circuit.

**Air Conditioning Refrigerant**

See also Chlorofluorocarbon, Chemical Materials
Highly flammable, combustible – observe No Smoking policy.

Instructions given by the manufacturer must be followed. Avoid naked lights, wear suitable protective gloves and goggles.

If refrigerant comes into contact with the skin or eyes, rinse the affected areas with water immediately. Eyes should also be rinsed with an appropriate irrigation solution and should not be rubbed. SEEK MEDICAL ASSISTANCE IF NECESSARY.

**Air Conditioning Refrigerant - Do Nots**

- Do not expose refrigerant bottles to sunlight or heat.
- Do not stand refrigerant bottles upright; when filling, hold them with the valve downwards.
- Do not expose refrigerant bottles to frost.
- Do not drop refrigerant bottles.
- Do not vent refrigerant to atmosphere under any circumstance.
- Do not mix refrigerants i.e. R12 (Freon) and R134a.

**Antifreeze**

See also Fire, Solvents.

E.g. isopropanol, ethylene glycol, methanol.

Highly flammable, flammable, combustible.

Used in vehicle coolant systems, brake air pressure systems, screenwash solutions.

Vapors may be given off from coolant antifreeze (glycol) when heated. Avoid breathing these vapors.

Antifreeze may be absorbed through the skin in toxic or harmful quantities. Antifreeze, if swallowed can be fatal and medical attention should be sought immediately.

These products must not be used in any cooling or industrial water system which is connected or linked to general, food preparation or drinking water supplies.

**Asbestos**

Used in brake and clutch linings, transmission brake bands and gaskets. Jaguar original production and replacement items are asbestos free.

See also Warning Symbols on Vehicles at the end of this subsection.

Breathing asbestos dust may cause lung damage or, in some cases, cancer.

The use of drum cleaning units, vacuum cleaning or damp wiping is preferred.

Asbestos dust waste should be dampened, placed in a sealed container and marked to make sure safe disposal. If any cutting or drilling is attempted on materials containing asbestos the item should be dampened and only hand tools or low speed power tools used.

**Battery Acids**

See also Acids and Alkalis.

Gases released during charging are explosive. Never use naked flames or allow sparks near charging or recently charged batteries.

Ensure adequate ventilation.

**Brake and Clutch Linings and Pads**

See Asbestos.

**Brakes Fluids (Polyalkylene Glycols)**

See also Fire.

Splashes to the skin and eyes may cause irritation. Avoid skin and eye contact as far as possible. Inhalation vapor hazards do not arise at ambient temperatures because of the very low vapor pressure.

**Brazing**

See Welding.

**Chemical Materials**

See also Legal Aspects.

Chemical materials such as solvents, sealers, adhesives, paints, resin foams, battery acids, antifreeze, brake fluids, fuels, oils and grease should always be used with caution and stored and handled with care. They may be toxic, harmful, corrosive, irritant or highly flammable and give rise to hazardous fumes and dusts.

The effects of excessive exposure to chemicals may be immediate or delayed; briefly experienced or permanent; cumulative; superficial; life threatening; or may reduce life expectancy.

**Chemical Materials - Do's**

- Do carefully read and observe hazard and precaution warnings given on material containers (labels) and in any accompanying leaflets, posters or other instructions. Material health and safety data sheets can be obtained from manufacturers.
- Do remove chemical materials from the skin and clothing as soon as practical after soiling. Change heavily soiled clothing and have it cleaned.
- Do organise work practices and protective clothing to avoid soiling of the skin and eyes, breathing vapors, aerosols, dusts or fumes, inadequate container labelling fire and explosion hazards.
Do wash before breaks, before eating, smoking, drinking or using toilet facilities when handling chemical materials.
Do keep work areas clean, uncluttered and free of spills.
Do store chemical materials according to national and local regulations.
Do keep chemical materials out of the reach of children.

Chemical Materials - Do Nots
- Do not mix chemical materials except under the manufacturer's instructions; some chemicals can form other toxic or harmful chemicals, give off toxic or harmful fumes or become explosive when mixed together.
- Do not apply heat or flame to chemical materials except under the manufacturer's instructions. Some are highly flammable and some may release toxic or harmful fumes.
- Do not leave containers open. Fumes given off can build up to toxic, harmful or explosive concentrations. Some fumes are heavier than air and will accumulate in confined areas, pits etc.
- Do not transfer chemical materials to unlabeled containers.
- Do not clean hands or clothing with chemicals. Chemicals, particularly solvents and fuels, will dry skin and may cause irritation leading to dermatitis or be absorbed through the skin in toxic or harmful quantities.
- Do not use emptied containers for other materials except when they have been cleaned under supervised conditions.
- Do not sniff or smell chemical materials. Brief exposure to high concentrations of fumes can be toxic or harmful.

Chlorofluorocarbons (CFC)
There is concern in the scientific community that CFCs and Halons are depleting the upper ozone layer which filters out harmful ultraviolet radiation. Decreased filtration of ultraviolet radiation may result in increases in skin cancer, cataracts and immune system suppression in humans, as well as decreased productivity of crops and aquatic systems.

CFCs are used primarily as refrigerants in vehicle air conditioning systems and as aerosol propellants. Halons are used as fire extinguishants.
Jaguar supports worldwide elimination of CFC usage and it is recommended that Company subsidiaries and affiliates should phase out CFC usage as soon as acceptable substitutes are commercially available.

Clutch Fluids
See Brake fluids.

Clutch Linings and Pads
See Asbestos.

Corrosion Protection Materials
See also Solvents, Fire.

Highly flammable, flammable – observe No Smoking policy.

These materials are varied and the manufacturer's instructions should be followed. They may contain solvents, resins, petroleum products etc. Skin and eye contact should be avoided. They should only be sprayed in conditions of adequate ventilation and not in confined spaces.

Cutting
See Welding.

Dewaxing
See Solvents and Fuels (Kerosene).

Dusts

Powder, dusts or clouds may be irritant, harmful or toxic. Avoid breathing dusts from powdery chemical materials or those arising from dry abrasion operations. Wear respiratory protection if ventilation is inadequate.

Fine dusts of combustible material can present an explosion hazard. Avoid explosive limits and/or sources of ignition.

Electric Shock

Electric shock can result from the use of faulty electrical equipment or from the misuse of equipment in good condition.

Ensure that electrical equipment is maintained in good condition and frequently tested. Faulty equipment should be labelled and preferably removed from the work station.

Ensure that flexes, cables, plugs and sockets are not frayed, kinked, cut, cracked or otherwise damaged.

Ensure that electrical equipment and flexes do not come into contact with water.

Ensure that electrical equipment is protected by the correct rated fuse.

Never misuse electrical equipment and never use equipment which is in any way faulty. The results could be fatal.

Ensure that the cables of mobile electrical equipment cannot get trapped and damaged, such as in a vehicle hoist.

Ensure that the designated electrical workers are trained in basic First Aid.

In cases of electrocution:
- Switch off the power supply before approaching the victim.
- If this is not possible push or drag the victim from the source of electricity using dry non-conductive material.
- Commence resuscitation if trained to do so.
- SUMMON MEDICAL ASSISTANCE.

Engine Oils

Exhaust Fumes
These contain asphyxiating, harmful and toxic chemicals and particles such as carbon oxides, nitrogen oxides, aldehydes, lead and aromatic hydrocarbons. Engines should be run only under conditions of adequate exhaust extraction or general ventilation and not in confined spaces.

Gasoline (petrol) engine
There may not be adequate warning of odour or of irritation before toxic or harmful effects arise. These may be immediate or delayed.

Fibre Insulation
See also Dusts.
Used in noise and sound insulation.
The fibrous nature of surfaces and cut edges can cause skin irritation. This is usually a physical and not a chemical effect.
Precautions should be taken to avoid excessive skin contact through careful organization of work practices and the use of gloves.

Fire
See also Welding, Foams, Legal Aspects.
Many of the materials found on or associated with the repair of vehicles are highly flammable. Some give off toxic or harmful fumes if burnt.
Observe strict fire safety when storing and handling flammable materials or solvents, particularly near electrical equipment or welding processes.
Ensure, before using electrical or welding equipment, that there is no fire hazard present.
Have a suitable fire extinguisher available when using welding or heating equipment.

First Aid
Apart from meeting any legal requirements it is desirable for someone in the workshop to be trained in First Aid procedures.
Splashes in the eye should be flushed carefully with clean water for at least ten minutes.
Soiled skin should be washed with soap and water.
Individuals affected by inhalation of gases, fumes etc. should be removed to fresh air immediately. If effects persist, consult a doctor.
If liquids are swallowed inadvertently, consult a doctor giving him the information on the container or label. Do not induce vomiting unless this action is indicated on the label.

Flouroelastomer
See Viton.

Foams - Polyurethane
See also Fire.
Used in sound and noise insulation. Cured foams used in seat and trim cushioning.
Follow manufacturer's instructions.
Unreacted components are irritating and may be harmful to the skin and eyes. Wear gloves and goggles.
Individuals with chronic respiratory diseases, asthma, bronchial medical problems, or histories of allergic diseases should not work in or near uncured materials.
The components, vapors or spray mists can cause direct irritation, sensitivity reactions and may be toxic or harmful.
Vapors and spray mists must not be inhaled. These materials must be applied with adequate ventilation and respiratory protection. Do not remove the respirator immediately after spraying, wait until the vapor/mists have cleared.
Burning of the uncured components and the cured foams can generate toxic and harmful fumes. Smoking, naked flames or the use of electrical equipment during foaming operations and until vapors/mists have cleared should not be allowed. Any heat cutting of cured foams or partially cured foams should be conducted with extraction ventilation.

Freon
See Air Conditioning Refrigerant.

Fuels
See also, Fire, Legal Aspects, Chemicals and Solvents.
Avoid skin contact with fuel where possible. Should contact occur, wash the affected skin with soap and water.

Gasoline (Petrol)
Highly flammable - observe No Smoking policy.
Swallowing can result in mouth and throat irritation and absorption from the stomach can result in drowsiness and unconsciousness. Small amounts can be fatal to children. Aspiration of liquid into the lungs e.g. through vomiting, is a very serious hazard.
Gasoline dries the skin and can cause irritation and dermatitis on prolonged or repeated contact. Liquid in the eye causes severe pain.
Motor gasoline may contain appreciable quantities of benzene, which is toxic upon inhalation, and the concentration of gasoline vapors must be kept very low. High concentrations will cause eye, nose and throat irritation, nausea, headache, depression and symptoms of drunkenness. Very high concentrations will result in rapid loss of consciousness.

Ensure there is adequate ventilation when handling and using gasoline. Great care must be taken to avoid the serious consequences of inhalation in the event of vapor build up arising from spillages in confined spaces.

Special precautions apply to cleaning and maintenance operations on gasoline storage tanks. Gasoline should not be used as a cleaning agent. It must not be siphoned by mouth. See First Aid.

**Gas - oil (Diesel Fuel)**

See warnings and cautions in relevant manual sections.

Combustible.

Gross or prolonged skin contact with high boiling point gas oils may also cause serious skin disorders including skin cancer.

**Kerosene (Paraffin)**

Used also as heating fuel, solvent and cleaning agent.

Flammable - observe No Smoking policy.

Irritation of the mouth and throat may result from swallowing. The main hazard from swallowing arises if liquid aspiration into the lungs occurs.

Liquid contact dries the skin and can cause irritation or dermatitis. Splashes in the eye may be slightly irritating.

In normal circumstances the low volatility does not give rise to harmful vapors. Exposure to mists and vapors from kerosene at elevated temperature should be avoided (mists may arise in dewaxing). Avoid skin and eye contact and make sure there is adequate ventilation.

**Gas Cylinders**

See also Fire.

Gases such as oxygen, acetylene, argon and propane are normally stored in cylinders at pressures of up to 13.790 kPa, (2000 lb/in2) and great care should be taken in handling these cylinders to avoid mechanical damage to them or to the valve gear attached. The contents of each cylinder should be clearly identified by appropriate markings.

Cylinders should be stored in well ventilated enclosures, and protected from ice and snow, or direct sunlight. Fuel gases (e.g. acetylene and propane) should not be stored in close proximity to oxygen cylinders.

Care should be exercised to prevent leaks from gas cylinders and lines, and to avoid sources of ignition.

Only trained personnel should undertake work involving gas cylinders.

**Gases**

See Gas Cylinders.

**Gaskets (Fluoroelastomer)**

See Viton.

**General Workshop Tools and Equipment**

It is essential that all tools and equipment are maintained in good condition and the correct safety equipment is used where required.

Never use tools or equipment for any purpose other than that for which they were designed. Never over - load equipment such as hoists, jacks, axle and chassis stands or lifting slings. Damage caused by overloading is not always immediately apparent and may result in a fatal failure the next time that the equipment is used.

Do not use damaged or defective tools or equipment, particularly high speed equipment such as grinding wheels. A damaged grinding wheel can disintegrate without warning and cause serious injury.

Wear suitable eye protection when using grinding, chiselling or sand blasting equipment.

Wear a suitable breathing mask when using abrasive blasting equipment, working with asbestos-based materials or using spraying equipment.

Ensure adequate ventilation to control dusts, mists and fumes.

**High Pressure Air, Lubrication and Oil Test Equipment**

See also Lubricants and Greases.

Always keep high pressure equipment in good condition, and regularly maintained, particularly at joints and unions.

Never direct a high pressure nozzle, e.g. diesel injector, at the skin as the fluid may penetrate to the under - lying tissue etc., and cause serious injury.

**Halon**

See CFCs.

**Legal Aspects**

Many laws and regulations make requirements relating to health and safety in the use and disposal of materials and equipment in workshops. Some of these laws which apply in the U.K. are listed. Similar laws exist for other territories.
Highly Flammable Liquids and Liquified Petroleum Gases Regulations (1972).
Control of Pollution Act (1974).
Control of Lead at Work Regulations (1980).
Control of Substances Hazardous to Health (COSHH) Regulations (1989).
Reporting of injuries, diseases and dangerous occurrences regulations 1985 (RIDDOR).

Workshops should be familiar, in detail, with these and associated laws and regulations.
Consult the local factory inspectorate if in any doubt.

Lubricants and Greases
Avoid all prolonged and repeated contact with mineral oils. All lubricants and greases may be irritating to the eyes and skin.

Used Engine Oil
Prolonged and repeated contact with mineral oil will result in the removal of natural oils from the skin, leading to dryness, irritation and dermatitis. In addition, used engine oil contains potentially harmful contaminants which may cause skin cancer. Adequate means of skin protection and washing facilities must be provided.
Do not employ used engine oils as lubricants or for any application where appreciable skin contact is likely to occur.

There are publications describing the problems and advising on precautionary measures. For the UK a typical Health and Safety Executive publication is: SHW 397: Cautionary Notice: Effects of mineral oil on the skin.

Health Protection Precautions
- Avoid prolonged and repeated contact with oils, particularly used engine oils.
- Wear protective clothing, including impervious gloves where practicable.
- Do not put oily rags into pockets.
- Avoid contaminating clothing.
- Heavily soiled clothing and oil - impregnated footwear should not be worn. Overalls must be cleaned regularly.
- First Aid treatment should be obtained immediately for open cuts and wounds.
- Use barrier creams, applying them before each work period, to help the removal of oil from the skin.
- Wash with soap and water to make sure all oil is removed (skin cleansers and nail brushes will help). Preparations containing lanoline replace the natural skin oils which have been removed.
- Do not use gasoline (petrol), kerosene (paraffin), diesel fuel (gas oil), thinners or solvents for cleaning skin.
- If skin disorders develop, obtain medical advice without delay.
- Where practical, degrease components prior to handling.
- Where there is a risk of eye contact, eye protection should be worn, for example, chemical goggles or face shields; in addition an eye wash facility should be provided.

Environmental Precautions
Burning used engine oil in small space heaters or boilers can be recommended only for units of approved design. In the UK the heating system must meet the requirements of HM Inspectorate of Pollution for small burners of less than 0.4 MW. If in doubt check with the appropriate local authority and/or manufacturer of approved appliances.

Dispose of used oil and used oil filters through authorized waste disposal contractors or licensed waste disposal sites, or to the waste oil reclamation trade, batteries should also be disposed off under similar arrangments. If in doubt, contact the relevant local authority for advice on disposal facilities.
It is illegal to pour used oil, antifreeze and automatic transmission fluid on to the ground, down sewers, drains, or into water courses.

Noise
Some operations may produce high noise levels which could, in time, damage hearing. In these cases, suitable ear protection must be worn.

Noise Insulation Materials
See Foams, Fibre Insulation.

0-Rings (Fluoroelastomer)
See Viton.

Paints
See also body and paint manual.
See also Solvents, Chemical Materials.

Highly flammable, flammable - observe No Smoking policy

Pressurized Equipment
See High Pressure Air, Lubrication and Oil Test Equipment.

Solder
Solders are mixtures of metals such that the melting point of the mixture is below that of the constituent metals (normally lead and tin). Solder application does not normally give rise to toxic lead fumes, provided a gas/air flame is used. Oxy - acetylene flames should not be used, as they are much hotter and will cause lead fumes to be produced.
Some fumes may be produced by the application of any flame to surfaces coated with grease etc. and inhalation of these should be...
Removal of excess solder should be undertaken with care, to make sure that fine lead dust is not produced, which can give toxic effects if inhaled. Respiratory protection may be necessary.

Solder spillage and filings should be collected and removed promptly to prevent general air contamination by lead.

High standards of personal hygiene are necessary in order to avoid ingestion of lead or inhalation of solder dust from clothing.

**Solvents**

See also Chemical Materials, Fuels (Kerosene), Fire.

e.g. acetone, white spirit, toluene, xylene, trichloroethane.

Used in cleaning and dewaxing materials, paints, plastics, resins, thinners etc.

Some may be highly flammable or flammable.

Skin contact will degrease the skin and may result in irritation and dermatitis following repeated or prolonged contact. Some can be absorbed through the skin in toxic or harmful quantities.

Splashes in the eye may cause severe irritation and could lead to loss of vision.

Brief exposure of high concentrations of vapors or mists will cause eye and throat irritation, drowsiness, dizziness, headaches and, in the worst circumstances, unconsciousness.

Repeated or prolonged exposure to excessive but lower concentrations of vapors or mists, for which there might not be adequate warning indications, can cause more serious toxic or harmful effects.

Aspiration into the lungs (e.g. through vomiting) is the most serious consequence of swallowing.

Avoid splashes to the skin, eyes and clothing. Wear protective gloves, goggles and clothing if necessary.

Ensure good ventilation when in use, avoid breathing fumes, vapors and spray mists and keep containers tightly sealed. Do not use in confined spaces.

When spraying materials containing solvents, e.g. paints, adhesive, coatings, use extraction ventilation or personal respiratory protection in the absence of adequate general ventilation.

Do not apply heat or flame except under specific and detailed manufacturer’s instructions.

**Sound Insulation**

See Fibre Insulation, Foams.

**Suspended Loads**

⚠️ CAUTION: Never improvise lifting tackle.

There is always a danger when loads are lifted or suspended. Never work under an unsupported, suspended or raised load e.g. suspended engine, etc.

Always make sure that lifting equipment such as jacks, hoists, axle stands, slings, etc., are adequate and suitable for the job, in good condition and regularly maintained.

**Transmission Brake Bands**

See Asbestos.

**Underseal**

See Corrosion Protection.

**Viton**

In common with many other manufacturers’ vehicles, some components fitted to the Jaguar range have ‘O’ rings, seals or gaskets which contain a material known as ‘Viton’.

Viton is a fluoroelastomer, that is a synthetic rubber type which contains Fluorine. It is commonly used for ‘O’ rings, gaskets and seals of all types. Although Viton is the most well known fluoroelastomer, there are others, including Fluorel and Tecmoflon.

When used under design conditions fluoroelastomers are perfectly safe. If, however, they are exposed to temperatures in excess of 400º C, the material will not burn, but will decompose, and one of the products formed is hydrofluoric acid.

This acid is extremely corrosive and may be absorbed directly, through contact, into the body.

‘O’ rings, seals or gaskets which have been exposed to very high temperatures will appear charred or as a black sticky substance.

DO NOT, under any circumstances touch them or the attached components.

Enquiries should be made to determine whether Viton or any other fluoroelastomer has been used in the affected ‘O’ ring, seal or gasket. If they are of natural rubber or nitrile there is no hazard. If in doubt, be cautious and assume that the material may be Viton or any fluoroelastomer.

If Viton or any other fluoroelastomers have been used, the affected area should be decontaminated before the commencement of work.

Disposable heavy duty plastic gloves should be worn at all times, and the affected area washed down using wire wool and a limewater (calcium hydroxide) solution to neutralize the acid before disposing of the decomposed Viton residue and final cleaning of the area. After use, the plastic gloves should be discarded carefully and safely.

**Welding**
Welding processes include Resistance Welding (Spot Welding), Arc Welding and Gas Welding.

**Resistance Welding**
This process may cause particles of molten metal to be emitted at a high velocity, and the eyes and skin must be protected.

**Arc Welding**
This process emits a high level of ultra-violet radiation which may cause arc-eye and skin burns to the operator and to other persons nearby. Gas-shielded welding processes are particularly hazardous in this respect. Personal protection must be worn, and screens used to shield other people.

**CONTACT LENS WEARERS ARE ADVISED TO REVERT TO ORDINARY SPECTACLES WHEN ARC WELDING as the arc spectrum is believed to emit microwaves which dry out the fluid between the lens and the eye. This may result in blindness when the lens is removed from the eye.**

Metal spatter will also occur, and appropriate eye and skin protection is necessary.

The heat of the welding arc will produce fumes and gases from the metals being welded, the rods and from any applied coatings or contamination on the surfaces being worked on. These gases and fumes may be toxic and inhalation of these should be avoided. The use of extraction ventilation to remove the fumes from the working area may be necessary particularly in cases where the general ventilation is poor, or where considerable welding work is anticipated. In extreme cases or confined spaces where adequate ventilation cannot be provided, air-fed respirators may be necessary.

**Gas Welding (and Cutting)**
Oxy-acetylene torches may be used for welding and cutting, and special care must be taken to prevent leakage of these gases, with consequent risk of fire and explosion.

The process will produce metal spatter and eye and skin protection is necessary.

The flame is bright, and eye protection should be used, but the ultra-violet emission is much less than that from arc welding, and lighter filters may be used.

The process itself produces few toxic fumes, but such fumes and gases may be produced from coatings on the work, particularly during cutting away of damaged body parts, and inhalation of the fumes should be avoided.

In brazing, toxic fumes may be produced from the metals in the brazing rod, and a severe hazard may arise if brazing rods containing cadmium are used. In this event particular care must be taken to avoid inhalation of fumes and expert advice may be required.

**SPECIAL PRECAUTIONS MUST BE TAKEN BEFORE ANY WELDING OR CUTTING TAKES PLACE ON VESSELS WHICH HAVE CONTAINED COMBUSTIBLE MATERIALS, E.G. BOILING OR STEAMING OUT OF FUEL TANKS.**

**Warning Symbols on Vehicles**
Decals showing warning symbols will be found on various vehicle components.

These decals must not be removed. The warnings are for the attention of owners/operators and persons carrying out service or repair operations on the vehicle.

The most commonly found decals are reproduced below together with an explanation of the warnings.

1. **Components or assemblies displaying the warning triangle and open book symbol advise consultation of the relevant section of the owners handbook before touching or attempting adjustments of any kind.**

2. **Components or assemblies displaying the warning triangle with the electrified arrow and open book symbol give warning of inherent high voltages. Never touch these with the engine running or the ignition switched on. See Electric Shock in this subsection.**
3. Jaguar vehicles and replacement parts which contain asbestos are identified by this symbol. See Asbestos in this subsection.

4. Components or assemblies displaying this symbol give warning that the component contains a corrosive substance. See Acids and Alkalis in this subsection.

5. Vehicles displaying the caution circle with a deleted lighted match symbol, caution against the use of naked lights or flames within the immediate vicinity due to the presence of highly flammable or explosive liquids or vapors. See Fire in this subsection.

6. All vehicles fitted with the passenger air bag from the factory have a warning sticker attached to the instrument panel, prohibiting the use of rear facing child seats in the front seating position. Failure to follow this instructions may result in personal injury.

**White Spirit**

See Solvents.

**Safety Precautions**

- **WARNINGS:**

  - Working on the fuel system results in fuel and fuel vapor being present in the atmosphere. Fuel vapor is extremely flammable, hence great care must be taken whilst working on the fuel system. Adhere strictly to the following precautions:
    - Do not smoke in the work area.
    - Display 'no smoking' signs around the area.
    - Disconnect the battery before working on the fuel system.
    - Do not connect/disconnect electrical circuits, use electrical equipment or other tools or engage in working practices which in any way may result in the production of sparks.
    - Ensure that a CO2 fire extinguisher is close at hand.
Ensure that dry sand is available to soak up any fuel spillage.
Empty fuel using suitable fire proof equipment into an authorized explosion proof container.
Do not empty fuel while working in a workshop or a pit.
Ensure that working area is well ventilated.
Ensure that any work on the fuel system is only carried out by experienced and well qualified maintenance personnel.
Ensure that fume extraction equipment is used where appropriate.

Fume extraction equipment must be in operation when solvents are used e.g. Trichloroethane, white spirit, sbp3, methylene chloride, perchlorethylene. Do not smoke in the vicinity of volatile degreasing agents.

Whenever possible, use a ramp or pit whilst working beneath a vehicle, in preference to jacking. Position chocks at the wheels as well as applying the parking brake. Never rely on a jack alone to support a vehicle. Use axle stands, or blocks carefully placed at the jacking points, to provide a rigid location. Check that any lifting equipment used has adequate capacity and is fully serviceable. Ensure that a suitable form of fire extinguisher is conveniently located. When using electrical tools and equipment, inspect the power lead for damage and check that it is properly earthed. Disconnect the earth (grounded) terminal of the vehicle battery. Do not disconnect any pipes of the air conditioning refrigeration system unless you are trained and instructed to do so. A refrigerant is used which can cause blindness if allowed to come into contact with the eyes. Ensure that adequate ventilation is provided when volatile degreasing agents are being used.

Adhere strictly to handling and safety instructions given on containers and labels. Keep oils and solvents away from naked flames and other sources of ignition. Do not apply heat in an attempt to free seized nuts or fittings; as well as causing damage to protective coatings, there is a risk of damage from stray heat to electronic equipment and brake lines. Do not leave tools, equipment, spilt oil etc. around the work area. Wear protective overalls and use barrier cream when necessary.

Environmental Protection

In some countries it is illegal to pour used oil onto the ground, down sewers or drains, or into water courses. The burning of used engine oil in small space heaters or boilers is not recommended unless emission control equipment is fitted. Dispose of used oil through authorized waste disposal contractors, to licensed waste disposal sites or to the waste oil reclamation trade. If in doubt, contact the Local Authority for advice on disposal facilities.
General Information - How To Use This Manual

Copyright Statement

Workshop Manual Organization

This manual covers descriptive, diagnostic (including OBD), and repair aspects to service the vehicle effectively.

The manual is arranged in sections, each section dealing with a specific part of a vehicle system. For example, Section 412-03 covers air conditioning, which is part of the climate control system.

The first digit of the section number indicates the group. There are five groups:

- General Information.
- Chassis.
- Powertrain.
- Electrical.
- Body and Paint.

The second and third digits of the section number indicate the vehicle system.

The last two digits of the section number indicate the part of the system covered by the section.
General Information - Important Safety Instructions
Description and Operation

Safety Notice

Appropriate service methods and correct repair procedures are essential for the safe, reliable operation of all motor vehicles, as well as the safety of the person doing the work. This manual provides general directions for accomplishing service and repair work with tested effective techniques. Following them will help assure reliability.

There are numerous variations in procedures, techniques, tools, and parts for servicing vehicles, as well as in the skill of the person doing the work. This manual cannot possibly anticipate all such variations and provide advice or cautions as to each. Accordingly, anyone who departs from the instructions provided in the manual must first establish that neither personal safety or vehicle integrity is compromised from choices of methods, tools or parts.
General Information - Road/Roller Testing

Description and Operation

Road or roller testing may be carried out for various reasons and a procedure detailing pre-test checks, through engine starting and stopping, pre-driving checks, on-test checks to final checks on completion of the test is given overleaf.

Unless complete vehicle performance is being checked, the full road test procedure need not be carried out. Instead, those items particularly relevant to the system/s being checked can be extracted.

Pre - Test Checks

WARNING: If the brake system hydraulic fluid level is low, pedal travel is excessive or a hydraulic leak is found, do not attempt to road test the vehicle until the reason for the low fluid level, excessive pedal travel or hydraulic leak is found and rectified.

It is suggested that pre-test checks, and functional tests of those systems/circuits which affect the safe and legal operations of the vehicle, such as brakes, lights and steering, should always be carried out before the road or roller test.

- Engine oil level
- Engine coolant level
- Tires, for correct pressure, compatible types and tread patterns, and wear within limits.
- There is sufficient fuel in the tank to complete the test.
- All around the engine, transmission and under the vehicle for oil, coolant, hydraulic and fuel leaks. Make a note of any apparent leaks and wipe off the surrounding areas to make it easier to identify the extent of the leak on completion of the test.

Starting the Engine

• NOTE: On initial drive away from cold and within the first 1.5 km (1 mile), do not depress accelerator pedal beyond half travel until the vehicle has attained a minimum speed of 25 km/h (15 miles/h). Never operate at high engine speed or with the accelerator pedal at full travel whilst the engine is cold.

With the ignition switched off, check:

- The handbrake is applied.
- The gear lever is in neutral.
- All instrument gauges (except fuel gauge) read zero.

With the ignition switched on, check:

- Ignition controlled warning lights come on.
- Engine temperature gauge registers a reading compatible with the engine temperature.
- Fuel gauge registers a reading appropriate to the fuel level in the tank.
- The operation of the handbrake warning light and fluid level warning indicator light.

On Road or Roller Test Check:

CAUTION: If road testing, check the brake operation while still travelling at low speed before continuing with the test. If the brakes pull to one side, or appear to be otherwise faulty, do not continue with the road test until the fault has been found and rectified.

- Clutch pedal operation is not stiff or heavy.
- Initial gear engagement is smooth and there is no evidence of clutch drag.
- Handbrake control operates smoothly and the handbrake releases quickly and completely.
- Clutch takes up the drive smoothly, without slip or judder.
- The engine power output is satisfactory, full power is achieved, acceleration is smooth and pedal operation not stiff or heavy, and engine speed returns to idle correctly.
- There is no excessive or abnormally colored smoke from the engine under normal driving, heavy load or overrun conditions.
- Steering operation, including power steering where fitted, is smooth, accurate, not excessively heavy or with excessive free play or vibration. Does not pull to one side and self centres smoothly after cornering.
- Speedometer, oil pressure warning lamp, coolant temperature gauge and tachometer (where fitted) register the correct readings or operate correctly.
- Switches and controls operate smoothly and positively, warning or indicator lights operate correctly and the direction indicator control self cancels when the steering is returned to the straight ahead position.
- Heating and ventilation systems work correctly and effectively.
- Brake operation and efficiency.

Brake Testing

WARNING: When brake testing, avoid breathing the smoke or fumes from hot brakes, this may contain asbestos dust which is hazardous to health, see Health and Safety Precautions.

Avoid brake testing on busy roads where it can cause inconvenience or danger to other road users.

CAUTION: Brake testing which includes heavy brake applications should not be carried out with new brake pads/discs or linings/drums until the components have bedded - in. New brake friction components will not reach full efficiency until the bedding - in process is complete.

Test the brakes at several speeds within the normal operating range using both light and heavy pedal pressure. Note any tendency to snatch, pull or drag, and any undue delay in application or release.

Allow the vehicle to coast and note any tendency to pull to one side, or evidence that the brakes are binding.

After stopping the vehicle (not immediately after a period of heavy braking), carefully check the brake temperature. A disc which feels hot, or appreciably hotter than the others, indicates that the brake is binding.

After completion of the test, check for:

- Oil, coolant, hydraulic, air and fuel leaks.
Abnormal temperature of any moving components or assemblies, e.g. wheel hubs, transmission, axle etc., which might indicate overtightness or lack of lubrication.
WARNING: Always handle all solvents, sealers and adhesives with extreme care. Some contain chemicals or give off fumes which can be dangerous to health. Always follow the manufacturers instructions. If in doubt about any substance, particularly a solvent, DO NOT use it.

CAUTION: If in doubt about the suitability of any proprietary solvent or sealer for a particular application, contact the manufacturer of the product for information regarding storage, handling and application.

The Solvents, Sealers and Adhesives subsection refers to some commonly used chemicals and materials, hazards associated with their use, and safety measures to be taken.

**Adhesives and Sealers**

Highly flammable, flammable, combustible – observe No Smoking policy.

Generally should be stored in No Smoking' areas. Cleanliness and tidiness in use should be observed e.g. disposable paper covering benches; should be dispensed from applicators where possible; containers, including secondary containers, should be labelled appropriately.

**Solvent - based Adhesives/Sealers - See Solvents**

Follow manufacturer's instructions.

**Water - based Adhesives/Sealers**

Those based on polymer emulsions and rubber latexes may contain small amounts of volatile toxic and harmful chemicals. Skin and eye contact should be avoided and adequate ventilation provided during use.

**Hot Melt Adhesives**

In the solid state, they are safe. In the molten state they may cause burns and health hazards may arise from the inhalation of toxic fumes.

Use appropriate protective clothing and a thermostatically controlled heater with a thermal cut - out and adequate extraction.

**Resin - based Adhesives/Sealers e.g. Epoxide and Formaldehyde Resin - based**

Mixing should be carried out in well ventilated areas, as harmful or toxic volatile chemicals may be released.

Skin contact with uncured resins and hardeners can result in irritation, dermatitis, and absorption of toxic or harmful chemicals through the skin. Splashes can damage the eyes.

Provide adequate ventilation and avoid skin and eye contact.

**Anaerobic, Cyanoacrylate (Super - glues) and other Acrylic Adhesives**

Many are irritant, sensitizing or harmful to the skin and/or respiratory tract. Some are eye irritants.

Skin and eye contact should be avoided and the manufacturer's instructions followed.

Cyanoacrylate adhesives (super-glues) MUST NOT contact the skin or eyes. If skin or eye tissue is bonded, cover with a clean moist pad and seek immediate medical attention. Do not attempt to pull tissue apart. Use in well ventilated areas as vapors can cause irritation to the nose and eyes.

For two - pack systems see Resin - based and Isocyanate Adhesives/Sealers.

**Isocyanate (Polyurethane) Adhesives/Sealers**

See also Resin - based Adhesives

Individuals suffering from asthma or respiratory allergies should not work with or near these materials as sensitivity reactions can occur.

Over exposure is irritating to the eyes and respiratory system. Excessive concentrations may produce effects on the nervous system including drowsiness. In extreme cases, loss of consciousness may result. Long term exposure to vapor concentrations may result in adverse health effects.

Prolonged contact with the skin may lead to skin irritation and, in some cases, dermatitis.

Splashes entering the eye will cause discomfort and possible damage.

Any spraying should preferably be carried out in exhaust ventilated booths removing vapors and spray droplets from the breathing zone.

Wear appropriate gloves, eye and respiratory protection.
Protecting the Vehicle

Always install covers to protect the fenders before commencing work in the engine compartment. Always install the interior protection kit, wear clean overalls and wash hands or wear gloves before working inside the vehicle. Avoid spilling hydraulic fluid, antifreeze or battery acid on the paintwork. In the event of spillage, wash off with water immediately. Use polythene sheets in the luggage compartment to protect carpets. Always use the recommended service tool, or a satisfactory equivalent, where specified. Protect temporarily exposed screw threads by replacing nuts or installing caps.

Vehicle in Workshop

When working on a vehicle in the workshop always make sure that:

- The parking brake is applied or the wheels are securely chocked to prevent the vehicle moving forwards or backwards
- If the engine is to be run, there is adequate ventilation, or an extraction hose to remove exhaust fumes is installed
- There is adequate room to jack up the vehicle and remove the wheels, if necessary
- Fender covers are always installed if any work is to be carried out in the engine compartment
- The battery is disconnected if working on the engine, underneath the vehicle, or if the vehicle is jacked up

⚠️ CAUTION: When electric arc welding on a vehicle, always disconnect the generator wiring to prevent the possibility of a surge of current causing damage to the internal components of the generator.

- If using welding equipment on the vehicle, ensure a suitable fire extinguisher is readily available.
### Vehicle Identification Number (VIN)

The official VIN for title and registration purposes is stamped on a metal plate and fastened to the instrument panel. It is positioned close on the left-hand side of the vehicle and is visible from the outside.

The vehicle identification number is also located on the vehicle certification label.

**Automatic Transmission Number**

The serial number of the transmission unit is displayed on a metal label or bar code (if equipped) attached to the transmission casing.

**Manual Transmission Number**

The serial number of the transmission unit is stamped into the bottom of the clutch housing.

**Engine Number - 3.0L**

The engine number is contained on a bar code label on the front cover and is also stamped in the cylinder block casting on the left-hand side of the engine below the engine mounting.

**Engine Number - 2.7L Diesel**

The serial number is stamped on an engine web on the right-hand side of the cylinder block behind the engine mounting.

**Engine Number - 3.5L, 4.2L and 4.2L Supercharged**

The serial number is stamped on an engine web on the left-hand side of the cylinder block behind the engine mounting. The emission code is also located here, on the transmission flange.
Jacking and Lifting - Jacking

Safety Precautions

WARNING: The jack provided with the vehicle is intended to be used in an emergency for changing a deflated tire. To avoid damage to the vehicle, never use the jack to raise the vehicle for any other purpose. Refer to the Driver Handbook when using the jack supplied with the vehicle. Failure to follow these instructions may result in personal injury.

The following safety precautions must be observed when raising the vehicle to carry out service operations:

- Never rely on a jack alone to support a vehicle. Always use suitable vehicle stands to provide rigid support.
- When working beneath a vehicle, whenever possible use a vehicle hoist instead of a jack and vehicle stands.
- Make sure that the vehicle is standing on firm, level ground before using a jack.
- Do not rely on the parking brake alone; chock the wheels and put the automatic transmission into Park if possible.
- Check that any lifting equipment used has adequate capacity for the load being lifted and is in correct working order.
Lifting Points—Twin-Post Hoist and Floor Jack

• CAUTIONS:

⚠️ Do not allow the hoist adapters to contact the steering linkage, suspension arms, stabilizer bar, rear subframe stabilizer brackets or to compress the lower suspension arm stabilizer bar insulator. Damage to the suspension, exhaust and steering linkage components may occur if care is not exercised when positioning the hoist adapters of two-post hoists prior to lifting the vehicle.

⚠️ Never use the differential housing as a lift point. Damage to the differential housing and cover may occur.

⚠️ When using a floor jack, a cushioned pad must be utilized to avoid body damage.

Vehicle Support Points
NOTE: Prior to vehicle recovery, make sure the vehicle keys are available and the security system is disarmed.

Vehicle recovery methods are:

- By flat-bed transporter.
- By rear suspended tow.
- By rear suspended tow.

**Transporter or Trailer Recovery**

[Image of transporter or trailer recovery]

When the vehicle is being recovered by transporter or trailer:

- The parking brake must be applied and the wheels chocked.
- The gear selector lever must be in Neutral. Do not select Park on automatic transmission vehicles, as the parking lock mechanism may be damaged by the forward and backward rocking motion of the vehicle.
- The vehicle must be securely tied down to the transporter or trailer.

**Rear Suspended Tow**

[Image of rear suspended tow]

When the vehicle is being recovered by rear suspended tow:

- The ignition key must be removed from the ignition switch to lock the steering.
- The rear wheels must be correctly positioned in the lifting cradle and securely tied down.

**Emergency Towing**

![WARNING: If the engine is not running, the steering will become heavy and the force necessary to effectively apply the brakes will be greatly increased.](image)

![CAUTION: A vehicle with a defective transmission must be towed by rear suspended tow.](image)

When the vehicle is being towed on its own wheels:

- Local regulations for the towing of vehicles must be followed. In some countries the registration number of the towing vehicle and an 'On Tow' sign or warning triangle must be displayed at the rear of the towed vehicle.
- The gear selector lever must be in Neutral.
- The ignition switch must be in position II to release the steering lock and make the direction indicators, horn and stop lamps operate.
- A distance of 0.8 km (0.5 mile) must not be exceeded.
- A speed of 48 km/h (30 mph) must not be exceeded.
- The tow rope must be attached to the front towing eye.
Noise, Vibration and Harshness - Noise, Vibration and Harshness (NVH)

Description and Operation

Noise, vibration and harshness (NVH) is becoming more important as vehicles become more sophisticated and passenger comfort levels increase. This section is designed to aid in the diagnosis, testing and repair of NVH concerns.

- Noise is defined as sounds not associated with the operation of passenger compartment equipment that interface with customer satisfaction.
- Vibration is defined as impulses felt by the customer that are not caused by road surface changes.
- Harshness is a ride quality issue where the customer feels that the vehicle response to the road surface is sharply transmitted to the customer.

Diagnostic Theory

Diagnosis is more than just following a series of interrelated steps in order to find the solution to the specific condition. It is a way of looking at systems that are not functioning the way they should and finding out why. Also it is knowing how the system should work and whether it is working correctly.

There are basic rules for diagnosis. If these rules are followed, the cause of the condition is usually found the first time through the system.

Know the System

- Know how the parts go together.
- Know how the system operates as well as its limits and what happens when the system goes wrong.
- Sometimes this means checking the system against one that is known to be working correctly.

Know the History of the System

A clue in any one of these areas may save time:

- How old or new is the system?
- What kind of treatment has it had?
- Has it been repaired in the past in such a manner that might relate to the present condition?
- What is the repair history?

Know the History of the Condition

- Did it start suddenly or appear gradually?
- Was it related to some other occurrence such as a collision or previous part renewal?
- Know how the condition made itself known; it may be an important clue to the cause.

Know the Probability of Certain Conditions Developing

- Look for the simple rather than the complex.
- For example:
  - Electrical conditions usually occur at connections rather than components.
  - An engine no-start is more likely to be caused by a loose wire or small adjustment rather than a sheared-off camshaft.
- Know the difference between impossible and improbable. Certain failures in a system can be improbable but still happen.
- New parts are just that, new. It does not mean they are always good functioning parts.

Do Not Cure the Symptom and Leave the Cause

Lowering the pressure in a front tire may correct the condition of a vehicle leaning to one side, but it does not correct the original condition.

Be Positive the Cause is Found

- Double check the findings.
- What caused a worn component?
- A loose transmission or engine mount could indicate that other mounts are also loose.

Diagnostic Charts

Charts are a simple way of expressing the relationship between basic logic and a physical system of components. They help discover the cause of a condition in the least time. Diagnostic charts combine many areas of diagnosis into one visual display:

- probability of certain things occurring in a system
- speed of checking certain components or functions before others
- simplicity of carrying out certain tests before others
- elimination of checking huge portions of a system by carrying out simple tests
- certainty of narrowing down the search to a small portion before carrying out in-depth testing

The fastest way to find a condition is to work with the tools that are available. This means working with proven diagnostic charts and the correct special equipment for the system.
Noise, Vibration and Harshness (NVH) Diagnosis and Testing

Inspection and Verification

1. Verify the customer's concerns by operating the vehicle to duplicate the condition.
2. Visually inspect the vehicle to determine any obvious cause(s) of the concern(s).
3. If the inspection reveals obvious causes that can be readily identified, repair as necessary.
4. If the concern(s) remains after the inspection, determine the symptom(s) and go to the Symptom Chart.

How To Use This Diagnostic Procedure Section

- Noise, vibration and harshness (NVH) concerns have become more important as vehicles have become more sensitive to these vibrations. This section is designed as an aid to identifying these situations.
- The section provides diagnostic procedures based on symptoms. If the condition occurs at high speed, for instance, the most likely place to start is under High Speed Shake.
- The road test procedure will tell how to sort the conditions into categories and how to tell a vibration from a shake.
- A series of Road Test Quick Checks is provided to make sure that a cause is either pinpointed or eliminated.
- Name the condition, proceed to the appropriate section and locate the correct diagnosis. When the condition is identified, the job is partly done.
- Follow the diagnostic procedure as outlined.
- Quick Checks are described within the step, while more involved tests and adjustments are outlined in General Procedures.
- Always follow each step exactly and make notes to recall important findings later.

Customer Interview

The road test and customer interview (if available) provide information that will help identify the concerns and will provide direction to the correct starting point for diagnosis.

Identify the Condition

NVH problems usually occur in a number of areas:

- Tires
- Engine accessories
- Suspension
- Driveline
- Air leakage (wind noise)
- Squeaks and rattles
- Heating Ventilation and Air Conditioning (HVAC)
- Electrical (e.g. motor noise)
- Transmission
- Engine

It is important, therefore, that an NVH concern be isolated into its specific area(s) as soon as possible. The easiest and quickest way to do this is to carry out the Road Test as outlined.

Noise Diagnostic Procedure

Non-Axle Noise

The five most important sources of non-axle noise are exhaust, tires, roof racks, trim and mouldings, and transmission.

Therefore, make sure that none of the following conditions are the cause of the noise before proceeding with a driveline teardown and diagnosis.

- In certain conditions, the pitch of the exhaust may sound very much like gear noise. At other times, it can be mistaken for a wheel bearing rumble.
- Tires, especially snow tires, can have a high pitched tread whine or roar, similar to gear noise. Radial tires, to some degree, have this characteristic. Also, any non-standard tire with an unusual tread construction may emit a roar or whine type noise.
- Trim and mouldings can also cause whistling or a whining noise.
- Clunk may be a metallic noise heard when the automatic transmission is engaged in reverse or drive, or it may occur when the throttle is applied or released. It is caused by backlash somewhere in the driveline.
- Bearing rumble sounds like marbles being tumbled. This condition is usually caused by a damaged wheel bearing.

Noise Conditions

- Gear noise is typically a howling or whining due to gear damage or incorrect bearing preload. It can occur at various speeds and driving conditions, or it can be continuous.
- Chuckle is a particular rattling noise that sounds like a stick against the spokes of a spinning bicycle wheel. It occurs while decelerating from 64 km/h (40 miles/h) and can usually be heard all the way to a stop. The frequency varies with vehicle speed.
- Knock is very similar to chuckle, though it may be louder and occurs on acceleration or deceleration. The teardown will disclose what has to be corrected.

Check and rule out tires, exhaust and trim items before disassembling the transmission to diagnose and correct gear noise.

The noises described under Road Test usually have specific causes that can be diagnosed by observation as the unit is disassembled. The initial clues are the type of noise heard on the road test and the driving conditions.

Vibration Conditions

- NOTE: New Constant Velocity (CV) joints should not be installed unless disassembly and inspection revealed unusual wear.

Clicking, popping or grinding noises may be caused by the following:

- Cut or damaged CV joint boots resulting in inadequate or contaminated lubricant in the outboard or inboard CV joint bearing
Vibration at highway speeds may be caused by the following:

- Out-of-balance front or rear wheels
- Out-of-round tires
- Driveline imbalance
- Driveline run-out (alignment)

**NOTE:** Rear drive half shafts are not balanced and do not contribute to rotational vibration disturbances.

Shudder or vibration during acceleration may be caused by the following:

- Excessively worn or damaged outboard or inboard CV joint bearing housing
- Excessively high CV joint operating angles caused by incorrect ride height. Check ride height, verify correct spring rate and check items under Inoperative Conditions

**Leakage Conditions**

1. Inspect the CV joint boots for evidence of cracks, tears or splits.
2. Inspect the underbody for any indication of grease splatter in the vicinity of the rear drive half shaft, outboard and inboard CV joint boot locations, which is an indication of CV joint boot or CV joint boot clamp damage.
3. Inspect the inboard CV joint bearing housing seal for leakage.

**Inoperative Conditions**

If a CV joint or rear drive half shaft pull-out occurs, check the following:

- Suspension components for correct location, damage or wear
- Bushings for wear
- Subframe for damage
- Bent or worn components:
  - Stabilizer bar link
  - Left-hand rear suspension lower arm and bushing
  - Right-hand rear suspension lower arm and bushing
  - Rear wheel hub and rear drive half shaft

**Road Test**

A gear-driven unit will produce a certain amount of noise. Some noise is acceptable and may be audible at certain speeds or under various driving conditions as on a newly paved blacktop road. The slight noise is in no way detrimental and must be considered normal.

The road test and customer interview (if available) provide information needed to identify the condition and give direction to the correct starting point for diagnosis.

1. Make notes throughout the diagnosis routine. Make sure to write down even the smallest piece of information, because it may turn out to be the most important.
2. Do not touch anything until a road test and a thorough visual inspection of the vehicle have been carried out. Leave the tire pressures and vehicle load just where they were when the condition was first observed. Adjusting tire pressures, vehicle load or making other adjustments may reduce the conditions intensity to a point where it cannot be identified clearly. It may also inject something new into the system, preventing correct diagnosis.
3. Make a visual inspection as part of the preliminary diagnosis routine, writing down anything that does not look right. Note tire pressures, but do not adjust them yet. Note leaking fluids, loose nuts and bolts, or bright spots where components may be rubbing against each other. Check the luggage compartment for unusual loads.
4. Road test the vehicle and define the condition by reproducing it several times during the road test.
5. Carry out the Road Test Quick Checks as soon as the condition is reproduced. This will identify the correct diagnostic procedure. Carry out the Road Test Quick Checks more than once to verify they are providing a valid result. Remember, the Road Test Quick Checks may not tell where the concern is, but they will tell where it is not.

**Road Test Quick Checks**

1. 24-80 km/h (15-50 miles/h): With light acceleration, a moaning noise is heard and possibly a vibration is felt in the front floor pan. It is usually worse at a particular engine speed and at a particular throttle setting during acceleration at that speed. It may also produce a moaning sound, depending on what component is causing it. Refer to Tip-In Moan in the Symptom Chart.
2. Acceleration/Deceleration: With slow acceleration and deceleration, a shake is sometimes noticed in the steering wheel/column, seats, front floor pan, front door trim panel or front end sheet metal. It is a low frequency vibration (around 9-15 cycles per second). It may or may not be increased by applying brakes lightly. Refer to Idle Boom/Shake/Vibration in the Symptom Chart.
3. High Speed: A vibration is felt in the front floor pan or seats with no visible shake, but with an accompanying sound or rumble, buzz, hum, drone or booming noise. Coast with the clutch pedal depressed or shift control selector lever in neutral and engine idling. If vibration is still evident, it may be related to wheels, tires, front disc brake discs, wheel hubs or front wheel bearings. Refer to High Speed Shake in the Symptom Chart.
4. Engine rpm Sensitive: A vibration is felt whenever the engine reaches a particular rpm. It will disappear in neutral coasts. The vibration can be duplicated by operating the engine at the problem rpm while the vehicle is stationary. It can be caused by any component, from the accessory drive belt to the clutch or torque converter which turns at engine speed when the vehicle is stopped. Refer to High Speed Shake in the Symptom Chart.
5. Noise and Vibration While Turning: Clicking, popping, or grinding noises may be due to the following:

- Worn, damaged, or incorrectly installed front wheel bearing.
- Worn or damaged incorrectly installed rear drive half shaft.
Road Conditions

An experienced technician will always establish a route that will be used for all NVH diagnosis road tests. The road selected should be reasonably smooth, level and free of undulations (unless a particular condition needs to be identified). A smooth asphalt road that allows driving over a range of speeds is best. Gravel or bumpy roads are unsuitable because of the additional road noise produced. Once the route is established and consistently used, the road noise variable is eliminated from the test results.

• NOTE: Some concerns may be apparent only on smooth asphalt roads.

If a customer complains of a noise or vibration on a particular road and only on a particular road, the source of the concern may be the road surface. If possible, try to test the vehicle on the same type of road.

Vehicle Preparation

Carry out a thorough visual inspection of the vehicle before carrying out the road test. Note anything which is unusual. Do not repair or adjust any condition until the road test is carried out, unless the vehicle is inoperative or the condition could pose a hazard to the technician.

After verifying the condition has been corrected, make sure all components removed have been installed.

Lift Test

After a road test, it is sometimes useful to do a similar test on a lift.

When carrying out the high-speed shake diagnosis or engine accessory vibration diagnosis on a lift, observe the following precautions:

© WARNING: If only one drive wheel is allowed to rotate, speed must be limited to 55 km/h (35 miles/h) indicated on the speedometer since actual wheel speed will be twice that indicated on the speedometer. Speed exceeding 55 km/h (35 miles/h) or allowing the drive wheel to hang unsupported could result in tire disintegration, differential failure, constant velocity joint and driveshaft failure, which could cause serious personal injury and extensive vehicle damage. Failure to follow these instructions may result in personal injury.

© CAUTION: The suspension should not be allowed to hang free. When the CV joint is run at a very high angle, extra vibration as well as damage to the seals and joints can occur.

The rear suspension lower arm should be supported as far outboard as possible. To bring the vehicle to its correct ride height, the full weight of the vehicle should be supported in the rear by floor jacks. REFER to Section 100-02 Jacking and Lifting.

1. 1. Raise and support the vehicle. REFER to Section 100-02 Jacking and Lifting.

2. 2. Explore the speed range of interest using the Road Test Quick Checks as previously described.

3. 3. Carry out a coast down in neutral. If the vehicle is free of vibration when operating at a steady indicated speed and behaves very differently in drive and coast, a transmission concern is likely.

Note, however, that a test on the lift may produce different vibrations and noises than a road test because of the effect of the lift. It is not unusual to find vibrations on the lift that were not found in the road test. If the condition found on the road can be duplicated on the lift, carrying out experiments on the lift may save a great deal of time.

Symptom Chart

<table>
<thead>
<tr>
<th>Symptom</th>
<th>Possible Sources</th>
<th>Action</th>

  * Rear wheel drive half shaft joint boots.         | * GO to Pinpoint Test D.                   |
| Non-axle noise                                   | * Trim/mouldings.  
  * A/C system.  
  * Accessories.                                     | * GO to Pinpoint Test E.                   |

Pinpoint Tests

• NOTE: These Pinpoint Tests are designed to take the technician through a step-by-step diagnosis procedure to determine the cause of a condition. It may not always be necessary to follow the chart to its conclusion. Carry out only the Pinpoint Test steps necessary to correct the condition. Then check operation of the system to make sure the condition is corrected.

After verifying that the condition has been corrected, make sure all components removed have been installed.

PINPOINT TEST A : HIGH-SPEED SHAKE

<table>

### PINPOINT TEST D : WHEEL END VIBRATION ANALYSIS

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>D1: INSPECT THE TIRES</strong></td>
<td></td>
</tr>
<tr>
<td><img src="image8.png" alt="Image" /> Inspect the tires.</td>
<td>- Raise and support the vehicle. REFER to Section 100-02 Jacking and Lifting.</td>
</tr>
<tr>
<td></td>
<td>- Inspect the tires for:</td>
</tr>
<tr>
<td></td>
<td>- Correct tire size</td>
</tr>
<tr>
<td></td>
<td>- Tire/wheel compatibility</td>
</tr>
<tr>
<td></td>
<td>- Wear or damage</td>
</tr>
<tr>
<td></td>
<td>- Tire beads correctly seated</td>
</tr>
</tbody>
</table>
Are the tires OK?
Yes  GO to D2.
No  INSPECT the wheels. For additional information, refer to Section 204-00 Suspension System - General Information.

D2: INSPECT WHEEL BEARINGS

Inspect the wheel bearings.
REFER to Section 204-00 Suspension System - General Information.

Are the wheel bearings OK?
Yes  GO to D3.
No  REPAIR as necessary. REPEAT the Road Test as outlined.

D3: INSPECT THE CONSTANT VELOCITY (CV) JOINT BOOTS

Inspect the CV joint boots.

- Spin the rear tire by hand
- Inspect for evidence of cracks, tears, splits or splattered grease

Are the CV joint boots OK?
Yes  GO to D4.
No  REPAIR as necessary. REPEAT the Road Test as outlined.

D4: INSPECT WHEEL AND TIRE RUNOUT

Inspect the wheel and tire runout.

- Carry out the Wheel and Tire Check procedure.
  REFER to Section 204-04 Wheels and Tires.

Is the wheel and tire runout OK?
Yes  Balance the wheels and tires. Refer to the wheel balance equipment manufacturers instructions.
No  REPAIR as necessary.
  REFER to Section 204-04 Wheels and Tires.
  REPEAT the Road Test as outlined.

PINPOINT TEST E : NON-AXLE NOISE

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>E1: INSPECT VEHICLE TRIM</td>
<td></td>
</tr>
</tbody>
</table>

Check the grille and trim mouldings to see if they are the source of the noise.

Are the vehicle trim components causing the noise?
Yes  INSTALL new trim or REPAIR as necessary.
  REFER to Section 501-08 Exterior Trim and Ornamentation.
No  GO to E2.

E2: CHECK THE A/C SYSTEM FOR NOISE

Check the A/C system components for noise by turning the A/C system on and off.

Is the A/C system causing the noise?
Yes  Diagnose the A/C system.
  REFER to Section 412-00 Climate Control System - General Information.
No  GO to E3.

E3: CHECK NON-FACTORY ACCESSORIES

Inspect any accessories for being the source of the noise. Example: grounding body-to-frame, antennas, visors, bug deflectors and fog lights.

Are the accessories the cause of the noise?
Yes  ADJUST, REPAIR or INSTALL new accessories or fasteners as required.
No  Verify the customer concern.
1. Loosen the muffler inlet pipe and resonator pipe to exhaust manifold fasteners at the flanges and the muffler inlet connection.
2. Place a stand to support the muffler parallel to the vehicle frame with the muffler pipe bracket free of stress.
3. Tighten the muffler connection.
4. Position the exhaust pipes to the manifolds and tighten. Make sure that the catalytic converter and heat shield do not contact the frame rails.
5. With the complete exhaust system tight (and cooled) the rear hanger insulator should be angled forward, to allow the system to expand rearward when heated during normal running.
## Suspension System - General Information -

### Vehicle Ride Height

<table>
<thead>
<tr>

Suspension System - General Information - Wheel Alignment Angles

Description and Operation

Camber, caster and toe are adjustable on the front suspension system. Only the toe is adjustable on the rear suspension system. Camber and caster are adjusted by means of eccentric cams on the lower arm mounting bolts. The front toe is adjusted by use of the front tie-rod. The rear toe is adjusted by the use of toe link assemblies connecting the knuckles to the rear sub-frame.

**Camber**

*Negative Camber*

*Positive Camber*

Camber is the vertical tilt of the wheel when viewed from the front. Camber can be positive or negative and has a direct effect on tire wear.

**Caster**

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Positive caster</td>
</tr>
<tr>
<td>2</td>
<td>True vertical</td>
</tr>
<tr>
<td>β</td>
<td>Steering axis</td>
</tr>
</tbody>
</table>

Caster is the deviation from vertical of an imaginary line drawn through the ball joints when viewed from the side. The caster specifications in this section will give the vehicle the best directional stability characteristics when loaded and driven. The caster setting is not related to tire wear.

**Toe**

*Positive Toe (Toe-In)*
Negative Toe (Toe-Out)

The vehicle toe setting:
  - affects tire wear and directional stability.

**Ride Height**

*NOTE: All ride height measurements are carried out with vehicle empty and 9 liters of fuel in tank (showroom condition).*

**Wheel Track**

**Crabbing**

Crabbing is the condition in which the independent rear suspension (IRS) system is not square to the chassis. Heavily crowned roads can give the illusion of crabbing.
**Wander**

Wander is the tendency of the vehicle to require frequent, random left and right steering wheel corrections to maintain a straight path down a level road.

**Shimmy**

Shimmy, as observed by the driver, is rotational oscillations of the steering wheel which may come and go over time, generally resulting from wheel and tire imbalances.

Shimmy can be experienced at any speed but generally between 50 to 90 miles/hour (80 to 145 km/h) and is most often experienced on smooth roads at steady speeds.

**Nibble**

Sometimes confused with shimmy, nibble is a condition resulting from tire interaction with various road surfaces or brake disc irregularity and observed by the driver as small rotational oscillations of the steering wheel.

**Poor Returnability of the Steering**

Poor returnability of the steering is used to describe the poor return of the steering wheel to center after a turn or the steering correction is completed.

**Drift/Pull**

Pull is a tugging sensation, felt by the hands on the steering wheel, that must be overcome to keep the vehicle going straight.

Drift describes what a vehicle with this condition does with hands off the steering wheel.

- A vehicle-related drift/pull, on a flat road, will cause a consistent deviation from the straight-ahead path and require constant steering input in the opposite direction to counteract the effect.
- Drift/pull may be induced by conditions external to the vehicle (i.e., wind, road crown).

**Vague On-Center Feel**

Vague on-center feel is characterized by little or no buildup of turning effort felt in the steering wheel as the wheel is rocked slowly left and right within very small turns around center or straight-ahead (under 20 degrees of steering wheel turn). Efforts may be said to be "flat on center."

- In the diagnosis of a roadability problem, it is important to understand the difference between wander and vague on-center feel.
Suspension System - General Information - Suspension System
Diagnosis and Testing

Inspection and Verification

1. Verify the customer's concern by carrying out a road test on a smooth road. If any vibrations are apparent, refer to Section 100-04 Noise, Vibration and Harshness.

2. Visually inspect for obvious signs of mechanical damage.

Visual Inspection Chart

<table>

Component Tests

**Ball Joint Inspection**

- NOTE: The front suspension is shown in the following procedures. The inspection of the rear suspension upper ball joint is similar.

1. **Raise and support the vehicle.**
   REFER to Section 100-02 Jacking and Lifting.

2. **Prior to carrying out any inspection of the ball joints, inspect the front wheel bearings.**
   REFER to Wheel Bearing Inspection in this section.

3. **CAUTION: The safety stand beneath the suspension lower lower arm must only support the weight of the suspension and not the full weight of the vehicle. Failure to follow this instruction may result in damage to the components.**

   3. Position a safety stand beneath the front suspension lower arm or rear suspension lower arm to be tested.
4. While an assistant pulls and pushes the top and bottom of the tire, observe the relative movement between the ball joint and the front suspension lower arm. Any movement at or exceeding the specification indicates a worn or damaged ball joint. Install a new ball joint as necessary. REFER to Section 204-01 Front Suspension.

5. While an assistant pulls and pushes the top and bottom of the tire, observe the relative movement between the ball joint and the front suspension upper arm or rear suspension upper arm. Any movement at or exceeding the specification indicates a worn or damaged ball joint. Install a new upper arm as necessary. Refer to Section 204-01 Front Suspension or Section 204-02 Rear Suspension.

6. Remove the safety stand.

7. Lower the vehicle.
Suspension System - General Information - Camber and Caster Adjustment

General Procedures

- NOTE: The camber and caster adjustment for the left-hand side is shown, the procedure for adjusting the right-hand side is similar.
- NOTE: This procedure must be carried out using a 4-post ramp.

All vehicles

1. Check the camber and caster settings. Follow the equipment manufacturer's instructions.

Vehicles requiring caster adjustment

2. NOTE: Left-hand shown, right-hand similar.

   Loosen the front lower arm lock nut.

3. NOTE: Adjustments to the caster will affect the toe settings. Therefore, the caster and toe may need to be adjusted at the same time to achieve the correct settings.

   • NOTE: Left-hand shown, right-hand similar.

   Rotate the caster adjustment cam bolt to adjust the caster.

Vehicles requiring camber adjustment

4. Check the caster settings. Follow the equipment manufacturer's instructions. Adjust as necessary.

5. NOTE: Make sure the caster adjustment cam bolt does not rotate.

   • NOTE: Left-hand shown, right-hand similar.

   Tighten the caster adjustment cam bolt lock nut.

   • Tighten to 175 Nm.
6. NOTE: Adjustments to the camber will affect the toe settings. Therefore, the camber and toe may need to be adjusted at the same time to achieve the correct settings.
   • NOTE: Left-hand shown, right-hand similar.
     Loosen the tie-rod end lock nut.
     • Clean and lubricate the lock nut and tie-rod threads.

7. NOTE: Do not allow the tie-rod end or steering gear boot to twist when the tie-rod is rotated.
   • NOTE: Left-hand, shown right-hand similar.
     Rotate the tie-rod to adjust the toe.

8. NOTE: Left-hand shown, right-hand similar.
     Loosen the rear lower arm lock nut.

9. NOTE: Left-hand shown, right-hand similar.
     Rotate the camber adjustment cam bolt to adjust the camber.

10. Check the camber and toe settings. Follow the equipment manufacturer's instructions. Adjust as necessary.
11. NOTE: Make sure the camber adjustment cam bolt does not rotate.
• NOTE: Left-hand shown, right-hand similar.
Tighten the rear lower arm lock nut.
  • Tighten to 175 Nm.

12. NOTE: Make sure the tie-rod or tie-rod end does not rotate.
• NOTE: Left-hand shown, right-hand similar.
Tighten the tie-rod end lock nut
  • Tighten to 100 Nm.
Suspension System - General Information - Four-Wheel Alignment

General Procedures

• CAUTIONS:

⚠️ Make sure the vehicle is on a flat level surface.

⚠️ Make sure the tire pressures are within specification.

⚠️ Make sure that only the manufacturers' recommended four wheel alignment equipment is used.

⚠️ Make sure the steering is in the straight ahead position.

1. For wheel alignment information, refer to the suspension specification section. For additional information, refer to: Specifications (204-00 Suspension System - General Information, Specifications).

2. Check the tie rod ends, suspension joints, wheel bearings and wheels and tires for damage, wear and free play.
   • Adjust or repair any worn, damaged or incorrectly adjusted components.

3. Check and adjust tire pressures.

4. Position the vehicle on a calibrated, level, vehicle lift.

5. Release the vehicle parking brake.

6. Using only four-wheel alignment equipment approved by Jaguar, check the wheel alignment.

7. NOTE: LH illustration shown, RH is similar.
   To adjust, loosen the toe link locknuts.

8. CAUTION: Do not allow the gaiter to twist.
   • NOTE: Both tie rods must be rotated by an equal amount.
   • NOTE: LH illustration shown, RH is similar.
   Adjust the rear toe.

9. Tighten the toe link locknuts to 55 Nm (40 lb.ft).

10. NOTE: LH illustration shown, RH is similar.
    To adjust the caster, loosen the front lower arm lock nuts.
11. **NOTE:** LH illustration shown, RH is similar.

   Rotate the caster adjustment cam bolt.

12. **CAUTION:** Make sure the caster adjustment bolt does not rotate while the lock nut is being tightened.

   Tighten the caster adjustment cam bolt nut.
   - Tighten the nut and bolt to 175 Nm (129 lb.ft).

13. **CAUTION:** Adjustments made to the camber setting will affect the front toe setting. Therefore, the camber and toe may need to be adjusted at the same time.

   • **NOTE:** LH illustration shown, RH is similar.

   To adjust the camber, loosen the rear lower arm lock nuts.

14. **NOTE:** LH illustration shown, RH is similar.

   Rotate the camber adjustment cam bolt.

15. **CAUTION:** Make sure the camber adjustment bolt does not rotate while the lock nut is being tightened.

   Tighten the camber adjustment cam bolt nut.
   - Tighten the nut and bolt to 175 Nm (129 lb.ft).

16. **NOTE:** LH illustration shown, RH is similar.

   To adjust, loosen the tie rod end lock nuts.
17. **CAUTION:** Do not allow the gaiter to twist.
- NOTE: Both tie rods must be rotated by an equal amount.
- NOTE: LH illustration shown, RH is similar.
  Adjust the front toe.

18. Tighten the tie rod end lock nuts to 55 Nm (40 lb.ft).
19. Using only four-wheel alignment equipment approved by Jaguar, check the wheel alignment.
General Procedures

1. Start the engine and center the steering wheel.
2. Turn the engine off, and hold the steering wheel in the "straight ahead" position by attaching a rigid link from the steering wheel to the brake pedal.
3. Check the toe settings. Follow the equipment manufacturer's instructions.
4. **NOTE**: Left-hand shown, right-hand similar.
   
   Loosen the tie-rod end lock nut.
   
   - Clean and lubricate the lock nut and tie-rod threads.

5. **NOTE**: Do not allow the tie-rod end or steering gear boot to twist when the front tie-rod is rotated.

   - **NOTE**: Left-hand shown, right-hand similar
   
   Rotate the tie-rod to adjust the toe setting.

6. **NOTE**: Make sure the tie-rod or tie-rod end does not rotate.

   - **NOTE**: Left-hand shown, right-hand similar.
   
   Tighten the tie-rod end lock nut.
   
   - Tighten to 100 Nm.

7. Recheck the toe settings. Follow the equipment manufacturer's instructions.
1. Check the toe settings. Follow the equipment manufacturer's instructions.

2. **NOTE: Left-hand, shown right-hand similar.**
   - Loosen the lock nut.
     - Clean and lubricate the lock nut and toe link threads.

3. Rotate the toe link to adjust the toe settings.

4. Tighten the lock nut.

5. Check the toe settings. Follow the equipment manufacturer's instructions.
1. Raise and support the vehicle. For additional information, refer to Section 100-02 Jacking and Lifting.

2. **NOTE:** Make sure the wheel rotates freely and the brake pads are retracted sufficiently to allow movement of the tire and wheel assembly. Firmly grasp the tire at the top and bottom and move the wheel inward and outward while lifting the weight of the tire off the wheel bearing.

3. If the tire and wheel is loose on the wheel hub assembly or does not rotate freely, install a new front wheel hub or rear hub as necessary. For additional information, refer to Section 204-01 Front Suspension or Section 204-02 Rear Suspension.

</table>
The independent front suspension is of the double wishbone type and is mounted on the front subframe, the front subframe consisting of a pressed steel fabrication.

The rear of the front subframe provides the mounting points for the power assisted steering gear and the engine mounts.

A vertical knuckle arm is installed between the lower and upper suspension arms. This wheel knuckle carries the lower arm swivel joint, front hub, ABS rotor, ABS sensor, wheel bearing and brake assembly.

A coaxial shock absorber and spring assembly is installed between the lower arm and vehicle body.

As the road wheel rises, the movement is transmitted to the vertical link, then through the ball joints to the upper and lower arms and the coaxial shock absorber and spring assembly.

A stabilizer bar is mounted via clamps and bushes to the front subframe and is linked via connecting links to each of the lower arms.

When cornering, weight is naturally transferred to the outer wheel and there is a natural tendency for the inner wheel to lift. The stabilizer bar helps to reduce the vehicle roll.

⚠️ WARNING: No attempt must be made to weld or repair the front subframe. If it is damaged a new one must be installed.
Front Suspension - Front Suspension
Diagnosis and Testing
For additional information, refer to Section 204-00 Suspension System - General Information
Front Suspension - Front Lower Arm
Removal and Installation

Removal

1. Remove the wheel and tire. For additional information, refer to: Wheel and Tire (204-04 Wheels and Tires, Removal and Installation).

2. Remove the air deflector. For additional information, refer to: Air Deflector (501-02 Front End Body Panels, Removal and Installation).

3. Remove the front lower arm retaining nut and bolt.

4. NOTE:
   - Remove and discard the nut and bolt.

Installation

1. NOTE: Install a new nut and bolt.
   - To install, reverse the removal procedure.
     - Stage 1: Tighten to 60 Nm.
     - Stage 2: Tighten 135°.

2. Install the front lower arm inner retaining nut and bolt.

3. Install the air deflector. For additional information, refer to: Air Deflector (501-02 Front End Body Panels, Removal and Installation).
4. Install the wheel and tire.
   For additional information, refer to: Wheel and Tire (204-04 Wheels and Tires, Removal and Installation).

5. **CAUTION:** The final tightening of the front lower arm inner retaining nut and bolt must be carried out with the vehicle on its wheels.
   
   Tighten to 175 Nm.

6. Using only four-wheel alignment equipment approved by Jaguar, check the wheel alignment, and adjust if required.
   For additional information, refer to: Four-Wheel Alignment (204-00 Suspension System - General Information, General Procedures).
## Front Suspension - Rear Lower Arm

### Removal and Installation

#### Special Tool(s)

<table>
<thead>
<tr>
<th>Tool</th>
<th>Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ball Joint Splitter</td>
<td>204-327</td>
</tr>
</tbody>
</table>

### Removal

1. Remove the wheel and tire. For additional information, refer to: [Wheel and Tire](204-04 Wheels and Tires, Removal and Installation).

2. Remove the air deflector.

3. Remove the stabilizer bar link retaining nut.

4. Remove the stabilizer bar link.
5. Detach the tie rod end.

6. Detach the steering gear.

7. Secure the steering gear.

8. Detach the shock absorber and spring assembly.

9. Detach the rear lower.
10. Detach the front lower arm.
   - Remove and discard the retaining nut and bolt.

11. **CAUTION:** Prevent the rear lower arm ball joint ball pin hexagon from rotating. Failure to follow this instruction may result in damage to the lower ball joint boot.

   Loosen the rear lower arm ball joint retaining nut.

12. **CAUTION:** Prevent the rear lower arm ball joint ball pin hexagon from rotating. Failure to follow this instruction may result in damage to the lower ball joint boot.

   Adjust the rear lower arm ball joint retaining nut until the ball joint thread cannot be seen.

13. **WARNING:** Make sure the special tool is supported while carrying out the operation. Failure to follow this instruction may result in personal injury.

   • **CAUTIONS:**
     - Make sure the special tool is supported while carrying out the operation. Failure to follow this instruction may result in damage to the special tool.
     - Make sure the special tool is correctly located and the lower ball joint boot is not damaged while carrying out the operation. Failure to follow this instruction may result in damage to the component.

   Using the special tool, release the rear lower arm ball joint from the wheel knuckle lower pivot.

   • **CAUTION:** Make sure the special tool is not over tightened while carrying out the operation. Failure to follow this instruction may result in damage to the special tool.

   - Tighten the special tool adjusting bolt to a maximum of 60 Nm.
   - If the rear lower arm ball joint releases from the wheel knuckle lower pivot using no more than 60 Nm on the special tool adjusting bolt, proceed to step 15.
   - If the rear lower arm ball joint does not release from the wheel knuckle lower pivot using no more than 60 Nm on the special tool adjusting bolt, proceed to step 14.
14. **WARNING:** Make sure the special tool is supported while carrying out the operation. Failure to follow this instruction may result in personal injury.

- **CAUTIONS:**
  - Make sure the special tool is supported while carrying out the operation. Failure to follow this instruction may result in damage to the special tool.
  - Make sure the special tool is correctly located and the lower ball joint boot is not damaged while carrying out the operation. Failure to follow this instruction may result in damage to the component.
  - **NOTE:** Do not carry out this step if the rear lower arm ball joint released from the wheel knuckle lower pivot in step 13.

Using the special tool, release the rear lower arm ball joint from the wheel knuckle lower pivot.

14. **CAUTION:** Make sure the special tool is not over tightened while carrying out the operation. Failure to follow this instruction may result in damage to the special tool.

1. Tighten the special tool adjusting bolt to a maximum of 60 Nm.
2. Strike the top surface of the special tool directly above the rear lower arm ball joint at the point indicated using a copper and hide mallet.

15. **CAUTION:** Prevent the rear lower arm ball joint ball pin hexagon from rotating. Failure to follow this instruction may result in damage to the lower ball joint boot.

Remove the rear lower arm.
- Remove and discard the retaining nut.

**Installation**

1. **CAUTION:** Prevent the rear lower arm ball joint ball pin hexagon from rotating. Failure to follow this instruction may result in damage to the lower ball joint boot.

- **NOTE:** Install a new retaining nut.

Attach the rear lower arm.
- Tighten to 92 Nm.

2. **NOTE:** Install a new retaining nut and bolt.

Attach the front lower arm.
- Stage 1: Tighten to 60 Nm.
- Stage 2: Tighten 135°.
3. Attach the rear lower arm.

4. Attach the shock absorber and spring assembly.
   - Tighten to 175 Nm.

5. Remove and discard the retaining straps.

6. Attach the steering gear.
   - Tighten to 100 Nm.

7. Attach the tie rod end.
   - Tighten to 55 Nm.
8. Install the stabilizer bar link.

9. Attach the stabilizer bar link.
   - Tighten to 47 Nm.

10. Install the air deflector.

11. Install the wheel and tire.
    For additional information, refer to: Wheel and Tire (204-04 Wheels and Tires, Removal and Installation).

12. **CAUTION:** The final tightening of the rear lower arm inner retaining nut and bolt must be carried out with the vehicle on its wheels.
    - Tighten to 175 Nm.
13. Tighten to 70 Nm.

14. Carry out the camber and caster adjustment.
For additional information, refer to: Camber and Caster Adjustment
(204-00 Suspension System - General Information, General Procedures).
Front Suspension - Rear Lower Arm Bushing
Removal and Installation

</tr>
</tbody>
</table>

**Removal**

1. Remove the rear lower arm. For additional information, refer to Rear Lower Arm in this section.
2. Using the special tools remove the rear lower arm bushing.

**Installation**
1. Install the special tools to the rear lower arm.

2. Install the rear lower arm bushing to the special tool.

3. Using the special tools, partially install the rear lower arm bushing.

4. Using the special tool, completely install the rear lower arm bushing.

5. Install the rear lower arm.
   For additional information, refer to Rear Lower Arm in this section.
Removal

1. Remove the wheel and tire. For additional information, refer to Section [204-04 Wheels and Tires].
2. Remove the stabilizer bar link retaining nut.

3. Remove the stabilizer bar link.

4. Detach the shock absorber.

5. **CAUTION:** Make sure the wheel knuckle is supported. Failure to follow these instructions may result in damage to the vehicle. Detach the upper arm.

6. Lower the vehicle.
7. Remove the shock absorber and spring assembly mounting cover plate.

8. Disconnect the electrical connector.

9. Remove the shock absorber and spring assembly.

**Installation**

1. Install the shock absorber and spring assembly.

   1. Tighten to 27 Nm.
2. Connect the electrical connector.

3. Install the shock absorber and spring assembly mounting cover plate.

4. **CAUTION:** Make sure the wheel knuckle is supported. Failure to follow these instructions may result in damage to the vehicle.
   
   Attach the upper arm.
   
   1. Tighten to 90 Nm.

5. Attach the shock absorber.
   
   - Tighten to 175 Nm.

6. Install the stabilizer bar link.
7. Attach the stabilizer bar link.
   - Tighten to 47 Nm.

8. Install the wheel and tire assembly.
   For additional information, refer to Section 204-04 Wheels and Tires.

9. Tighten to 70 Nm.

Removal

⚠️ **CAUTION:** Make sure the supporting tools are orientated correctly to the rear lower arm. Failure to follow this instruction may cause damage to the component.

1. Remove the rear lower arm.  
   For additional information, refer to [Rear Lower Arm](#) in this section.
2. Using the special tools remove the shock absorber bushing.

![Removal Diagram](image)

Installation

⚠️ **CAUTION:** Make sure the supporting tools are orientated correctly to the rear lower arm. Failure to follow this instruction may cause damage to the component.
1. NOTE: Make sure the shock absorber bushing boot is correctly located into the special tool.
   Install the shock absorber bushing to the special tool.

2. Using the special tools install the shock absorber bushing.

3. Install the rear lower arm.
   For additional information, refer to Rear Lower Arm in this section.
Removal and Installation

**Removal**

1. Reposition the dipstick tube.
   - Remove the dipstick tube retaining bolt.

2. **NOTE:** Left-hand shown, right-hand similar.
   Loosen the exhaust manifold retaining nut.

3. **NOTE:** Left-hand shown, right-hand similar.
   Install the special tool to the exhaust manifold.
   - Install the retaining bolt.
4. NOTE: Left-hand shown, right-hand similar.
   Install the retaining bolt.

5. Install the special tool support bars to the special tool.

6. Install the special tool.

7. Remove the air deflector.

8. Remove the radiator splash shield.

9. Remove both the front wheel and tires.
   For additional information, refer to Section 204-04 Wheels and Tires.
10. NOTE: Left-hand shown, right-hand similar.
Remove the stabilizer bar link retaining nut.

11. NOTE: Left-hand shown, right-hand similar.
Remove the stabilizer bar link.

12. Detach the steering gear.

13. NOTE: Left-hand shown, right-hand similar.
Loosen the front lower arm retaining nut and bolt.

14. NOTE: Left-hand shown, right-hand similar.
Loosen the rear lower arm retaining nut and bolt.
15. NOTE: Left-hand shown, right-hand similar.
Detach the shock absorber and spring assembly.

16. NOTE: Left-hand shown, right-hand similar.
Detach the engine mount.

17. Install the special tool.

18. NOTE: Left-hand shown, right-hand similar.
Remove the front subframe front retaining bolt.

19. NOTE: Left-hand shown, right-hand similar.
Remove the front subframe rear retaining bolt.
20. Lower the special tool by approximately 200 mm (7.9 in).

21. NOTE: Left-hand shown, right-hand similar.
   Remove the stabilizer bar clamp.

22. Remove the stabilizer bar.

**Installation**

1. Install the stabilizer bar

2. NOTE: Left-hand shown, right-hand similar.
   Install the stabilizer bar clamp.
   - Tighten to 55 Nm.
3. NOTE: Left-hand shown, right-hand similar.
   Install the front subframe rear retaining bolt.
   ● Tighten to 115 Nm.

4. NOTE: Left-hand shown, right-hand similar.
   Install the front subframe front retaining bolt.
   ● Tighten to 200 Nm.

5. Remove the special tool.

6. NOTE: Left-hand shown, right-hand similar.
   Attach the engine mount.
   ● Tighten to 63 Nm.

7. NOTE: Left-hand shown, right-hand similar.
   Attach the shock absorber and spring assembly.
   1. Tighten to 175 Nm.
8. NOTE: Left-hand shown, right-hand similar.
Tighten the rear lower arm retaining nut and bolt.

9. NOTE: Left-hand shown, right-hand similar.
Tighten the front lower arm retaining nut and bolt.

10. Install the steering gear.
1. Tighten to 100 Nm.

11. Install the stabilizer bar link.

12. NOTE: Left-hand shown, right-hand similar.
Attach the stabilizer bar link.
• Tighten to 47 Nm.
13. Check the front subframe alignment. For additional information, refer to Section 502-00 Uni-Body, Subframe and Mounting System.

14. Install both the front wheel and tires. For additional information, refer to Section 204-04 Wheels and Tires.

15. Install the radiator splash shield.

16. Remove the air deflector.

17. **CAUTION:** The final tightening of the rear lower arm inner retaining nut and bolt must be carried out with the vehicle on its wheels.

   • **NOTE:** Left-hand shown, right-hand similar.
   
   Tighten to 175 Nm.

18. **CAUTION:** The final tightening of the rear lower arm inner retaining nut and bolt must be carried out with the vehicle on its wheels.

   • **NOTE:** Left-hand shown, right-hand similar.
   
   Tighten to 175 Nm.
19. **NOTE:** Left-hand shown, right-hand similar.
   Tighten to 70 Nm.

20. Remove the special tool.
   - Loosen the special tool adjustment bolts.

21. Remove the special tool support bars from the special tool.

22. **NOTE:** Left-hand shown, Right-hand similar.
    Remove the retaining bolt.

23. **NOTE:** Left-hand shown, Right-hand similar.
    Remove the special tool from the exhaust manifold.
    - Remove the retaining bolt.
24. NOTE: Left-hand shown, Right-hand similar.

Tighten the exhaust manifold retaining nut.
  • Tighten to 20 Nm.

25. Reposition the dipstick tube.
  • Remove the dipstick tube retaining bolt.
  • Tighten to 10 Nm.
### Front Suspension - Front Stabilizer Bar 2.7L V6 - TdV6

#### Removal

**All vehicles**

1. **Remove the intake air shutoff throttle.**  
   For additional information, refer to: [Intake Air Shutoff Throttle](#) (303-04C Fuel Charging and Controls - 2.7L V6 - TdV6, Removal and Installation).

2. **Install the special tool.**

3. **Install the special tool.**

4. **Remove the air deflector.**  
   For additional information, refer to: [Air Deflector](#) (501-02 Front End Body)
5. Remove the radiator splash shield. For additional information, refer to: **Radiator Splash Shield** (501-02 Front End Body Panels, Removal and Installation).

6. Remove both the front wheel and tires. For additional information, refer to: **Wheel and Tire** (204-04 Wheels and Tires, Removal and Installation).

Vehicles with automatic transmission

7. Remove the transmission fluid cooler. For additional information, refer to: **Transmission Fluid Cooler** (307-02 Transmission/Transaxle Cooling, Removal and Installation).

All vehicles

8. Remove the right-hand splash shield.

9. Detach the engine coolant inlet pipe from the front subframe.

10. Detach the power steering hose retaining clip from the front subframe.

11. **NOTE:** Left-hand shown, right-hand similar.

   Remove the stabilizer bar link upper retaining nut.
12. NOTE: Left-hand shown, right-hand similar.
   Remove the stabilizer bar link lower retaining bolt and nut and remove the stabilizer bar link.

13. CAUTION: The steering gear must be supported. Failure to follow this instruction may result in damage to the steering gear.
   Detach the steering gear.

14. NOTE: Left-hand shown, right-hand similar.
   Loosen the front lower arm retaining nut and bolt.

15. NOTE: Left-hand shown, right-hand similar.
   Loosen the rear lower arm retaining nut and bolt.

16. NOTE: Left-hand shown, right-hand similar.
   Detach the front shock absorber and spring assembly.
17. NOTE: Left-hand shown, right-hand similar. Remove the engine mount retaining nut.

18. Install the special tool to the front subframe.

19. NOTE: Left-hand shown, right-hand similar. Remove the front subframe front retaining bolt.

20. NOTE: Left-hand shown, right-hand similar. Remove the front subframe rear retaining bolt.

21. **CAUTION:** When lowering the special tool care must be taken to manoeuvre the special tool so that the front subframe does not touch the air conditioning (A/C) pipes. Failure to follow this instruction may result in damage to the A/C pipes.

   Lower the special tool by approximately 200 mm (7.9 in).
22. **NOTE:** Left-hand shown, right-hand similar.

Remove the stabilizer bar clamp.

23. Remove the stabilizer bar.

### Installation

All vehicles

1. **CAUTION:** When raising the special tool care must be taken to manoeuvre the special tool so that the front subframe does not touch the air conditioning (A/C) pipes. Failure to follow this instruction may result in damage to the A/C pipes.

   Install the stabilizer bar.

2. **NOTE:** Left-hand shown, right-hand similar.

   Install the stabilizer bar clamp.
   - Tighten to 55 Nm.
3. NOTE: Left-hand shown, right-hand similar.
   Install the special tool.

4. NOTE: Left-hand shown, right-hand similar.
   Install the front subframe rear retaining bolt.
   • Tighten to 80 Nm + 240°.

5. Remove the special tool.

6. Install the front subframe front retaining bolt.
   • Tighten to 150 Nm + 240°.

7. Remove the special tool.
8. Install the front subframe front retaining bolt.
   • Tighten to 150 Nm + 240°.

9. Remove the special tool.

10. NOTE: Left-hand shown, right-hand similar.
    Install the engine mount retaining nut.
    • Tighten to 63 Nm.

11. NOTE: Left-hand shown, right-hand similar.
    Attach the front shock absorber and spring assembly.
    • Tighten to 175 Nm.

12. CAUTION: The final tightening of the rear lower arm inner retaining nut and bolt must be carried out with the vehicle on its wheels.
    • NOTE: Left-hand shown, right-hand similar.
    Hand tighten the rear lower arm retaining nut and bolt.
13. **CAUTION:** The final tightening of the front lower arm inner retaining nut and bolt must be carried out with the vehicle on its wheels.
   • **NOTE:** Left-hand shown, right-hand similar.
   Hand tighten the front lower arm retaining nut and bolt.

   • Tighten to 100 Nm.

15. Install the stabilizer bar link.

16. Attach the stabilizer bar link and install the stabilizer bar link retaining nut.
   • Tighten to 43 Nm.

17. Attach the power steering hose retaining clip to the front subframe.
18. Attach the engine coolant inlet pipe to the front subframe.

19. Install the right-hand splash shield.

Vehicles with automatic transmission

20. Install the transmission fluid cooler.
   For additional information, refer to: Transmission Fluid Cooler (307-02 Transmission/Transaxle Cooling, Removal and Installation).

All vehicles

21. Install both the front wheel and tires.
   For additional information, refer to: Wheel and Tire (204-04 Wheels and Tires, Removal and Installation).

22. Install the radiator splash shield.
   For additional information, refer to: Radiator Splash Shield (501-02 Front End Body Panels, Removal and Installation).

23. Install the air deflector.
   For additional information, refer to: Air Deflector (501-02 Front End Body Panels, Removal and Installation).

24. **CAUTION:** The final tightening of the rear lower arm inner retaining nut and bolt must be carried out with the vehicle on its wheels.
   - NOTE: Left-hand shown, right-hand similar.
   
   Tighten to 175 Nm.

25. **CAUTION:** The final tightening of the front lower arm inner retaining nut and bolt must be carried out with the vehicle on its wheels.
   - NOTE: Left-hand shown, right-hand similar.
   
   Tighten to 175 Nm.
26. **NOTE:** Left-hand shown, right-hand similar.
Tighten to 70 Nm.

27. Remove the special tool.

28. Remove the special tool.

29. Install the intake air shutoff throttle.
For additional information, refer to: Intake Air Shutoff Throttle (303-04C Fuel Charging and Controls - 2.7L V6 - TdV6, Removal and Installation).

**Removal**

**Vehicles without supercharger**

1. Remove the throttle body. For additional information, refer to: (303-04B Fuel Charging and Controls - V8 4.2L Petrol/V8 S/C 4.2L Petrol)

   - Throttle Body - Vehicles Without: Supercharger, VIN Range: M45255->N52047 (Removal and Installation),

**Vehicles with supercharger**

2. Remove the air cleaner outlet pipe.

   For additional information, refer to: Air Cleaner Outlet Pipe (303-12B Intake Air Distribution and Filtering - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Removal and Installation).

**All vehicles**

3. **NOTE:** Vehicles without supercharger shown, vehicles with supercharger similar.

   Install the special tools.
4. NOTE: Vehicles with supercharger shown, vehicles without supercharger similar.

• NOTE: Right-hand shown, left-hand similar.

Install the special tool.

5. Remove the air deflector.
   For additional information, refer to: Air Deflector (501-02 Front End Body Panels, Removal and Installation).

6. Remove the radiator splash shield.
   For additional information, refer to: Radiator Splash Shield (501-02 Front End Body Panels, Removal and Installation).

7. Remove both the front wheels and tires.
   For additional information, refer to: Wheel and Tire (204-04 Wheels and Tires, Removal and Installation).

8. NOTE: Left-hand shown, right-hand similar.

   Remove the stabilizer bar link retaining nut.

9. NOTE: Left-hand shown, right-hand similar.

   Remove the stabilizer bar link.
10. Detach the steering gear.

11. Secure the steering gear.

12. NOTE: Left-hand shown, right-hand similar.
Loosen the front lower arm retaining nut and bolt.

13. NOTE: Left-hand shown, right-hand similar.
Loosen the rear lower arm retaining nut and bolt.

14. NOTE: Left-hand shown, right-hand similar.
Detach the shock absorber and spring assembly.
15. NOTE: Left-hand shown, right-hand similar.
Detach the engine mount.

16. Install the special tool.

17. NOTE: Left-hand shown, right-hand similar.
Remove the front subframe front retaining bolt.

18. NOTE: Left-hand shown, right-hand similar.
Remove the front subframe rear retaining bolt.

19. Lower the special tool by approximately 200 mm (7.9 in).

20. NOTE: Left-hand shown, right-hand similar.
Remove the stabilizer bar clamp.
21. Remove the stabilizer bar.

**Installation**

**All vehicles**

1. Install the stabilizer bar.

2. **NOTE: Left-hand shown, right-hand similar.**
   - Install the stabilizer bar clamp.
   - **Tighten to 55 Nm.**

3. **NOTE: Left-hand shown, right-hand similar.**
   - Install the special tools.
4. **NOTE:** Left-hand shown, right-hand similar.
   Install the front subframe rear retaining bolts.
   - Tighten to 80 Nm + 240°.

5. Remove the special tool.

6. Install the front subframe front retaining bolt.
   - Tighten to 150 Nm + 240°.

7. Remove the special tool.

8. Install the front subframe front retaining bolt.
   - Tighten to 150 Nm + 240°.
9. Remove the special tool.

10. NOTE: Left-hand shown, right-hand similar.
    Attach the engine mount.
    • Tighten to 63 Nm.

11. NOTE: Left-hand shown, right-hand similar.
    Attach the shock absorber and spring assembly.
    • Tighten to 175 Nm.

12. NOTE: Left-hand shown, right-hand similar.
    Tighten the rear lower arm retaining nut and bolt.

13. NOTE: Left-hand shown, right-hand similar.
    Tighten the front lower arm retaining nut and bolt.
14. Detach the steering gear.

15. Attach the steering gear.
   - Tighten to 100 Nm.

16. NOTE: Left-hand shown, right-hand similar.
    Install the stabilizer bar link.

17. NOTE: Left-hand shown, right-hand similar.
    Attach the stabilizer bar link.
    - Tighten to 47 Nm.

18. Install both the front wheels and tires.
    For additional information, refer to: Wheel and Tire (204-04 Wheels and Tires, Removal and Installation).

19. Install the radiator splash shield.
    For additional information, refer to: Radiator Splash Shield (501-02 Front End Body Panels, Removal and Installation).

20. Install the air deflector.
    For additional information, refer to: Air Deflector (501-02 Front End Body Panels, Removal and Installation).
21. **CAUTION:** The final tightening of the rear lower arm inner retaining nut and bolt must be carried out with the vehicle on its wheels.

- **NOTE:** Left-hand shown, right-hand similar.

  Tighten to 175 Nm.

22. **CAUTION:** The final tightening of the rear lower arm inner retaining nut and bolt must be carried out with the vehicle on its wheels.

- **NOTE:** Left-hand shown, right-hand similar.

  Tighten to 175 Nm.

23. **NOTE:** Left-hand shown, right-hand similar.

  Tighten to 70 Nm.

24. **NOTE:** Vehicles with supercharger shown, vehicles without supercharger similar.

- **NOTE:** Right-hand shown, left-hand similar.

  Remove the special tool.

  - Loosen the special tool adjustment bolts.
25. NOTE: Vehicles without supercharger shown, vehicles with supercharger similar.

Remove the special tools.

Vehicles with supercharger

26. Install the air cleaner outlet pipe.
For additional information, refer to: Air Cleaner Outlet Pipe (303-12B Intake Air Distribution and Filtering - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Removal and Installation).

Vehicles without supercharger

27. Install the throttle body. For additional information, refer to: (303-04B Fuel Charging and Controls - V8 4.2L Petrol/V8 S/C 4.2L Petrol)

Throttle Body - Vehicles Without: Supercharger, VIN Range: M45255->N52047 (Removal and Installation),
Throttle Body - Vehicles Without: Supercharger, VIN Range: N52048->N99999 (Removal and Installation).
Front Suspension - Front Stabilizer Bar Link
Removal and Installation

Removal

1. Raise and support the vehicle.
   For additional information, refer to Section 100-02 Jacking and Lifting.
2. Remove the stabilizer bar link retaining nut.

3. Remove the stabilizer bar link.

Installation

1. Install the stabilizer bar link.

2. Tighten to 47 Nm.

3. Lower the vehicle.
4. Tighten to 70 Nm.
**Front Suspension - Stabilizer Bar Link Bushing**

**Removal and Installation**

### Special Tool(s)

### Removal

1. Remove the rear lower arm.
   For additional information, refer to Rear Lower Arm in this section.
2. Using the special tools remove the stabilizer bar link bushing.

### Installation

1. **NOTE:** Apply water to lubricate the bushing.
   Using the special tools install the stabilizer bar link bushing.
2. Install the rear lower arm.
   For additional information, refer to Rear Lower Arm in this section.
Front Suspension - Upper Arm LH
Removal and Installation

Removal

1. Remove the shock absorber and spring assembly. For additional information, refer to Shock Absorber and Spring Assembly in this section.

2. Remove the cowl vent screen. For additional information, refer to Section 501-02 Front End Body Panels.

3. Disconnect the electrical connector.

4. Remove the brake pedal travel sensor.
   1. Remove the brake pedal travel sensor retaining clip.
   2. Remove the brake pedal travel sensor.

5. Remove the upper arm retaining nut.

6. Remove the air cleaner assembly. For additional information, refer to Section 303-12A Intake Air Distribution and Filtering Section 303-12B Intake Air Distribution and Filtering Section 303-12C Intake Air Distribution and Filtering Section 303-12A Intake Air Distribution and Filtering Section 303-12B Intake Air Distribution and Filtering Section 303-12C Intake Air Distribution and Filtering

7. Remove the upper arm retaining nut.
Installation

1. Install the upper arm.

2. Install the upper arm retaining nut.
   - Tighten to 47 Nm.

3. Install the upper arm retaining nut.

4. Install the shock absorber and spring assembly.
   For additional information, refer to Shock Absorber and Spring Assembly in this section.

8. Remove the upper arm.
5. **CAUTION:** The final tightening of the Upper arm retaining nut must be carried out with the vehicle on its wheels.
   Tighten to 47 Nm.

6. **CAUTION:** The final tightening of the Upper arm retaining nut must be carried out with the vehicle on its wheels.
   Tighten to 47 Nm.

7. Install the air cleaner assembly. For additional information, refer to Section 303-12A Intake Air Distribution and Filtering, Section 303-12B Intake Air Distribution and Filtering, Section 303-12C Intake Air Distribution and Filtering, Section 303-12A Intake Air Distribution and Filtering, Section 303-12B Intake Air Distribution and Filtering, Section 303-12C Intake Air Distribution and Filtering.

8. Install the brake pedal travel sensor.
   1. Install the brake pedal travel sensor retaining clip.
   2. Install the brake pedal travel sensor retaining clip.

9. Connect the electrical connector.

10. Install the cowl vent screen.
    For additional information, refer to Section 501-02 Front End Body Panels.
Front Suspension - Upper Arm RH
Removal and Installation

Removal

1. Remove the shock absorber and spring assembly. For additional information, refer to Shock Absorber and Spring Assembly in this section.

2. Remove the cabin air filter. For additional information, refer to Section 412-01 Air Distribution and Filtering.

3. Remove the cabin air filter housing retaining nut.

4. Remove the cabin air filter housing.

5. Remove the engine compartment support.

6. Remove the engine compartment panel.
7. Detach the wiring harness mounting bracket.

8. Remove the upper arm retaining nut.

9. Detach the engine compartment battery junction box.
   1. Release the engine compartment battery junction box retaining clips.
   2. Detach the engine compartment battery junction box.

10. Detach the hydraulic control unit.

11. Remove the upper arm retaining nut.
12. Remove the upper arm.

**Installation**

1. Install the upper arm.

2. Install the upper arm retaining nut.

3. Install the upper arm retaining nut.

4. Install the shock absorber and spring assembly. For additional information, refer to [Shock Absorber and Spring Assembly](#) in this section.
5. **CAUTION:** The final tightening of the Upper arm retaining nut must be carried out with the vehicle on its wheels.
   
   Tighten to 47 Nm.

6. **CAUTION:** The final tightening of the Upper arm retaining nut must be carried out with the vehicle on its wheels.
   
   Tighten to 47 Nm.

7. Attach the hydraulic control unit.

8. Attach the engine compartment battery junction box.
   1. reposition the engine compartment battery junction box.
   2. Attach the engine compartment battery junction box.

9. Attach the wiring harness mounting bracket.
10. Install the engine compartment panel.

11. Install the engine compartment support.

12. Install the cabin air filter housing.

13. Install the cabin air filter housing retaining nut.

14. Install the cabin air filter.
For additional information, refer to Section 412-01 Air Distribution and Filtering.
Front Suspension - Front Wheel Bearing and Wheel Hub
Removal and Installation

Removal

1. Remove the brake disc. For additional information, refer to: (206-03 Front Disc Brake)
   
   Brake Disc - Vehicles With: Standard Brakes, VIN Range: M45255->N52047 (Removal and Installation),
   Brake Disc - Vehicles With: Standard Brakes, VIN Range: N52048->N99999 (Removal and Installation),
   Brake Disc - Vehicles With: High Performance Brakes, VIN Range: M45255->N52047 (Removal and Installation),

2. Detach the front wheel speed sensor harness.

3. Remove the front wheel speed sensor.
   - Disconnect the electrical connector.

4. **CAUTION:** Do not attempt to release the wheel hub by hitting it with a hammer directly, loosen the wheel hub retaining bolts partially before applying an even amount of force to the head of each bolts to release the wheel hub from the wheel knuckle. Failure to follow this instruction may cause damage to the component.
   
   Remove the wheel bearing and wheel hub retaining bolts.

5. Remove the wheel bearing and wheel hub.
Installation

1. To install, reverse the removal procedure.
   - Tighten to 90 Nm.
**Front Suspension - Wheel Knuckle**

**Removal and Installation**

<table>

<tr>
<th>Special Tool(s)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ball Joint Splitter</td>
</tr>
<tr>
<td>204-327</td>
</tr>
</tbody>
</table>

**Removal**

1. Remove the brake disc shield. For additional information, refer to:
   - Brake Disc Shield - Vehicles With: Standard Brakes (206-03 Front Disc Brake, Removal and Installation),
   - Brake Disc Shield - Vehicles With: High Performance Brakes (206-03, Removal and Installation).

2. Remove the stabilizer bar link retaining nut.

3. Remove the stabilizer bar link.

4. **CAUTION:** Prevent the tie-rod end ball joint ball pin hexagon from rotating. Failure to follow this instruction may result in damage to the tie-rod end ball joint boot.

   Detach the tie-rod end.
5. **CAUTIONS:**

- Prevent the upper ball joint ball pin hexagon from rotating. Failure to do so may result in damage to the upper ball joint boot.

- Make sure the wheel knuckle is supported. Failure to follow these instructions may result in damage to the component.
  
  Detach the upper arm.

6. **CAUTION:** Prevent the rear lower arm ball joint ball pin hexagon from rotating. Failure to follow this instruction may result in damage to the lower ball joint boot.

Loosen the rear lower arm ball joint retaining nut.

7. **CAUTION:** Prevent the rear lower arm ball joint ball pin hexagon from rotating. Failure to follow this instruction may result in damage to the lower ball joint boot.

Adjust the rear lower arm ball joint retaining nut until the ball joint thread cannot be seen.

8. **WARNING:** Make sure the special tool is supported while carrying out the operation. Failure to follow this instruction may result in personal injury.

- **CAUTIONS:**

  - Make sure the special tool is supported while carrying out the operation. Failure to follow this instruction may result in damage to the special tool.

  - Make sure the special tool is correctly located and the lower ball joint boot is not damaged while carrying out the operation. Failure to follow this instruction may result in damage to the component.

Using the special tool, release the rear lower arm ball joint from the wheel knuckle lower pivot.

8. **CAUTION:** Make sure the special tool is not over tightened while carrying out the operation. Failure to follow this instruction may result in damage to the special tool.

- Tighten the special tool adjusting bolt to a maximum of 60 Nm.

- If the rear lower arm ball joint releases from the wheel knuckle lower pivot using no more than 60 Nm on the special tool adjusting bolt, proceed to step 10.

- If the rear lower arm ball joint does not release from the wheel knuckle lower pivot using no more than 60 Nm on the special tool adjusting bolt, proceed to step 9.
9. **WARNING:** Make sure the special tool is supported while carrying out the operation. Failure to follow this instruction may result in personal injury.

- **CAUTIONS:**
  - Make sure the special tool is supported while carrying out the operation. Failure to follow this instruction may result in damage to the special tool.
  - Make sure the special tool is correctly located and the lower ball joint boot is not damaged while carrying out the operation. Failure to follow this instruction may result in damage to the component.
  - **NOTE:** Do not carry out this step if the rear lower arm ball joint released from the wheel knuckle lower pivot in step 8.

Using the special tool, release the rear lower arm ball joint from the wheel knuckle lower pivot.

9. **CAUTION:** Make sure the special tool is not over tightened while carrying out the operation. Failure to follow this instruction may result in damage to the special tool.

1. Tighten the special tool adjusting bolt to a maximum of 60 Nm.

2. Strike the top surface of the special tool directly above the rear lower arm ball joint at the point indicated using a copper and hide mallet.

10. **WARNING:** Make sure the wheel knuckle is supported while carrying out the operation. Failure to follow this instruction may result in personal injury.

- **CAUTIONS:**
  - Make sure the wheel knuckle is supported while carrying out the operation. Failure to follow this instruction may result in damage to the component.
  - Prevent the rear lower arm ball joint ball pin hexagon from rotating. Failure to follow this instruction may result in damage to the lower ball joint boot.

Remove the wheel knuckle.

- Remove and discard the retaining nut.

### Installation

1. **CAUTION:** Prevent the rear lower arm ball joint ball pin hexagon from rotating. Failure to follow this instruction may result in damage to the lower ball joint boot.

- **NOTE:** Install a new retaining nut.

Install the wheel knuckle

- Tighten to 92 Nm.
2. Attach the upper arm.
   - Tighten to 90 Nm.

3. Attach the tie-rod end.
   - Tighten to 55 Nm.

4. Install the stabilizer bar link.

5. Attach the stabilizer bar link.
   - Tighten to 47 Nm.

6. Install the brake disc shield. For additional information, refer to:
   - Brake Disc Shield - Vehicles With: Standard Brakes (206-03 Front Disc Brake, Removal and Installation)
   - Brake Disc Shield - Vehicles With: High Performance Brakes (206-03, Removal and Installation)
7. Tighten to 70 Nm.
Front Suspension - Shock Absorber and Spring Assembly
Disassembly and Assembly

Disassembly

1. Remove the shock absorber and spring assembly. For additional information, refer to Shock Absorber and Spring Assembly in this section.

2. Install the shock absorber and spring assembly to the special tool

3. **WARNING: THE SPRING IS UNDER EXTREME TENSION, CARE MUST BE TAKEN AT ALL TIMES. FAILURE TO FOLLOW THESE INSTRUCTIONS MAY RESULT IN PERSONAL INJURY.**

   Compress the road spring.

4. Remove the shock absorber retaining nut.

5. Release the road spring.
6. Remove the shock absorber.

Assembly

1. **CAUTION:** Make sure the spring ends align correctly against the spring seats

   To assemble, reverse the disassembly procedure.

2. Vehicles without adaptive damping.
   - Tighten to 50 Nm.

3. Vehicles with adaptive damping.
   - Tighten to 27 Nm.

The independent rear suspension features aluminium upper and lower control arms which carry the hub assemblies and shock absorber and spring assemblies.

### Components

The wheel knuckle:
- carries the wheel hub.
- carries the brake caliper assembly.
- carries the Anti-lock brake (ABS) sensor.
- carries the wheel hub bearing and bearing seals.
- is of a unique design for vehicles with supercharger.

The stabilizer link:
- is of a steel construction with a ball joint at each end.
- transmits vertical movements of the rear suspension to the stabilizer bar.

The stabilizer bar:
- is mounted on the subframe.
- is connected to the left and right hand lower wishbones by the stabilizer bar drop links.
- is fitted to all models with or without sports suspension.
The upper arm:
- is a one piece aluminium casting and incorporates a built in ball joint.
- is the upper support for the wheel knuckle.
- is fitted with height sensors which is part of the high intensity discharge (HID) lights feature.

The tie rod:
- is of a two piece steel construction with a ball joint at both ends.
- is utilized to adjust rear wheel alignment.

The lower arm:
- is a one piece aluminium casting, with integral mounting points for the shock absorber and spring assembly and the stabilizer bar link.
- is the lower support for the wheel knuckle.
- vehicles with supercharger have a stronger lower arm for the increased torque capacity.

The shock absorber and spring assembly is mounted between the lower wishbone and the vehicle body.

There are several variants of spring and damper combinations to enable standard and sport suspension options.
Rear Suspension - Rear Suspension
Diagnosis and Testing
For additional information, refer to Section 204-00 Suspension System - General Information.
Removal

All vehicles

1. Make sure the park brake is in the off position.
2. Remove the wheel and tire.
   For additional information, refer to Section 204-04 Wheels and Tires.
3. Detach the shock absorber and spring assembly from the lower arm.

4. Detach the stabilizer bar link.

Vehicles without Brembo brakes

5. CAUTION: The brake caliper must be supported at all times.
   Detach the brake caliper and secure to one side.
   - Remove and discard the brake caliper retaining bolts.

Vehicles with Brembo brakes

6. CAUTION: The brake caliper must be supported at all times.
   Detach the brake caliper and secure to one side.
   - Remove and discard the brake caliper retaining bolts.
7. Remove and discard the retaining clips and reposition the brake disc.

All vehicles

8. Detach the lower arm from the wheel hub assembly.

9. Remove the lower arm.

Installation

All vehicles

1. **CAUTION:** The final tightening of the rear suspension components must be carried out with the vehicle on its wheels.

   Install the lower arm.
   - Install the retaining bolts.
2. **CAUTION:** The final tightening of the rear suspension components must be carried out with the vehicle on its wheels.

   Install the retaining bolt.

Vehicles without Brembo brakes

3. Attach the brake caliper.
   - Install new brake caliper retaining bolts.
   - Tighten to 103 Nm.

Vehicles with Brembo brakes

4. Attach the brake caliper.
   - Install new brake caliper retaining bolts.
   - Tighten to 70 Nm.

All vehicles

5. Attach the stabilizer bar link.
   - Tighten to 48 Nm.
6. **CAUTION:** The final tightening of the rear suspension components must be carried out with the vehicle on its wheels.

   Install the shock absorber and spring assembly retaining bolt.

7. Install the wheel and tire.

   For additional information, refer to Section [204-04 Wheels and Tires](#).

8. Lower the vehicle.

9. **CAUTION:** The final tightening of the rear suspension components must be carried out with the vehicle on its wheels.

   Tighten to 163 Nm.

10. **CAUTION:** The final tightening of the rear suspension components must be carried out with the vehicle on its wheels.

    Tighten to 150 Nm.

11. **CAUTION:** The final tightening of the rear suspension components must be carried out with the vehicle on its wheels.

    Tighten to 133 Nm.

12. Check the wheel alignment and adjust as necessary.

    For additional information, refer to Section [204-00 Suspension System - General Information](#).
Rear Suspension - Shock Absorber and Spring Assembly
Removal and Installation

Removal

All Vehicles

1. Remove the luggage compartment side trim panel. For additional information, refer to Section 501-05 Interior Trim and Ornamentation.

Vehicles with Active Suspension

2. Disconnect the active suspension damper electrical connector.

All Vehicles

3. Remove the retaining nuts.

4. Remove the wheel and tire. For additional information, refer to Section 204-04 Wheels and Tires.

5. Remove the shock absorber and spring assembly.

Installation

All vehicles
1. **CAUTION:** The final tightening of the rear suspension components must be carried out with the vehicle on its wheels.

   Install the shock absorber and spring assembly retaining bolt.

2. Install the shock absorber and spring assembly retaining nuts.
   - Tighten to 28 Nm.

Vehicles with Active Suspension

3. Connect the active suspension damper electrical connector.

All vehicles

4. Install the wheel and tire.
   For additional information, refer to Section [204-04 Wheels and Tires](#).

5. Lower the vehicle.

6. **CAUTION:** The final tightening of the rear suspension components must be carried out with the vehicle on its wheels.

   Tighten to 133 Nm.

7. Check the wheel alignment and adjust as necessary.
   For additional information, refer to Section [204-00 Suspension System - General Information](#).
### Special Tool(s)

</tbody>
</table>

### Removal

1. **WARNING:** Failure to follow this instruction may cause damage to the vehicle.

   Mark the orientation of the shock absorber in relation to the lower suspension arm.

2. Remove the rear shock absorber and spring assembly.
   For additional information, refer to: [Shock Absorber and Spring Assembly](204-02 Rear Suspension, Removal and Installation).

3. **NOTE:** Place the shock absorber with the recessed side facing upwards.
   • **NOTE:** With assistance make sure the special tool is aligned.

   Using the special tool, support the shock absorber.

4. **NOTE:** Position the special tool onto the recessed side of the bush.
   • **NOTE:** With assistance make sure the special tool is aligned.

   Position and align the special tool to the shock absorber bush.
5. **NOTE:** With assistance make sure the component is aligned.
Using the special tools, slowly push the bush from the shock absorber.

---

**Installation**

1. **NOTE:** Make sure the bush is clean and free from oil or grease.
   - **NOTE:** Use a suitable lubricant to allow the bush to locate into the special tool.
   Locate the new bush in the special tool.

2. **WARNING:** Failure to follow this instruction may cause damage to the vehicle.
   - **NOTE:** Make sure the shock absorber is clean and free from oil or grease and is not damaged prior to pushing in the new bush.
   - **NOTE:** Make sure the bush is installed following the same direction as removal.
   - **NOTE:** Make sure correct alignment is maintained.
   Using the special tools, align the bush to the shock absorber.

3. **NOTE:** Make sure correct alignment is maintained.
   Slowly push the bush into the shock absorber until the tool reaches the stop.

4. **WARNING:** Failure to follow this instruction may cause damage to the vehicle.
   - **NOTE:** Make sure the shock absorber and spring assembly are placed in the correct orientation to the vehicle.
   Install the rear shock absorber and spring assembly.
For additional information, refer to: **Shock Absorber and Spring Assembly** (204-02 Rear Suspension, Removal and Installation).
Rear Suspension - Rear Stabilizer Bar
Removal and Installation

Special Tool(s)
Powertrain assembly jack
HTJ1200-2

Removal
All vehicles

1. Drain the right-hand fuel tank saddle. For additional information, refer to Section 310-00 Fuel System - General Information.

2. Remove both the upper arms. For additional information, refer to Upper Arm in this section.

3. Remove the front muffler. For additional information, refer to Section 309-00 Exhaust System.

Vehicles with Brembo brakes

4. **CAUTION:** The brake caliper must be supported at all times. Detach the brake caliper and secure to one side.
   - Remove and discard the brake caliper retaining bolts.

Vehicles without Brembo brakes

5. Remove the brake pads. For additional information, refer to Section 206-04 Rear Disc Brake.

6. **CAUTION:** The brake caliper must be supported at all times. Detach the brake caliper and brake caliper anchor plate and secure to one side.
   - Remove and discard the brake caliper retaining bolts.

All vehicles

www.JagDocs.com
7. **NOTE:** Left-hand shown right-hand similar.
   Disconnect the anti-lock brake system (ABS) sensor electrical connector.

8. **NOTE:** Right-hand shown left-hand similar.
   Detach the shock absorber and spring assembly from the lower arm.

9. **CAUTION:** Under no circumstances must the flexible coupling (or its fixings) be loosened or removed from the driveshaft
   Detach the driveshaft from the rear drive axle flange.
   - Mark the position of the driveshaft in relation to the rear drive axle flange.
   - Mark the position of the balance nut in relation to the rear drive axle flange (if fitted).
   - Mark the position of each nut and bolt in relation to the rear drive axle flexible joint.

10. Detach the fuel filler pipe.
    - Undo and reposition the hose clip.

11. Detach the electric parking brake motor harness.
12. Disconnect the electric parking brake motor electrical connector.

13. **NOTE:** Left-hand shown right-hand similar.
Remove the reinforcement plate retaining bolts.

14. Using the special tool, support the subframe.

15. **NOTE:** Left-hand shown right-hand similar.
Remove the subframe rear mount retaining bolt.

16. **NOTE:** Left-hand shown right-hand similar.
Remove the subframe front mount retaining bolt.

17. Lower the subframe.
18. NOTE: Right-hand shown left-hand similar. 
Remove the stabilizer bar link retaining nut.

19. NOTE: Left-hand shown right-hand similar. 
Remove the stabilizer bar.

---

**Installation**

All vehicles

1. NOTE: Left-hand shown right-hand similar. 
   Install the stabilizer bar. 
   • Tighten to 55 Nm.

2. NOTE: Right-hand shown left-hand similar. 
   Install the stabilizer bar link retaining nut. 
   • Tighten to 48 Nm.

3. Reposition the subframe.
4. NOTE: Left-hand shown right-hand similar.
Install the subframe front mount retaining bolt.
  • Tighten to 125 Nm.

5. NOTE: Left-hand shown right-hand similar.
Install the subframe rear mount retaining bolt.
  • Tighten to 125 Nm.

6. NOTE: Left-hand shown right-hand similar.
Install the reinforcement plate retaining bolts.
  • Tighten to 48 Nm.

7. Connect the electric parking brake motor electrical connector.

8. Attach the electric parking brake motor harness.
9. Attach the fuel filler pipe.
   - Reposition and tighten hose clip.

10. Attach the driveshaft to the rear drive axle flange.
    - Tighten to 88 Nm.

11. NOTE: Left-hand shown right-hand similar.
    Connect the ABS sensor electrical connector.

Vehicles without Brembo brakes

12. Attach the brake caliper and brake caliper anchor plate.
    - Install new brake caliper retaining bolts.
    - Tighten to 103 Nm.

13. Install the brake pads.
    For additional information, refer to Section 206-04 Rear Disc Brake.

Vehicles with Brembo brakes
14. Attach the brake caliper.
   - Install new brake caliper retaining bolts.
   - Tighten to 70 Nm.

All vehicles

15. Install the front muffler.
    For additional information, refer to Section 309-00 Exhaust System.

16. Install both the upper arms.
    For additional information, refer to Upper Arm in this section.

17. Fill the right-hand fuel tank saddle.
    For additional information, refer to Section 310-00 Fuel System - General Information.

18. **CAUTION:** The final tightening of the rear suspension components must be carried out with the vehicle on its wheels.
    Tighten to 133 Nm.

19. Check the wheel alignment and adjust as necessary.
    For additional information, refer to Section 204-00 Suspension System - General Information.

20. Carry out the rear subframe alignment procedure.
    For additional information, refer to Section 502-00 Uni-Body, Subframe and Mounting System.
Rear Suspension - Upper Arm
Removal and Installation

Removal

1. Remove the wheel and tire. For additional information, refer to Section 204-04 Wheels and Tires.
2. Detach the high intensity discharge (HID) sensor link rod.

3. Detach the anti-lock brake system (ABS) sensor wiring harness.

4. Detach the upper arm from the wheel knuckle.

5. Remove the upper arm.

Installation
1. Install the upper arm.

2. Attach the anti-lock brake system (ABS) sensor wiring harness.

3. Attach the high intensity discharge (HID) sensor link rod.

4. Attach the upper arm to the wheel knuckle.

5. Install the wheel and tire.
   For additional information, refer to Section 204-04 Wheels and Tires.

6. Lower the vehicle.
7. **CAUTION:** The final tightening of the rear suspension components must be carried out with the vehicle on its wheels.

   Tighten to 98 Nm.

---

8. **CAUTION:** The final tightening of the rear suspension components must be carried out with the vehicle on its wheels.

   Tighten to 90 Nm.

---

9. Check and adjust the wheel alignment as necessary.

   For additional information, refer to Section [204-00 Suspension System - General Information](#).
**Rear Suspension - Rear Wheel Bearing**

**Removal and Installation**

</tbody>
</table>

**Removal**

1. Loosen the wheel hub nut.

2. Remove the brake disc. For additional information, refer to: (206-04 Rear Disc Brake)
Brake Disc - Vehicles With: Standard Brakes, VIN Range: M45255->N52047 (Removal and Installation),
Brake Disc - Vehicles With: High Performance Brakes, VIN Range: M45255->N52047 (Removal and Installation),
Brake Disc - VIN Range: N52048->N99999 (Removal and Installation).

3. Detach the anti-lock brake system (ABS) sensor.

4. Detach the outer tie-rod.

5. Detach the lower arm from the wheel knuckle.

6. Remove the wheel hub nut.

7. Using the special tools, detach the halfshaft.
8. Remove the wheel knuckle assembly.

9. Using the special tools, remove the wheel hub from the bearing.

10. Using the special tools, remove the inner bearing race from the hub.

11. Remove the circlip.

12. Using the special tools, remove the bearing from the wheel knuckle.
Installation

1. NOTE: The final tightening of the rear suspension components must be carried out with the vehicle on its wheels.

   Using the special tools, install the bearing to the wheel knuckle.

2. Install the circlip.

3. Using the special tools, install the wheel hub to the bearing.

4. Install the wheel knuckle assembly.
   - Tighten to 90 Nm.
5. **NOTE:** Using the old wheel hub nut tighten to 150 Nm.
   Attach the wheel knuckle to the halfshaft.

6. Install the lower arm to the wheel knuckle retaining bolt.

7. Install the outer tie rod retaining bolt.

8. Install the ABS sensor.
   - Tighten to 10 Nm.

9. Install the brake disc. For additional information, refer to: (206-04 Rear Disc Brake)

   Brake Disc - Vehicles With: Standard Brakes, VIN Range: M45255->N52047 (Removal and Installation),
   Brake Disc - Vehicles With: High Performance Brakes, VIN Range: M45255->N52047 (Removal and Installation),
   Brake Disc - VIN Range: N52048->N99999 (Removal and Installation).

10. Lower the vehicle.
11. **NOTE:** Remove and discard the old wheel hub nut, install a new wheel hub nut.

   Tighten the wheel hub nut.
   - Tighten to 300 Nm.

12. **CAUTION:** The final tightening of the rear suspension components must be carried out with the vehicle on its wheels.

   Tighten to 150 Nm.

13. **CAUTION:** The final tightening of the rear suspension components must be carried out with the vehicle on its wheels.

   Tighten to 55 Nm.
Disassembly and Assembly

Special Tool(s)

Compressor, Coil Spring
204-476

Disassembly

1. Remove the shock absorber and spring assembly.
   For additional information, refer to Shock Absorber and Spring Assembly in this section.

2. **WARNING:** Make sure the shock absorber is secured by fully inserting the locking pin in to the special tool. Failure to follow these instructions may result in personal injury.
   Install the shock absorber and spring assembly to the special tool as shown.

3. **WARNING:** AS THE SPRING IS UNDER EXTREME TENSION CARE MUST BE TAKEN AT ALL TIMES. FAILURE TO FOLLOW THESE INSTRUCTIONS MAY RESULT IN PERSONAL INJURY.
   Clamp the road spring.

4. Remove the shock absorber retaining nut.
   • Remove and discard the retaining nut.

5. Release the road spring.
6. Remove the shock absorber.

Assembly

1. **CAUTION:** Make sure the spring ends butt correctly against the spring seats.
   Install the shock absorber and spring assembly to the special tool.

2. **WARNING:** AS THE SPRING IS UNDER EXTREME TENSION CARE MUST BE TAKEN AT ALL TIMES. FAILURE TO FOLLOW THESE INSTRUCTIONS MAY RESULT IN PERSONAL INJURY.
   Clamp the road spring.

3. Vehicles without adaptive damping.
   - Install a new retaining nut.
   - Tighten to 50 Nm.

4. Vehicles with adaptive damping.
   - Install a new retaining nut.
   - Tighten to 27 Nm.
5. Release the road spring.

6. Remove the shock absorber and spring assembly from the special tool.

Wheels and Tires - Wheels and Tires
Description and Operation

• WARNINGS:

⚠️ Do not mix different types of tires on the same vehicle such as radial, bias or bias belted tires except in emergencies (temporary spare usage). Failure to follow these instructions may result in personal injury.

⚠️ Never run the engine with one wheel off the ground, for example when changing a wheel. The wheel resting on the ground may cause the vehicle to move. Failure to follow these instructions may result in personal injury.

⚠️ Aftermarket aerosol tire sealants are extremely flammable. Always question the customer to make sure these products have not been used. Failure to follow these instructions may result in personal injury.

⚠️ Always wear safety goggles or a face shield when performing any work with wheel and tire assemblies. Failure to follow these instructions may result in personal injury.

⚠️ Retighten the wheel nuts at 800 km (500 miles) after any wheel change or anytime the wheel nuts are loosened. Failure to follow these instructions may result in personal injury.

⚠️ Failure to retighten the wheel nuts at the specified mileage could cause the wheels to come become detached while the vehicle is in motion. Failure to follow these instructions may result in personal injury.

⚠️ Each individual axle, wheel and tire has its own maximum weight or tire inflation rating. Do not overload or over-inflate beyond the capacity of the lowest rated components of the system. Failure to follow these instructions may result in personal injury.

⚠️ When changing a wheel, make sure that the vehicle cannot move. Always apply the parking brake and select the transmission park position. Failure to follow these instructions may result in personal injury.

⚠️ Reduce air pressure as much as possible by pushing the valve core plunger in before removing the valve core. Failure to follow these instructions may result in personal injury.

⚠️ CAUTION: Do not clean aluminium wheels with steel wool, abrasive type cleaners or detergents. Failure to follow these instructions may result in damage to the vehicle.

**Locking Wheel Nuts**

<table>
<thead>
<tr>
<th>Item</th>
<th>Part Number</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>—</td>
<td>Locking wheel nut</td>
</tr>
<tr>
<td>2</td>
<td>—</td>
<td>Locking wheel nut socket</td>
</tr>
</tbody>
</table>

Locking wheel nuts are fitted to all UK and Mexico vehicles with alloy wheels and are available as an accessory in certain other markets. One locking wheel nut is fitted to each road wheel and may only be removed by using the correctly coded socket. Locking wheel nuts are available in one length. The correct socket is supplied with the vehicle tool kit. Sets of sockets are available to Jaguar dealers.

**Recommended Tires**

The radial ply tires recommended by Jaguar meet the high speed performance of the vehicle. Only tires of identical specification may be fitted as replacements. Under no circumstances must cross-ply tires be fitted.

**Tire Inflation Pressures**

All recommended tires, including winter tires, must be inflated to the pressures shown in the Specifications sub-section. Inflation pressures must only be checked when the tires are cold.

**Tire Replacement and Wheel-Interchanging**
When the replacement of a tire is necessary, it is preferable to fit a complete set. If two replacement tires are fitted (to one axle), they must be of the same manufacturer and type as those on the other axle.

New tires must be balanced before fitting to the vehicle.

**Winter (Snow) Tires**

Winter tires must only be fitted in complete four-wheel sets of the same type and size. The maximum speed with winter tires fitted (without snow chains) is 210 km/h (131 mile/h) for H rated tires or 240 km/h (149 mile/h) for V rated tires.

When using snow chains, note that:

- Snow chains must only be fitted to the rear wheels.
- Only Jaguar snow chains should be used.
- Snow chains must not be used on roads which are clear of snow.
- The maximum speed with winter tires and snow chains fitted is 48 km/h (30 mile/h).
- Traction control (where fitted) must be switched OFF when using snow chains.

**Rotational Indicators**

Some recommended winter tires may have an arrow moulded in the sidewall to indicate the correct direction of rotation. It is essential tires are fitted so that the arrow is pointing in the direction of rotation.

Some of the recommended tires for normal and winter use have an asymmetric tread pattern. These tires have inside and outside markers which should be fitted appropriately to the wheel.

**Temporary-Use Spare Wheel**

In certain markets, the spare wheel supplied with the vehicle is of the temporary-use type. It is narrower than the normal road wheel and takes up less room in the wheel luggage compartment.

When using this type of spare wheel note that:

- Maximum speed must not exceed 80 km/h (50 mile/h).
- The normal road wheel must be replaced as soon as possible.
- Only one temporary-use wheel may be fitted to the vehicle at any time.
- Traction control (where fitted) must be switched OFF.

**Tread Wear Indicator**

Tread wear indicators are molded into the bottom of the tread grooves across the width of the tire. The tire must be renewed when tread wear indicators become visible at the surface of the tread.

Note that tire tread depth and condition must comply with prevailing local legislation.
Wheels and Tires - Wheels and Tires
Diagnosis and Testing

General notes

Factory installed tires and wheels are designed to operate satisfactory when inflated to the recommended inflation pressures; refer to the Specifications sub-section. The recommended pressures apply to vehicle loads up to and including full-rated load capacity.

Correct tire pressures and driving technique have an important influence on tire life. Heavy cornering, excessively rapid acceleration and unnecessary sharp braking increase tire wear.

Replacement tires should follow the recommended:

- Size.
- Speed rating.
- Load range.
- Radial construction type.

The use of any other size or type may seriously affect:

- Safety.
- Ride.
- Handling.
- Speedometer and odometer calibration.
- Vehicle ground clearance.
- Tire clearance between body and chassis.
- Wheel bearing life.
- Brake cooling.

Wheels need to be renewed when:

- Impact damaged.
- Heavily corroded.
- Porous.
- Wheel stud holes or seats become damaged.
- They have excessive radial or lateral runout.

Safety notes

- **WARNINGS:**
  
  Do not mix different types of tires on the same vehicle. Handling may be seriously affected resulting in loss of control. Failure to follow these instructions may result in personal injury.

  When using winter tires, observe the direction of the sidewall moulded indicators; correct tire rotational direction is critical. Failure to follow these instructions may result in personal injury.

  A tire and wheel must always be correctly matched. Wider or narrower tires than recommended could cause danger through sudden deflation. Failure to follow these instructions may result in personal injury.

  When using the temporary spare wheel, maximum speed must not exceed 50 mile/h (80 km/h). Drive with caution and replace with the specified wheel / tire assembly as soon as possible. Failure to follow these instructions may result in personal injury.

  Traction control (if available) must not be engaged with a temporary spare wheel fitted. Failure to follow these instructions may result in personal injury.

  When changing a wheel, make sure that the vehicle cannot move. Always apply the parking brake and select the transmission park position. Failure to follow these instructions may result in personal injury.

  Never run the engine with one wheel off the ground, for example, when changing the wheel. The wheel resting on the ground may cause the vehicle to move. Failure to follow these instructions may result in personal injury.

  Tighten the wheel nuts to specification. Too tight may cause damage, too loose may allow the wheel to become detached. Failure to follow these instructions may result in personal injury.

  Use only wheels and wheel nuts supplied by Jaguar. Aftermarket wheels or wheel nuts may not fit or function correctly and could cause injury or damage. Failure to follow these instructions may result in personal injury.

Inspection and Verification

1. Verify the customer's concern by driving the vehicle.
2. Visually inspect for obvious signs of damage:

<table>
<thead>
<tr>
<th>Visual Inspection Chart</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mechanical</td>
</tr>
<tr>
<td>Incorrect tire pressure</td>
</tr>
<tr>
<td>Wheel imbalance</td>
</tr>
<tr>
<td>Tires worn beyond tread wear indicators</td>
</tr>
<tr>
<td>Cuts</td>
</tr>
<tr>
<td>Abrasions</td>
</tr>
</tbody>
</table>
3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. If the concern is not visually evident, verify the symptom and refer to Symptom Chart.

**Tire Wear Inspection**

To maximize tire performance, inspect the tires for signs of incorrect inflation and uneven wear which may indicate a need for balancing, rotation or front suspension alignment. Tires should also be checked frequently for cuts, stone bruises, abrasions, blisters, and for objects that may have become embedded in the tread. More frequent inspections are recommended when rapid or extreme temperature changes occur or when road surfaces are rough or occasionally littered with debris.

**Tire Wear Diagnosis**

New tires should be installed if the wear indicators are exposed or if there is severe shoulder wear. Shoulder wear is usually caused by either excessive camber or excessive toe on radial tires.

Sometimes incorrect rear toe settings or damaged struts will cause severe cupping' or scalloped' tire wear on non-drive wheels. Incorrect rear toe alignment will also cause other unusual wear patterns.

**Road Test**

A tire vibration diagnostic procedure always begins with a road test. The road test and customer interview (if available) will provide much of the information needed to find the source of a vibration.

During the road test, drive the vehicle on a road that is smooth and free of undulations. If vibration is apparent, note and record the following:

- The speed at which the vibration occurs.
- What type of vibration occurs in each speed range.
  - mechanical or audible.
- How the vibration is affected by changes in the following:
  - engine torque.
  - vehicle speed.
  - engine speed.
- Type of vibration-sensitivity: torque sensitive, vehicle speed sensitive or engine speed sensitive.

The following explanations help isolate the source of the vibration.

**Torque Sensitive**

This means that the condition may be improved or made worse by accelerating, decelerating, coasting, maintaining a steady vehicle speed or applying engine torque.

**Vehicle Speed Sensitive**

This means that the vibration always occurs at the same vehicle speed and is not affected by engine torque, engine speed or the transmission gear selected.

**Engine Speed Sensitive**

This means that the vibration occurs at varying vehicle speeds when a different transmission gear is selected. It may sometimes be isolated by increasing or decreasing engine speed with the transmission in NEUTRAL or by stall testing with the transmission in gear. If the condition is engine speed sensitive, the cause is probably not related to the tires.

If the road test indicates that there is tire whine, but no shake or vibration, the noise originates with the contact between the tire and the road surface.

A thumping noise usually means that the tire has a flat or soft spot making a noise as they slap the roadway. Tire whine may be distinguished from axle noise. Tire whine remains the same over a range of speeds.

Wheels and Tires - Wheel and Tire
Removal and Installation

Removal

1. **CAUTION:** Do not use heat to loosen a seized wheel nut. Excessive heat may cause damage to the wheel and wheel bearings. Loosen the wheel nuts.

2. Raise and support the vehicle. For additional information, refer to Section 100-02 Jacking and Lifting.

3. Remove the wheel and tire assembly.

Installation

1. **WARNINGS:**

   - Make sure there is no contamination of the wheel, hub or brake disc contact surfaces. Installation without metal to metal contact at the mounting surfaces may cause the wheel nuts to loosen and allow the wheel to detach with the vehicle in motion. Failure to follow these may result in personal injury.

   - Apply a small amount of grease to the hub and wheel mating surfaces before installation. Make sure the grease does not come into contact with the vehicles braking components. Failure to follow these instructions may result in personal injury.

To install, reverse the removal procedure.

- Tighten to 128 Nm.
The vehicle dynamic suspension system is designed to control excessive body motions in bounce, pitch and roll while maintaining/improving ride and feel. The system controls the settings of the four vehicle dampers between firm and soft based on the road conditions and driver inputs.

The system uses the three accelerometers, vehicle speed and the brake switch status to calculate the vehicle motion. The vehicle speed and brake status information is passed to the module on the SCP network. The module then calculates the bounce, pitch and roll of the vehicle and adjusts the dampers to change the ride state. This will only occur at speeds over 3 mph (4 kph).
Inspection and Verification

1. **Verify the customer concern.**
2. **Visually inspect for obvious signs of mechanical or electrical damage.**

<table>

</tr>
</tbody>
</table>

3. **If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.**
4. **If the cause is not visually evident, verify the symptom and refer to the Jaguar Approved Diagnostic System.**
Vehicle Dynamic Suspension - Accelerometer
Removal and Installation

Removal

1. Remove the radiator splash shield. For additional information, refer to Section 501-02 Front End Body Panels.
2. Remove the radiator lower cowl.
3. Disconnect the electrical connector.
4. Remove the accelerometer.

Installation

1. To install, reverse the removal procedure.
Vehicle Dynamic Suspension - Adaptive Damping Module

Removal

1. Reposition the luggage compartment floor covering.
   1. Detach the luggage compartment floor covering.
   2. Reposition the luggage compartment floor covering.

2. Disconnect the adaptive damping module electrical connector.

3. Remove the adaptive damping module.

Installation

1. To install, reverse the removal procedure.
Vehicle Dynamic Suspension - Front Vertical Accelerometer

Removal

1. Remove the radiator splash shield. For additional information, refer to Section 501-02 Front End Body Panels.
2. Remove the radiator lower cowl.

3. Disconnect the electrical connector.
4. Remove the front vertical accelerometer vertical sensor.

Installation

1. To install, reverse the removal procedure.
Vehicle Dynamic Suspension - Rear Vertical Accelerometer
Removal and Installation

Removal

1. Reposition the luggage compartment floor covering.
   1. Detach the luggage compartment floor covering.
   2. Reposition the luggage compartment floor covering.

2. Remove the luggage compartment trim panel.

3. Remove the luggage compartment side trim panel.

4. Detach the rear electronics module (REM) bracket.
5. Disconnect the electrical connector.

6. Remove the adaptive damping rear vertical accelerometer.

**Installation**

1. To install, reverse the removal procedure.
The driveline transfers engine torque to the drive wheels. Power is transmitted through the transmission to the driveshaft and then to the rear drive axle which is connected to the rear drive halfshaft.

Driveline Vibration

Driveline vibration exhibits a higher frequency and lower amplitude than high-speed shake. Driveline vibration is directly related to the speed of the vehicle and is usually noticed at various speed ranges. Driveline vibration can be felt as a tremor in the floorpan or is heard as a rumble, hum, or boom. Driveline vibration can exist in all drive modes, but may exhibit different symptoms depending upon whether the vehicle is accelerating, decelerating, cruising, or coasting. Check the driveline angles if the vibration is particularly noticeable during acceleration or deceleration, especially at lower speeds. Check that the centre bearing washers between the body and bearing housing are 3mm minimum and 8mm maximum thickness.

In order to diagnose vibrations in the driveshaft, refer to the Jaguar approved diagnostic system for analysis/rectification.

Driveline Angle

Driveline angularity is the angular relationship between the engine crankshaft, the driveshaft, and the rear drive axle pinion. Factors determining driveline angularity include ride height, rear springs and engine mounts.

An incorrect driveline (pinion) angle can often be detected by the driving condition in which the vibration occurs.

- A vibration during coasting from 72 to 56 km/h (45 to 35 mph) is often caused by a high pinion angle.
- A vibration during acceleration from 56 to 72 km/h (35 to 45 mph) may indicate a low pinion angle.

When these conditions exist, check the driveline angles.

If the tires and driveline angle are not the cause, carry out the Noise, Vibration and Harshness (NVH) tests to determine whether the concern is caused by a condition in the driveline.

For additional information, refer to: Noise, Vibration and Harshness (NVH) (100-04 Noise, Vibration and Harshness, Diagnosis and Testing).

Rear Drive Axle Identification Tag

**CAUTION:** The rear drive axle identification tag is the official identifier. Do not damage the tag. Always reinstall the tag if removed.

The plant code denotes a particular rear drive axle design and specific ratio. In addition, the plant code will not change as long as that particular rear drive axle never undergoes an external design change. If, however, an internal design change takes place during the production life of the rear drive axle and that internal change affects parts interchangeability, a dash and numerical suffix is added to the plant code. This means that as an assembly both rear drive axles are interchangeable; however, internally they are different. Therefore, each requires different internal parts at the time of repair.
Inspection and Verification

**CAUTION:** Only serviceable items can be renewed or adjusted. Failure to follow this instruction may result in the warranty of the component being rejected.

Certain driveline trouble symptoms are also common to the engine, transmission, wheel bearings, tires, and other parts of the vehicle. For this reason, make sure that the cause of the trouble is in the driveline before adjusting, repairing, or installing any new components. REFER to: Noise, Vibration and Harshness (NVH) (100-04 Noise, Vibration and Harshness, Diagnosis and Testing).

1. **Verify the customer concern by carrying out a road test of the vehicle.**
2. **Visually inspect for obvious signs of mechanical damage.**
3. **If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.**
4. **If the concern is not visually evident, verify the symptom and refer to the Symptom Chart.**

### Rear Drive Axle Noise

#### Gear Howl and Whine

Gear howl or whining of the ring gear and pinion is due to an incorrect gear pattern, gear damage or incorrect bearing preload.

#### Bearing Whine

Bearing whine is a high-pitched sound similar to a whistle. It is usually caused by worn/damaged pinion bearings, which are operating at driveshaft speed. Bearing noise occurs at all driving speeds. This distinguishes it from gear whine which is speed dependent.

As noted, pinion bearings make a high-pitched, whistling noise, usually at all speeds. If however there is only one pinion bearing that is worn/damaged, the noise may vary in different driving phases.

A wheel bearing noise can be mistaken for a pinion bearing noise.

#### Chuckle

Chuckles that occur on the coast driving phase is usually caused by excessive clearance between the differential gear hub and the differential case bore.

Damage to a gear tooth on the coast side can cause a noise identical to a chuckle. A very small tooth nick or ridge on the edge of a tooth can cause the noise.
Knock

Knock, which can occur on all driving phases, has several causes including damaged teeth or gears.

A gear tooth damaged on the drive side is a common cause of the knock.

Clunk

Clunk is a metallic noise heard when the automatic transmission is engaged in REVERSE or DRIVE. The noise may also occur when the throttle is applied or released. Clunk is caused by transmission calibration, backlash in the driveline or loose suspension components and is felt or heard in the vicinity of the rear drive axle.

Bearing Rumble

Bearing rumble sounds like marbles being tumbled. This condition is usually caused by a worn/damaged wheel bearing. The lower pitch is because the wheel bearing turns at only about one-third of the driveshaft speed. Wheel bearing noise also may be high-pitched, similar to gear noise, but will be evident in all four driving modes.

All vehicles

1. Raise and support the vehicle.
   For additional information, refer to: Lifting (100-02 Jacking and Lifting, Description and Operation).

2. Remove the support bracket.

All except vehicles with diesel engine

3. NOTE: Right-hand shown, Left-hand similar.
   Detach the rear muffler and tailpipe exhaust hanger insulator.

4. CAUTION: Using a suitable transmission jack, support the intermediate muffler.
   Detach the intermediate muffler exhaust hanger insulators.

All vehicles
5. Reposition the driveshaft heat shield.
   1. Remove the retaining bolts.
   2. Reposition the driveshaft heat shield.

6. Loosen the driveshaft centre bearing retaining bolts two complete turns.

7. **CAUTION:** Make sure the driveshaft centre bearing is correctly aligned to the driveshaft. Failure to follow these instructions may result in damage to the vehicle.
   Using the special tool, align driveshaft centre bearing.
   - Tighten to 40 Nm.

8. Install the driveshaft heat shield retaining bolts.
   1. Reposition the driveshaft heat shield.
   2. Install the driveshaft heat shield retaining bolts.
      1. Tighten to 7 Nm.

All except vehicles with diesel engine
9. Attach the intermediate muffler exhaust hanger insulators.

10. NOTE: Right-hand shown, Left-hand similar.
    Attach the rear muffler and tailpipe exhaust hanger insulator.

All vehicles

11. Install the support bracket.
    - Tighten to 9 Nm.

</tbody>
</table>

**CAUTION:** To preserve 'drive line' refinement, individual parts, other than fixings, MUST NOT be renewed. In the event of any balance or driveshaft component related concern, the complete assembly must be renewed. Under no circumstances may the flexible coupling be removed from the driveshaft (or its fixings be loosened). Do not drop or subject the driveshaft to damage.

- **NOTE:** All driveshaft assemblies are balanced. If undercoating the vehicle, protect the driveshaft, universal joints and the rear drive axle shafts to prevent over-spray of the undercoating material.

The driveshaft consists of the following:

- A two piece welded steel tube with a splined center slip joint.
- A universal joint.
- A center bearing.
- Two flexible joints.

**Universal Joint**

The universal joint is:

- A lubed-for-life design and requires no lubrication in service.
Driveshaft - Driveshaft
Diagnosis and Testing

For additional information, refer to Section 205-00 Driveline System - General Information.
1. For additional information, refer to the Jaguar Approved Diagnostic System.
Driveshaft - Driveshaft
Removal and Installation

Removal

1. Raise and support the vehicle. For additional information, refer to Section 100-02 Jacking and Lifting.
2. Remove the support bracket.

3. NOTE: Right-hand shown, Left-hand similar.
   Detach the rear muffler and tailpipe exhaust hanger insulator.

4. CAUTION: Using a suitable transmission jack, support the intermediate muffler.
   Detach the intermediate muffler exhaust hanger insulators.

5. Remove the driveshaft heat shield.
   1. Remove the retaining bolts.
   2. Remove the driveshaft heat shield.
6. **CAUTION:** Under no circumstances must the flexible coupling (or its fixings) be loosened or removed from the driveshaft.

   - Detach the driveshaft from the transmission flange.
   - Mark the position of the driveshaft in relation to the transmission flange.
   - Mark the position of each nut and bolt in relation to the transmission flexible joint.

7. **CAUTION:** Under no circumstances must the flexible coupling (or its fixings) be loosened or removed from the driveshaft

   - Detach the driveshaft from the rear drive axle flange.
   - Mark the position of the driveshaft in relation to the rear drive axle flange.
   - Mark the position of the balance nut in relation to the rear drive axle flange (if fitted).
   - Mark the position of each nut and bolt in relation to the rear drive axle flexible joint.

8. **CAUTION:** Support the driveshaft front and rear sections.

   - **NOTE:** Note the position of the driveshaft centre bearing spacers.
   - Remove the driveshaft.
   - Remove the driveshaft centre bearing spacers.

---

**Installation**

1. **NOTE:** If a new driveshaft is installed, refer to Jaguar Approved Diagnostic System to establish the correct location for the balance nut if required.

   - **NOTE:** Do not fully tighten the driveshaft centre bearing retaining bolts.
   - Tighten the driveshaft centre bearing retaining bolts.
   - Install the driveshaft centre bearing spacers.
2. Attach the driveshaft to the rear drive axle flange.
   - Tighten to 88 Nm.

3. Attach the driveshaft to the transmission flange.
   - Tighten to 108 Nm.

4. **CAUTION:** Make sure the driveshaft centre bearing is correctly aligned to the driveshaft. Failure to follow these instructions may result in damage to the vehicle.

   Carry out the Driveline Angle Inspection,
   For additional information, refer to Section 205-00 Driveline System - General Information.

</tbody>
</table>

The rear axle drive pinion receives power from the engine through the transmission and driveshaft. The drive pinion gear rotates the differential drive gear which is bolted to the differential housing outer flange. Inside the differential housing, two differential pinion gears are mounted on a differential shaft which is pinned to the differential housing. These differential pinion gears are engaged with the differential side gears to which the halfshafts are splined. As the differential gear turns, it rotates the halfshafts and rear wheels.

When it is necessary for one wheel and halfshaft to rotate faster than the other, the faster turning differential side gear causes the differential pinion gears to roll on the slower turning differential side gear. This allows differential action between the two halfshafts.

Removal

1. Remove the driveshaft.
   For additional information, refer to: Driveshaft (205-01 Driveshaft, Removal and Installation).

2. CAUTIONS:

   ! The following step must be carried out to make sure the correct drive pinion flange retaining nut torque is achieved.

   ! Only use a paint mark to match mark the drive pinion and flange.

   Remove the drive pinion flange nut.
   
   - Match mark the drive pinion nut to the drive pinion flange.
   - Match mark the drive pinion flange to the drive pinion shaft.
   - Loosen the drive pinion flange nut 180°.
   - Tighten the drive pinion flange nut to the match mark.
   - Note the force required to tighten to the match mark.
   - Remove the drive pinion flange nut.
3. Using the special tools, remove the drive pinion flange.

4. Remove the drive pinion seal dust cover.

5. Using a suitable tool, remove the drive pinion seal.

### Installation

1. **CAUTION:** If the drive pinion seal becomes misaligned during installation, remove it and install a new one.

   - **NOTE:** Check the rear drive axle pinion flange, rear axle housing and drive pinion splines for damage.

   Using the special tool, install the drive pinion seal.

2. Install the drive pinion seal dust cover.

3. **CAUTION:** Only use the correct special tools to install the drive pinion flange.

   Using the special tools, install the drive pinion flange.
4. Install a new drive pinion flange nut.
   - Tighten the drive pinion flange nut to the force noted on removal.
   - Tighten the drive pinion flange nut to a further 10%.

5. **CAUTION:** Axle fluid should flow from the filler plug threaded hole when full. Failure to follow this instruction may result in damage to the axle.
   - Check and top up the axle assembly fluid level as required.
     - **NOTE:** Install a new fluid level filler plug.
     - Tighten to 34 Nm.

6. Install the driveshaft.
   For additional information, refer to: Driveshaft (205-01 Driveshaft, Removal and Installation).
Removal

1. Remove both halfshafts. For additional information, refer to: Rear Halfshaft (205-05 Rear Drive Halfshafts, Removal and Installation).

2. **CAUTION:** Under no circumstances must the flexible coupling (or its fixings) be loosened or removed from the driveshaft.

   Detach the driveshaft from the differential flange.
   - Mark the position of the driveshaft in relation to the differential flange.
   - Mark the position of the balance nut in relation to the differential flange (if fitted).
   - Mark the position of each nut and bolt in relation to the driveshaft flexible joint.

3. **CAUTION:** When supporting the axle assembly, use a suitable packing material to prevent damage to the axle assembly.

   Using the special tool, support the axle assembly.

4. Remove the axle assembly.

Installation

1. **NOTE:** Make sure the axle front retaining bolt washer and spacer are installed correctly.
   - **NOTE:** Make sure the driveshaft nuts and bolts are installed correctly.

   To install, reverse the removal procedure.

2. Tighten to 200 Nm.
3. Tighten to 90 Nm.

4. Tighten to 88 Nm.
Rear Drive Axle/Differential - Axle Housing Bushing
Removal and Installation

**Special Tool(s)**

- Forcing screw remover and installer
  - 204-274

- Bearing kit
  - JAG-061

- Receiving Cup and mount plate
  - 205-534

- Remover Front Mount Bush
  - 205-533

- Installer front mount bush
  - 204-245

- Installer Front Mount Bush
  - 204-243

**Removal**

1. Remove the axle assembly.
   For additional information, refer to Axle Assembly in this section.

2. Using the special tools, remove the axle housing bushing.
Installation

1. The bushing should be installed with the raised molding at 45 degrees to the centre line of the pinion shaft.

2. Using the special tools, install the axle housing bushing.

3. Install the axle assembly.
   For additional information, refer to Axle Assembly in this section.

<td>Inner CV joint</td>
</tr>
<tr>
<td>7</td>
<td></td>
<td>Halfshaft</td>
</tr>
</tbody>
</table>

The rear drive halfshafts are of unequal lengths and both inner and outer joints are of the CV type.

The outer CV joints are fitted with an ABS ring which is continuously monitored by the wheel speed sensor.

The inner and outer CV joints are linked by a solid halfshaft. The inner CV joints are retained in the rear drive axle with the aid of a spring clip.

Handling Rear Drive Halfshafts

The following points should be observed when handling rear drive halfshafts:

- Do not pull on the CV joints.
- Do not allow the CV joints to exceed 18 degrees of travel.
- Check polished surfaces and splines for damage.
- Do not allow the CV joint boots to come into contact with sharp edges, hot vehicle components or the exhaust system.
- Do not drop the rear drive halfshafts, this may cause damage to the splined sections of the CV joints, the threaded sections of the CV joints or the interior of the boots which may not be visible.
- Do not support the rear drive halfshaft by holding the CV joint alone.

Underbody Protection and Corrosion Prevention

The CV joint boots should be covered during application of underbody protection or corrosion prevention. Foreign matter on the CV boots may cause premature ageing of the material. Foreign material on the rear drive halfshafts may cause imbalance.
Rear Drive Halfshafts - Rear Drive Halfshafts

Diagnosis and Testing

For additional information, refer to Section 205-00 Driveline System - General Information.

### Removal

1. Loosen the wheel hub nut.

2. Remove the brake disc. For additional information, refer to:
3. Detach the anti-lock brake system (ABS) sensor.

4. Detach the outer tie rod.

5. Detach the lower arm from the wheel knuckle.

6. Remove the wheel hub nut.

7. Using the special tools, detach the halfshaft.
8. Remove the wheel knuckle assembly.

9. **CAUTION:** To avoid damage to the halfshaft constant velocity (CV) joints and boots, do not allow the CV joints to exceed 18 degrees of travel.
   - **NOTE:** The halfshaft is retained in the axle assembly by a retaining clip.
     - Using the special tools, remove the halfshaft.
     - Remove and discard the retaining clip.

10. Remove the halfshaft seal.

---

**Installation**

**CAUTION:** The final tightening of the rear suspension components must be carried out with the vehicle on its wheels.

1. Using the special tool, install the halfshaft seal.
2. Install a new retaining clip.

3. CAUTIONS:
   - The next four steps must be carried out within 5 minutes of applying the sealant.
   - Install the halfshaft within 5 minutes of applying the sealant.
   - Apply a 3mm diameter bead of Loctite WSK-M2G349-A4 or equivalent meeting Jaguar specification to the halfshaft splines.

4. CAUTIONS:
   - Do not damage the axle shaft seal.
   - To avoid damage to the halfshaft CV joints and boots, do not allow the CV joints to exceed 18 degrees of travel.
   - Make sure no damage occurs to the halfshaft seal when installing the halfshaft.
   - • NOTE: Do not fully engage the halfshaft into the axle assembly.
      Install the halfshaft.
      1. Install the special tool to the halfshaft seal.
      2. Install the halfshaft.

5. Remove the special tool.

6. CAUTIONS:
   - To avoid damage to the halfshaft CV joints and boots, do not allow the CV joints to exceed 18 degrees of travel.
   - Make sure no damage occurs to the halfshaft seal when installing the halfshaft.
   - • NOTE: Make sure the retaining clip is correctly seated.
      Attach the halfshaft.
7. **CAUTION:** Axle fluid should flow from the filler plug threaded hole when full. Failure to follow this instruction may result in damage to the axle.

    Check and top up the axle assembly fluid level as required.
    - **NOTE:** Install a new fluid level filler plug.
    - Tighten to 34 Nm.

8. Install the wheel knuckle assembly.

9. **NOTE:** Using the old wheel hub nut, tighten to 150 Nm.

    Attach the wheel knuckle to the halfshaft.

10. Install the lower arm to the wheel knuckle.

11. Install the outer tie rod retaining nut.
12. Install the ABS sensor.
   - Tighten to 9 Nm.

13. Install the brake disc. For additional information, refer to:
   Brake Disc - Vehicles With: Standard Brakes, VIN Range: G00442->G45170 (206-04, Removal and Installation),
   Brake Disc - Vehicles With: High Performance Brakes, VIN Range: G00442->G45170 (206-04, Removal and Installation),
   Brake Disc - VIN Range: N52048->N99999 (206-04 Rear Disc Brake, Removal and Installation).

   or
   For additional information, refer to: Brake Disc - VIN Range: N52048->N99999 (206-04 Rear Disc Brake, Removal and Installation).

14. Remove and discard the old wheel hub nut, install a new wheel hub nut.
   - Tighten to 300 Nm.

15. **CAUTION:** The final tightening of the rear suspension components must be carried out with the vehicle on its wheels.
   Tighten to 150 Nm.

16. **CAUTION:** The final tightening of the rear suspension components must be carried out with the vehicle on its wheels.
   Tighten to 55 Nm.
Removal

1. Remove the halfshaft.
   For additional information, refer to [Halfshaft](#) in this section.

2. **CAUTION:** Use suitable protective covers to protect the halfshaft.
   Using a suitable clamp, secure the halfshaft.

3. **CAUTION:** Make sure the inner constant velocity (CV) joint is not separated from the halfshaft.
   Remove and discard the inner CV joint boot retaining clip.

4. **CAUTION:** Make sure the CV joint ball bearings do not drop out of the CV joint.
   Using a suitable tool, remove the inner CV joint.

5. Remove the inner CV joint boot.
   - Remove and discard the retaining clip.

Installation

All vehicles

1. Install the inner CV joint boot.
   - Install a new retaining clip.
   - Using a suitable tool, install the retaining clip.

Vehicles with 2.5L engine...
2. **CAUTION:** Make sure the CV joint ball bearings do not drop out of the CV joint.

   • **NOTE:** Use a CV grease meeting Jaguar specification.

   Fit the inner CV joint.
   - Fill the CV joint with 40 grams of grease.
   - Fill the CV joint boot with 100 grams of grease.

Vehicles with 3.0L engine

3. **CAUTION:** Make sure the CV joint ball bearings do not drop out of the CV joint.

   • **NOTE:** Use a CV grease meeting Jaguar specification.

   Fit the inner CV joint.
   - Fill the CV joint with 40 grams of grease.
   - Fill the CV joint boot with 100 grams of grease.

Vehicles with 4.2L engine without supercharger

4. **CAUTION:** Make sure the CV joint ball bearings do not drop out of the CV joint.

   • **NOTE:** Use a CV grease meeting Jaguar specification.

   Fit the inner CV joint.
   - Fill the CV joint with 40 grams of grease.
   - Fill the CV joint boot with 100 grams of grease.

Vehicles with 4.2L engine with supercharger

5. **CAUTION:** Make sure the CV joint ball bearings do not drop out of the CV joint.

   • **NOTE:** Use a CV grease meeting Jaguar specification.

   Fit the inner CV joint.
   - **NOTE:** Make sure grease is not applied inside the CV joint boot.
   - **NOTE:** Make sure grease is applied to the CV joint.
   - Fill the CV joint with 100 grams of grease.

All vehicles
6. **CAUTION:** Make sure the CV joint is not separated from the halfshaft.

- **NOTE:** Make sure enough air is present in the CV boot.

  Install a new retaining clip.
  - Using a suitable tool, install the retaining clip.

7. Install a new retaining clip.

8. Remove the halfshaft from the clamp.

9. Install the halfshaft.
   For additional information, refer to [Halfshaft](#) in this section.
Rear Drive Halfshafts - Outer Constant Velocity (CV) Joint Boot
Removal and Installation

Removal

1. Remove the Halfshaft.
   For additional information, refer to Halfshaft in this section.

2. **CAUTION**: Use suitable protective covers to protect the halfshaft.
   Using a suitable clamp, secure the halfshaft.

3. Remove the outer constant velocity (CV) joint boot retaining clip.
   - Remove and discard the retaining clip.

4. **CAUTION**: Do not damage the bearing retainer.
   - NOTE: The outer CV joint is retained to the shaft by a spring clip.
     Using a suitable brass drift, remove the outer CV joint.

5. Remove the retaining clip.
   - Remove and discard the retaining clip.

6. Remove the outer CV joint boot.
   - Remove and discard the retaining clip.

Installation

All vehicles
1. Install the outer CV joint boot.
   - Install the new retaining clip.
   - Using a suitable tool, install the retaining clip.

2. Install the new retaining clip.

Vehicles with 2.5L engine

3. **CAUTION:** Make sure the CV joint ball bearings do not drop out of the CV joint.
   - **NOTE:** Use a CV grease meeting Jaguar specification.

   Fit the outer CV joint.
   - Fill the CV joint with 50 grams of grease.
   - Fill the CV joint boot with 85 grams of grease.

Vehicles with 3.0L engine

4. **CAUTION:** Make sure the CV joint ball bearings do not drop out of the CV joint.
   - **NOTE:** Use a CV grease meeting Jaguar specification.

   Fit the outer CV joint.
   - Fill the CV joint with 55 grams of grease.
   - Fill the CV joint boot with 65 grams of grease.

Vehicles with 4.2L engine without supercharger
5. **CAUTION:** Make sure the CV joint ball bearings do not drop out of the CV joint.

   - **NOTE:** Use a CV grease meeting Jaguar specification.

   Fit the outer CV joint.
   - Fill the CV joint with 55 grams of grease.
   - Fill the CV joint boot with 65 grams of grease.

Vehicles with 4.2L engine with supercharger

6. **CAUTION:** Make sure the CV joint ball bearings do not drop out of the CV joint.

   - **NOTE:** Use a CV grease meeting Jaguar specification.

   Fit the outer CV joint.
   - **NOTE:** Make sure grease is not applied inside the CV joint boot.
   - **NOTE:** Make sure grease is applied to the CV joint.
   - Fill the CV joint with 100 grams of grease.

All vehicles

7. **NOTE:** Make sure enough air is present in the CV boot.

   Install the new retaining clip.
   - Using a suitable tool, install the retaining clip.

8. Remove the halfshaft from the clamp.
9. Install the halfshaft.
   For additional information, refer to [Halfshaft](#) in this section.
CAUTION: Do not use brake fluid ITT Super Dot 4 on 2006my vehicles onwards. Failure to follow this instruction may result in damage to the vehicle.

• NOTE: Brake fluid ITT Super Dot 4 has now been superseded by Shell ESL Super Dot 4 which is the Jaguar recommended brake fluid. Shell ESL Super Dot 4 can be used on all model years.

### Brake System - General Information -

#### Lubricants, Fluids, Sealers and Adhesives

- **CAUTION:** Do not use brake fluid ITT Super Dot 4 on 2006my vehicles onwards. Failure to follow this instruction may result in damage to the vehicle.

- **NOTE:** Brake fluid ITT Super Dot 4 has now been superseded by Shell ESL Super Dot 4 which is the Jaguar recommended brake fluid. Shell ESL Super Dot 4 can be used on all model years.

Brake System - General Information -

Lubricants, Fluids, Sealers and Adhesives

⚠️ CAUTION: Do not use brake fluid ITT Super Dot 4 on 2006MY vehicles onwards. Failure to follow this instruction may result in damage to the vehicle.

- NOTE: Brake fluid ITT Super Dot 4 has now been superseded by Shell ESL Super Dot 4 which is the Jaguar recommended brake fluid. Shell ESL Super Dot 4 can be used on all model years.

Brake System - General Information - Brake System

VIN Range: M45255->N52047

Description and Operation

WARNING: BRAKE DUST, IF INHALED CAN DAMAGE YOUR HEALTH. ALWAYS REMOVE BRAKE DUST USING A VACUUM BRUSH. DO NOT USE A COMPRESSED-AIR LINE TO DISPERSE BRAKE DUST INTO THE ATMOSPHERE. Failure to follow this instruction may result in personal injury.

• CAUTIONS:

Brake pads must always be replaced in axle sets.

Replacement of nuts and bolts: Various thread-locking devices are used on nuts and bolts throughout the vehicle. These devices restrict the number of times a nut or bolt can be used.

For additional information, refer to: General Service Information (100-00 General Information, Description and Operation).

The high performance brake caliper is aligned to the brake disc when it is first installed to the vehicle, therefore, care must be taken not to disturb this alignment. When removing the caliper; remove the bolts that secure the anchor bracket to the vertical link only. DO NOT loosen any other caliper bolts.

The braking system is a diagonally split, dual circuit design featuring front and rear disc brakes.

The hydraulic system provides separate circuits for each pair of diagonally opposed wheels (left front, right rear and right front, left rear).

The standard front brake caliper has two retaining bolts that attach the brake caliper to the anchor plate. These are of double, sliding piston type which makes sure equal effort is applied through both brake pads. The anchor plate is attached to the wheel knuckle with two bolts. The standard rear brake calipers are single pistoned floating caliper type, which also incorporates the park brake mechanism. The standard brake disc is manufactured from cast iron and is of the vented type. It is retained on the hub by two retaining clips and the wheel studs.

In vehicles fitted with high performance brakes, the front and rear brake calipers have two retaining bolts that attach the brake caliper to the wheel knuckle. These are four piston fixed type which makes sure that equal effort is applied through both brake pads. The rear brakes have separate brake calipers for the parking brake. The brake disc is manufactured from cast iron and is of the vented type. It is retained on the hub by two retaining clips and the wheel studs. The brake pads in all cases are asbestos free.

Braided steel brake hoses are now fitted to reduce expansion under braking pressure and are light weight design.

The brake master cylinder is of a tandem design and is linked to a brake booster to reduce the brake pedal effort. The tandem design will make sure that in the event of one brake circuit failure the other will remain fully operational. The brake booster operating rod is connected directly to the brake pedal.

The electric parking brake (EPB) control is located in the floor console and operates the rear brakes through a motor and cable system.
Description and Operation

**WARNING:** Brake fluid contains polyglycol ethers and polyglycols. Avoid contact with the eyes. Wash hands thoroughly after handling, as prolonged contact may cause irritation and dermatitis. If brake fluid contacts the eyes, flush the eyes with cold water or eyewash solution and seek medical attention. If taken internally do not induce vomiting, seek immediate medical attention. Failure to follow these instructions may result in personal injury.

The braking system is a diagonally split, dual circuit design featuring front and rear disc brakes.

The hydraulic system provides separate circuits for each pair of diagonally opposed wheels (left front, right rear and right front, left rear).

The standard front brake caliper has two retaining bolts that attach the brake caliper to the anchor plate. These are of single, sliding piston type. The anchor plate is attached to the wheel knuckle with two bolts. The standard brake disc is manufactured from cast iron and is of the vented type. It is retained on the hub by two retaining clips and the wheel studs.

The high performance front brake caliper has two retaining bolts that attach the brake caliper to the anchor plate. These are of single, sliding piston type. The anchor plate is attached to the wheel knuckle with two bolts. The high performance brake disc is manufactured from cast iron and is of the vented type. It is retained on the hub by two retaining clips and the wheel studs.

The rear brake calipers are single pistoned floating caliper type, which also incorporates the park brake mechanism. In addition, the high performance caliper has a logo badge which has to be removed when changing the brake pads. The brake disc is manufactured from cast iron and is of the vented type. It is retained on the hub by two retaining clips and the wheel studs.

The brake pads in all cases are asbestos free.

Braided steel brake hoses are fitted to reduce expansion under braking pressure and are of a light weight design.

The brake master cylinder is of a tandem design and is linked to a brake booster to reduce the brake pedal effort. The tandem design will make sure that in the event of one brake circuit failure the other will remain fully operational. The brake booster operating rod is connected directly to the brake pedal.

The parking brake module is located in the luggage compartment behind the right-hand rear luggage compartment trim panel and operates the rear brakes through a motor and cable system.
Brake System - General Information - Brake System

Diagnosis and Testing

Principles of Operations

The brake system operates by transferring effort applied to the brake pedal, by the driver to the brakes at each wheel.

The braking effort is distributed to each wheel, using a hydraulic system. The system is assisted using a vacuum brake booster that reduces pedal effort for a given hydraulic pressure. The parking brake operates on the rear wheels and is applied using a pull/push switch mounted on the floor console. The adjustable pedal system allows adjustment of the throttle, brake and clutch pedals by a switch fitted on the steering column shroud.

Inspection and Verification

• NOTE: Prior to carrying out any diagnosis, make sure that the brake system warning indicator is functional.

Visually examine the front and rear wheel and tire assemblies for damage such as uneven wear patterns, tread worn out or sidewall damage. Verify the tires are the same size, type and, where possible, same manufacture. Replace the damaged wheel or excessively worn tire. For additional information, refer to Section 204-04 Wheels and Tires.

Wheels and tires must be cleared of any foreign matter and tire pressures adjusted to the correct specification.

If the tires exhibit uneven wear or feathering, the cause must be corrected. Check the steering and suspension components for damage or wear and, if necessary, check and adjust front wheel alignment. For additional information, refer to Section 204-00 Suspension System - General Information.

Carry out a road test to compare actual vehicle braking performance with the performance standards expected by the driver. The ability of the test driver to make valid comparisons and detect performance deficiencies will depend on experience.

The driver should have a thorough knowledge of brake system operation and accepted general performance guidelines to make good comparisons and detect performance concerns.

An experienced brake technician will always establish a route that will be used for all brake diagnosis road tests. The roads selected will be reasonably smooth and level. Gravel or bumpy roads are not suitable because the surface does not allow the tires to grip the road equally. Crowned roads should be avoided because of the large amount of weight shifted to the low set of wheels on this type of road. Once the route is established and consistently used, the road surface variable can be eliminated from the test results.

Before a road test, obtain a complete description of the customer concerns or suspected condition. From the description, the technician’s experience will allow the technician to match possible causes with symptoms. Certain components will be tagged as possible suspects while others will be eliminated by the evidence. More importantly, the customer description can reveal unsafe conditions which should be checked or corrected before the road test. The description will also help form the basic approach to the road test by narrowing the concern to specific components, vehicle speed or conditions.

Begin the road test with a general brake performance check. Keeping the description of the concern in mind, test the brakes at different vehicle speeds using both light and heavy pedal pressure. To determine if the concern is in the front or rear braking system, use the brake pedal and then use the parking brake control. If the condition (pull, vibration, pulsation) occurs only with the parking brake, the concern is in the rear brake system.

If the concern becomes evident during this check, verify it fits the description given before the road test. If the concern is not evident, attempt to duplicate the condition using the information from the description.

If a concern exists, use the Symptom Chart in order to isolate it to a specific sub-system and condition description. From this description, a list of possible sources can be used to further narrow the cause to a specific component or condition.

Apply the brake pedal lightly three or four times. Wait 15 seconds for the vacuum to recover. Push down on the brake pedal until it stops moving downward or an increased resistance to the brake pedal travel occurs. Hold the brake pedal in the applied position while increasing the engine speed to 2000 revs/min. Release the accelerator pedal.

Does the brake pedal move downward as the engine speed returns to idle?
Yes
No

GO to D4.

CHECK the vacuum to brake booster. For additional information, refer to Section 206-07 Power Brake Actuation.

D4: CHECK BRAKE FLUID LEVEL

1. Check the brake master cylinder reservoir fluid level.

Is the fluid level OK?
Yes
No

BLEED the brake system. For additional information, refer to General Procedures. TEST the system for normal operation.

CHECK brake master cylinder reservoir sealing points. For additional information, refer to Brake Master Cylinder Component Test in this section. ADD fluid and BLEED the brake system. For additional information, refer to General Procedures. TEST the system for normal operation. REPEAT road test if necessary.

PINPOINT TEST E : THE PEDAL GOES DOWN FAST

TEST CONDITIONS

E1: ROAD TEST VEHICLE

1. Road test and apply the brake pedal.

Is the brake pedal effort and brake pedal travel normal?
Yes
Vehicle is OK.
No
GO to E2.

E2: CHECK BRAKE FLUID LEVEL

1. Check the brake master cylinder reservoir fluid level.

Is the fluid level within specification?
Yes
GO to E3.
No

CHECK the brake master cylinder reservoir sealing points. For additional information, refer to Brake Master Cylinder Component Test in this section. ADD fluid and BLEED brake system. For additional information, refer to General Procedures. TEST the system for normal operation. REPEAT road test if necessary.

E3: CHECK BRAKE PEDAL TRAVEL-PRESSURIZE SYSTEM

1. Pump the brake pedal rapidly (five times).

Does the brake pedal travel build up and then hold?
Yes
BLEED the brake system. Refer to the General Procedures. TEST the system for normal operation. REPEAT road test. For additional information, refer to Section 206-06 Hydraulic Brake Actuation
No
GO to E4.

E4: CHECK FOR BRAKE SYSTEM LEAKS

1. Check for external brake system leaks. For additional information, refer to Brake master cylinder in this section.

Are leaks found?
Yes
REPAIR as necessary. ADD fluid and BLEED brake system. For additional information, refer to General Procedures. TEST the system for normal operation. REPEAT road test.
No
System is OK.

PINPOINT TEST F : THE PEDAL GOES DOWN SLOWLY

TEST CONDITIONS

F1: ROAD TEST VEHICLE - CHECK BRAKE PEDAL OPERATION

1. Check if the condition occurs during actual stopping application by applying the brake pedal while the vehicle is moving.

Does the condition occur when the vehicle is moving?
Yes
GO to F2.
No
GO to F3.

F2: CHECK FOR BRAKE SYSTEM LEAKS

1. Check for external brake system leaks. For additional information, refer to Brake master cylinder in this section.

Are there any external brake system leaks?
Yes
REPAIR as necessary. ADD fluid and BLEED brake system. For additional information, refer to General Procedures. TEST the system for normal operation.
No
GO to F3.

F3: CARRY OUT A BRAKE MASTER CYLINDER BYPASS TEST

1. Test for brake master cylinder bypass condition. Refer to Brake master cylinder component test in this section.

Are there any concerns found?
Yes
INSTALL a new brake master cylinder, ADD fluid and BLEED the brake system. For additional information, refer to General Procedures. TEST the system for normal operation.
No
System is OK.

PINPOINT TEST G : EXCESSIVE BRAKE PEDAL EFFORT
### G1: Check Brake Pads

<table>

INSTALL the brake calipers correctly or INSTALL new brake calipers as necessary. TEST the system for normal operation. REPEAT road test if necessary. No: Vehicle is OK.</td>
</tr>
</tbody>
</table>

### PINPOINT TEST I: Brakes Drag

<table>
<thead>
<tr>
<th><strong>Steps</strong></th>
<th><strong>Details/Results/Actions</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>I1: Road Test Vehicle</strong></td>
<td><strong>Road test the vehicle and apply the brakes.</strong>&lt;br&gt;<strong>Are the brakes functioning correctly?</strong>&lt;br&gt;Yes: Vehicle is OK. No: GO to I2.</td>
</tr>
<tr>
<td><strong>I2: Check Brake Calipers</strong></td>
<td><strong>Check the front caliper pistons for binding, leaking or sticking.</strong>&lt;br&gt;<strong>Check the rear caliper pistons for binding, leaking or sticking.</strong> For additional information, refer to Section 206-03 Front Disc Brake. Check the rear caliper pistons for binding, leaking or sticking. For additional information, refer to Section 206-04 Rear Disc Brake.</td>
</tr>
</tbody>
</table>
Do the disc brake caliper pistons and pins bind, leak or stick?

Yes
INSPECT the brake calipers and parking brake cables. INSTALL new components as necessary. Road test vehicle.

No
GO to I3.

I3: CHECK BRAKE BOOSTER

1 Check the brake booster connecting rod alignment and travel. For additional information, refer to Section 206-07 Power Brake Actuation.

Is the connecting rod OK?

Yes
Vehicle is OK.

No
INSTALL a new brake booster. For additional information, refer to Section 206-07 Power Brake Actuation. TEST the system for normal operation.

PINPOINT TEST J : EXCESSIVE/ERRATIC BRAKE PEDAL TRAVEL

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>J1: TEST ON ROUGH ROAD</td>
<td></td>
</tr>
<tr>
<td>1 Road test the vehicle on rough road conditions.</td>
<td></td>
</tr>
<tr>
<td>2 Apply the brakes slowly.</td>
<td></td>
</tr>
</tbody>
</table>

Is the brake pedal effort and brake pedal travel normal?

Yes
Vehicle is OK.

No
GO to J2.

J2: CHECK BRAKE FLUID LEVEL

1 Check the brake master cylinder reservoir fluid level.

Is the fluid level OK?

Yes
GO to J3.

No
CHECK brake master cylinder reservoir sealing points. For additional information, refer to Brake master cylinder in this section. ADD brake fluid and BLEED the brake system. For additional information, refer to General Procedures. TEST the system for normal operation. REPEAT road test if necessary.

J3: CHECK BRAKE PEDAL RESERVE

Engine is idle.
1 Apply the brake pedal lightly three or four times.
2 Wait 15 seconds for the vacuum to replenish.
3 Push down on the brake pedal until it stops moving downward or an increased resistance to the brake pedal travel occurs.
4 Hold the brake pedal in the applied position while increasing the engine speed to 2000 revs/min.
5 Release the accelerator pedal.

Does the brake pedal move downward as the engine speed returns to idle?

Yes
GO to J4.

No
CHECK the vacuum to the brake booster. For additional information, refer to Section 206-07 Power Brake Actuation.

J4: CHECK THE FRONT HUB AND BEARING ASSEMBLY

1 Check the front hub and bearing assembly. For additional information, refer to Section 204-00 Suspension System - General Information.

Are the front wheel bearings loose?

Yes
INSTALL a new front wheel bearing if damaged. For additional information, refer to Section 204-00 Suspension System - General Information. TEST the system for normal operation.

No
CHECK the front brake discs for thickness variances. For additional information, refer to General Procedures.

PINPOINT TEST K : SLOW OR INCOMPLETE BRAKE PEDAL RETURN

<table>
<thead>
<tr>

<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>K1: CHECK FOR BRAKE PEDAL RETURN</td>
<td></td>
</tr>
<tr>
<td>1 Run the engine at fast idle while making several brake applications.</td>
<td></td>
</tr>
<tr>
<td>2 Pull the brake pedal rearward with approximately 44.5 N (10lb) force.</td>
<td></td>
</tr>
<tr>
<td>3 Release the brake pedal and measure the distance to the toe board.</td>
<td></td>
</tr>
<tr>
<td>4 Make a hard brake application.</td>
<td></td>
</tr>
<tr>
<td>5 Release the brake pedal and measure the brake pedal to toe board distance. The brake pedal should return to its original position.</td>
<td></td>
</tr>
</tbody>
</table>

Does the brake pedal return to its original position?

Yes
Vehicle is OK.

No
GO to K2.

K2: CHECK FOR BRAKE PEDAL BINDING

1 Check the brake pedal to make sure it is operating freely.

Is the brake pedal operating freely?

Yes
INSTALL a new brake booster. For additional information, refer to Section 206-07 Power Brake Actuation. TEST the system for normal operation.

No
REPAIR or INSTALL new brake pedal. TEST the system for normal operation.

Component Tests

Brake Booster
1. Check all hoses and connections. All unused vacuum connectors should be capped. Hoses and their connections should be correctly secured and in good condition with no holes and no collapsed areas. Inspect the valve on the brake booster for damage.

2. Check the hydraulic brake system for leaks or low fluid.

3. With the transmission in PARK (automatic transmissions) or in NEUTRAL (manual transmissions), stop the engine and apply the parking brake. Pump the brake pedal several times to exhaust all vacuum in the system.

4. With the engine switched off and all vacuum in the system exhausted, apply the brake pedal and hold it down. Start the engine. If the vacuum system is operating, the brake pedal will tend to move downward under constant foot pressure. If no motion is felt, the vacuum booster system is not functioning.

5. Remove the vacuum hose from the brake booster. Manifold vacuum should be available at the brake booster end of the hose with the engine at idle speed and the transmission in PARK or NEUTRAL. Make sure that all unused vacuum outlets are correctly capped, hose connectors are correctly secured and vacuum hoses are in good condition. When it is established that manifold vacuum is available to the brake booster, connect the vacuum hose to the brake booster and repeat Step 3. If no downward movement of the brake pedal is felt, install a new brake booster.

6. Operate the engine for a minimum of 10 seconds at a fast idle. Stop the engine and allow the vehicle to stand for 10 minutes. Then, apply the brake pedal with approximately 89 N (20lb) of force. The pedal feel (brake application) should be the same as that noted with the engine running. If the brake pedal feels hard (no power assist), install a new valve and then repeat the test. If the brake pedal still feels hard, install a new brake booster.

**Brake Master Cylinder**

Usually, the first and strongest indicator of anything wrong in the brake system is a feeling through the brake pedal. In diagnosing the condition of the brake master cylinder, check pedal feel as evidence of a brake concern. Check for brake warning lamp illumination and the brake fluid level in the brake master cylinder reservoir.

**Normal Conditions**

The following conditions are considered normal and are not indicators that the brake master cylinder is in need of repair:

- New brake systems are designed to produce a pedal effort that is not as hard as in the past. Complaints of light pedal efforts should be compared to the pedal efforts of another vehicle of the same model and year.
- The fluid level will fall with brake pad wear.

**Abnormal Conditions**

- **NOTE:** Prior to carrying out any diagnosis, make sure the brake system warning indicator is functional.

Changes in the brake pedal feel or brake pedal travel are indicators that something could be wrong in the brake system. The diagnostic procedure and techniques use brake pedal feel, warning indicator illumination and low brake fluid level as indicators to diagnosing brake system concerns. The following conditions are considered abnormal and indicate that the brake master cylinder is in need of repair:

- Brake pedal goes down fast. This could be caused by an external or internal leak.
- Brake pedal goes down slowly. This could be caused by an internal or external leak.
- Brake pedal is low or feels spongy. This condition may be caused by no fluid in the brake master cylinder, reservoir cap vent holes clogged or air in the hydraulic system.
- Brake pedal effort is excessive. This may be caused by a bind or obstruction in the pedal/linkage, a faulty non return valve, booster or insufficient booster vacuum.
- Rear brakes lock up during light pedal force. This may be caused by damaged brake pads, a partially applied parking brake, a damaged ABS sensor or bearing failure.
- Brake pedal effort erratic. This condition could be caused by the brake booster or incorrectly installed brake pads.
- Brake warning indicator is on. This may be caused by low fluid level or float assembly damaged.

**Non Pressure Leaks**

Any reduced fluid volume in the brake master cylinder reservoir condition may be caused by two types of none pressure external leaks.

Type 1: An external leak may be occur at the brake master cylinder reservoir cap because of incorrect positioning of gasket and cap. Reposition cap and gasket.

Type 2: An external leak may occur at the brake master reservoir mounting seals. Repair such a leak by installing new seals and make sure that the brake master reservoir retaining bolt is correctly installed.

Type 3: An external leak may occur in the manual transmission clutch operating system. For additional information, refer to Section 308-00 Manual Transmission/Transaxle and Clutch - General Information.
Brake System - General Information - Brake Disc Runout Check

General Procedures

Check

1. Remove the wheel and tire. For additional information, refer to Section 204-04 Wheels and Tires.

2. NOTE: For vehicles with Brembo brakes, detach the parking brake caliper.
   Detach the front or rear brake caliper.

3. Install all wheel nuts and tighten equally to 20 Nm. Make sure that the brake disc is fully seated against the hub face.

4. Install a dial test indicator gauge and holding fixture to a suitable mounting point.

5. NOTE: If the runout is outside specification, check the hub face runout. Using the dial test indicator, measure the inner and outer faces of the brake disc.
   1. Position the gauge so that it contacts the disc 10 mm (0.4 in) from the outer edge.
   2. Slowly rotate the hub/disc assembly. Note the reading.

6. If a front hub runout check is required, remove the front brake disc. For additional information, refer to Section 206-03 Front Disc Brake. If a rear hub runout check is required, remove the rear brake disc. For additional information, refer to Section 206-04 Rear Disc Brake.

7. NOTE: The hub surface should be free from dirt and corrosion. Do not use abrasive cloths to clean hub faces. Using the dial test indicator, measure the hub face runout.
   1. Position the gauge so that it contacts the mounting tube between the stud and the chamfer.
   2. Slowly rotate the hub and note the runout. For additional information, refer to the specification chart.
   ● If the front hub runout exceeds the specifications, install a new hub, brake disc and recheck. For additional information, refer to Section 204-01 Front Suspension. If the rear hub runout exceeds the specifications, install a new hub, brake disc and recheck. For additional information, refer to Section 204-02 Rear Suspension.

8. If the front hub face is within specification, install a new brake disc. For additional information, refer to Section 206-03 Front Disc Brake. If the rear hub face is within specification, install a new disc. For additional information, refer to Section 206-04 Rear Disc Brake.

9. Install the wheel and tire. For additional information, refer to Section 204-04 Wheels and Tires.
Brake System - General Information - Brake System Bleeding

VIN Range: M45255->N52047

General Procedures

**WARNING:** Brake Fluid contains polyglycol ethers and polyglycols. Avoid contact with the eyes. Wash hands thoroughly after handling, as prolonged contact may cause irritation and dermatitis. If brake fluid contacts the eyes, flush the eyes with cold water or eyewash solution and seek medical attention. If taken internally do not induce vomiting, seek immediate medical attention. Failure to follow these instructions may result in personal injury.

**CAUTIONS:**

- Make sure that the vehicle is standing on a level surface or supported on a wheel free lift.
- If brake fluid comes into contact with the paintwork, the affected area must be immediately washed down with cold water.

**NOTE:** The system consists of separate circuits for each front and diagonally opposite rear wheel. Each front to rear circuit and each wheel circuit can be bled individually of each other.

**NOTE:** The service ABS hydraulic control unit is supplied pre-filled with brake fluid. Therefore, a conventional bleed procedure should be adequate to remove all the air from the brake system.

1. **CAUTION:** Make sure that the brake fluid reservoir filler cap does not become contaminated.

   Remove the brake master cylinder reservoir filler cap.

2. **NOTE:** Always use fluid from a sealed container and dispose of used fluid safely.

   Fill up the brake master cylinder reservoir to the MAX mark as necessary.

3. Install a bleed tube to the rear right-hand brake caliper bleed nipple.

4. **Bleed the circuit.**
   - Make sure the bleed tube is firmly attached to the bleed nipple.
   - Submerge the end of the bleed tube in a bleed jar containing a small quantity of approved brake fluid.
   - Position the bleed jar base at least 300 mm (12 in) above the bleed nipple to maintain fluid pressure and prevent air leaking past the bleed nipple threads.
   - Open the bleed nipple half a turn.
   - Slowly apply the brake pedal to its maximum travel (this forces brake fluid into the bleed jar).
   - Close the bleed nipple.
   - Return the brake pedal to the rest position.
   - Wait 2 seconds to allow the brake fluid to replenish the system.
   - Fill up the brake master cylinder reservoir to the MAX mark as necessary.
   - Continue to bleed the circuit until air-free brake fluid is pumped into the jar.
   - Fully tighten the bleed nipple.

5. Repeat the procedure for the rear left, front right and front left-hand brake circuits.

6. Fill up the brake master cylinder reservoir to the MAX mark as necessary.
7. Install the brake master cylinder reservoir filler cap.

Additional Procedure to Bleed New Calipers with Integral Park Brake Mechanism

• NOTE: Due to the complexity of the fluid path within the integral parking brake calipers, it may be difficult to achieve a satisfactory result using the procedure above when new calipers have been installed.

1. Using the Jaguar approved diagnostic system, put the parking brake system into service mode.
2. Remove both rear wheels and tires.
   For additional information, refer to Section 204-04 Wheels and Tires.
3. Bleed the braking system.
   For additional information, refer to Brake System Bleeding in this section.
4. Disconnect the parking brake cable.
   1. Release the tension.
   2. Disconnect the parking brake cable.

5. Detach the parking brake cable.
   1. Release the retaining tangs.
   2. Detach the parking brake cable.

6. Detach the brake caliper from the anchor bracket.
7. **NOTE:** The inner brake pad must have at least 7mm of friction material. If there is less than 7mm, a new pad must be used. Remove the outer brake pad.

8. Attach the brake caliper with a protective cloth placed between the caliper fingers and the disc.

9. Slowly apply the brake pedal until the piston is extended to the brake disc.
10. Detach the brake caliper from the anchor bracket.

11. **Bleed the caliper.**
   - Make sure the bleed tube is firmly attached to the bleed nipple.
   - Submerge the end of the bleed tube in a bleed jar containing a small quantity of approved brake fluid.
   - Position the bleed jar base at least 300 mm (12 in) above the bleed nipple to maintain fluid pressure and prevent air leaking past the bleed nipple threads.
   - Position the brake caliper with the piston facing down and the bleed nipple at the top.
   - Open the bleed nipple half a turn.
   - Using the special tool, fully retract the caliper piston.
   - Close the bleed nipple.
   - Repeat the above procedure twice.
   - Fill up the brake master cylinder reservoir to the MAX mark as necessary.
   - Continue to bleed the caliper using the above procedure until air-free brake fluid is pumped into the jar.
   - Fully tighten the bleed nipple.
   - Make sure the piston grooves are aligned to fit the brake pad peg when the caliper is assembled.
12. Install the outer brake pad.

13. Install the brake caliper.
   - Install new brake caliper guide pin retaining bolts.
   - Tighten to 34 Nm.

14. Bleed the braking system.
    For additional information, refer to Brake System Bleeding in this section.

15. Install the wheels and tires.
    For additional information, refer to Section 204-04 Wheels and Tires.
WARNING: Brake fluid contains polyglycol ethers and polyglycols. Avoid contact with the eyes. Wash hands thoroughly after handling, as prolonged contact may cause irritation and dermatitis. If brake fluid contacts the eyes, flush the eyes with cold water or eyewash solution and seek medical attention. If taken internally do not induce vomiting, seek immediate medical attention. Failure to follow these instructions may result in personal injury.

CAUTIONS:

Make sure that the vehicle is standing on a level surface or supported on a wheel free lift.

If brake fluid comes into contact with the paintwork, the affected area must be immediately washed down with cold water.

NOTE: The system consists of separate circuits for each front and diagonally opposite rear wheel. Each front to rear circuit and each wheel circuit can be bled individually of each other.

NOTE: The service anti-lock braking system (ABS) hydraulic control unit is supplied pre-filled with brake fluid. Therefore, a conventional bleed procedure should be adequate to remove all the air from the brake system.

All vehicles

1. **CAUTION: Make sure that the brake master cylinder reservoir filler cap does not become contaminated.**
   
   Remove the brake master cylinder reservoir filler cap.

2. **NOTE: Always use fluid from a sealed container and dispose of used fluid safely.**
   
   Fill up the brake master cylinder reservoir to the MAX mark as necessary.

3. Install a bleed tube to the rear right-hand brake caliper bleed nipple.

4. Bleed the circuit.
   
   - Make sure the bleed tube is firmly attached to the bleed nipple.
   - Submerge the end of the bleed tube in a bleed jar containing a small quantity of approved brake fluid.
   - Position the bleed jar base at least 300 mm (12 in) above the bleed nipple to maintain fluid pressure and prevent air leaking past the bleed nipple threads.
   - Open the bleed nipple half a turn.
   - Slowly apply the brake pedal to its maximum travel (this forces brake fluid into the bleed jar).
   - Close the bleed nipple.
   - Return the brake pedal to the rest position.
   - Wait 2 seconds to allow the brake fluid to replenish the system.
   - Fill up the brake master cylinder reservoir to the MAX mark as necessary.
   - Continue to bleed the circuit until air-free brake fluid is pumped into the jar.
1. Fully tighten the bleed nipple.

5. Repeat the procedure for the rear left, front right and front left-hand brake circuits.

6. Fill up the brake master cylinder reservoir to the MAX mark.

7. Due to the complexity of the fluid path within the integral park brake calipers, it may be difficult to achieve a satisfactory result using the procedure above when new calipers have been installed. Therefore carry out the following steps to make sure that the system is properly bled.

7. Remove both rear wheels and tires.
For additional information, refer to: Wheel and Tire (204-04, Removal and Installation).

Vehicles with high performance brakes

8. NOTE: Left-hand shown, right-hand similar.

Remove the logo badge.

All vehicles

9. NOTE: Left-hand shown, right-hand similar.

Remove the anti-rattle spring.

10. NOTE: Left-hand shown, right-hand similar.

Remove the brake caliper retaining bolt dust covers.
11. NOTE: Left-hand shown, right-hand similar.
Detach the brake caliper.

12. NOTE: The inner brake pad must have at least 7mm of friction material. If there is less than 7mm a new pad must be used.
• NOTE: Left-hand shown, right-hand similar.
Remove the outer brake pad.

13. NOTE: Left-hand shown, right-hand similar.
Attach the brake caliper with a protective cloth placed between the caliper fingers and the disc.

14. Slowly apply the brake pedal until the piston is extended to the brake disc.

15. NOTE: Left-hand shown, right-hand similar.
Detach the brake caliper.

16. Bleed the caliper.
• Make sure the bleed tube is firmly attached to the bleed nipple.
• Submerge the end of the bleed tube in a bleed jar containing a small quantity of approved brake fluid.
• Position the bleed jar base at least 300 mm (12 in) above the bleed nipple to maintain fluid pressure and prevent air leaking past the bleed nipple threads.
• Position the brake caliper with the piston facing down and the bleed nipple at the top.
• Open the bleed nipple half a turn.
- Using a suitable tool, fully retract the caliper piston.
- Close the bleed nipple.
- Repeat the above procedure twice.
- Fill up the brake master cylinder reservoir to the MAX mark as necessary.
- Continue to bleed the caliper using the above procedure until air-free brake fluid is pumped into the jar.
- Fully tighten the bleed nipple.

17. NOTE: Left-hand shown, right-hand similar.
Install the outer brake pad.

18. NOTE: Left-hand shown, right-hand similar.
Install the brake caliper.
- Tighten to 28 Nm.

19. NOTE: Left-hand shown, right-hand similar.
Install the brake caliper retaining bolt dust covers.

20. NOTE: Left-hand shown, right-hand similar.
Install the anti-rattle spring.
21. NOTE: Left-hand shown, right-hand similar.
Install the logo badge.
- Tighten to 5 Nm.

All vehicles

22. Install the wheels and tires.
For additional information, refer to: Wheel and Tire (204-04, Removal and Installation).

23. NOTE: Always use fluid from a sealed container and dispose of used fluid safely.
Fill up the brake master cylinder reservoir to the MAX mark as necessary.

24. CAUTION: Make sure that the brake master cylinder reservoir filler cap does not become contaminated.
Install the brake master cylinder reservoir filler cap.
Front Disc Brake -

Lubricants, Fluids, sealers and Adhesives

⚠️ CAUTION: Do not use brake fluid ITT Super Dot 4 on 2006my vehicles onwards. Failure to follow this instruction may result in damage to the vehicle.

- **NOTE:** Brake fluid ITT Super Dot 4 has now been superseded by Shell ESL Super Dot 4 which is the Jaguar recommended brake fluid. Shell ESL Super Dot 4 can be used on all model years.

Vehicles without Brembo brakes

For vehicles without Brembo brakes, the brake system consists of the following components:

- Brake pads
- Double piston, floating calipers
- Brake discs
- Brake caliper anchor plates
- Steel braided brake hoses

The brake caliper has two retaining bolts that attach the brake caliper to the anchor plate. These are of double, sliding piston type which makes sure equal effort is applied through both brake pads. The anchor plate is attached to the wheel knuckle with two bolts. The hydraulic system provides separate circuits for each pair of diagonally opposed wheels (i.e. left front, right rear and right front, left rear).

The brake disc is manufactured from cast iron and is of the vented type. It is retained on the hub by two retaining clips and the wheel studs.

Vehicles with Brembo brakes
For vehicles with Brembo brakes, the brake system consists of the following components:

- Brake pads
- Four piston, fixed calipers
- Drilled brake discs
- Steel braided brake hoses

The brake caliper has two retaining bolts that attach the brake caliper to the wheel knuckle. These are of four piston fixed type which makes sure that equal effort is applied through both brake pads. The hydraulic system provides separate circuits for each pair of diagonally opposed wheels (i.e. left front, right rear and right front, left rear).

The brake disc is manufactured from cast iron and is of the vented type. It is retained on the hub by two retaining clips and the wheel studs.

For vehicles without Brembo brakes, the brake system consists of the following components:

- Brake pads
- Single piston, floating calipers
- Brake discs
- Brake caliper anchor plates
- Steel braided brake hoses

The brake caliper has two retaining bolts that attach the brake caliper to the anchor plate. These are of single, sliding piston type which makes sure equal effort is applied through both brake pads. The anchor plate is attached to the wheel knuckle with two bolts. The hydraulic system provides separate circuits for each pair of diagonally opposed wheels (i.e. left front, right rear and right front, left rear).

The brake disc is manufactured from cast iron and is of the vented type. It is retained on the hub by two retaining clips and the wheel studs.

The rear brake caliper incorporates the parking brake of which is self adjusting according to brake pad wear.

For vehicles with Brembo brakes, the brake system consists of the following components:

- Brake pads
- Four piston, fixed calipers
- Brake discs
- Steel braided brake hoses

The brake caliper has two retaining bolts that attach the brake caliper to the wheel knuckle. These are of four piston fixed type which makes sure that equal effort is applied through both brake pads. The hydraulic system provides separate circuits for each pair of diagonally opposed wheels (i.e. left front, right rear and right front, left rear).

The brake disc is manufactured from cast iron and is of the solid type. It is retained on the hub by two retaining clips and the wheel studs.
The brake system consists of the following components:

- Brake pads
- Single piston, floating calipers
- Brake discs
- Brake caliper anchor plates
- Steel braided brake hoses

The brake caliper has two retaining bolts that attach the brake caliper to the anchor plate. These are of single, sliding piston type. In addition, the high performance caliper has a logo badge which has to be removed when changing the brake pads. The anchor plate is attached to the wheel knuckle with two bolts. The hydraulic system provides separate circuits for each pair of diagonally opposed wheels (i.e. left front, right rear and right front, left rear).

The brake disc is manufactured from cast iron and is of the vented type. It is retained on the hub by two retaining clips and the wheel studs.

The rear brake caliper incorporates the parking brake of which is self adjusting according to brake pad wear.

### Removal

**All vehicles**

1. Carry out the parking brake cable tension release procedure. For additional information, refer to: Parking Brake Cable Tension Release - VIN Range: G45704->G99999 (206-05 Parking Brake and Actuation, General Procedures).

2. Remove both rear wheels and tires. For additional information, refer to: Wheel and Tire (204-04 Wheels and Tires, Removal and Installation).

3. **NOTE:** Left-hand shown, right-hand similar.

   Detach the parking brake cable.

---

**Vehicles with high performance brakes**
4. NOTE: Left-hand shown, right-hand similar.

Remove the logo badge.

5. NOTE: Left-hand shown, right-hand similar.

Remove the anti-rattle spring.

6. CAUTIONS:

⚠️ Brake fluid contains polyglycol ethers and polyglycols. Avoid contact with the eyes. Wash hands thoroughly after handling, as prolonged contact may cause irritation and dermatitis. If brake fluid contacts the eyes, flush the eyes with cold water or eyewash solution and seek medical attention. If taken internally do not induce vomiting, seek immediate medical attention. Failure to follow these instructions may result in personal injury.

⚠️ If brake fluid comes into contact with the paintwork, the affected area must be immediately washed down with cold water.

⚠️ Cap the brake hose to prevent loss of fluid and prevent dirt ingress.

• NOTE: To prevent the loss of brake fluid, apply the brake pedal hold-down tool and adjust to hold the brake pedal down 40 mm (1.6 in).

• NOTE: Left-hand shown, right-hand similar.

Detach the brake hose.

- Remove and discard the sealing washers.

7. NOTE: Left-hand shown, right-hand similar.

Remove the brake caliper retaining bolt dust covers.
8. NOTE: Left-hand shown, right-hand similar.
Remove the brake caliper.
1. Remove the brake caliper retaining bolts.
2. Remove the brake caliper.

9. NOTE: Left-hand shown, right-hand similar.
Remove the brake pads.

**Installation**

All vehicles

1. **WARNING:** Do not use compressed air to disperse brake dust into the atmosphere.

- **CAUTIONS:**

  - Brake pads must always be replaced in axle sets.
  - Make sure the brake disc faces are clean before installation.
- **NOTE:** Make sure that the brake pad with the anti-rattle spring is installed to the inboard side of the brake disc.
- **NOTE:** Left-hand shown, right-hand similar.

Install the brake pads.

2. **CAUTIONS:**

  - As the piston is pushed back into the caliper housing, the brake fluid level in the reservoir will rise. Do not allow the reservoir to overflow.
  - If brake fluid comes into contact with the paintwork, the affected area must be immediately washed down with cold water.
- **NOTE:** Only the extraction bolt from special tool 303-588 is used.
- **NOTE:** Only the forcing plate from special tool 206-080 is used.
- **NOTE:** Right-hand shown, left-hand similar.

Using the special tools, fully retract the brake caliper piston.
3. NOTE: Left-hand shown, right-hand similar.
Install the brake caliper retaining bolts.
   1. Install the brake caliper.
   2. Tighten to 28 Nm.

4. NOTE: Left-hand shown, right-hand similar.
Install the brake caliper retaining bolt dust covers.

5. NOTE: Left-hand shown, right-hand similar.
Attach the brake hose.
   • Install new sealing washers.
   • Tighten to 35 Nm.

6. NOTE: Left-hand shown, right-hand similar.
Install the anti-rattle spring.

Vehicles with high performance brakes
7. NOTE: Left-hand shown, right-hand similar.
   Install the logo badge.
   - Tighten to 5 Nm.

All vehicles

8. Attach the parking brake cable.

9. Remove the brake pedal hold-down tool.

10. Bleed the brake system.
   For additional information, refer to: Brake System Bleeding (206-00 Brake System - General Information, General Procedures).

11. Install both rear wheels and tires.
    For additional information, refer to: Wheel and Tire (204-04 Wheels and Tires, Removal and Installation).
Removal

1. Remove the brake pads.
   For additional information, refer to: Brake Pads - VIN Range: G45171->G99999 (206-04, Removal and Installation).

2. ⚠️ CAUTION: The brake caliper must be supported at all times.
   • NOTE: Left-hand shown, right-hand similar.
   Remove the brake caliper anchor plate.
     • Remove and discard the brake caliper anchor plate retaining bolts.

3. NOTE: If the same brake disc is to be installed, the tip of a hub must be marked with a corresponding part of the brake disc for alignment.
   • NOTE: Left-hand shown, right-hand similar.
   Remove the brake disc.
     • Remove and discard the brake disc retaining clips.

Installation

1. ⚠️ WARNING: Do not use compressed air to disperse brake dust into the atmosphere.
   • CAUTIONS:
     ⚠️ Brake discs must always be replaced in axle sets.
     ⚠️ Make sure the brake disc faces are clean before installation.
     • NOTE: Left-hand shown, right-hand similar.
   To install, reverse the removal procedure.
     • Tighten to 103 Nm.
Removal

1. Remove the brake disc. For additional information, refer to: (206-04 Rear Disc Brake)
   - Brake Disc - Vehicles With: Standard Brakes, VIN Range: M45255->N52047 (Removal and Installation),
   - Brake Disc - Vehicles With: High Performance Brakes, VIN Range: M45255->N52047 (Removal and Installation),
   - Brake Disc - VIN Range: N52048->N99999 (Removal and Installation).

2. Remove the brake disc shield.
   - Drill out the rivets.

Installation

1. To install, reverse the removal procedure.
   - Install new rivets.
Removal and Installation

Removal

All vehicles

1. **CAUTION:** Whilst carrying out rear parking brake related service procedures, the tension on the rear parking brake release actuator will need to be released. Failure to follow this instruction may result in the parking brake to function incorrectly or become inoperative.

   Carry out the parking brake cable tension release.
   For additional information, refer to: Parking Brake Cable Tension Release (206-05 Parking Brake and Actuation, General Procedures).

2. Remove both rear wheels and tires.
   For additional information, refer to: Wheel and Tire (204-04 Wheels and Tires, Removal and Installation).

   Vehicles with high performance brakes

3. Remove the logo badge.

All vehicles
4. **NOTE:** Left-hand shown, right-hand similar.
   Remove the anti-rattle spring.

5. **NOTE:** Left-hand shown, right-hand similar.
   Remove the brake caliper retaining bolt dust covers.

6. **CAUTION:** The brake caliper must be supported at all times.
   • **NOTE:** Left-hand shown, right-hand similar.
   Detach the brake caliper.
   1. Remove the brake caliper retaining bolts.
   2. Detach the brake caliper.

7. **NOTE:** Left-hand shown, right-hand similar.
   Remove the brake pads.

---

**Installation**
1. **CAUTIONS:**

⚠️ As the piston is pushed back into the caliper housing, the brake fluid level in the reservoir will rise. Do not allow the reservoir to overflow.

⚠️ If brake fluid comes into contact with the paintwork, the affected area must be immediately washed down with cold water.

- **NOTE:** Only the extraction bolt from special tool 303-588 is used.
- **NOTE:** Only the forcing plate from special tool 206-080 is used.
- **NOTE:** Right-hand shown, left-hand similar.

Using the special tools, fully retract the brake caliper piston.

2. **WARNING:** Do not use compressed air to disperse brake dust into the atmosphere.

- **CAUTIONS:**

⚠️ Make sure the brake disc faces are clean before installation.

⚠️ Brake pads must always be replaced in axle sets.

- **NOTE:** Make sure that the brake pad with the anti-rattle spring is installed to the inboard side of the brake disc.

- **NOTE:** Left-hand shown, right-hand similar.

To install, reverse the removal procedure.

- Tighten to 28 Nm.

3. Tighten to 5 Nm.

4. **CAUTION:** Calibrate the electric park brake using Jaguar approved diagnostic system. If the Jaguar approved diagnostic system is not available disconnect the battery for approximately 30 seconds, the vehicle will then prompt the driver to carry out the calibration procedure as per the vehicle hand book on re-connection.

   Calibrate the electric parking brake module using the Jaguar approved diagnostic system.

5. **NOTE:** Do not start the engine or operate the electronic park brake before depressing the brake pedal.

   Repeatedly depress the brake pedal until brake pressure is evident.

Electric Park Brake

The electric park brake (EPB) system is operated by a floor console mounted switch. The rear calipers are activated by cables from an electric motor and actuator unit which is mounted on the rear subframe. Overall control of the EPB is from a control module which is located in the luggage compartment behind the right-hand rear luggage compartment trim panel. On vehicles with Brembo brakes separate parking brake calipers are fitted.

EPB Operation

To apply the parking brake, pull the parking brake switch upwards and release. The switch will then return to the neutral position and the parking brake low fluid warning light will illuminate on the instrument cluster. To release the parking brake set the ignition switch to position 2 or with the engine running, apply the footbrake and press the parking brake switch down. The parking brake is automatically released when the selector is moved from the 'P' position.

If the vehicle is stationary and the gear selector is in 'D' or 'R' and the parking brake is applied, then the parking brake will automatically release when the accelerator pedal is depressed.

The parking brake is automatically applied when the key is removed from the ignition switch. If the parking brake is required to be permanently released press and hold the parking brake switch down and at the same time remove the key. If the parking brake is operated while the vehicle is in motion the message 'PARKBRAKE ON' will be displayed on the message centre. The warning lamp in the instrument cluster will be illuminated and a warning chime will sound.

If the battery has been discharged or disconnected a message 'APPLY PARKBRAKE' will be displayed when the ignition is next switched on.
Apply the footbrake and pull the parking brake switch up to apply the parking brake. This is required to reset the parking brake system which will now function correctly.
### Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

<table>
<thead>
<tr>
<th>Mechanical</th>
<th>Electrical</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parking brake cable</td>
<td>Fuse(s)</td>
</tr>
<tr>

<td>Check for bent/corroded pins</td>
</tr>
<tr>
<td>Parking brake pads</td>
<td>Parking brake switch</td>
</tr>
<tr>
<td>Drop link caps</td>
<td>Parking brake module</td>
</tr>
</tbody>
</table>

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the cause is not visually evident and the Jaguar approved diagnostic system is not available, use a suitable code reader to retrieve any fault codes before proceeding to the Diagnostic Trouble Code (DTC) Index Chart (or the Symptom Chart if no DTCs are set), for actions to take.

• Service brake not correctly adjusted following lining change  
• Caliper malfunction  
• Actuator malfunction | Refer to the symptom chart for actions regarding mechanical operation |

Pinpoint Tests

⚠️ CAUTION: When probing connectors to take measurements in the course of the pinpoint tests, use the adaptor kit, part number 3548-1358-00.

- NOTE: Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.
- NOTE: When performing electrical voltage or resistance tests, always use a digital multimeter (DMM) accurate to 3 decimal places, and with an up-to-date calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.
- NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

**PINPOINT TEST A : DTC B1342; CONTROL MODULE FAILURE**

- **No**: GO to B3.

### B2: CHECK THE SIGNAL GROUND CIRCUIT TO THE EPB SWITCHPACK FOR HIGH RESISTANCE

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Disconnect the battery negative terminal.</td>
</tr>
<tr>
<td>2</td>
<td>Disconnect the EPB control module electrical connector, CR32.</td>
</tr>
<tr>
<td>3</td>
<td>Measure the resistance between TL82, pin 06 (WU) and CR32, pin 12 (WU).</td>
</tr>
<tr>
<td><strong>Yes</strong></td>
<td>REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.</td>
</tr>
<tr>
<td><strong>No</strong></td>
<td>Go to B3.</td>
</tr>
</tbody>
</table>

### B3: CHECK THE VOLTAGE FROM THE EPB CONTROL MODULE TO THE SWITCHPACK

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Reconnect the battery negative terminal.</td>
</tr>
<tr>
<td>2</td>
<td>Reconnect the EPB control module electrical connector, CR32.</td>
</tr>
<tr>
<td>3</td>
<td>Turn the ignition switch to the <strong>ON</strong> position.</td>
</tr>
<tr>
<td>4</td>
<td>Measure the voltage between TL82, pin 08 (WU) and GROUND.</td>
</tr>
<tr>
<td>5</td>
<td>Measure the voltage between TL82, pin 04 (RW) and GROUND.</td>
</tr>
<tr>
<td><strong>Yes</strong></td>
<td>GO to B4.</td>
</tr>
<tr>
<td><strong>No</strong></td>
<td>Check the EPB switch function. CLEAR the DTC. TEST the system for normal operation.</td>
</tr>
</tbody>
</table>

### B4: CHECK THE EPB CONTROL MODULE TO SWITCHPACK CIRCUITS FOR HIGH RESISTANCE

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Disconnect the battery negative terminal.</td>
</tr>
<tr>
<td>2</td>
<td>Disconnect the EPB control module electrical connector, CR32.</td>
</tr>
<tr>
<td>3</td>
<td>Measure the resistance between TL82, pin 08 (WU) and CR32, pin 05 (WU).</td>
</tr>
<tr>
<td>4</td>
<td>Measure the resistance between TL82, pin 04 (RW) and CR32, pin 06 (RW).</td>
</tr>
<tr>
<td><strong>Yes</strong></td>
<td>REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.</td>
</tr>
<tr>
<td><strong>No</strong></td>
<td>Go to B5.</td>
</tr>
</tbody>
</table>

### B5: CHECK THE EPB CONTROL MODULE TO SWITCHPACK CIRCUITS FOR SHORT TO GROUND

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Reconnect the battery negative terminal.</td>
</tr>
<tr>
<td>2</td>
<td>Measure the resistance between TL82, pin 08 (WU) and GROUND.</td>
</tr>
<tr>
<td>3</td>
<td>Measure the resistance between TL82, pin 04 (RW) and GROUND.</td>
</tr>
<tr>
<td><strong>Yes</strong></td>
<td>REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.</td>
</tr>
<tr>
<td><strong>No</strong></td>
<td>Contact dealer technical support for advice on possible EPB control module failure.</td>
</tr>
</tbody>
</table>

### PINPOINT TEST C : DTC C1989; PARK BRAKE APPLY AND RELEASE SWITCH CONTACTS ENERGIZED SIMULTANEOUSLY

**Test Conditions**

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Disconnect the EPB switchpack electrical connector, TL82.</td>
</tr>
<tr>
<td>2</td>
<td>Connect an ohmmeter between pins 06 and 08 of the switch.</td>
</tr>
<tr>
<td>3</td>
<td>Operate the switch to the <strong>Apply</strong> position.</td>
</tr>
<tr>
<td><strong>Yes</strong></td>
<td>GO to C2.</td>
</tr>
<tr>
<td><strong>No</strong></td>
<td>INSTALL a new switchpack. REFER to Parking Brake Switch - in this section. CLEAR the DTC. TEST the system for normal operation.</td>
</tr>
</tbody>
</table>

### C2: CHECK PARK BRAKE RELEASE SWITCH FUNCTION

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Connect an ohmmeter between pins 04 and 06 of the switch.</td>
</tr>
<tr>

</table>

PINPOINT TEST E : DTC C1799; HALL EFFECT SENSOR FAILURE

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Disconnect the EPB motor electrical connector, CV07.</td>
<td>E1: CHECK THE HALL EFFECT SENSOR POWER SUPPLY</td>
</tr>
<tr>
<td></td>
<td>2 Measure the voltage between CV07, pin 03 (Y) and GROUND.</td>
</tr>
<tr>
<td>Is the voltage less than 3 volts?</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>GO to E2.</td>
</tr>
<tr>
<td>No</td>
<td>GO to E3.</td>
</tr>
<tr>
<td>Disconnect the battery negative terminal.</td>
<td>E2: CHECK THE HALL EFFECT SENSOR POWER SUPPLY CIRCUIT FOR HIGH RESISTANCE</td>
</tr>
<tr>
<td></td>
<td>2 Disconnect the EPB control module electrical connector, CR32.</td>
</tr>
<tr>
<td></td>
<td>3 Measure the resistance between CV07, pin 03 (Y) and CR32, pin 10 (Y).</td>
</tr>
</tbody>
</table>
Is the resistance greater than 5 ohms?
Yes
   REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
No
   GO to E3.

### E3: CHECK THE HALL EFFECT SENSOR SIGNAL GROUND
1. Reconnect the battery negative terminal.
2. Measure the resistance between CV07, pin 05 (WU) and GROUND.

Is the resistance greater than 5 ohms?
Yes
   GO to E4.
No
   GO to E5.

### E4: CHECK THE HALL EFFECT SENSOR SIGNAL GROUND CIRCUIT FOR HIGH RESISTANCE
1. Measure the resistance between CV07, pin 05 (WU) and CR32, pin 12 (WU).

Is the resistance greater than 5 ohms?
Yes
   REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
No
   GO to E5.

### E5: CHECK THE HALL EFFECT SENSOR INPUT CIRCUIT FOR HIGH RESISTANCE
1. Measure the resistance between CV07, pin 04 (YB) and CR32, pin 04 (YB).

Is the resistance greater than 5 ohms?
Yes
   REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
No
   INSTALL a new hall effect sensor. (The hall effect sensor is not available separately). REFER to Parking Brake Release Actuator - in this section.
   CLEAR the DTC. TEST the system for normal operation. If the DTC is repeated, contact dealer technical support for advice on possible EPB module failure.
Parking Brake and Actuation - Parking Brake

Overview

There are some changes to diagnostics for 2006 my, the most obvious of which will be the change to 7-digit diagnostic trouble codes (DTCs) from the familiar 5-digit.

Refer to the DTC index in this section for guidance on how to use these codes with the Jaguar approved diagnostic system or a scan tool.

For additional information on the description and operation of the system, REFER to: Parking Brake (206-05 Parking Brake and Actuation, Description and Operation).

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

<table>
<thead>
<tr>
<th>Mechanical</th>
<th>Electrical</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parking brake cable</td>
<td>Fuse(s)</td>
</tr>
<tr>
<td>Parking brake actuator</td>
<td>Wiring harness/electrical connectors</td>
</tr>
<tr>
<td>Parking brake caliper</td>
<td>Check for bent/corroded pins</td>
</tr>
<tr>
<td>Parking brake pads</td>
<td>Parking brake switch</td>
</tr>
<tr>
<td>Drop link caps</td>
<td>Parking brake module</td>
</tr>
</tbody>
</table>

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the cause is not visually evident use the Jaguar approved diagnostic system or a scan tool to retrieve the fault codes before proceeding to the diagnostic trouble code (DTC) Index.

Symptom Chart

<table>
<thead>
<tr>
<th>Symptom</th>
<th>Possible Sources</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>The parking brake will not engage or release</td>
<td>Cables fouled, trapped or damaged</td>

</tr>
</tbody>
</table>

DTC index

• NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

<tr>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

*Yes* GO to A2.

*No* GO to A8.

#### DETAILS/RESULTS/ACTIONS

<table>
<thead>
<tr>
<th>A2: CHECK THE PRIMARY RELEASE SIGNAL CIRCUIT FOR SHORT CIRCUIT TO POWER</th>
</tr>
</thead>
<tbody>
<tr>
<td>Measure the resistance between:</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>CA265, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake switch apply 1 - signal - Pin 11</td>
</tr>
<tr>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

*Yes* GO to A3.

*No* GO to A9.

#### A3: CHECK THE SECONDARY APPLY SIGNAL CIRCUIT FOR SHORT CIRCUIT TO POWER

<table>
<thead>
<tr>
<th>A3: CHECK THE SECONDARY APPLY SIGNAL CIRCUIT FOR SHORT CIRCUIT TO POWER</th>
</tr>
</thead>
<tbody>
<tr>
<td>Measure the resistance between:</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>CA266, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake switch apply 2 - signal - Pin 02</td>
</tr>
<tr>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

*Yes* GO to A4.

*No* GO to A10.

#### A4: CHECK THE SECONDARY RELEASE SIGNAL CIRCUIT FOR SHORT CIRCUIT TO POWER
Measure the resistance between:

<table>
<thead>
<tr>
<th>CA266, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake switch release 2 - signal - Pin 14</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

Yes
GO to A5.

No
GO to A11.

A5: CHECK THE PRIMARY APPLY SIGNAL CIRCUIT FOR OPEN CIRCUIT

Electric parking brake switch connector, CA243 disconnected.

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>CA243, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake switch apply 1 - signal - Pin 10</td>
<td>Electric parking brake switch apply 1 - signal - Pin 08</td>
</tr>
</tbody>
</table>

Is the resistance less than 10 ohms?

Yes
GO to A6.

No
REPAIR the open circuit. For additional information, refer to the wiring diagrams.

A6: CHECK THE SWITCH RETURN CIRCUIT FOR OPEN CIRCUIT

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA266, harness side</th>
<th>CA243, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake switch - switch return - Pin 06</td>
<td>Electric parking brake switch - switch return - Pin 06</td>
</tr>
</tbody>
</table>

Is the resistance less than 10 ohms?

Yes
GO to A7.

No
REPAIR the open circuit. For additional information, refer to the wiring diagrams.

A7: CHECK THE ELECTRIC PARKING BRAKE SWITCH

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA243, component side</th>
<th>CA243, component side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake switch apply 1 - signal - Pin 08</td>
<td>Electric parking brake switch - switch return - Pin 06</td>
</tr>
</tbody>
</table>

Is the resistance between 595 ohms - 611 ohms?

Yes
An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s):- EPB module- EPB module connector CA265- EPB module connector CA266

No
INSTALL a new EPB switch.
REFER to: Parking Brake Switch (206-05 Parking Brake and Actuation, Removal and Installation).

A8: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SWITCH

Electric parking brake switch connector, CA243 disconnected.

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake switch apply 1 - signal - Pin 10</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>
### A9: Check if the Short Circuit is in the Harness or the Switch

1. Electric parking brake switch connector, CA243 disconnected.

2. Measure the resistance between:
   - CA265, harness side: Vehicle battery
   - Electric parking brake switch release 1 - signal - Pin 11: Positive terminal

3. Is the resistance greater than 100 Kohms?
   - Yes: INSTALL a new EPB switch. REFER to: Parking Brake Switch (206-05 Parking Brake and Actuation, Removal and Installation).
   - No: REPAIR the short circuit. For additional information, refer to the wiring diagrams.

### A10: Check if the Short Circuit is in the Harness or the Switch

1. Electric parking brake switch connector, CA243 disconnected.

2. Measure the resistance between:
   - CA266, harness side: Vehicle battery
   - Electric parking brake switch apply 2 - signal - Pin 02: Positive terminal

3. Is the resistance greater than 100 Kohms?
   - Yes: INSTALL a new EPB switch. REFER to: Parking Brake Switch (206-05 Parking Brake and Actuation, Removal and Installation).
   - No: REPAIR the short circuit. For additional information, refer to the wiring diagrams.

### A11: Check if the Short Circuit is in the Harness or the Switch

1. Electric parking brake switch connector, CA243 disconnected.

2. Measure the resistance between:
   - CA266, harness side: Vehicle battery
   - Electric parking brake switch release 2 - signal - Pin 14: Positive terminal
Is the resistance greater than 100 Kohms?

Yes
INSTALL a new EPB switch.
REFER to: Parking Brake Switch (206-05 Parking Brake and Actuation, Removal and Installation).

No
REPAIR the short circuit. For additional information, refer to the wiring diagrams.

PINPOINT TEST B: SECONDARY APPLY SWITCH CIRCUIT VOLTAGE OUT OF RANGE

TEST CONDITIONS | DETAILS/RESULTS/ACTIONS
--- | ---
B1: CHECK THE SECONDARY SWITCH CIRCUIT RESISTANCE |  
1 | Key off.  
2 | Electric parking brake module connector 2, CA266 disconnected.  
3 | Key on, engine off.  
4 | Measure the resistance between:

<table>
<thead>
<tr>
<th>CA266, harness side</th>
<th>CA266, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake switch apply 2 - signal - Pin 02</td>
<td>Electric parking brake switch - switch return - Pin 06</td>
</tr>
</tbody>
</table>

Is the resistance between 595 ohms - 611 ohms?

Yes
An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s): EPB fault - EPB module connector CA266

No
INSTALL a new EPB switch.
REFER to: Parking Brake Switch (206-05 Parking Brake and Actuation, Removal and Installation).

PINPOINT TEST C: CLUTCH PEDAL POSITION SENSOR SHORT CIRCUIT TO GROUND OR OPEN CIRCUIT

TEST CONDITIONS | DETAILS/RESULTS/ACTIONS
--- | ---
C1: CHECK THE 5 VOLT SUPPLY CIRCUIT FOR SHORT CIRCUIT TO GROUND |  
1 | Key off.  
2 | Electric parking brake module connector 1, CA265 disconnected.  
3 | Electric parking brake module connector 2, CA266 disconnected.  
4 | Key on, engine off.
Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clutch position sensor - supply - Pin 05</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

Yes
GO to C2.

No
GO to C6.

C2: CHECK THE SIGNAL CIRCUIT FOR SHORT CIRCUIT TO GROUND

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clutch position sensor - signal - Pin 06</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

Yes
GO to C3.

No
GO to C8.

C3: CHECK THE SIGNAL CIRCUIT FOR OPEN CIRCUIT

1. Clutch pedal position sensor (CLPS) connector, CA287 disconnected.

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>CA287, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clutch position sensor - signal - Pin 06</td>
<td>Clutch position sensor - signal - Pin 02</td>
</tr>
</tbody>
</table>

Is the resistance less than 10 ohms?

Yes
GO to C4.

No
GO to C8.

C4: CHECK THE 5 VOLT SUPPLY CIRCUIT FOR OPEN CIRCUIT

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>CA287, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clutch position sensor - supply - Pin 05</td>
<td>Clutch position sensor - supply - Pin 03</td>
</tr>
</tbody>
</table>

Is the resistance less than 10 ohms?

Yes
GO to C5.

No
REPAIR the open circuit. For additional information, refer to the wiring diagrams.

C5: CHECK THE SENSOR RETURN CIRCUIT FOR OPEN CIRCUIT

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA266, harness side</th>
<th>CA287, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clutch position sensor - ground - Pin 03</td>
<td>Clutch position sensor - ground - Pin 01</td>
</tr>
</tbody>
</table>

Is the resistance less than 10 ohms?

Yes
An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s):
- EPB module
- CLPS
- EPB module connector CA265
- EPB module connector CA266
- CLPS connector CA287

No
REPAIR the open circuit. For additional information, refer to the wiring diagrams.

C6: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SENSOR

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA286, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clutch position sensor - ground - Pin 03</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance less than 10 ohms?

Yes
GO to C7.

No
GO to C8.

C7: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SENSOR

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA286, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clutch position sensor - ground - Pin 01</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance less than 10 ohms?

Yes
GO to C8.

No
REPAIR the open circuit. For additional information, refer to the wiring diagrams.
Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
</table>

Clutch position sensor - supply - Pin 05 Negative terminal

Is the resistance greater than 100 Kohms?
Yes
INSTALL a new CLPS.
No
GO to C7.

C7: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SENSOR

In-Gear (IG) Switch connector, GB03 disconnected (vehicles with petrol engine). E55106

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
</table>

Clutch position sensor - supply - Pin 05 Negative terminal

Is the resistance greater than 100 Kohms?
Yes
INSTALL a new In-gear switch.
No
REPAIR the short circuit. For additional information, refer to the wiring diagrams.

C8: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SENSOR

Clutch pedal position sensor (CLPS) connector, CA287 disconnected. E55105

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
</table>

Clutch position sensor - signal - Pin 06 Negative terminal

Is the resistance greater than 100 Kohms?
Yes
INSTALL a new CLPS.
No
REPAIR the short circuit. For additional information, refer to the wiring diagrams.

PINPOINT TEST D : SECONDARY RELEASE SWITCH CIRCUIT VOLTAGE OUT OF RANGE

TEST CONDITIONS

D1: CHECK THE SECONDARY SWITCH CIRCUIT RESISTANCE

Key off.

Electric parking brake module connector 2, CA266 disconnected.

Key on, engine off.
Measure the resistance between:

<table>
<thead>
<tr>
<th>CA266, harness side</th>
<th>CA266, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake switch release 2 - signal - Pin 14</td>
<td>Electric parking brake switch - switch return - Pin 06</td>
</tr>
</tbody>
</table>

Is the resistance between 595 ohms - 611 ohms?

Yes

An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s): EPB module- EPB module connector CA266

No

INSTALL a new EPB switch.

REFER to: Parking Brake Switch (206-05 Parking Brake and Actuation, Removal and Installation).

PINPOINT TEST E : SECONDARY APPLY SWITCH CIRCUIT SHORT CIRCUIT TO GROUND

TEST CONDITIONS

1. Key off.

2. Electric parking brake module connector 2, CA266 disconnected.

3. Key on, engine off.

4. Measure the resistance between:

<table>
<thead>
<tr>
<th>CA266, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake switch apply 2 - signal - Pin 02</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

Yes

An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s): EPB module- EPB module connector CA266

No

GO to E2.

E2: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SWITCH

1. Electric parking brake switch connector, CA243 disconnected.

2. Measure the resistance between:

<table>
<thead>
<tr>
<th>CA266, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake switch apply 2 - signal - Pin 02</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

Yes

INSTALL a new EPB switch.

REFER to: Parking Brake Switch (206-05 Parking Brake and Actuation, Removal and Installation).

No

REPAIR the short circuit. For additional information, refer to the wiring diagrams.

PINPOINT TEST F : CLUTCH PEDAL POSITION SENSOR SHORT CIRCUIT TO BATTERY

TEST CONDITIONS

F1: CHECK THE 5 VOLT SUPPLY CIRCUIT FOR SHORT CIRCUIT TO POWER

1. Key off.
Electric parking brake module connector 1, CA265 disconnected.

Electric parking brake module connector 2, CA266 disconnected.

Key on, engine off.

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clutch position sensor - supply - Pin 05 Positive terminal</td>
<td></td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

Yes

GO to F2.

No

GO to F4.

F2: CHECK THE SIGNAL CIRCUIT FOR SHORT CIRCUIT TO POWER

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clutch position sensor - signal - Pin 06 Positive terminal</td>
<td></td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

Yes

GO to F3.

No

GO to F5.

F3: CHECK THE SENSOR RETURN GROUND CIRCUIT FOR SHORT CIRCUIT TO POWER

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA266, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clutch position sensor - ground - Pin 03 Positive terminal</td>
<td></td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

Yes

An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s): EPB module- EPB module connector CA265- EPB module connector CA266

No

GO to F6.

F4: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SENSOR

Clutch pedal position sensor (CLPS) connector, CA287 disconnected.

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clutch position sensor - supply - Pin 05 Positive terminal</td>
<td></td>
</tr>
</tbody>
</table>
F5: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SENSOR

1. Clutch pedal position sensor (CLPS) connector, CA287 disconnected.

2. Measure the resistance between:
   - CA265, harness side
   - Vehicle battery
     Clutch position sensor - signal - Pin 06
     Positive terminal

3. Is the resistance greater than 100 Kohms?
   Yes
   INSTALL a new CLPS.
   No
   GO to F7.

F6: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SENSOR

1. Clutch pedal position sensor (CLPS) connector, CA287 disconnected.

2. Measure the resistance between:
   - CA266, harness side
   - Vehicle battery
     Clutch position sensor - ground - Pin 03
     Positive terminal

3. Is the resistance greater than 100 Kohms?
   Yes
   INSTALL a new CLPS.
   No
   REPAIR the short circuit. For additional information, refer to the wiring diagrams.

F7: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SWITCH

1. In-Gear (IG) switch connector, GB04 disconnected (vehicles with diesel engine).

2. Measure the resistance between:
   - CA266, harness side
   - Vehicle battery
     Clutch position sensor - supply - Pin 05
     Positive terminal

3. Is the resistance greater than 100 Kohms?
   Yes
   INSTALL a new in-gear switch.
   No
   REPAIR the short circuit. For additional information, refer to the wiring diagrams.
## PINPOINT TEST G: SECONDARY APPLY HARNESS SHORT CIRCUIT TO BATTERY OR OPEN CIRCUIT

### TEST CONDITIONS

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>

<td>Go to G5.</td>
</tr>
<tr>
<td>No</td>
<td>Go to G11.</td>
</tr>
</tbody>
</table>

### G5: CHECK THE SECONDARY APPLY SIGNAL CIRCUIT FOR OPEN CIRCUIT
Electric parking brake switch, CA243 connector disconnected.

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA266, harness side</th>
<th>CA243, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake switch apply 2 - signal - Pin 02</td>
<td>Electric parking brake switch apply 2 - signal - Pin 07</td>
</tr>
</tbody>
</table>

Is the resistance less than 10 ohms?

Yes  **GO to G6.**

No  REPAIR the open circuit. For additional information, refer to the wiring diagrams.

G6: CHECK THE SWITCH RETURN SIGNAL CIRCUIT FOR OPEN CIRCUIT

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA266, harness side</th>
<th>CA243, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake switch - switch return - Pin 06</td>
<td>Electric parking brake switch - switch return - Pin 06</td>
</tr>
</tbody>
</table>

Is the resistance less than 10 ohms?

Yes  **GO to G7.**

No  REPAIR the open circuit. For additional information, refer to the wiring diagrams.

G7: CHECK THE ELECTRIC PARKING BRAKE SWITCH

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA243, component side</th>
<th>CA243, component side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake switch apply 2 - signal - Pin 07</td>
<td>Electric parking brake switch - switch return - Pin 06</td>
</tr>
</tbody>
</table>

Is the resistance between 595 ohms - 611 ohms?

Yes  An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s): EPB module- EPB module connector CA265- EPB module connector CA266

No  INSTALL a new EPB switch.

REFER to: Parking Brake Switch (206-05 Parking Brake and Actuation, Removal and Installation).

G8: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SWITCH

Electric parking brake switch, CA243 connector disconnected.

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake switch apply 1 - signal - Pin 10</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

Yes  INSTALL a new EPB switch.

REFER to: Parking Brake Switch (206-05 Parking Brake and Actuation, Removal and Installation).

No  REPAIR the short circuit. For additional information, refer to the wiring diagrams.

G9: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SWITCH
1. Electric parking brake switch, CA243 connector disconnected.

2. Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake switch release 1 - signal - Pin 11</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

- Yes
  - INSTALL a new EPB switch.
  - REFER to: Parking Brake Switch (206-05 Parking Brake and Actuation, Removal and Installation).

- No
  - REPAIR the short circuit. For additional information, refer to the wiring diagrams.

G10: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SWITCH

1. Electric parking brake switch, CA243 connector disconnected.

2. Measure the resistance between:

<table>
<thead>
<tr>
<th>CA266, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake switch apply 2 - signal - Pin 02</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

- Yes
  - INSTALL a new EPB switch.
  - REFER to: Parking Brake Switch (206-05 Parking Brake and Actuation, Removal and Installation).

- No
  - REPAIR the short circuit. For additional information, refer to the wiring diagrams.

G11: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SWITCH

1. Electric parking brake switch, CA243 connector disconnected.

2. Measure the resistance between:

<table>
<thead>
<tr>
<th>CA266, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake switch release 2 - signal - Pin 14</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

- Yes
  - INSTALL a new EPB switch.
  - REFER to: Parking Brake Switch (206-05 Parking Brake and Actuation, Removal and Installation).

- No
  - REPAIR the short circuit. For additional information, refer to the wiring diagrams.
PINPOINT TEST H: PRIMARY RELEASE SWITCH CIRCUIT OUT OF RANGE

**TEST CONDITIONS** | **DETAILS/RESULTS/ACTIONS**
---|---
1. Key off. | 2. Electric parking brake module connector 1, CA265 disconnected.

---

PINPOINT TEST I: PRIMARY APPLY SWITCH CIRCUIT OUT OF RANGE

**TEST CONDITIONS** | **DETAILS/RESULTS/ACTIONS**
---|---
1. Key off. | 2. Electric parking brake module connector 1, CA265 disconnected.
3 Electric parking brake module connector 2, CA266 disconnected.

4 Key on, engine off.
5 Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>CA266, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake switch apply 1 - signal - Pin 10</td>
<td>Electric parking brake switch - switch return - Pin 06</td>
</tr>
</tbody>
</table>

Is the resistance between 595 ohms - 611 ohms?

Yes
An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s): EPB module - EPB module connector CA265

No
INSTALL a new EPB switch.
REFER to: Parking Brake Switch (206-05 Parking Brake and Actuation, Removal and Installation).

PINPOINT TEST J : PRIMARY APPLY SWITCH CIRCUIT SHORT CIRCUIT TO GROUND

J1: CHECK THE PRIMARY APPLY SIGNAL CIRCUIT FOR SHORT CIRCUIT TO GROUND

1 Key off.
2 Electric parking brake module connector 1, CA265 disconnected.

3 Key on, engine off.
4 Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake switch apply 1 - signal - Pin 10</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

Yes
An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s): EPB module - EPB module connector CA265

No
GO to J2.

J2: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SWITCH

1 Electric parking brake switch connector, CA243 disconnected.
Measure the resistance between:

- **CA265**, harness side
- **Vehicle battery**

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake switch apply 1 - signal - Pin 10</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

- **Yes**
  - INSTALL a new EPB switch.
  - REFER to: Parking Brake Switch (206-05 Parking Brake and Actuation, Removal and Installation).

- **No**
  - REPAIR the short circuit. For additional information, refer to the wiring diagrams.

---

**PINPOINT TEST K : HIGH POWER BATTERY FEED CIRCUIT SHORT CIRCUIT TO GROUND OR OPEN CIRCUIT**

**K1: CHECK THE HIGH POWER SUPPLY CIRCUIT**

1. **Electric parking brake module connector 2, CA266 disconnected.**

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>CA266, harness side</td>
<td>Vehicle battery</td>
</tr>
<tr>
<td>Electric parking brake module - battery supply - Pin 01</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the voltage between 9 volts - 15 volts?

- **Yes**
  - An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s): EPB module

- **No**
  - No supply to the EPB circuit. check and repair the circuit as necessary. For additional information, refer to the wiring diagrams.

---

**PINPOINT TEST L : PRIMARY RELEASE SWITCH CIRCUIT SHORT CIRCUIT TO GROUND**

**L1: CHECK THE PRIMARY RELEASE SIGNAL CIRCUIT FOR SHORT CIRCUIT TO GROUND**

1. **Key off.**

2. **Electric parking brake module connector 1, CA265 disconnected.**

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>CA265, harness side</td>
<td>Vehicle battery</td>
</tr>
<tr>
<td>Electric parking brake switch release 1 - signal - Pin 11</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

- **Yes**
  - An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s): EPB module - EPB module connector CA265

- **No**
  - **GO to L2.**

**L2: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SWITCH**

---

**E55104**

**E55103**
1. Electric parking brake switch connector, CA243 disconnected.

2. Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake switch release 1 - signal - Pin 11</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

- Yes: INSTALL a new EPB switch. REFER to: Parking Brake Switch (206-05 Parking Brake and Actuation, Removal and Installation).
- No: REPAIR the short circuit. For additional information, refer to the wiring diagrams.

**PINPOINT TEST M: ACTUATOR OUTPUT SHORT CIRCUIT TO GROUND**

**M1: CHECK THE ACTUATOR NEGATIVE SIGNAL CIRCUIT FOR SHORT CIRCUIT TO GROUND**

1. Key off.
2. Electric parking brake switch connector, CA243 disconnected.

3. Key on, engine off.
4. Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake actuator - negative - Pin 07</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

- Yes: GO to M2.
- No: GO to M3.

**M2: CHECK THE ACTUATOR POSITIVE SIGNAL CIRCUIT FOR SHORT CIRCUIT TO GROUND**

1. Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake actuator - positive - Pin 14</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

- Yes: An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s): EPB module- EPB module connector CA265.
- No: GO to M4.

**M3: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE ACTUATOR**
**EPB actuator connector, CA269 disconnected.**

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake actuator - negative - Pin 07</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

**Yes**

INSTALL a new EPB actuator.

REFER to: Parking Brake Release Actuator (206-05 Parking Brake and Actuation, Removal and Installation).

**No**

REPAIR the short circuit. For additional information, refer to the wiring diagrams.

**M4: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE ACTUATOR**

EPB actuator connector, CA269 disconnected.

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake actuator - positive - Pin 14</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

**Yes**

INSTALL a new EPB actuator.

REFER to: Parking Brake Release Actuator (206-05 Parking Brake and Actuation, Removal and Installation).

**No**

REPAIR the short circuit. For additional information, refer to the wiring diagrams.

**PINPOINT TEST N : GEAR SHIFT POSITION FAULT, GENERAL ELECTRICAL FAILURE (VEHICLES WITH PETROL ENGINE ONLY)**

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>N1: CHECK THE SIGNAL CIRCUIT FOR SHORT CIRCUIT TO POWER</strong></td>
<td></td>
</tr>
</tbody>
</table>

1. Key off.

2. Electric parking brake module connector 1 connector, CA265 disconnected.

3. Key on, engine off.

4. Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>In-gear switch - signal - Pin 03</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>
Is the resistance greater than 100 Kohms?

Yes  GO to N2.

No  GO to N3.

N2: CHECK THE IN-GEAR SWITCH CIRCUIT RESISTANCE

1. Make sure the vehicle is in NEUTRAL.
2. Key off.
3. Electric parking brake module connector 2 connector, CA266 disconnected.

<table>
<thead>
<tr>
<th>Measure the resistance between:</th>
</tr>
</thead>
<tbody>
<tr>
<td>CA265, harness side</td>
</tr>
<tr>
<td>CA266, harness side</td>
</tr>
<tr>
<td>In-gear switch - signal - Pin 03</td>
</tr>
<tr>
<td>In-gear switch - return - Pin 15</td>
</tr>
</tbody>
</table>

Is the resistance between 580 ohms - 630 ohms?

Yes  An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s): - EPB module- EPB module connector CA265- EPB module connector CA266

No  GO to N6.

N3: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SWITCH

1. In-Gear (IG) switch connector, GB03 disconnected.

<table>
<thead>
<tr>
<th>Measure the resistance between:</th>
</tr>
</thead>
<tbody>
<tr>
<td>CA265, harness side</td>
</tr>
<tr>
<td>Vehicle battery</td>
</tr>
<tr>
<td>In-gear switch - signal - Pin 03</td>
</tr>
<tr>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

Yes  GO to N4.

No  REPAIR the short circuit. For additional information, refer to the wiring diagrams.

N4: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SWITCH

1. Measure the resistance between:

| GB03, harness side                |
| Vehicle battery                   |
| In-gear switch - return - Pin 01  |
| Positive terminal                 |

Is the resistance greater than 100 Kohms?

Yes  INSTALL a new in-gear switch.

No  GO to N5.

N5: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE CONTROL MODULE

1. Key off.
Electric parking brake module connector 2, CA266 disconnected.

Key on, engine off.
Measure the resistance between:

<table>
<thead>
<tr>
<th>GB03, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>In-gear switch - return - Pin 01</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?
Yes
INSTALL a new EPB module.
REFER to: Parking Brake Module (206-05 Parking Brake and Actuation, Removal and Installation).
No
REPAIR the short circuit. For additional information, refer to the wiring diagrams.

In-gear (IG) switch connector, GB03 disconnected.

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>GB03, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>In-gear switch - signal - Pin 03</td>
<td>In-gear switch - signal - Pin 02</td>
</tr>
</tbody>
</table>

Is the resistance less than 10 ohms?
Yes
GO to N7.
No
REPAIR the open circuit. For additional information, refer to the wiring diagrams.

In-gear switch - return - Pin 15
In-gear switch - return - Pin 01

Is the resistance less than 10 ohms?
Yes
GO to N8.
No
REPAIR the open circuit. For additional information, refer to the wiring diagrams.

In-gear switch - return - Pin 01
In-gear switch - signal - Pin 02

Is the resistance between 580 ohms - 630 ohms?
Yes
REPAIR the open circuit. For additional information, refer to the wiring diagrams.
No
INSTALL a new in-gear switch.

PINPOINT TEST O : HIGH POWER GROUND FEED OPEN CIRCUIT

TEST CONDITIONS | DETAILS/RESULTS/ACTIONS
O1: CHECK THE MODULE GROUND CIRCUIT FOR CONTINUITY
Electric parking brake module connector 2, CA266 disconnected.

<table>
<thead>
<tr>
<th>PINPOINT TEST P : ACTUATOR OUTPUT SHORT CIRCUIT TO BATTERY</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>TEST CONDITIONS</strong></td>
</tr>
<tr>
<td><strong>P1: CHECK THE ACTUATOR NEGATIVE SIGNAL CIRCUIT FOR SHORT CIRCUIT TO POWER</strong></td>
</tr>
<tr>
<td>Key off.</td>
</tr>
<tr>
<td>Key on, engine off.</td>
</tr>
<tr>
<td>Electric parking brake actuator - negative - Pin 07 - Positive terminal</td>
</tr>
<tr>
<td>Is the resistance greater than 100 Kohms?</td>
</tr>
<tr>
<td>Yes</td>
</tr>
<tr>
<td>No</td>
</tr>
</tbody>
</table>

| **P2: CHECK THE ACTUATOR POSITIVE SIGNAL CIRCUIT FOR SHORT CIRCUIT TO POWER** |
| CA265, harness side - Vehicle battery |
| Electric parking brake actuator - positive - Pin 14 - Positive terminal |
| Is the resistance greater than 100 Kohms? |
| Yes | An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s): EPB module - EPB module connector CA265 |
| No | GO to P4. |

P3: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE ACTUATOR
EPB actuator connector, CA269 disconnected.

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake actuator - negative - Pin 07</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

- No: REPAIR the short circuit. For additional information, refer to the wiring diagrams.

P4: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE ACTUATOR

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake actuator - positive - Pin 14</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

- No: REPAIR the short circuit. For additional information, refer to the wiring diagrams.

PINPOINT TEST Q: ACTUATOR HALL EFFECT SENSOR CIRCUIT FAILURE

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Q1: CHECK THE HALL EFFECT 5 VOLT SUPPLY CIRCUIT FOR SHORT CIRCUIT TO GROUND</td>
<td></td>
</tr>
<tr>
<td>Key off.</td>
<td></td>
</tr>
<tr>
<td>Electric parking brake module connector 1, CA265 disconnected.</td>
<td></td>
</tr>
</tbody>
</table>
### Electric parking brake module connector 2, CA266 disconnected.

1. **Key on, engine off.**
2. **Measure the resistance between:**
   - **CA265, harness side**
   - **Vehicle battery**
   - Electric parking brake hall effect - signal - Pin 12
   - Negative terminal
3. Is the resistance greater than 100 Kohms?
   - Yes [Go to Q2.](#)
   - No [Go to Q9.](#)

#### Q2: CHECK THE HALL EFFECT 5 VOLT SUPPLY CIRCUIT FOR SHORT CIRCUIT TO POWER

1. **Measure the resistance between:**
   - **CA265, harness side**
   - **Vehicle battery**
   - Electric parking brake hall effect - signal - Pin 12
   - Positive terminal
2. Is the resistance greater than 100 Kohms?
   - Yes [Go to Q3.](#)
   - No [Go to Q10.](#)

#### Q3: CHECK THE ACTUATOR SIGNAL CIRCUIT FOR SHORT CIRCUIT TO GROUND

1. **Measure the resistance between:**
   - **CA265, harness side**
   - **Vehicle battery**
   - Electric parking brake actuator - signal - Pin 10
   - Negative terminal
2. Is the resistance greater than 100 Kohms?
   - Yes [Go to Q4.](#)
   - No [Go to Q11.](#)

#### Q4: CHECK THE ACTUATOR SIGNAL CIRCUIT FOR SHORT CIRCUIT TO POWER

1. **Measure the resistance between:**
   - **CA266, harness side**
   - **Vehicle battery**
   - Electric parking brake actuator - signal - Pin 10
   - Negative terminal
2. Is the resistance greater than 100 Kohms?
   - Yes [Go to Q5.](#)
   - No [Go to Q12.](#)

#### Q5: CHECK THE SENSOR RETURN CIRCUIT FOR SHORT CIRCUIT TO BATTERY

1. **Measure the resistance between:**
   - **CA265, harness side**
   - **Vehicle battery**
   - Electric parking brake hall effect - ground - Pin 13
   - Positive terminal
2. Is the resistance greater than 100 Kohms?
   - Yes [Go to Q6.](#)
   - No [Go to Q13.](#)

#### Q6: CHECK THE SENSOR RETURN CIRCUIT FOR OPEN CIRCUIT

1. **EPB actuator connector, CA269 disconnected.**
2. **Measure the resistance between:**
   - **CA265, harness side**
   - **CA269, harness side**
   - Electric parking brake hall effect - ground - Pin 13
   - Electric parking brake hall effect - ground - Pin 05
Is the resistance less than 10 ohms?
Yes  Go to Q7.
No  REPAIR the open circuit. For additional information, refer to the wiring diagrams.

Q7: CHECK THE HALL EFFECT 5 VOLT SUPPLY CIRCUIT FOR OPEN CIRCUIT

<table>
<thead>
<tr>
<th>1</th>
<th>CA265, harness side</th>
<th>CA269, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake hall effect - signal - Pin 12</td>
<td>Electric parking brake hall effect - signal - Pin 03</td>
<td></td>
</tr>
</tbody>
</table>

Is the resistance less than 10 ohms?
Yes  Go to Q8.
No  REPAIR the open circuit. For additional information, refer to the wiring diagrams.

Q8: CHECK THE ACTUATOR SIGNAL CIRCUIT FOR OPEN CIRCUIT

<table>
<thead>
<tr>
<th>1</th>
<th>CA266, harness side</th>
<th>CA269, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake actuator - signal - Pin 10</td>
<td>Electric parking brake actuator - signal - Pin 04</td>
<td></td>
</tr>
</tbody>
</table>

Is the resistance less than 10 ohms?
Yes  An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s):- EPB module- EPB actuator- EPB module connector CA265- EPB module connector CA266- EPB actuator connector CA269
No  REPAIR the open circuit. For additional information, refer to the wiring diagrams.

Q9: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE ACTUATOR

1. EPB actuator connector, CA269 disconnected.

<table>
<thead>
<tr>
<th>2</th>
<th>CA265, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake hall effect - signal - Pin 12</td>
<td>Negative terminal</td>
<td></td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?
Yes  INSTALL a new EPB actuator.
   REFER to: Parking Brake Release Actuator (206-05 Parking Brake and Actuation, Removal and Installation).
No  REPAIR the short circuit. For additional information, refer to the wiring diagrams.

Q10: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE ACTUATOR

1. EPB actuator connector, CA269 disconnected.

<table>
<thead>
<tr>
<th>2</th>
<th>CA265, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake hall effect - signal - Pin 12</td>
<td>Positive terminal</td>
<td></td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?
Yes  INSTALL a new EPB actuator.
   REFER to: Parking Brake Release Actuator (206-05 Parking Brake and Actuation, Removal and Installation).
Q11: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE ACTUATOR

1. EPB actuator connector, CA269 disconnected.

2. Measure the resistance between:

<table>
<thead>
<tr>
<th>CA266, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake actuator - signal - Pin 10</td>
<td>Vehicle battery</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

Yes

INSTALL a new EPB actuator.

REFER to: Parking Brake Release Actuator (206-05 Parking Brake and Actuation, Removal and Installation).

No

REPAIR the short circuit. For additional information, refer to the wiring diagrams.

Q12: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE ACTUATOR

1. EPB actuator connector, CA269 disconnected.

2. Measure the resistance between:

<table>
<thead>
<tr>
<th>CA266, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake actuator - signal - Pin 10</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

Yes

INSTALL a new EPB actuator.

REFER to: Parking Brake Release Actuator (206-05 Parking Brake and Actuation, Removal and Installation).

No

REPAIR the short circuit. For additional information, refer to the wiring diagrams.

Q13: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE ACTUATOR

1. EPB actuator connector, CA269 disconnected.

2. Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake hall effect - ground - Pin 13</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

Yes

INSTALL a new EPB actuator.

REFER to: Parking Brake Release Actuator (206-05 Parking Brake and Actuation, Removal and Installation).

No

REPAIR the short circuit. For additional information, refer to the wiring diagrams.
No  REPAIR the short circuit. For additional information, refer to the wiring diagrams.

PINPOINT TEST R : SECONDARY RELEASE HARNESS SHORT CIRCUIT TO BATTERY OR OPEN CIRCUIT

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
</table>

R1: CHECK THE PRIMARY APPLY SIGNAL CIRCUIT FOR SHORT CIRCUIT TO POWER

1. Key off.
2. Electric parking brake module connector 1, CA265 disconnected.
3. Electric parking brake module connector 2, CA266 disconnected.
4. Key on, engine off.
5. Measure the resistance between:
   - CA265, harness side
   - Vehicle battery
   - Electric parking brake switch apply 1 - signal - Pin 10, Positive terminal
   - Is the resistance greater than 100 Kohms?
     Yes  GO to R2.
     No  GO to R8.

R2: CHECK THE PRIMARY RELEASE SIGNAL CIRCUIT FOR SHORT CIRCUIT TO POWER

1. Measure the resistance between:
   - CA265, harness side
   - Vehicle battery
   - Electric parking brake switch release 1 - signal - Pin 11, Positive terminal
   - Is the resistance greater than 100 Kohms?
     Yes  GO to R3.
     No  GO to R9.

R3: CHECK THE SECONDARY APPLY SIGNAL CIRCUIT FOR SHORT CIRCUIT TO POWER

1. Measure the resistance between:
   - CA266, harness side
   - Vehicle battery
   - Electric parking brake switch apply 2 - signal - Pin 02, Positive terminal
   - Is the resistance greater than 100 Kohms?
     Yes  GO to R4.
     No  GO to R10.

R4: CHECK THE SECONDARY RELEASE SIGNAL CIRCUIT FOR SHORT CIRCUIT TO POWER

1. Measure the resistance between:
   - CA266, harness side
   - Vehicle battery
   - Electric parking brake switch release 2 - signal - Pin 14, Positive terminal
   - Is the resistance greater than 100 Kohms?
     Yes  GO to R5.
     No  GO to R11.

R5: CHECK THE SECONDARY RELEASE SIGNAL CIRCUIT FOR OPEN CIRCUIT
1. Electric parking brake switch connector, CA243 disconnected.

2. Measure the resistance between:

<table>
<thead>
<tr>
<th>CA266, harness side</th>
<th>CA243, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake switch release 2 - signal - Pin 14</td>
<td>Electric parking brake switch release 2 - signal - Pin 05</td>
</tr>
</tbody>
</table>

Is the resistance less than 10 ohms?

Yes  **GO to R6.**

No  **REPAIR** the open circuit. For additional information, refer to the wiring diagrams.

R6: **CHECK THE SWITCH RETURN SIGNAL CIRCUIT FOR OPEN CIRCUIT**

1. Measure the resistance between:

<table>
<thead>
<tr>
<th>CA266, harness side</th>
<th>CA243, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake switch - switch return - Pin 06</td>
<td>Electric parking brake switch - switch return - Pin 06</td>
</tr>
</tbody>
</table>

Is the resistance less than 10 ohms?

Yes  **GO to R7.**

No  **REPAIR** the open circuit. For additional information, refer to the wiring diagrams.

R7: **CHECK THE ELECTRIC PARKING BRAKE SWITCH**

1. Measure the resistance between:

<table>
<thead>
<tr>
<th>CA243, component side</th>
<th>CA243, component side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake switch release 2 - signal - Pin 05</td>
<td>Electric parking brake switch - switch return - Pin 06</td>
</tr>
</tbody>
</table>

Is the resistance between 595 ohms - 611 ohms?

Yes  An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s):- EPB module- EPB module connector CA265- EPB module connector CA266

No  **INSTALL** a new EPB switch.

REFER to:  Parking Brake Switch (206-05 Parking Brake and Actuation, Removal and Installation).

R8: **CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SWITCH**

1. Electric parking brake switch connector, CA243 disconnected.

2. Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake switch apply 1 - signal - Pin 10</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

Yes  **INSTALL** a new EPB switch.

REFER to:  Parking Brake Switch (206-05 Parking Brake and Actuation, Removal and Installation).

No  **REPAIR** the short circuit. For additional information, refer to the wiring diagrams.

R9: **CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SWITCH**
1. Electric parking brake switch connector, CA243 disconnected.

2. Measure the resistance between:
   - **CA265, harness side**
   - **Vehicle battery**
   - Electric parking brake switch release 1 - signal - Pin 11
   - Positive terminal

   Is the resistance greater than 100 Kohms?
   - Yes
     INSTALL a new EPB switch.
     REFER to: Parking Brake Switch (206-05 Parking Brake and Actuation, Removal and Installation).
   - No
     REPAIR the short circuit. For additional information, refer to the wiring diagrams.

R10: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SWITCH

1. Electric parking brake switch connector, CA243 disconnected.

2. Measure the resistance between:
   - **CA266, harness side**
   - **Vehicle battery**
   - Electric parking brake switch apply 2 - signal - Pin 02
   - Positive terminal

   Is the resistance greater than 100 Kohms?
   - Yes
     INSTALL a new EPB switch.
     REFER to: Parking Brake Switch (206-05 Parking Brake and Actuation, Removal and Installation).
   - No
     REPAIR the short circuit. For additional information, refer to the wiring diagrams.

R11: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SWITCH

1. Electric parking brake switch connector, CA243 disconnected.

2. Measure the resistance between:
   - **CA266, harness side**
   - **Vehicle battery**
   - Electric parking brake switch release 2 - signal - Pin 14
   - Positive terminal

   Is the resistance greater than 100 Kohms?
   - Yes
     INSTALL a new EPB switch.
     REFER to: Parking Brake Switch (206-05 Parking Brake and Actuation, Removal and Installation).
   - No
     REPAIR the short circuit. For additional information, refer to the wiring diagrams.
PINPOINT TEST S: ACTUATOR DOES NOT FULLY RELEASE

| T2: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SWITCH |
| Electric parking brake switch connector, CA243 disconnected. |
Measure the resistance between:

<table>
<thead>
<tr>
<th>CA266, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake switch release 2 - signal - Pin 14</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

Yes
- INSTALL a new EPB switch.
- REFER to: Parking Brake Switch (206-05 Parking Brake and Actuation, Removal and Installation).

No
- REPAIR the short circuit. For additional information, refer to the wiring diagrams.

**PINPOINT TEST U: APPLY AND RELEASE SWITCH CONTACTS ENERGIZED SIMULTANEOUSLY**

<table>

</tr>
</tbody>
</table>

Is the resistance between 1.19 Kohms - 1.222 Kohms?

Yes
- An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s): - EPB module - EPB module connector CA265 - EPB module connector CA266

No
- GO to U4.

**U3: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SWITCH**
1. Electric parking brake switch, CA243 connector disconnected.

2. Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>CA265, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake switch apply 1 - signal - Pin 10</td>
<td>Electric parking brake switch release 1 - signal - Pin 11</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

Yes

INSTALL a new EPB switch.

REFER to: Parking Brake Switch (206-05 Parking Brake and Actuation, Removal and Installation).

No

REPAIR the short circuit. For additional information, refer to the wiring diagrams.

U4: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SWITCH

1. Electric parking brake switch connector, CA243 disconnected.

2. Measure the resistance between:

<table>
<thead>
<tr>
<th>CA266, harness side</th>
<th>CA266, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake switch apply 2 - signal - Pin 02</td>
<td>Electric parking brake switch release 2 - signal - Pin 14</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

Yes

INSTALL a new EPB switch.

REFER to: Parking Brake Switch (206-05 Parking Brake and Actuation, Removal and Installation).

No

REPAIR the short circuit. For additional information, refer to the wiring diagrams.

PINPOINT TEST V: BRAKE SWITCH INPUT STATUS PLAUSIBILITY FAILURE

TEST CONDITIONS | DETAILS/RESULTS/ACTIONS
--- | ---
V1: CHECK THE BRAKE SWITCH CIRCUIT FOR SHORT CIRCUIT TO POWER IN HARNESS

1. Key off.

2. Electric parking brake module connector 2, CA266 disconnected.

3. Key on, engine off.

4. Make sure the brake pedal is not pressed.

5. Measure the resistance between:

<table>
<thead>
<tr>
<th>CA266, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Brake switch - signal - Pin 07</td>
<td>Positive terminal</td>
</tr>

</tbody>
</table>
In-Gear (IG) switch connector, GB03 disconnected.

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>In-gear switch - signal - Pin 03</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

Yes

INSTALL a new in-gear switch.

No

REPAIR the short circuit. For additional information, refer to the wiring diagrams.

PINPOINT TEST X : ACTUATOR OUTPUT OPEN CIRCUIT

TEST CONDITIONS

X1: CHECK THE ACTUATOR CIRCUIT RESISTANCE

1. Key off.

2. Electric parking brake module connector 1, CA265 disconnected.

X2: CHECK THE ACTUATOR SIGNAL CIRCUIT FOR OPEN CIRCUIT

1. EPB actuator connector, CA269 disconnected.

2. Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>CA269, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake actuator - positive - Pin 14</td>
<td>Electric parking brake actuator - positive - Pin 01</td>
</tr>
</tbody>
</table>
Is the resistance less than 10 ohms?
Yes  
  GO to X3.
No  
  REPAIR the open circuit. For additional information, refer to the wiring diagrams.

**X3: CHECK THE ACTUATOR RETURN CIRCUIT FOR OPEN CIRCUIT**

1. Measure the resistance between:
   | CA265, harness side | CA269, harness side |
   | Electric parking brake actuator - negative | Electric parking brake actuator - negative |
   | Pin 07 | Pin 06 |

Is the resistance less than 10 ohms?
Yes  
  GO to X4.
No  
  REPAIR the open circuit. For additional information, refer to the wiring diagrams.

**X4: CHECK THE ACTUATOR CIRCUIT RESISTANCE**

1. Measure the resistance between:
   | CA269, component side | CA269, component side |
   | Electric parking brake actuator - positive | Electric parking brake actuator - negative |
   | Pin 01 | Pin 06 |

Is the resistance between 500 mohms - 1 ohm?
Yes  
  REPAIR the open circuit. For additional information, refer to the wiring diagrams.
No  
  INSTALL a new EPB actuator.  
  REFER to: Parking Brake Release Actuator (206-05 Parking Brake and Actuation, Removal and Installation).

**PINPOINT TEST Y: GEARSHIFT POSITION, SHORT CIRCUIT TO BATTERY (VEHICLES WITH DIESEL ENGINE ONLY)**

**TEST CONDITIONS**

**DETAILS/RESULTS/ACTIONS**

**Y1: CHECK THE IN-GEAR SWITCH SUPPLY CIRCUIT**

1. In-Gear (IG) switch connector, GB04 disconnected.

2. Key on, engine off.

3. Measure the voltage between:
   | GB04, harness side | Vehicle battery |
   | In-gear switch - supply | Negative terminal |

Is the voltage between 4.5 volts - 5.5 volts?
Yes  
  GO to Y2.
No  
  GO to Y4.

**Y2: CHECK THE IN-GEAR SWITCH SIGNAL CIRCUIT FOR SHORT CIRCUIT TO POWER**

1. Measure the resistance between:
   | GB04, harness side | Vehicle battery |
   | In-gear switch - signal - Pin 02 | Positive terminal |

Is the resistance greater than 100 Kohms?
Yes  
  GO to Y3.
No  
  GO to Y6.

**Y3: CHECK THE IN-GEAR SWITCH RETURN CIRCUIT FOR SHORT CIRCUIT TO POWER**

1. Measure the resistance between:
   | GB04, harness side | Vehicle battery |
   | In-gear switch - return - Pin 01 | Negative terminal |

Is the resistance greater than 100 Kohms?
Yes  
  An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s):- IG switch.
No  
  GO to Y7.

**Y4: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE CONTROL MODULE**

1. Key off.
Electric parking brake module connector 1, CA265 disconnected.

Key on, engine off.

Measure the resistance between:

<table>
<thead>
<tr>
<th>GB04, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>In gear switch - supply</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

Yes

INSTALL a new EPB module. REFER to: Parking Brake Module (206-05 Parking Brake and Actuation, Removal and Installation).

No

GO to Y5.

Y5: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SWITCH

Clutch pedal position sensor (CLPS) connector, CA287 disconnected.

Measure the resistance between:

<table>
<thead>
<tr>
<th>GB04, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>In gear switch - supply</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

Yes

INSTALL a new CLPS.

No

REPAIR the short circuit. For additional information, refer to the wiring diagrams.

Y6: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE CONTROL MODULE

Electric parking brake module connector 1, CA265 disconnected.

Measure the resistance between:

<table>
<thead>
<tr>
<th>GB04, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>In-gear switch - signal - Pin 02</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

Yes

INSTALL a new EPB module. REFER to: Parking Brake Module (206-05 Parking Brake and Actuation, Removal and Installation).

No

REPAIR the short circuit. For additional information, refer to the wiring diagrams.

Y7: CHECK THE IN-GEAR SWITCH CIRCUIT RESISTANCE
Electric parking brake module connector 2, CA266 disconnected.

Measure the resistance between:

<table>
<thead>
<tr>
<th>GB04, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>In-gear switch - return - Pin 01 Positive terminal</td>
<td></td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

Yes

INSTALL a new EPB module.

REFER to: Parking Brake Module (206-05 Parking Brake and Actuation, Removal and Installation).

No

REPAIR the short circuit. For additional information, refer to the wiring diagrams.

---

**PINPOINT TEST Z : CLUTCH PEDAL POSITION SENSOR SHORT CIRCUIT TO GROUND**

**TEST CONDITIONS**

Z1: CHECK THE 5 VOLT SUPPLY CIRCUIT FOR SHORT CIRCUIT TO GROUND

Key off.

Electric parking brake module connector 1, CA265 disconnected.

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clutch position sensor - supply - Pin 05 Negative terminal</td>
<td></td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

Yes

GO to Z2.

No

GO to Z6.

---

Z2: CHECK THE SIGNAL CIRCUIT FOR SHORT CIRCUIT TO GROUND

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clutch position sensor - signal - Pin 06 Negative terminal</td>
<td></td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

Yes

GO to Z3.

No

GO to Z7.

---

Z3: CHECK THE SIGNAL CIRCUIT FOR HIGH RESISTANCE
Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>CA287, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clutch position sensor - signal - Pin 06</td>
<td>Clutch position sensor - signal - Pin 02</td>
</tr>
</tbody>
</table>

Is the resistance less than 10 ohms?

Yes
  REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams.

No
  Go to Z4.

**Z4: CHECK THE 5 VOLT SUPPLY CIRCUIT FOR HIGH RESISTANCE**

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>CA287, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clutch position sensor - supply - Pin 05</td>
<td>Clutch position sensor - supply - Pin 03</td>
</tr>
</tbody>
</table>

Is the resistance less than 10 ohms?

Yes
  Go to Z5.

No
  REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams.

**Z5: CHECK THE SENSOR RETURN CIRCUIT FOR HIGH RESISTANCE**

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA266, harness side</th>
<th>CA287, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clutch position sensor - ground</td>
<td>Clutch position sensor - ground - pin 01</td>
</tr>
</tbody>
</table>

Is the resistance less than 10 ohms?

Yes
  An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following components(s):-- EPB module- CLPS- EPB module connector CA265- EPB module connector CA266- CLPS connector CA287

No
  REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams.

**Z6: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SENSOR**

Clutch pedal position sensor (CLPS) connector, CA287 disconnected.

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clutch position sensor - supply - Pin 05</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

Yes
  INSTALL a new CLPS.

No
  REPAIR the short circuit. For additional information, refer to the wiring diagrams.

**Z7: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SENSOR**
1. Clutch pedal position sensor (CLPS) connector, CA287 disconnected.

   Measure the resistance between:
   - CA265, harness side
   - Vehicle battery
   - Clutch position sensor - signal - Pin 06
   - Negative terminal

   Is the resistance greater than 100 Kohms?
   - Yes: INSTALL a new CLPS.
   - No: REPAIR the short circuit. For additional information, refer to the wiring diagrams.

PINPOINT TEST AA: CLUTCH PEDAL POSITION SENSOR, SHORT CIRCUIT TO POWER

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>AA1: CHECK THE 5 VOLT SUPPLY CIRCUIT FOR SHORT CIRCUIT TO POWER</td>
<td></td>
</tr>
</tbody>
</table>

1. Key off.

2. Electric parking brake module connector 1, CA265 disconnected.

3. Electric parking brake module connector 2, CA266 disconnected.

4. Key on, engine off.

5. Measure the resistance between:
   - CA265, harness side
   - Vehicle battery
   - Clutch position sensor - supply - Pin 05
   - Positive terminal

   Is the resistance greater than 100 Kohms?
   - Yes: GO to AA2.
   - No: GO to AA4.

AA2: CHECK THE SIGNAL CIRCUIT FOR SHORT CIRCUIT TO POWER

1. Measure the resistance between:
   - CA265, harness side
   - Vehicle battery
   - Clutch position sensor - signal - Pin 06
   - Positive terminal

   Is the resistance greater than 100 Kohms?
   - Yes: GO to AA3.
   - No: GO to AA5.

AA3: CHECK THE SENSOR RETURN GROUND CIRCUIT FOR SHORT CIRCUIT TO POWER
Measure the resistance between:

<table>
<thead>
<tr>
<th>CA266, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clutch pedal position sensor - ground - Pin 03 Positive terminal</td>
<td></td>
</tr>
</tbody>
</table>

Is the resistance less than 10 ohms?

Yes

An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s):
- EPB module
- EPB module connector CA265
- EPB module connector CA266

No

GO to AA6.

**AA4: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SENSOR**

1. Clutch pedal position sensor (CLPS) connector, CA287 disconnected.

2. Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clutch pedal position sensor - supply - Pin 05 Positive terminal</td>
<td></td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

Yes

INSTALL a new CLPS.

No

REPAIR the short circuit. For additional information, refer to the wiring diagrams.

**AA5: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SENSOR**

1. Clutch pedal position sensor (CLPS) connector, CA287 disconnected.

2. Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clutch position sensor - signal - Pin 06 Positive terminal</td>
<td></td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

Yes

INSTALL a new CLPS.

No

REPAIR the short circuit. For additional information, refer to the wiring diagrams.

**AA6: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SENSOR**

1. Clutch pedal position sensor (CLPS) connector, CA287 disconnected.

2. Measure the resistance between:

<table>
<thead>
<tr>
<th>CA266, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clutch pedal position sensor - ground - Pin 03 Positive terminal</td>
<td></td>
</tr>
</tbody>
</table>
PINPOINT TEST AB: GEARSHIFT POSITION FAULT, GENERAL ELECTRICAL FAILURE (VEHICLES WITH DIESEL ENGINE ONLY)

TEST CONDITIONS

AB1: CHECK THE 5 VOLT SUPPLY CIRCUIT FOR SHORT CIRCUIT TO GROUND

1. Key off.
2. Electric parking brake module connector 1, CA265 disconnected.
3. Electric parking brake module connector 2, CA266 disconnected.
4. Key on, engine off.
5. Measure the resistance between:
   - CA265, harness side
   - Vehicle battery
   - Clutch position sensor - supply - Pin 05
   - Negative terminal
   Is the resistance greater than 100 Kohms?
   Yes
   GO to AB2.
   No
   GO to AB6.

AB2: CHECK THE SIGNAL CIRCUIT FOR SHORT CIRCUIT TO GROUND

1. Measure the resistance between:
   - CA265, harness side
   - Vehicle battery
   - In-gear switch - signal - Pin 03
   - Negative terminal
   Is the resistance greater than 100 Kohms?
   Yes
   GO to AB3.
   No
   GO to AB8.

AB3: CHECK THE SIGNAL CIRCUIT FOR OPEN CIRCUIT

1. In-Gear (IG) switch connector, GB04 disconnected.
2. Measure the resistance between:
   - CA265, harness side
   - GB04, harness side
   - In-gear switch - signal - Pin 03
   - In-gear switch - signal - Pin 02
AB4: CHECK THE SWITCH RETURN CIRCUIT FOR OPEN CIRCUIT

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA266, harness side</th>
<th>GB04, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>In-gear switch - return - Pin 15</td>
<td>In-gear switch - signal - Pin 02</td>
</tr>
</tbody>
</table>

Is the resistance less than 10 ohms?

Yes  
GO to AB4.

No  
REPAIR the open circuit. For additional information, refer to the wiring diagrams.

AB5: CHECK THE 5 VOLT SUPPLY CIRCUIT FOR OPEN CIRCUIT

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>GB04, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clutch position sensor - supply - Pin 05</td>
<td>Clutch position sensor - supply - Pin 03</td>
</tr>
</tbody>
</table>

Is the resistance less than 10 ohms?

Yes  
GO to AB5.

An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s): IG switch- IG switch connector GB04- EPB module- EPB module connector CA265- EPB module connector CA266

No  
REPAIR the open circuit. For additional information, refer to the wiring diagrams.

AB6: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE IN-GEAR SWITCH

In-Gear (IG) switch connector, GB04 disconnected.

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clutch position sensor - supply - Pin 05</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

Yes  
INSTALL a new in-gear switch.

No  
GO to AB7.

AB7: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE CLUTCH POSITION SENSOR

Clutch pedal position sensor (CLPS) connector, CA287 disconnected.

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clutch position sensor - supply - Pin 05</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

Yes  
INSTALL a new CLPS.

No  
REPAIR the short circuit. For additional information, refer to the wiring diagrams.

AB8: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SWITCH
In-Gear (IG) switch connector, GB04 disconnected.

1. Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>In-gear switch - signal - Pin 03</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

   Is the resistance greater than 100 Kohms?
   Yes: INSTALL a new in-gear switch.
   No: REPAIR the short circuit. For additional information, refer to the wiring diagrams.

**PINPOINT TEST AC : PRIMARY RELEASE SWITCH CIRCUIT FAULT**

**TEST CONDITIONS**

**DETAILS/RESULTS/ACTIONS**

**AC1: CHECK THE PRIMARY RELEASE SWITCH SIGNAL CIRCUIT FOR SHORT CIRCUIT TO POWER**

1. Key off.
2. Electric parking brake module connector 1, CA265 disconnected.
3. Electric parking brake module connector 2, CA266 disconnected.

**AC2: CHECK THE PRIMARY APPLY SWITCH SIGNAL CIRCUIT FOR SHORT CIRCUIT TO POWER**

1. Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary release switch signal 1 - pin 11</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

   Is the resistance greater than 100 Kohms?
   Yes: GO to AC2.
   No: GO to AC8.

**AC3: CHECK THE SECONDARY APPLY SWITCH SIGNAL CIRCUIT FOR SHORT CIRCUIT TO POWER**

1. Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary apply switch signal 1 - pin 10</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

   Is the resistance greater than 100 Kohms?
   Yes: GO to AC3.
   No: GO to AC9.
Measure the resistance between:

<table>
<thead>
<tr>
<th>CA266, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Secondary apply switch signal 2 - pin 02</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

Yes

GO to AC4.

No

GO to AC10.

AC4: CHECK THE SECONDARY RELEASE SWITCH SIGNAL CIRCUIT FOR SHORT CIRCUIT TO POWER

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA266, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Secondary release switch signal 2 - pin 14</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

Yes

GO to AC5.

No

GO to AC11.

AC5: CHECK THE PRIMARY RELEASE SWITCH SIGNAL CIRCUIT FOR HIGH RESISTANCE

Electric parking brake switch connector, CA243 disconnected.

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>CA243, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary release switch signal 1 - pin 11</td>
<td>Primary release switch signal 1 - pin 04</td>
</tr>
</tbody>
</table>

Is the resistance less than 10 ohms?

Yes

GO to AC6.

No

REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams.

AC6: CHECK THE APPLY SWITCH RETURN CIRCUIT FOR HIGH RESISTANCE

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA266, harness side</th>
<th>CA243, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch return - pin 06</td>
<td>Switch return - pin 06</td>
</tr>
</tbody>
</table>

Is the resistance less than 10 ohms?

Yes

GO to AC7.

No

INSTALL a new parking brake switch.

REFER to: Parking Brake Switch (206-05 Parking Brake and Actuation, Removal and Installation).

AC7: CHECK THE SWITCH RESISTANCE

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA243, component side</th>
<th>CA243, component side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch release signal 1 - pin 04</td>
<td>Switch return - pin 06</td>
</tr>
</tbody>
</table>

Is the resistance between 595 and 611 ohms?

Yes

An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s): EPB module- EPB module connector CA265- EPB module connector CA266

No

INSTALL a new parking brake switch.

REFER to: Parking Brake Switch (206-05 Parking Brake and Actuation, Removal and Installation).

AC8: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SWITCH

Electric parking brake switch connector, CA243 disconnected.
Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, component side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release switch signal 1 - pin 11</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

Yes
- INSTALL a new parking brake switch.
- REFER to: Parking Brake Switch (206-05 Parking Brake and Actuation, Removal and Installation).

No
- REPAIR the short circuit. For additional information, refer to the wiring diagrams.

AC9: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SWITCH

1. Electric parking brake switch connector, CA243 disconnected.

2. Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, component side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Apply switch signal 1 - pin 10</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

Yes
- INSTALL a new parking brake switch.
- REFER to: Parking Brake Switch (206-05 Parking Brake and Actuation, Removal and Installation).

No
- REPAIR the short circuit. For additional information, refer to the wiring diagrams.

AC10: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SWITCH

1. Electric parking brake switch connector, CA243 disconnected.

2. Measure the resistance between:

<table>
<thead>
<tr>
<th>CA266, component side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Apply switch signal 2 - pin 02</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

Yes
- INSTALL a new parking brake switch.
- REFER to: Parking Brake Switch (206-05 Parking Brake and Actuation, Removal and Installation).

No
- REPAIR the short circuit. For additional information, refer to the wiring diagrams.

AC11: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SWITCH

1. Electric parking brake switch connector, CA243 disconnected.
Measure the resistance between:

<table>
<thead>
<tr>
<th>CA266, component side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release switch signal 2 - pin 14</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

**Yes**
- INSTALL a new parking brake switch.
- REFER to: Parking Brake Switch (206-05 Parking Brake and Actuation, Removal and Installation).

**No**
- REPAIR the short circuit. For additional information, refer to the wiring diagrams.
Parking Brake and Actuation - Parking Brake
VIN Range: N52048->N99999

Overview

There are some changes to diagnostics for 2006 my, the most obvious of which will be the change to 7-digit diagnostic trouble codes (DTCs) from the familiar 5-digit.

Refer to the DTC index in this section for guidance on how to use these codes with the Jaguar approved diagnostic system or a scan tool.

For additional information on the description and operation of the system, REFER to: Parking Brake (206-05 Parking Brake and Actuation, Description and Operation).

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

<table>
<thead>
<tr>
<th>Mechanical</th>
<th>Electrical</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parking brake cable</td>
<td>Fuse(s)</td>
</tr>
<tr>
<td>Parking brake actuator</td>
<td>Wiring harness/electrical connectors</td>
</tr>
<tr>
<td>Parking brake caliper</td>
<td>Check for bent/corroded pins</td>
</tr>
<tr>
<td>Parking brake pads</td>
<td>Parking brake switch</td>
</tr>
<tr>
<td>Drop link caps</td>
<td>Parking brake module</td>
</tr>
</tbody>
</table>

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. If the cause is not visually evident use the Jaguar approved diagnostic system or a scan tool to retrieve the fault codes before proceeding to the diagnostic trouble code (DTC) Index.

Symptom Chart

<table>
<thead>
<tr>
<th>Symptom</th>
<th>Possible Sources</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>The parking brake will not engage or release</td>
<td>● Cables fouled, trapped or damaged</td>
<td>● Check the rear and primary cables for fouling, trapping or damage</td>
</tr>
<tr>
<td></td>
<td>● Cables incorrectly routed or fixed</td>
<td>● Check the cable routing between caliper and subframe mountings. Make sure the cables sit above the rear anti-roll bar drop link caps, and that the drop link caps are not damaged</td>
</tr>
<tr>
<td></td>
<td>● Rear lining wear</td>
<td>● Check that the rear cable end fitting connector is correctly fitted into the caliper bracket, and is not damaged</td>
</tr>
<tr>
<td></td>
<td>● Service brake incorrectly adjusted following lining change</td>
<td>● Check that the rear cable end fitting connector is correctly fitted into the subframe bracket and is not damaged</td>
</tr>
<tr>
<td></td>
<td>● Caliper malfunction</td>
<td>● Check the 'C' clip between the cable and the subframe for fit/damage</td>
</tr>
<tr>
<td></td>
<td>● Actuator malfunction</td>
<td>● Check that the cable is correctly located into the reaction and connector brackets</td>
</tr>
<tr>
<td></td>
<td></td>
<td>● Inspect the rear brake linings (parkbrake caliper linings for vehicles with supercharger) for wear</td>
</tr>
<tr>
<td></td>
<td></td>
<td>● Check the parkbrake cable for correct adjustment</td>
</tr>
<tr>
<td></td>
<td></td>
<td>● Fully retract the cables. Pump the brake pedal hard five times</td>
</tr>
<tr>
<td></td>
<td></td>
<td>● Check the condition of the rear caliper (parkbrake caliper for vehicles with supercharger). Make sure the caliper return spring is correctly fitted</td>
</tr>
<tr>
<td></td>
<td></td>
<td>● Check the actuator for damage and/or excessive noise in normal operation</td>
</tr>
<tr>
<td></td>
<td></td>
<td>● For additional information, REFER to: (206-05 Parking Brake and Actuation), Parking Brake Cable Tension Release (General Procedures), Parking Brake Pads - Vehicles With: High Performance Brakes (Removal and Installation), Parking Brake Cable (Removal and Installation), Parking Brake Module (Removal and Installation), Parking Brake Release Actuator (Removal and Installation).</td>
</tr>
</tbody>
</table>

DTC index

• NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

</tr>
<tr>
<td>Yes</td>
<td>GO to A4.</td>
</tr>
<tr>
<td>No</td>
<td>GO to A10.</td>
</tr>
</tbody>
</table>
Measure the resistance between:

<table>
<thead>
<tr>
<th>CA266, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake switch release 2 - signal - Pin 14</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

Yes

Go to A5.

No

Go to A11.

A5: CHECK THE PRIMARY APPLY SIGNAL CIRCUIT FOR OPEN CIRCUIT

A6: CHECK THE SWITCH RETURN CIRCUIT FOR OPEN CIRCUIT

A7: CHECK THE ELECTRIC PARKING BRAKE SWITCH

A8: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SWITCH
A9: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SWITCH

1. Electric parking brake switch connector, CA243 disconnected.

2. Measure the resistance between:
   - CA265, harness side - Vehicle battery
   - Electric parking brake switch release 1 - signal - Pin 11 - Positive terminal

   Is the resistance greater than 100 Kohms?
   Yes
   INSTALL a new EPB switch.
   REFER to: Parking Brake Switch (206-05 Parking Brake and Actuation, Removal and Installation).
   No
   REPAIR the short circuit. For additional information, refer to the wiring diagrams.

A10: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SWITCH

1. Electric parking brake switch connector, CA243 disconnected.

2. Measure the resistance between:
   - CA266, harness side - Vehicle battery
   - Electric parking brake switch apply 2 - signal - Pin 02 - Positive terminal

   Is the resistance greater than 100 Kohms?
   Yes
   INSTALL a new EPB switch.
   REFER to: Parking Brake Switch (206-05 Parking Brake and Actuation, Removal and Installation).
   No
   REPAIR the short circuit. For additional information, refer to the wiring diagrams.

A11: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SWITCH

1. Electric parking brake switch connector, CA243 disconnected.

2. Measure the resistance between:
   - CA266, harness side - Vehicle battery
   - Electric parking brake switch release 2 - signal - Pin 14 - Positive terminal
Is the resistance greater than 100 Kohms?
Yes
INSTALL a new EPB switch.
REFER to: Parking Brake Switch (206-05 Parking Brake and Actuation, Removal and Installation).
No
REPAIR the short circuit. For additional information, refer to the wiring diagrams.

PINPOINT TEST B : SECONDARY APPLY SWITCH CIRCUIT VOLTAGE OUT OF RANGE

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>B1: CHECK THE SECONDARY SWITCH CIRCUIT RESISTANCE</td>
<td></td>
</tr>
<tr>
<td>1 Key off.</td>
<td></td>
</tr>
<tr>
<td>2 Electric parking brake module connector 2, CA266 disconnected.</td>
<td></td>
</tr>
</tbody>
</table>

| 3 Key on, engine off. | |
| 4 Measure the resistance between: CA266, harness side | CA266, harness side |
| Electric parking brake switch apply 2 - signal - Pin 02 | Electric parking brake switch - switch return - Pin 06 |

Is the resistance between 595 ohms - 611 ohms?
Yes
An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s):- EPB fault- EPB module connector CA266
No
INSTALL a new EPB switch.
REFER to: Parking Brake Switch (206-05 Parking Brake and Actuation, Removal and Installation).

PINPOINT TEST C : CLUTCH PEDAL POSITION SENSOR SHORT CIRCUIT TO GROUND OR OPEN CIRCUIT

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>C1: CHECK THE 5 VOLT SUPPLY CIRCUIT FOR SHORT CIRCUIT TO GROUND</td>
<td></td>
</tr>
<tr>
<td>1 Key off.</td>
<td></td>
</tr>
<tr>
<td>2 Electric parking brake module connector 1, CA265 disconnected.</td>
<td></td>
</tr>
</tbody>
</table>

| 3 Electric parking brake module connector 2, CA266 disconnected. | |
| 4 Key on, engine off. | |
Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clutch position sensor - supply - Pin 05</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?
Yes
No

C2: CHECK THE SIGNAL CIRCUIT FOR SHORT CIRCUIT TO GROUND

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clutch position sensor - signal - Pin 06</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?
Yes
No

C3: CHECK THE SIGNAL CIRCUIT FOR OPEN CIRCUIT

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>CA287, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clutch position sensor - signal - Pin 06</td>
<td>Clutch position sensor - signal - Pin 02</td>
</tr>
</tbody>
</table>

Is the resistance less than 10 ohms?
Yes
No

C4: CHECK THE 5 VOLT SUPPLY CIRCUIT FOR OPEN CIRCUIT

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>CA287, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clutch position sensor - supply - Pin 05</td>
<td>Clutch position sensor - supply - Pin 03</td>
</tr>
</tbody>
</table>

Is the resistance less than 10 ohms?
Yes
No

C5: CHECK THE SENSOR RETURN CIRCUIT FOR OPEN CIRCUIT

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA266, harness side</th>
<th>CA287, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clutch position sensor - ground - Pin 03</td>
<td>Clutch position sensor - ground - Pin 01</td>
</tr>
</tbody>
</table>

Is the resistance less than 10 ohms?
Yes
An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s):
- EPB module
- CLPS
- EPB module connector CA265
- EPB module connector CA266
- CLPS connector CA287
No

C6: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SENSOR

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>CA287, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clutch position sensor - signal - Pin 02</td>
<td>Clutch position sensor - signal - Pin 06</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?
Yes
No

Clutch pedal position sensor (CLPS) connector, CA287 disconnected.

C2: CHECK THE SIGNAL CIRCUIT FOR SHORT CIRCUIT TO GROUND

Clutch pedal position sensor (CLPS) connector, CA287 disconnected.

C3: CHECK THE SIGNAL CIRCUIT FOR OPEN CIRCUIT

C4: CHECK THE 5 VOLT SUPPLY CIRCUIT FOR OPEN CIRCUIT

C5: CHECK THE SENSOR RETURN CIRCUIT FOR OPEN CIRCUIT

C6: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SENSOR
**PINPOINT TEST D: SECONDARY RELEASE SWITCH CIRCUIT VOLTAGE OUT OF RANGE**

**TEST CONDITIONS**

**DETAILS/RESULTS/ACTIONS**

**D1: CHECK THE SECONDARY SWITCH CIRCUIT RESISTANCE**

1. Key off.

2. Electric parking brake module connector 2, CA266 disconnected.

3. Key on, engine off.
Measure the resistance between:

<table>
<thead>
<tr>
<th>CA266, harness side</th>
<th>CA266, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake switch release 2 - signal - Pin 14</td>
<td>Electric parking brake switch - switch return - Pin 06</td>
</tr>
</tbody>
</table>

Is the resistance between 595 ohms - 611 ohms?

Yes

An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s):- EPB module- EPB module connector CA266

No

INSTALL a new EPB switch.

REFER to: Parking Brake Switch (206-05 Parking Brake and Actuation, Removal and Installation).

PINPOINT TEST E : SECONDARY APPLY SWITCH CIRCUIT SHORT CIRCUIT TO GROUND

TEST CONDITIONS

E1: CHECK THE SECONDARY APPLY SIGNAL CIRCUIT FOR SHORT CIRCUIT TO GROUND

1. Key off.
2. Electric parking brake module connector 2, CA266 disconnected.
3. Key on, engine off.
4. Measure the resistance between:

<table>
<thead>
<tr>
<th>CA266, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake switch apply 2 - signal - Pin 02</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

Yes

An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s):- EPB module- EPB module connector CA266

No

GO to E2.

E2: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SWITCH

1. Electric parking brake switch connector, CA243 disconnected.
2. Measure the resistance between:

<table>
<thead>
<tr>
<th>CA266, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake switch apply 2 - signal - Pin 02</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

Yes

INSTALL a new EPB switch.

REFER to: Parking Brake Switch (206-05 Parking Brake and Actuation, Removal and Installation).

No

REPAIR the short circuit. For additional information, refer to the wiring diagrams.

PINPOINT TEST F : CLUTCH PEDAL POSITION SENSOR SHORT CIRCUIT TO BATTERY

TEST CONDITIONS

F1: CHECK THE 5 VOLT SUPPLY CIRCUIT FOR SHORT CIRCUIT TO POWER

1. Key off.
Electric parking brake module connector 1, CA265 disconnected.

Electric parking brake module connector 2, CA266 disconnected.

Key on, engine off.

Measure the resistance between:

- **CA265, harness side**
- **Vehicle battery**

Clutch position sensor - supply - Pin 05

Positive terminal

Is the resistance greater than 100 Kohms?

Yes

GO to F2.

No

GO to F4.

F2: CHECK THE SIGNAL CIRCUIT FOR SHORT CIRCUIT TO POWER

Measure the resistance between:

- **CA265, harness side**
- **Vehicle battery**

Clutch position sensor - signal - Pin 06

Positive terminal

Is the resistance greater than 100 Kohms?

Yes

GO to F3.

No

GO to F5.

F3: CHECK THE SENSOR RETURN GROUND CIRCUIT FOR SHORT CIRCUIT TO POWER

Measure the resistance between:

- **CA266, harness side**
- **Vehicle battery**

Clutch position sensor - ground - Pin 03

Positive terminal

Is the resistance greater than 100 Kohms?

Yes

An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s):
- EPB module
- EPB module connector CA265
- EPB module connector CA266

No

GO to F6.

F4: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SENSOR

Clutch pedal position sensor (CLPS) connector, CA287 disconnected.

Measure the resistance between:

- **CA265, harness side**
- **Vehicle battery**

Clutch position sensor - supply - Pin 05

Positive terminal
Is the resistance greater than 100 Kohms?
Yes
INSTALL a new CLPS.
No
GO to F7.

F5: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SENSOR

1. Clutch pedal position sensor (CLPS) connector, CA287 disconnected.

2. Measure the resistance between:
   - CA265, harness side
   - Vehicle battery
   - Clutch position sensor - signal - Pin 06
   - Positive terminal

   Is the resistance greater than 100 Kohms?
   Yes
   INSTALL a new CLPS.
   No
   GO to F7.

F6: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SENSOR

1. Clutch pedal position sensor (CLPS) connector, CA287 disconnected.

2. Measure the resistance between:
   - CA266, harness side
   - Vehicle battery
   - Clutch position sensor - ground - Pin 03
   - Positive terminal

   Is the resistance greater than 100 Kohms?
   Yes
   INSTALL a new CLPS.
   No
   REPAIR the short circuit. For additional information, refer to the wiring diagrams.

F7: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SWITCH

1. In-Gear (IG) switch connector, GB04 disconnected (vehicles with diesel engine).

2. Measure the resistance between:
   - CA266, harness side
   - Vehicle battery
   - Clutch position sensor - supply - Pin 05
   - Positive terminal

   Is the resistance greater than 100 Kohms?
   Yes
   INSTALL a new in-gear switch.
   No
   REPAIR the short circuit. For additional information, refer to the wiring diagrams.
## PINPOINT TEST G: SECONDARY APPLY HARNESS SHORT CIRCUIT TO BATTERY OR OPEN CIRCUIT

### TEST CONDITIONS

<table>
<thead>
<tr>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Key off.</td>
</tr>
<tr>
<td>Electric parking brake module connector 1, CA265 disconnected.</td>
</tr>
</tbody>
</table>

### G1: CHECK THE PRIMARY APPLY SIGNAL CIRCUIT FOR SHORT CIRCUIT TO POWER

<table>
<thead>
<tr>
<th>Key on, engine off.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake module connector 2, CA266 disconnected.</td>
</tr>
</tbody>
</table>

### Test Conditions

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake switch apply 1 - signal - Pin 10 Positive terminal</td>
<td></td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

| Yes | GO to G2. |
| No  | GO to G8. |

### G2: CHECK THE PRIMARY RELEASE SIGNAL CIRCUIT FOR SHORT CIRCUIT TO POWER

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake switch release 1 - signal - Pin 11 Positive terminal</td>
<td></td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

| Yes | GO to G3. |
| No  | GO to G9. |

### G3: CHECK THE SECONDARY APPLY SIGNAL CIRCUIT FOR SHORT CIRCUIT TO POWER

<table>
<thead>
<tr>
<th>CA266, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake switch apply 2 - signal - Pin 02 Positive terminal</td>
<td></td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

| Yes | GO to G4. |
| No  | GO to G10. |

### G4: CHECK THE SECONDARY RELEASE SIGNAL CIRCUIT FOR SHORT CIRCUIT TO POWER

<table>
<thead>
<tr>
<th>CA266, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake switch release 2 - signal - Pin 14 Positive terminal</td>
<td></td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

| Yes | GO to G5. |
| No  | GO to G11. |

### G5: CHECK THE SECONDARY APPLY SIGNAL CIRCUIT FOR OPEN CIRCUIT
Electric parking brake switch, CA243 connector disconnected.

1. Measure the resistance between:

<table>
<thead>
<tr>
<th>CA266, harness side</th>
<th>CA243, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake switch apply 2 - signal - Pin 02</td>
<td>Electric parking brake switch apply 2 - signal - Pin 07</td>
</tr>
</tbody>
</table>

Is the resistance less than 10 ohms?
Yes
No
  - REPAIR the open circuit. For additional information, refer to the wiring diagrams.

G6: CHECK THE SWITCH RETURN SIGNAL CIRCUIT FOR OPEN CIRCUIT

1. Measure the resistance between:

<table>
<thead>
<tr>
<th>CA266, harness side</th>
<th>CA243, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake switch - switch return - Pin 06</td>
<td>Electric parking brake switch - switch return - Pin 06</td>
</tr>
</tbody>
</table>

Is the resistance less than 10 ohms?
Yes
No
  - REPAIR the open circuit. For additional information, refer to the wiring diagrams.

G7: CHECK THE ELECTRIC PARKING BRAKE SWITCH

1. Measure the resistance between:

<table>
<thead>
<tr>
<th>CA243, component side</th>
<th>CA243, component side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake switch apply 2 - signal - Pin 07</td>
<td>Electric parking brake switch - switch return - Pin 06</td>
</tr>
</tbody>
</table>

Is the resistance between 595 ohms - 611 ohms?
Yes
  - An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s): EPB module- EPB module connector CA265- EPB module connector CA266
No
  - INSTALL a new EPB switch.
  - REFER to: Parking Brake Switch (206-05 Parking Brake and Actuation, Removal and Installation).

G8: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SWITCH

1. Electric parking brake switch, CA243 connector disconnected.

2. Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake switch apply 1 - signal - Pin 10</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?
Yes
  - INSTALL a new EPB switch.
  - REFER to: Parking Brake Switch (206-05 Parking Brake and Actuation, Removal and Installation).
No
  - REPAIR the short circuit. For additional information, refer to the wiring diagrams.

G9: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SWITCH
Electric parking brake switch, CA243 connector disconnected.

1. Measure the resistance between:
   - **CA265**, harness side Veihcule battery
   - Electric parking brake switch release 1 - signal - Pin 11 Positive terminal

2. Is the resistance greater than 100 Kohms?
   - Yes
     - INSTALL a new EPB switch.
     - REFER to: Parking Brake Switch (206-05 Parking Brake and Actuation, Removal and Installation).
   - No
     - REPAIR the short circuit. For additional information, refer to the wiring diagrams.

G10: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SWITCH

Electric parking brake switch, CA243 connector disconnected.

1. Measure the resistance between:
   - **CA266**, harness side Vehicle battery
   - Electric parking brake switch apply 2 - signal - Pin 02 Positive terminal

2. Is the resistance greater than 100 Kohms?
   - Yes
     - INSTALL a new EPB switch.
     - REFER to: Parking Brake Switch (206-05 Parking Brake and Actuation, Removal and Installation).
   - No
     - REPAIR the short circuit. For additional information, refer to the wiring diagrams.

G11: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SWITCH

Electric parking brake switch, CA243 connector disconnected.

1. Measure the resistance between:
   - **CA266**, harness side Vehicle battery
   - Electric parking brake switch release 2 - signal - Pin 14 Positive terminal

2. Is the resistance greater than 100 Kohms?
   - Yes
     - INSTALL a new EPB switch.
     - REFER to: Parking Brake Switch (206-05 Parking Brake and Actuation, Removal and Installation).
   - No
     - REPAIR the short circuit. For additional information, refer to the wiring diagrams.
**PINPOINT TEST H : PRIMARY RELEASE SWITCH CIRCUIT OUT OF RANGE**

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Key off.</td>
<td>Electric parking brake module connector 1, CA265 disconnected.</td>
</tr>
<tr>
<td>Electric parking brake module connector 1, CA265 disconnected.</td>
<td></td>
</tr>
</tbody>
</table>

**TEST CONDITIONS DETAILS/RESULTS/ACTIONS**

1. Key off.
2. Electric parking brake module connector 1, CA265 disconnected.
3. Electric parking brake module connector 2, CA266 disconnected.
4. Key on, engine off.
5. Measure the resistance between:
   - CA265, harness side: Electric parking brake switch release 1 - signal - Pin 11
   - CA266, harness side: Electric parking brake switch - switch return - Pin 06
6. Is the resistance between 595 ohms - 611 ohms?
   - Yes: An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s): EPB module- EPB module connector CA265
   - No: INSTALL a new EPB switch.

REFER to: Parking Brake Switch (206-05 Parking Brake and Actuation, Removal and Installation).

**PINPOINT TEST I : PRIMARY APPLY SWITCH CIRCUIT OUT OF RANGE**

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Key off.</td>
<td>Electric parking brake module connector 1, CA265 disconnected.</td>
</tr>
<tr>
<td>Electric parking brake module connector 1, CA265 disconnected.</td>
<td></td>
</tr>
</tbody>
</table>
Electric parking brake module connector 2, CA266 disconnected.

Key on, engine off.

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>CA266, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake switch apply 1 - signal - Pin 10</td>
<td>Electric parking brake switch - switch return - Pin 06</td>
</tr>
</tbody>
</table>

Is the resistance between 595 ohms - 611 ohms?
Yes

An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s): EPB module - EPB module connector CA265

No

INSTALL a new EPB switch.

REFER to: Parking Brake Switch (206-05 Parking Brake and Actuation, Removal and Installation).

**PINPOINT TEST J : PRIMARY APPLY SWITCH CIRCUIT SHORT CIRCUIT TO GROUND**

**TEST CONDITIONS**

1. Key off.
2. Electric parking brake module connector 1, CA265 disconnected.

**DETAILS/RESULTS/ACTIONS**

| J1: CHECK THE PRIMARY APPLY SIGNAL CIRCUIT FOR SHORT CIRCUIT TO GROUND |

Key on, engine off.

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake switch apply 1 - signal - Pin 10</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?
Yes

An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s): EPB module - EPB module connector CA265

No

GO to J2.

**J2: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SWITCH**

Electric parking brake switch connector, CA243 disconnected.
Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake switch apply 1 - signal - Pin 10</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

Yes

INSTALL a new EPB switch.

REFER to: Parking Brake Switch (206-05 Parking Brake and Actuation, Removal and Installation).

No

REPAIR the short circuit. For additional information, refer to the wiring diagrams.

PINPOINT TEST K: HIGH POWER BATTERY FEED CIRCUIT SHORT CIRCUIT TO GROUND OR OPEN CIRCUIT

TEST CONDITIONS

K1: CHECK THE HIGH POWER SUPPLY CIRCUIT

1. Electric parking brake module connector 2, CA266 disconnected.

2. Measure the voltage between:

<table>
<thead>
<tr>
<th>CA266, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake module - battery supply - Pin 01</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the voltage between 9 volts - 15 volts?

Yes

An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s): EPB module

No

No supply to the EPB circuit. check and repair the circuit as necessary. For additional information, refer to the wiring diagrams.

PINPOINT TEST L: PRIMARY RELEASE SWITCH CIRCUIT SHORT CIRCUIT TO GROUND

TEST CONDITIONS

L1: CHECK THE PRIMARY RELEASE SIGNAL CIRCUIT FOR SHORT CIRCUIT TO GROUND

1. Key off.

2. Electric parking brake module connector 1, CA265 disconnected.

3. Key on, engine off.

4. Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake switch release 1 - signal - Pin 11</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

Yes

An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s): EPB module- EPB module connector CA265

No

GO to L2.

L2: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SWITCH
Electric parking brake switch connector, CA243 disconnected.

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake switch release 1 - signal - Pin 11</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

Yes
INSTALL a new EPB switch.
REFER to: Parking Brake Switch (206-05 Parking Brake and Actuation, Removal and Installation).

No
REPAIR the short circuit. For additional information, refer to the wiring diagrams.

---

**PINPOINT TEST M : ACTUATOR OUTPUT SHORT CIRCUIT TO GROUND**

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>M1: CHECK THE ACTUATOR NEGATIVE SIGNAL CIRCUIT FOR SHORT CIRCUIT TO GROUND</strong></td>
<td></td>
</tr>
</tbody>
</table>

1. Key off.

2. Electric parking brake switch connector, CA243 disconnected.

3. Key on, engine off.

4. Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake actuator - negative - Pin 07</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

Yes
An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s):- EPB module- EPB module connector CA265

No
GO to M3.

5. GO to M4.

6. GO to M2.

7. GO to M4.

---

**M2: CHECK THE ACTUATOR POSITIVE SIGNAL CIRCUIT FOR SHORT CIRCUIT TO GROUND**

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake actuator - positive - Pin 14</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

Yes
An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s):- EPB module- EPB module connector CA265

No
GO to M4.

---

**M3: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE ACTUATOR**
EPB actuator connector, CA269 disconnected.

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake actuator - negative - Pin 07</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?
Yes
INSTALL a new EPB actuator.
REFER to: Parking Brake Release Actuator (206-05 Parking Brake and Actuation, Removal and Installation).
No
REPAIR the short circuit. For additional information, refer to the wiring diagrams.

M4: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE ACTUATOR

EPB actuator connector, CA269 disconnected.

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake actuator - positive - Pin 14</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?
Yes
INSTALL a new EPB actuator.
REFER to: Parking Brake Release Actuator (206-05 Parking Brake and Actuation, Removal and Installation).
No
REPAIR the short circuit. For additional information, refer to the wiring diagrams.

PINPOINT TEST N: GEAR SHIFT POSITION FAULT, GENERAL ELECTRICAL FAILURE (VEHICLES WITH PETROL ENGINE ONLY)

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>N1: CHECK THE SIGNAL CIRCUIT FOR SHORT CIRCUIT TO POWER</td>
<td></td>
</tr>
<tr>
<td>1</td>
<td>Key off.</td>
</tr>
<tr>
<td>2</td>
<td>Electric parking brake module connector 1 connector, CA265 disconnected.</td>
</tr>
</tbody>
</table>

Key on, engine off.

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>In-gear switch - signal - Pin 03</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>
Is the resistance greater than 100 Kohms?
Yes  
   GO to N2.
No  
   GO to N3.

### N2: CHECK THE IN-GEAR SWITCH CIRCUIT RESISTANCE

1. Make sure the vehicle is in NEUTRAL.
2. Key off.
3. Electric parking brake module connector 2 connector, CA266 disconnected.

   ![Diagram](E55104)

4. Measure the resistance between:
   - CA265, harness side
   - CA266, harness side
   - In-gear switch - signal - Pin 03
   - In-gear switch - return - Pin 15

   Is the resistance between 580 ohms - 630 ohms?
   Yes  
      An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s): EPB module- EPB module connector CA265- EPB module connector CA266
   No  
      GO to N6.

### N3: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SWITCH

1. In-Gear (IG) switch connector, GB03 disconnected.

   ![Diagram](E55106)

2. Measure the resistance between:
   - CA265, harness side
   - Vehicle battery
   - In-gear switch - signal - Pin 03
   - Positive terminal

   Is the resistance greater than 100 Kohms?
   Yes  
      GO to N4.
   No  
      REPAIR the short circuit. For additional information, refer to the wiring diagrams.

### N4: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SWITCH

1. Measure the resistance between:
   - IG Switch, harness side
   - Vehicle battery
   - In-gear switch - return - Pin 01
   - Positive terminal

   Is the resistance greater than 100 Kohms?
   Yes  
      INSTALL a new in-gear switch.
   No  
      GO to N5.

### N5: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE CONTROL MODULE

1. Key off.
Electric parking brake module connector 2, CA266 disconnected.

Key on, engine off.

Measure the resistance between:

<table>
<thead>
<tr>
<th>IG Switch, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>In-gear switch - return - Pin 01</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

Yes

INSTALL a new EPB module.

REFER to: Parking Brake Module (206-05 Parking Brake and Actuation, Removal and Installation).

No

REPAIR the short circuit. For additional information, refer to the wiring diagrams.

In-gear (IG) switch connector, GB03 disconnected.

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>IG Switch, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>In-gear switch - signal - Pin 03</td>
<td>In-gear switch - signal - Pin 02</td>
</tr>
</tbody>
</table>

Is the resistance less than 10 ohms?

Yes

GO to N7.

No

REPAIR the open circuit. For additional information, refer to the wiring diagrams.

N7: CHECK THE SENSOR RETURN CIRCUIT FOR OPEN CIRCUIT

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>IG Switch, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>In-gear switch - return - Pin 15</td>
<td>In-gear switch - return - Pin 01</td>
</tr>
</tbody>
</table>

Is the resistance less than 10 ohms?

Yes

GO to N8.

No

REPAIR the open circuit. For additional information, refer to the wiring diagrams.

N8: CHECK THE IG SWITCH CIRCUIT RESISTANCE

Measure the resistance between:

<table>
<thead>
<tr>
<th>IG Switch, component side</th>
<th>IG Switch, component side</th>
</tr>
</thead>
<tbody>
<tr>
<td>In-gear switch - return - Pin 01</td>
<td>In-gear switch - signal - Pin 02</td>
</tr>
</tbody>
</table>

Is the resistance between 580 ohms - 630 ohms?

Yes

REPAIR the open circuit. For additional information, refer to the wiring diagrams.

No

INSTALL a new in-gear switch.

PINPOINT TEST O : HIGH POWER GROUND FEED OPEN CIRCUIT

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>O1: CHECK THE MODULE GROUND CIRCUIT FOR CONTINUITY</td>
<td></td>
</tr>
</tbody>
</table>
Electric parking brake module connector 2, CA266 disconnected.

1. Measure the resistance between:
   - CA266, harness side
   - Vehicle battery
   - Electric parking brake module - ground - Pin 13
   - Negative terminal

   Is the resistance less than 10 ohms?
   - Yes
     An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s): EPB Module
   - No
     REPAIR the open circuit. For additional information, refer to the wiring diagrams.

PINPOINT TEST P: ACTUATOR OUTPUT SHORT CIRCUIT TO BATTERY

P1: CHECK THE ACTUATOR NEGATIVE SIGNAL CIRCUIT FOR SHORT CIRCUIT TO POWER

1. Key off.
2. Electric parking brake module connector 1, CA265 disconnected.
3. Key on, engine off.
4. Measure the resistance between:
   - CA265, harness side
   - Vehicle battery
   - Electric parking brake actuator - negative - Pin 07
   - Positive terminal

   Is the resistance greater than 100 Kohms?
   - Yes
     GO to P2.
   - No
     GO to P3.

P2: CHECK THE ACTUATOR POSITIVE SIGNAL CIRCUIT FOR SHORT CIRCUIT TO POWER

1. Measure the resistance between:
   - CA265, harness side
   - Vehicle battery
   - Electric parking brake actuator - positive - Pin 14
   - Positive terminal

   Is the resistance greater than 100 Kohms?
   - Yes
     An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s):
     EPB module
     EPB module connector CA265
   - No
     GO to P4.

P3: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE ACTUATOR
**EPB actuator connector, CA269 disconnected.**

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake actuator - negative - Pin 07</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

**Yes**
- INSTALL a new EPB actuator.
- REFER to: Parking Brake Release Actuator (206-05 Parking Brake and Actuation, Removal and Installation).

**No**
- REPAIR the short circuit. For additional information, refer to the wiring diagrams.

**P4: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE ACTUATOR**

**EPB actuator connector, CA269 disconnected.**

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake actuator - positive - Pin 14</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

**Yes**
- INSTALL a new EPB actuator.
- REFER to: Parking Brake Release Actuator (206-05 Parking Brake and Actuation, Removal and Installation).

**No**
- REPAIR the short circuit. For additional information, refer to the wiring diagrams.

**PINPOINT TEST Q : ACTUATOR HALL EFFECT SENSOR CIRCUIT FAILURE**

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Q1: CHECK THE HALL EFFECT 5 VOLT SUPPLY CIRCUIT FOR SHORT CIRCUIT TO GROUND</strong></td>
<td></td>
</tr>
<tr>
<td>1. Key off.</td>
<td></td>
</tr>
<tr>
<td>2. Electric parking brake module connector 1, CA265 disconnected.</td>
<td></td>
</tr>
</tbody>
</table>
Electric parking brake module connector 2, CA266 disconnected.

Key on, engine off.

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake hall effect - signal - Pin 12</td>
<td></td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

Yes

GO to Q2.

No

GO to Q9.

Q2: CHECK THE HALL EFFECT 5 VOLT SUPPLY CIRCUIT FOR SHORT CIRCUIT TO POWER

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake hall effect - signal - Pin 12</td>
<td></td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

Yes

GO to Q3.

No

GO to Q10.

Q3: CHECK THE ACTUATOR SIGNAL CIRCUIT FOR SHORT CIRCUIT TO GROUND

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA266, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake actuator - signal - Pin 10</td>
<td></td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

Yes

GO to Q4.

No

GO to Q11.

Q4: CHECK THE ACTUATOR SIGNAL CIRCUIT FOR SHORT CIRCUIT TO POWER

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA266, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake actuator - signal - Pin 10</td>
<td></td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

Yes

GO to Q5.

No

GO to Q12.

Q5: CHECK THE SENSOR RETURN CIRCUIT FOR SHORT CIRCUIT TO BATTERY

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake hall effect - ground - Pin 13</td>
<td></td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

Yes

GO to Q6.

No

GO to Q13.

Q6: CHECK THE SENSOR RETURN CIRCUIT FOR OPEN CIRCUIT

EPB actuator connector, CA269 disconnected.

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>CA269, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake hall effect - ground - Pin 13</td>
<td>Electric parking brake hall effect - ground - Pin 05</td>
</tr>
</tbody>
</table>
Is the resistance less than 10 ohms?
Yes  **GO to Q7.**
No  REPAIR the open circuit. For additional information, refer to the wiring diagrams.

### Q7: CHECK THE HALL EFFECT 5 VOLT SUPPLY CIRCUIT FOR OPEN CIRCUIT

1 Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>CA269, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake hall effect - signal - Pin 12</td>
<td>Electric parking brake hall effect - signal - Pin 03</td>
</tr>
</tbody>
</table>

Is the resistance less than 10 ohms?
Yes  **GO to Q8.**
No  REPAIR the open circuit. For additional information, refer to the wiring diagrams.

### Q8: CHECK THE ACTUATOR SIGNAL CIRCUIT FOR OPEN CIRCUIT

1 Measure the resistance between:

<table>
<thead>
<tr>
<th>CA266, harness side</th>
<th>CA269, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake actuator - signal - Pin 10</td>
<td>Electric parking brake actuator - signal - Pin 04</td>
</tr>
</tbody>
</table>

Is the resistance less than 10 ohms?
Yes
An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s):
- EPB module
- EPB actuator
- EPB module connector CA265
- EPB module connector CA266
- EPB actuator connector CA269

No  REPAIR the open circuit. For additional information, refer to the wiring diagrams.

### Q9: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE ACTUATOR

1 EPB actuator connector, CA269 disconnected.

2 Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake hall effect - signal - Pin 12</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?
Yes  INSTALL a new EPB actuator.
**REFER to:** Parking Brake Release Actuator (206-05 Parking Brake and Actuation, Removal and Installation).
No  REPAIR the short circuit. For additional information, refer to the wiring diagrams.

### Q10: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE ACTUATOR

1 EPB actuator connector, CA269 disconnected.

2 Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake hall effect - signal - Pin 12</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?
Yes  INSTALL a new EPB actuator.
**REFER to:** Parking Brake Release Actuator (206-05 Parking Brake and Actuation, Removal and Installation).
**Q11: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE ACTUATOR**

1. EPB actuator connector, CA269 disconnected.

2. Measure the resistance between:
   - **CA266, harness side**
   - **Vehicle battery**
   - Electric parking brake actuator - signal - Pin 10
   - Negative terminal

   Is the resistance greater than 100 Kohms?
   - Yes
     - INSTALL a new EPB actuator.
     - REFER to: Parking Brake Release Actuator (206-05 Parking Brake and Actuation, Removal and Installation).
   - No
     - REPAIR the short circuit. For additional information, refer to the wiring diagrams.

**Q12: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE ACTUATOR**

1. EPB actuator connector, CA269 disconnected.

2. Measure the resistance between:
   - **CA266, harness side**
   - **Vehicle battery**
   - Electric parking brake actuator - signal - Pin 10
   - Positive terminal

   Is the resistance greater than 100 Kohms?
   - Yes
     - INSTALL a new EPB actuator.
     - REFER to: Parking Brake Release Actuator (206-05 Parking Brake and Actuation, Removal and Installation).
   - No
     - REPAIR the short circuit. For additional information, refer to the wiring diagrams.

**Q13: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE ACTUATOR**

1. EPB actuator connector, CA269 disconnected.

2. Measure the resistance between:
   - **CA265, harness side**
   - **Vehicle battery**
   - Electric parking brake hall effect - ground - Pin 13
   - Positive terminal

   Is the resistance greater than 100 Kohms?
   - Yes
     - INSTALL a new EPB actuator.
     - REFER to: Parking Brake Release Actuator (206-05 Parking Brake and Actuation, Removal and Installation).
   - No
     - REPAIR the short circuit. For additional information, refer to the wiring diagrams.
No
REPAIR the short circuit. For additional information, refer to the wiring diagrams.

P nur: TEST R : SECONDARY RELEASE HARNESS SHORT CIRCUIT TO BATTERY OR OPEN CIRCUIT

TEST CONDITIONS | DETAILS/RESULTS/ACTIONS
--- | ---
1 | Key off.
2 | Electric parking brake module connector 1, CA265 disconnected.
3 | Electric parking brake module connector 2, CA266 disconnected.
4 | Key on, engine off.
5 | Measure the resistance between:
   **CA265, harness side** | **Vehicle battery**
   Electric parking brake switch apply 1 - signal - Pin 10, Positive terminal
   Is the resistance greater than 100 Kohms?
   Yes | GO to R2.
   No | GO to R8.
6 | Measure the resistance between:
   **CA265, harness side** | **Vehicle battery**
   Electric parking brake switch release 1 - signal - Pin 11, Positive terminal
   Is the resistance greater than 100 Kohms?
   Yes | GO to R3.
   No | GO to R9.
7 | Measure the resistance between:
   **CA266, harness side** | **Vehicle battery**
   Electric parking brake switch apply 2 - signal - Pin 02, Positive terminal
   Is the resistance greater than 100 Kohms?
   Yes | GO to R4.
   No | GO to R10.
8 | Measure the resistance between:
   **CA266, harness side** | **Vehicle battery**
   Electric parking brake switch release 2 - signal - Pin 14, Positive terminal
   Is the resistance greater than 100 Kohms?
   Yes | GO to R5.
   No | GO to R11.

R5: CHECK THE SECONDARY RELEASE SIGNAL CIRCUIT FOR OPEN CIRCUIT
Electric parking brake switch connector, CA243 disconnected.

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA266, harness side</th>
<th>CA243, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake switch release 2 - signal - Pin 14</td>
<td>Electric parking brake switch release 2 - signal - Pin 05</td>
</tr>
</tbody>
</table>

Is the resistance less than 10 ohms?
Yes  **GO to R6.**
No  REPAIR the open circuit. For additional information, refer to the wiring diagrams.

R6: CHECK THE SWITCH RETURN SIGNAL CIRCUIT FOR OPEN CIRCUIT

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA266, harness side</th>
<th>CA243, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake switch - switch return - Pin 06</td>
<td>Electric parking brake switch - switch return - Pin 06</td>
</tr>
</tbody>
</table>

Is the resistance less than 10 ohms?
Yes  **GO to R7.**
No  REPAIR the open circuit. For additional information, refer to the wiring diagrams.

R7: CHECK THE ELECTRIC PARKING BRAKE SWITCH

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA243, component side</th>
<th>CA243, component side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake switch release 2 - signal - Pin 05</td>
<td>Electric parking brake switch - switch return - Pin 06</td>
</tr>
</tbody>
</table>

Is the resistance between 595 ohms - 611 ohms?
Yes  An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s): EPB module- EPB module connector CA265- EPB module connector CA266
No  INSTALL a new EPB switch.
    REFER to: **Parking Brake Switch** (206-05 Parking Brake and Actuation, Removal and Installation).

R8: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SWITCH

Electric parking brake switch connector, CA243 disconnected.

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake switch apply 1 - signal - Pin 10</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?
Yes  INSTALL a new EPB switch.
    REFER to: **Parking Brake Switch** (206-05 Parking Brake and Actuation, Removal and Installation).
No  REPAIR the short circuit. For additional information, refer to the wiring diagrams.

R9: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SWITCH
1. Electric parking brake switch connector, CA243 disconnected.

2. Measure the resistance between:

<table>
<thead>
<tr>
<th></th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>CA265, harness side</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

Yes

- INSTALL a new EPB switch.
- REFER to: [Parking Brake Switch](206-05 Parking Brake and Actuation, Removal and Installation).

No

- REPAIR the short circuit. For additional information, refer to the wiring diagrams.

R10: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SWITCH

1. Electric parking brake switch connector, CA243 disconnected.

2. Measure the resistance between:

<table>
<thead>
<tr>
<th></th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>CA266, harness side</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

Yes

- INSTALL a new EPB switch.
- REFER to: [Parking Brake Switch](206-05 Parking Brake and Actuation, Removal and Installation).

No

- REPAIR the short circuit. For additional information, refer to the wiring diagrams.

R11: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SWITCH

1. Electric parking brake switch connector, CA243 disconnected.

2. Measure the resistance between:

<table>
<thead>
<tr>
<th></th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>CA266, harness side</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

Yes

- INSTALL a new EPB switch.
- REFER to: [Parking Brake Switch](206-05 Parking Brake and Actuation, Removal and Installation).

No

- REPAIR the short circuit. For additional information, refer to the wiring diagrams.
PINPOINT TEST S: ACTUATOR DOES NOT FULLY RELEASE

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>S1: CHECK THE HIGH CURRENT GROUND CIRCUIT FOR AN OPEN CIRCUIT IN THE HARNESS</td>
<td></td>
</tr>
<tr>
<td>Key off.</td>
<td></td>
</tr>
<tr>
<td>Electric parking brake connector 2, CA266 disconnected.</td>
<td></td>
</tr>
</tbody>
</table>

3. Measure the resistance between:
   - CA266, harness side - Vehicle battery
   - Electric parking brake module - ground - Pin 13 - Negative terminal

Is the resistance less than 10 ohms?

Yes
   - An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s): EPB module - EPB module connector CA266

No
   - REPAIR the open circuit. For additional information, refer to the wiring diagrams.

PINPOINT TEST T: SECONDARY RELEASE SWITCH CIRCUIT SHORT CIRCUIT TO GROUND

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>T1: CHECK THE SECONDARY RELEASE SIGNAL CIRCUIT FOR SHORT CIRCUIT TO GROUND</td>
<td></td>
</tr>
<tr>
<td>Key off.</td>
<td></td>
</tr>
<tr>
<td>Electric parking brake connector 1, CA265 disconnected.</td>
<td></td>
</tr>
</tbody>
</table>

3. Key on, engine off.
4. Measure the resistance between:
   - CA266, harness side - Vehicle battery
   - Electric parking brake switch release 2 - signal - Pin 14 - Negative terminal

Is the resistance greater than 100 Kohms?

Yes
   - An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s): EPB module - EPB module connector CA266

No
   - GO to T2.

T2: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SWITCH

1. Electric parking brake switch connector, CA243 disconnected.
Measure the resistance between:

<table>
<thead>
<tr>
<th>CA266, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake switch release 2 - signal - Pin 14</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

Yes

INSTALL a new EPB switch.

REFER to: Parking Brake Switch (206-05 Parking Brake and Actuation, Removal and Installation).

No

REPAIR the short circuit. For additional information, refer to the wiring diagrams.

PINPOINT TEST U : APPLY AND RELEASE SWITCH CONTACTS ENERGIZED SIMULTANEOUSLY

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>U1: CHECK THE PRIMARY EPB APPLY AND RELEASE CIRCUIT FOR SHORT CIRCUIT FAULTS</td>
<td></td>
</tr>
<tr>
<td>1 Key off.</td>
<td></td>
</tr>
<tr>
<td>2 Electric parking brake module connector 1, CA265 disconnected.</td>
<td></td>
</tr>
<tr>
<td>3 Electric parking brake module connector 2, CA266 disconnected.</td>
<td></td>
</tr>
<tr>
<td>4 Make sure the parking brake switch is not in the apply or release position.</td>
<td></td>
</tr>
</tbody>
</table>
| 5 Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>CA265, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake switch apply 1 - signal - Pin 10</td>
<td>Electric parking brake switch release 1 - signal - Pin 11</td>
</tr>
</tbody>
</table>

Is the resistance between 1.19 Kohms - 1.222 Kohms?

Yes

GO to U2.

No

GO to U3.

U2: CHECK THE SECONDARY EPB APPLY AND RELEASE CIRCUIT FOR SHORT CIRCUIT FAULTS

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 Make sure the parking brake switch is not in the apply or release position.</td>
<td></td>
</tr>
</tbody>
</table>
| 2 Measure the resistance between:

<table>
<thead>
<tr>
<th>CA266, harness side</th>
<th>CA266, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake switch apply 2 - signal - Pin 02</td>
<td>Electric parking brake switch release 2 - signal - Pin 14</td>
</tr>
</tbody>
</table>

Is the resistance between 1.19 Kohms - 1.222 Kohms?

Yes

An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s): - EPB module- EPB module connector CA265- EPB module connector CA266

No

GO to U4.

U3: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SWITCH

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 Make sure the parking brake switch is not in the apply or release position.</td>
<td></td>
</tr>
</tbody>
</table>
| 2 Measure the resistance between:

<table>
<thead>
<tr>
<th>CA266, harness side</th>
<th>CA266, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake switch apply 2 - signal - Pin 02</td>
<td>Electric parking brake switch release 2 - signal - Pin 14</td>
</tr>
</tbody>
</table>

Is the resistance between 1.19 Kohms - 1.222 Kohms?

Yes

An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s): - EPB module- EPB module connector CA265- EPB module connector CA266

No

GO to U4.
Electric parking brake switch, CA243 connector disconnected.

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>CA265, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake switch apply 1 - signal - Pin 10</td>
<td>Electric parking brake switch release 1 - signal - Pin 11</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

Yes

INSTALL a new EPB switch.
 REFER to: Parking Brake Switch (206-05 Parking Brake and Actuation, Removal and Installation).

No

REPAIR the short circuit. For additional information, refer to the wiring diagrams.

U4: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SWITCH

Electric parking brake module connector, CA243 disconnected.

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA266, harness side</th>
<th>CA266, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake switch apply 2 - signal - Pin 02</td>
<td>Electric parking brake switch release 2 - signal - Pin 14</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

Yes

INSTALL a new EPB switch.
 REFER to: Parking Brake Switch (206-05 Parking Brake and Actuation, Removal and Installation).

No

REPAIR the short circuit. For additional information, refer to the wiring diagrams.

PINPOINT TEST V: BRAKE SWITCH INPUT STATUS PLAUSIBILITY FAILURE

V1: CHECK THE BRAKE SWITCH CIRCUIT FOR SHORT CIRCUIT TO POWER IN HARNESS

Key off.

Electric parking brake module connector 2, CA266 disconnected.

Key on, engine off.

Make sure the brake pedal is not pressed.

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA266, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Brake switch - signal - Pin 07</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>
Is the resistance greater than 100 Kohms?
Yes  **GO to V2.**
No  **GO to V3.**

**V2: CHECK THE BRAKE SWITCH CIRCUIT FOR SHORT CIRCUIT TO GROUND IN THE HARNESS**

1. Measure the resistance between:
   - **CA266, harness side**
   - **Vehicle battery**
   - Brake switch - signal - Pin 07
   - Negative terminal

   Is the resistance greater than 100 Kohms?
   Yes  The following items have not been fully tested: - EPB module - Brake switch - ECM
   No  REPAIR the short circuit. For additional information, refer to the wiring diagrams.

**V3: CHECK THE BRAKE SWITCH CIRCUIT FOR SHORT CIRCUIT TO POWER IN THE HARNESS**

1. Brake switch connector, CR78 disconnected.

2. Measure the resistance between:
   - **CA266, harness side**
   - **Vehicle battery**
   - Brake switch - signal - Pin 07
   - Positive terminal

   Is the resistance greater than 100 Kohms?
   Yes  INSTALL a new brake switch.
   No  REPAIR the short circuit. For additional information, refer to the wiring diagrams.

**PINPOINT TEST W : GEARSHIFT POSITION SHORT CIRCUIT TO GROUND (VEHICLES WITH PETROL ENGINE ONLY)**

**TEST CONDITIONS**

**DETAILS/RESULTS/ACTIONS**

**W1: CHECK THE SIGNAL CIRCUIT FOR SHORT CIRCUIT TO GROUND**

1. Key off.

2. Electric parking brake module connector 1, CA265 disconnected.

3. Key on, engine off.

4. Measure the resistance between:
   - **CA265, harness side**
   - **Vehicle battery**
   - In-gear switch - signal - Pin 03
   - Negative terminal

   Is the resistance greater than 100 Kohms?
   Yes  An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s): - EPB module - EPB module connector CA265
   No  **GO to W2.**

**W2: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE IG SWITCH**
In-Gear (IG) switch connector, GB03 disconnected.

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>In-gear switch - signal - Pin 03</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

Yes
INSTALL a new in-gear switch.

No
REPAIR the short circuit. For additional information, refer to the wiring diagrams.

PINPOINT TEST X : ACTUATOR OUTPUT OPEN CIRCUIT

TEST CONDITIONS

X1: CHECK THE ACTUATOR CIRCUIT RESISTANCE

Key off.

Electric parking brake module connector 1, CA265 disconnected.

Key on, engine off.

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>CA265, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake actuator - positive - Pin 14</td>
<td>Electric parking brake actuator - negative - Pin 07</td>
</tr>
</tbody>
</table>

Is the resistance between 0.5 ohms - 1 ohms?

Yes
An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s):-
- EPB module
- EPB module connector CA265

No
GO to X2.

X2: CHECK THE ACTUATOR SIGNAL CIRCUIT FOR OPEN CIRCUIT

EPB actuator connector, CA269 disconnected.

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>CA269, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric parking brake actuator - positive - Pin 14</td>
<td>Electric parking brake actuator - positive - Pin 01</td>
</tr>
</tbody>
</table>
Is the resistance less than 10 ohms?
Yes  **GO to X3.**
No  REPAIR the open circuit. For additional information, refer to the wiring diagrams.

### X3: CHECK THE ACTUATOR RETURN CIRCUIT FOR OPEN CIRCUIT

1. Measure the resistance between:
   - **CA265, harness side**
   - Electric parking brake actuator - negative
   - Pin 07
   - **CA269, harness side**
   - Electric parking brake actuator - negative
   - Pin 06

   Is the resistance less than 10 ohms?
   Yes  **GO to X4.**
   No  REPAIR the open circuit. For additional information, refer to the wiring diagrams.

### X4: CHECK THE ACTUATOR CIRCUIT RESISTANCE

1. Measure the resistance between:
   - **CA269, component side**
   - Electric parking brake actuator - positive
   - Pin 01
   - **CA269, component side**
   - Electric parking brake actuator - negative
   - Pin 06

   Is the resistance between 0.5 ohms - 1 ohm?
   Yes  REPAIR the open circuit. For additional information, refer to the wiring diagrams.
   No  INSTALL a new EPB actuator.
   REFER to: Parking Brake Release Actuator (206-05 Parking Brake and Actuation, Removal and Installation).

---

### PINPOINT TEST Y: GEARSHIFT POSITION, SHORT CIRCUIT TO BATTERY (VEHICLES WITH DIESEL ENGINE ONLY)

#### TEST CONDITIONS

#### DETAILS/RESULTS/ACTIONS

### Y1: CHECK THE IN-GEAR SWITCH SUPPLY CIRCUIT

1. In-Gear (IG) switch connector, GB04 disconnected.

2. Key on, engine off.

3. Measure the voltage between:
   - **GB04, harness side**
   - Vehicle battery
   - In-gear switch - supply
   - Negative terminal

   Is the voltage between 4.5 volts - 5.5 volts ?
   Yes  **GO to Y2.**
   No  **GO to Y4.**

### Y2: CHECK THE IN-GEAR SWITCH SIGNAL CIRCUIT FOR SHORT CIRCUIT TO POWER

1. Measure the resistance between:
   - **GB04, harness side**
   - Vehicle battery
   - In-gear switch - signal - Pin 02
   - Positive terminal

   Is the resistance greater than 100 Kohms?
   Yes  **GO to Y3.**
   No  **GO to Y6.**

### Y3: CHECK THE IN-GEAR SWITCH RETURN CIRCUIT FOR SHORT CIRCUIT TO POWER

1. Measure the resistance between:
   - **GB04, harness side**
   - Vehicle battery
   - In-gear switch - return - Pin 01
   - Negative terminal

   Is the resistance greater than 100 Kohms?
   Yes  An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s):- IG switch
   No  **GO to Y7.**

### Y4: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE CONTROL MODULE

1. Key off.
Electric parking brake module connector 1, CA265 disconnected.

Key on, engine off.

Measure the resistance between:

<table>
<thead>
<tr>
<th>GB04, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>In gear switch - supply</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

Yes

INSTALL a new EPB module.

REFER to: Parking Brake Module (206-05 Parking Brake and Actuation, Removal and Installation).

No

GO to Y5.

Y5: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SWITCH

Clutch pedal position sensor (CLPS) connector, CA287 disconnected.

Measure the resistance between:

<table>
<thead>
<tr>
<th>GB04, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>In gear switch - signal - Pin 02</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

Yes

INSTALL a new CLPS.

No

REPAIR the short circuit. For additional information, refer to the wiring diagrams.

Y6: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE CONTROL MODULE

Electric parking brake module connector 1, CA265 disconnected.

Measure the resistance between:

<table>
<thead>
<tr>
<th>GB04, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>In gear switch - signal - Pin 02</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

Yes

INSTALL a new EPB module.

REFER to: Parking Brake Module (206-05 Parking Brake and Actuation, Removal and Installation).

No

REPAIR the short circuit. For additional information, refer to the wiring diagrams.

Y7: CHECK THE IN-GEAR SWITCH CIRCUIT RESISTANCE
Electric parking brake module connector 2, CA266 disconnected.

1. Measure the resistance between:

<table>
<thead>
<tr>
<th>GB04, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>In-gear switch - return - Pin 01</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

Yes

- INSTALL a new EPB module.
- REFER to: Parking Brake Module (206-05 Parking Brake and Actuation, Removal and Installation).

No

- REPAIR the short circuit. For additional information, refer to the wiring diagrams.

 PINPOINT TEST Z : CLUTCH PEDAL POSITION SENSOR SHORT CIRCUIT TO GROUND

TEST CONDITIONS

Z1: CHECK THE 5 VOLT SUPPLY CIRCUIT FOR SHORT CIRCUIT TO GROUND

1. Key off.
2. Electric parking brake module connector 1, CA265 disconnected.

Z2: CHECK THE SIGNAL CIRCUIT FOR SHORT CIRCUIT TO GROUND

1. Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clutch position sensor - supply - Pin 05</td>

</table>

Is the resistance greater than 100 Kohms?

Yes

- GO to Z6.

No

- GO to Z7.

Z6: CHECK THE SIGNAL CIRCUIT FOR OPEN CIRCUIT

1. Key on, engine off.
2. Electric parking brake module connector 1, CA265 disconnected.

Z7: CHECK THE SIGNAL CIRCUIT FOR HIGH RESISTANCE

1. Key on, engine off.
2. Electric parking brake module connector 2, CA266 disconnected.

Z8: CHECK THE SIGNAL CIRCUIT FOR SHORT CIRCUIT TO GROUND

1. Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clutch position sensor - signal - Pin 06</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

Yes

- INSTALL a new EPB module.
- REFER to: Parking Brake Module (206-05 Parking Brake and Actuation, Removal and Installation).

No

- REPAIR the short circuit. For additional information, refer to the wiring diagrams.

Z9: CHECK THE SIGNAL CIRCUIT FOR HIGH RESISTANCE

1. Key on, engine off.
2. Electric parking brake module connector 2, CA266 disconnected.

Z10: CHECK THE SIGNAL CIRCUIT FOR OPEN CIRCUIT

1. Key on, engine off.
2. Electric parking brake module connector 2, CA266 disconnected.
1. Clutch pedal position sensor (CLPS) connector, CA287 disconnected.

2. Measure the resistance between:
   - CA265, harness side
   - CA287, harness side
   - Clutch position sensor - signal - Pin 06
   - Clutch position sensor - signal - Pin 02

   Is the resistance less than 10 ohms?
   Yes
   - REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams.
   No
   - GO to Z4.

Z4: CHECK THE 5 VOLT SUPPLY CIRCUIT FOR HIGH RESISTANCE

1. Measure the resistance between:
   - CA265, harness side
   - CA287, harness side
   - Clutch position sensor - supply - Pin 05
   - Clutch position sensor - supply - Pin 03

   Is the resistance less than 10 ohms?
   Yes
   - GO to Z5.
   No
   - REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams.

Z5: CHECK THE SENSOR RETURN CIRCUIT FOR HIGH RESISTANCE

1. Measure the resistance between:
   - CA266, harness side
   - CA287, harness side
   - Clutch position sensor - ground
   - Clutch position sensor - ground - pin 01

   Is the resistance less than 10 ohms?
   Yes
   - An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following components(s): EPB module- CLPS- EPB module connector CA265- EPB module connector CA266- CLPS connector CA287
   No
   - REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams.

Z6: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SENSOR

1. Clutch pedal position sensor (CLPS) connector, CA287 disconnected.

2. Measure the resistance between:
   - CA265, harness side
   - Vehicle battery
   - Clutch position sensor - supply - Pin 05
   - Negative terminal

   Is the resistance greater than 100 Kohms?
   Yes
   - INSTALL a new CLPS.
   No
   - REPAIR the short circuit. For additional information, refer to the wiring diagrams.

Z7: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SENSOR
1. **Clutch pedal position sensor (CLPS) connector, CA287 disconnected.**

2. Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clutch position sensor - signal - Pin 06</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

   Is the resistance greater than 100 Kohms?
   - **Yes**
     - INSTALL a new CLPS.
   - **No**
     - REPAIR the short circuit. For additional information, refer to the wiring diagrams.

### PINPOINT TEST AA : CLUTCH PEDAL POSITION SENSOR, SHORT CIRCUIT TO POWER

#### TEST CONDITIONS

#### DETAILS/RESULTS/ACTIONS

**AA1: CHECK THE 5 VOLT SUPPLY CIRCUIT FOR SHORT CIRCUIT TO POWER**

1. Key off.

   2. Electric parking brake module connector 1, CA265 disconnected.

**AA2: CHECK THE SIGNAL CIRCUIT FOR SHORT CIRCUIT TO POWER**

1. Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clutch position sensor - supply - Pin 05</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

   Is the resistance greater than 100 Kohms?
   - **Yes**
     - GO to AA2.
   - **No**
     - GO to AA4.

**AA3: CHECK THE SENSOR RETURN GROUND CIRCUIT FOR SHORT CIRCUIT TO POWER**

1. Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clutch position sensor - signal - Pin 06</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

   Is the resistance greater than 100 Kohms?
   - **Yes**
     - GO to AA3.
   - **No**
     - GO to AA5.
Measure the resistance between:

<table>
<thead>
<tr>
<th>CA266, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clutch pedal position sensor - ground - Pin 03</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance less than 10 ohms?

Yes

An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s):
- EPB module
- EPB module connector CA265
- EPB module connector CA266

No

GO to AA6.

AA4: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SENSOR

1. Clutch pedal position sensor (CLPS) connector, CA287 disconnected.

2. Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clutch pedal position sensor - supply - Pin 05</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

Yes

INSTALL a new CLPS.

No

REPAIR the short circuit. For additional information, refer to the wiring diagrams.

AA5: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SENSOR

1. Clutch pedal position sensor (CLPS) connector, CA287 disconnected.

2. Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clutch position sensor - signal - Pin 06</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

Yes

INSTALL a new CLPS.

No

REPAIR the short circuit. For additional information, refer to the wiring diagrams.

AA6: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SENSOR

1. Clutch pedal position sensor (CLPS) connector, CA287 disconnected.

2. Measure the resistance between:

<table>
<thead>
<tr>
<th>CA266, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clutch pedal position sensor - ground - Pin 03</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>
Is the resistance greater than 100 Kohms?
Yes
INSTALL a new CLPS.
No
REPAIR the short circuit. For additional information, refer to the wiring diagrams.

</tr>
</tbody>
</table>

Is the resistance less than 10 ohms?
Yes
   **GO to AB5.**
No
   REPAIR the open circuit. For additional information, refer to the wiring diagrams.

**AB5: CHECK THE 5 VOLTS SUPPLY CIRCUIT FOR OPEN CIRCUIT**

<table>
<thead>
<tr>
<th>Measure the resistance between:</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>CA265, harness side</strong></td>
<td><strong>GB04, harness side</strong></td>
</tr>
<tr>
<td>Clutch position sensor - supply - Pin 05</td>
<td>Clutch position sensor - supply - Pin 03</td>
</tr>
</tbody>
</table>

Is the resistance less than 10 ohms?
Yes
   An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s): IG switch, IG switch connector GB04, EPB module, EPB module connector CA265, EPB module connector CA266.
No
   REPAIR the open circuit. For additional information, refer to the wiring diagrams.

**AB6: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE IN-GEAR SWITCH**

1. In-Gear (IG) switch connector, GB04 disconnected.

2. Measure the resistance between:
<table>
<thead>
<tr>
<th><strong>CA265, harness side</strong></th>
<th><strong>Vehicle battery</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Clutch position sensor - supply - Pin 05</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?
Yes
   INSTALL a new in-gear switch.
No
   **GO to AB7.**

**AB7: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE CLUTCH POSITION SENSOR**

1. Clutch pedal position sensor (CLPS) connector, CA287 disconnected.

2. Measure the resistance between:
<table>
<thead>
<tr>
<th><strong>CA265, harness side</strong></th>
<th><strong>Vehicle battery</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Clutch position sensor - supply - Pin 05</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?
Yes
   INSTALL a new CLPS.
No
   REPAIR the short circuit. For additional information, refer to the wiring diagrams.

**AB8: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SWITCH**
In-Gear (IG) switch connector, GB04 disconnected.

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>In-gear switch - signal - Pin 03</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

Yes

INSTALL a new in-gear switch.

No

REPAIR the short circuit. For additional information, refer to the wiring diagrams.

**PINPOINT TEST AC: PRIMARY RELEASE SWITCH CIRCUIT FAULT**

**TEST CONDITIONS**

**DETAILS/RESULTS/ACTIONS**

**AC1: CHECK THE PRIMARY RELEASE SWITCH SIGNAL CIRCUIT FOR SHORT CIRCUIT TO POWER**

1. Key off.

2. Electric parking brake module connector 1, CA265 disconnected.

3. Electric parking brake module connector 2, CA266 disconnected.

4. Key on, engine off.

5. Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary release switch signal 1 - pin 11</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

Yes

GO to AC2.

No

GO to AC8.

**AC2: CHECK THE PRIMARY APPLY SWITCH SIGNAL CIRCUIT FOR SHORT CIRCUIT TO POWER**

1. Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, harness side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary apply switch signal 1 - pin 10</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

Yes

GO to AC3.

No

GO to AC9.

**AC3: CHECK THE SECONDARY APPLY SWITCH SIGNAL CIRCUIT FOR SHORT CIRCUIT TO POWER**
AC4: CHECK THE SECONDARY RELEASE SWITCH SIGNAL CIRCUIT FOR SHORT CIRCUIT TO POWER

1. Measure the resistance between:
   - CA266, harness side Vehicle battery
   - Secondary apply switch signal 2 - pin 02 Positive terminal

   Is the resistance greater than 100 Kohms?
   Yes
   - GO to AC5.
   No
   - GO to AC10.

AC5: CHECK THE PRIMARY RELEASE SWITCH SIGNAL CIRCUIT FOR HIGH RESISTANCE

1. Electric parking brake switch connector, CA243 disconnected.

2. Measure the resistance between:
   - CA265, harness side CA243, harness side
   - Primary release switch signal 1 - pin 11 Primary release switch signal 1 - pin 04

   Is the resistance less than 10 ohms?
   Yes
   - GO to AC6.
   No
   - REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams.

AC6: CHECK THE APPLY SWITCH RETURN CIRCUIT FOR HIGH RESISTANCE

1. Measure the resistance between:
   - CA266, harness side CA243, harness side
   - Switch return - pin 06 Switch return - pin 06

   Is the resistance less than 10 ohms?
   Yes
   - GO to AC7.
   No
   - INSTALL a new parking brake switch.
     REFER to: Parking Brake Switch (206-05 Parking Brake and Actuation, Removal and Installation).

AC7: CHECK THE SWITCH RESISTANCE

1. Measure the resistance between:
   - CA243, component side CA243, component side
   - Switch release signal 1 - pin 04 Switch return - pin 06

   Is the resistance between 595 and 611 ohms?
   Yes
   - An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s): - EPB module - EPB module connector CA265 - EPB module connector CA266
   No
   - INSTALL a new parking brake switch.
     REFER to: Parking Brake Switch (206-05 Parking Brake and Actuation, Removal and Installation).

AC8: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SWITCH

1. Electric parking brake switch connector, CA243 disconnected.
Measure the resistance between:

<table>
<thead>
<tr>
<th>CA265, component side</th>
<th>Vehicle battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release switch signal 1 - pin 11</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

**Yes**
- INSTALL a new parking brake switch.
- REFER to: Parking Brake Switch (206-05 Parking Brake and Actuation, Removal and Installation).

**No**
- REPAIR the short circuit. For additional information, refer to the wiring diagrams.

**AC9: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SWITCH**

1. Electric parking brake switch connector, CA243 disconnected.

2. Electric parking brake switch connector, CA243 disconnected.

AC9: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SWITCH

1. Electric parking brake switch connector, CA243 disconnected.

2. Electric parking brake switch connector, CA243 disconnected.

AC10: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SWITCH

1. Electric parking brake switch connector, CA243 disconnected.

2. Electric parking brake switch connector, CA243 disconnected.

AC11: CHECK IF THE SHORT CIRCUIT IS IN THE HARNESS OR THE SWITCH

1. Electric parking brake switch connector, CA243 disconnected.
<table>
<thead>
<tr>
<th></th>
<th>Measure the resistance between:</th>
</tr>

<tbody>
<tr>
<td></td>
<td><strong>CA266, component side</strong></td>
</tr>
<tr>
<td></td>
<td>Release switch signal 2 - pin 14</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

**Yes**
- INSTALL a new parking brake switch.
- REFER to: Parking Brake Switch (206-05 Parking Brake and Actuation, Removal and Installation).

**No**
- REPAIR the short circuit. For additional information, refer to the wiring diagrams.
Parking Brake and Actuation - Parking Brake Cable Tension Release

General Procedures

Special Tool(s)

| Electric parking brake release tool | 206-082 |
| Electric parking brake release tool | 206-082-01 |

• CAUTIONS:

Whilst carrying out rear parking brake related service procedures, the tension on the rear parking brake release actuator will need to be released. Failure to follow this instruction may result in the parking brake to function incorrectly or become inoperative.

The warranty of the electric parking brake release tool will be invalidated if the casing has been removed.

All vehicles

1. WARNING: Always use the Jaguar Approved Diagnostic System to release the parking brake cable tension, when carrying out repair operations on the electric park brake which require the cable tension to be released.

Connect the Jaguar approved diagnostic system to release the parking brake cable tension.

WARNING: The procedure below should only be used in emergency situations, to release the electric parking brake. All calibration of the parking brake system will be lost, and the parking brake will need to be re-calibrated to function correctly.

• NOTE: The tools shown must only be used in the event of an emergency.

Vehicles with automatic transmission

2. Move the selector lever to the "P" position.

Vehicles with manual transmission

3. Move the gearshift lever into a forward gear position.

All vehicles

4. Release the parking brake.

Vehicles built up to 01/2004

5. Remove the luggage compartment floor covering.
6. Remove the luggage compartment trim panel.

7. Remove the luggage compartment side trim panel.
   - Remove the luggage compartment side trim panel retaining clips.

Vehicles built 02/2004 onwards

8. Reposition the luggage compartment floor covering.
   1. Detach the luggage compartment floor covering.
   2. Reposition the luggage compartment floor covering.

9. Detach the luggage compartment side trim panel and reposition to one side.

Vehicles built up to 01/2004
10. Disconnect the parking brake module electrical connector.

Vehicles built 02/2004 onwards

11. **CAUTION:** Disconnect the parking brake module electrical connectors in the sequence shown. Failure to follow this instruction may result in diagnostic trouble codes being stored in the module.

Disconnect the parking brake module electrical connectors.

Vehicles built up to 01/2004

12. Connect the special tool to the parking brake module wiring harness electrical connector.

Vehicles built 02/2004 onwards

13. Connect the special tools to the parking brake module wiring harness electrical connectors.

All vehicles
14. NOTE: Operate the parking brake release tool until an audible noise is heard from the parking brake release actuator.

Release the parking brake cable tension.

15. Remove the special tool and carry out any necessary repair to the system.

Vehicles built up to 01/2004

16. Connect the parking brake module electrical connector.

17. Install the luggage compartment side trim panel.
   - Install the luggage compartment side trim panel retaining clips.

Vehicles built 02/2004 onwards

18. Install the luggage compartment trim panel.
19. **CAUTION:** Connect the parking brake module electrical connectors in the sequence shown. Failure to follow this instruction may result in diagnostic trouble codes being stored in the module.

Connect the parking brake module electrical connectors.

20. Attach the luggage compartment side trim panel.

All vehicles

21. Install the luggage compartment floor covering.

22. **NOTE:** The brake pedal must be applied when calibrating the parking brake switch.

Apply the parking brake.

Vehicles with manual transmission

23. Move the gearshift lever to the "Neutral" position.

All vehicles

24. **CAUTION:** Calibrate the electric park brake using Jaguar approved diagnostic system. If the Jaguar approved diagnostic system is not available disconnect the battery for approximately 30 seconds, the vehicle will then prompt the driver to carry out the calibration procedure as per the vehicle hand book on re-connection.

Calibrate the electric parking brake module using the Jaguar approved diagnostic system.
Parking Brake and Actuation - Parking Brake Cable
Removal and Installation

Removal

1. Carry out the parking brake cable release. For additional information, refer to Parking Brake Cable Tension Release in this section.

2. Remove both rear wheels and tires. For additional information, refer to Section 204-04 Wheels and Tires.

3. Detach the parking brake cable.
   1. Reposition the parking brake caliper lever.
   2. Detach the parking brake cable.

4. Detach the parking brake cable.
   1. Reposition the retaining tang.
   2. Detach the parking brake cable.

5. Remove the parking brake cable.
   1. Detach the parking brake cable retaining tangs.
   2. Remove the parking brake cable.

Installation

1. NOTE: Install a new parking brake cable retaining bracket.

   To install, reverse the removal procedure.
Parking Brake and Actuation - Parking Brake Module
Removal and Installation

**Removal**

All vehicles

1. Remove the luggage compartment floor covering.
   1. Detach the luggage compartment floor covering.
   2. Reposition the luggage compartment floor covering.

Vehicles built up to VIN:N13088

2. Remove the luggage compartment trim panel.

3. Remove the luggage compartment side trim panel.
   - Remove the luggage compartment side trim panel retaining clips.

Vehicles built from VIN:N13089

4. Detach the luggage compartment side trim panel and reposition to one side.

Vehicles built up to VIN:N13088
5. Detach the parking brake module.

6. Remove the parking brake module.
   - Disconnect the parking brake module electrical connectors.

Vehicles built from VIN:N13089

7. Disconnect the parking brake module electrical connectors.

8. Remove the parking brake module.

**Installation**

- **NOTE:** If a new parking brake module is installed it must be configured using the Jaguar approved diagnostic system.

1. To install, reverse the removal procedure.
Parking Brake and Actuation - Parking Brake Pads
Vehicles With: High Performance Brakes
Removal and Installation

<table>
<thead>
<tr>
<th>Special Tool(s)</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Brake caliper piston retractor tool</td>
<td>206-081</td>
</tr>
</tbody>
</table>

**Removal**

1. Carry out the parking brake cable tension release. For additional information, refer to: [Parking Brake Cable Tension Release](206-05 Parking Brake and Actuation, General Procedures).
2. Remove both rear wheels and tires. For additional information, refer to: [Wheel and Tire](204-04 Wheels and Tires, Removal and Installation).
3. Detach the parking brake cable.
   - 1. Reposition the parking brake caliper lever.
   - 2. Detach the parking brake cable.
4. Remove the parking brake pads.
   - 1. Remove the parking brake pad retaining pins.
   - 2. Remove the parking brake pad anti-rattle spring plate.
   - 3. Remove the parking brake pads.
5. Remove the parking brake caliper.
   - Remove and discard the parking brake caliper retaining bolts.

**Installation**

1. **CAUTIONS:**
   - Make sure the brake disc faces are clean before installation.
   - Brake pads must always be replaced in axle sets.
Install new parking brake caliper retaining bolts.

- NOTE: Using a suitable tool, fully retract the parking brake caliper pistons.

To install, reverse the removal procedure.

2. Tighten to 70 Nm.
Removal

- NOTE: Procedure is for both federal and non federal markets. Please refer to the relevant steps where appropriate.

1. Carry out the parking brake cable tension release. For additional information, refer to: Parking Brake Cable Tension Release (206-05 Parking Brake and Actuation, General Procedures).

2. Raise and support the vehicle. For additional information, refer to: Lifting (100-02 Jacking and Lifting, Description and Operation).

3. Disconnect the parking brake release actuator electrical connector.

4. Remove the parking brake release actuator retaining bolts.

5. Detach the parking brake release actuator cable.
   1. For right-hand side connector bracket:
      1. Reposition the retaining tang.
      2. Detach the parking brake cable.
   2. For left-hand side reaction bracket, detach the parking brake cable.
6. **NOTE:** Note the fitted position.
   Detach the parking brake release actuator cable.

7. **NOTE:** Non federal market vehicles only.
   Remove the parking brake actuator assembly toward the right-hand rear wheel.

8. **NOTE:** Non federal market vehicles only.
   Remove the parking brake release actuator assembly.

9. **NOTE:** Federal market vehicles only.
   Remove the support bracket.
   - Remove the bolts.

10. **NOTE:** Federal market vehicles only.
    Reposition the driveshaft heat shield.
    1. Remove the retaining bolts.
    2. Reposition the driveshaft heat shield.
11. **NOTE:** Federal market vehicles only.
Release the driveshaft centre bearing.
- Remove the retaining bolts.
- Remove the spacers.

12. **CAUTION:** Under no circumstances must the flexible coupling (or its fixings) be loosened or removed from the driveshaft.

- **NOTE:** Federal market vehicles only.
  Detach the driveshaft from the differential flange.
  - Mark the position of the driveshaft in relation to the differential flange.
  - Mark the position of the balance nut in relation to the differential flange (if fitted).
  - Mark the position of each nut and bolt in relation to the driveshaft flexible joint.

13. **CAUTION:** When supporting the axle assembly, use suitable packing material to prevent damage to the axle assembly.

- **NOTE:** Federal market vehicles only.
  Support the axle assembly using special tool HTJ1200-02.

14. **NOTE:** Federal market vehicles only.
Release the axle assembly.
- Remove the retaining bolts.

15. **CAUTION:** Make sure the halfshafts remain clear of the rear suspension/subframe.

- **NOTE:** Federal market vehicles only.
  Lower the axle assembly.

16. **NOTE:** Federal market vehicles only.
Remove the parking brake actuator.
1. NOTE: Make sure the parking brake cable is correctly routed.
To install, reverse the removal procedure.
* Tighten to 20 Nm.

2. NOTE: Federal market vehicles only.
* NOTE: Loosely tighten the axle assembly rear retaining bolts.
Install the axle assembly.

3. NOTE: Federal market vehicles only.
Remove the special tool HTJ1200-02, supporting the axle assembly.

4. NOTE: Federal market vehicles only.
Install the special tool.

5. NOTE: Federal market vehicles only.
Using the special tool and a torque wrench, tighten the axle rear retaining bolts.
* Tighten to 200 Nm.
* To make sure the axle rear retaining bolts are torqued to the correct specification, using the special tool and a torque wrench the following calculation steps must be followed.
1. Step 1. Multiply 200 Nm by the effective length of the torque wrench (1).
2. Step 2. Add the effective length of the special tool (2) to the effective length of the torque wrench (1).
3. Step 3. Divide the total of step 1 by the total of step 2.
4. Step 4. Set the torque wrench to the figure arrived at in step 3.
6. **NOTE**: Federal market vehicles only.
Tighten to 90 Nm.

7. **NOTE**: Federal market vehicles only.
Tighten to 88 Nm.

8. **NOTE**: Federal market vehicles only.
- **NOTE**: Do not fully tighten the driveshaft centre bearing retaining bolts at this stage.
  
  Tighten the driveshaft centre bearing retaining bolts.
  - Install the driveshaft centre bearing spacers.

9. **NOTE**: Federal market vehicles only.
Carry out the Driveline Angle Inspection.
For additional information, refer to: Driveline Angle Inspection (205-00 Driveline System - General Information, General Procedures).

10. **CAUTION**: Calibrate the electric park brake using Jaguar approved diagnostic system. If the Jaguar approved diagnostic system is not available disconnect the battery for approximately 30 seconds, the vehicle will then prompt the driver to carry out the calibration procedure as per the vehicle hand book on re-connection.

    Calibrate the electric parking brake module using the Jaguar approved diagnostic system.
Parking Brake and Actuation - Parking Brake Switch
Removal and Installation

Removal

Vehicles with manual transmission

1. Remove the gearshift lever.

Vehicles with automatic transmission

3. Remove the 'J' gate surround.

All vehicles

4. Remove the parking brake switch retaining screws.
5. Remove the parking brake switch.

Installation

1. To install, reverse the removal procedure.
Hydraulic Brake Actuation -
Lubricants, Fluids, Sealers and Adhesives

⚠️ CAUTION: Do not use brake fluid ITT Super Dot 4 on 2006my vehicles onwards. Failure to follow this instruction may result in damage to the vehicle.

• NOTE: Brake fluid ITT Super Dot 4 has now been superseded by Shell ESL Super Dot 4 which is the Jaguar recommended brake fluid. Shell ESL Super Dot 4 can be used on all model years.

WARNING: Brake fluid contains polyglycol ethers and polyglycols. Avoid contact with the eyes. Wash hands thoroughly after handling, as prolonged contact may cause irritation and dermatitis. If brake fluid contacts the eyes, flush the eyes with cold water or eyewash solution and seek medical attention. If taken internally, do not induce vomiting, seek immediate medical attention. Failure to follow these instructions may result in personal injury.

The hydraulic brake system is of a pedal operated, diagonally split dual line brake system that consists of the following components:

- A brake booster.
- A brake master cylinder.
- Front brake discs.
- Rear brake discs.
- Rear brake calipers.
- Brake tubes and hoses.
- Anti-lock brake system (ABS).

Brake Master Cylinder

The brake master cylinder is a dual piston type. The master cylinder operates as follows:

- When the brake pedal is applied, pressure is applied by mechanical linkage to the primary and secondary systems.
- Brake master cylinder pistons apply hydraulic pressure to the two circuits.

The master cylinder consists of the following components:

- Primary and secondary pistons.
- Brake master cylinder fluid reservoir with integral fluid level warning indicator.

Adjustable Pedals

The adjustable pedal system comprises of a throttle pedal assembly with an adjustment motor and drive cables. The drive cables are attached to the brake and clutch adjustment mechanisms. The pedals move forward and rearward together. Two separate pedal positions can be set and stored in the memory for driver recall. The pedal position adjustment is by a switch fitted on the steering column shroud.
Hydraulic Brake Actuation - Hydraulic Brake Actuation
Diagnosis and Testing

For additional information, refer to Section 206-00 Brake System - General Information.
Removal

All vehicles

1. **CAUTION:** If brake fluid is spilled on the paintwork, the affected area must be immediately washed down with cold water.
   - **NOTE:** Make sure the brake fluid reservoir filler cap does not become contaminated.
   
   Remove the brake fluid reservoir filler cap.

2. Disconnect the brake fluid level sensor electrical connector.

3. Using a suitable suction device drain the brake fluid reservoir.

Vehicles with manual transmission

4. Disconnect the clutch master cylinder feed hose.
5. Remove the brake fluid reservoir from the master cylinder.
   1. Remove the brake fluid reservoir retaining bolt.
   2. Remove the brake fluid reservoir from the brake master cylinder.

**Installation**

1. **NOTE:** Install new O-ring seals.
   
   To install, reverse the removal procedure.

2. Tighten to 8 Nm.

3. After installation, bleed the brake system. For additional information, refer to Section 206-00 Brake System - General Information.
Hydraulic Brake Actuation - Brake Fluid Reservoir

2.7L V6 - TdV6
Removal and Installation

**Removal**

*All vehicles*

1. Remove the engine compartment cover.

2. **CAUTION:** If brake fluid is spilt on the paintwork, the affected area must be immediately washed down with cold water.

   • **NOTE:** Make sure the brake fluid reservoir filler cap does not become contaminated.

   Remove the brake fluid reservoir filler cap.

3. Using a suitable suction device drain the brake fluid reservoir.

4. Disconnect the brake fluid level sensor electrical connector.

*Vehicles with manual transmission*
5. Disconnect the clutch master cylinder feed hose.

All vehicles

6. Remove the brake fluid reservoir.
   - Remove the brake fluid reservoir retaining bolt.
   - Detach the brake fluid reservoir from the brake master cylinder.

7. Remove and discard the O-ring seals.

Installation

All vehicles

1. NOTE: Lubricate the new O-ring seals with clean brake fluid.

Install new O-ring seals.
2. Install the brake fluid reservoir.
   - Attach the brake fluid reservoir to the brake master cylinder.
   - Install the brake fluid reservoir retaining bolt.
   - Tighten to 8 Nm.

Vehicles with manual transmission

3. Connect the clutch master cylinder feed hose.

All vehicles

4. Bleed the brake hydraulic system.
   For additional information, refer to: Brake System Bleeding - VIN Range: M45255->N52047 (206-00 Brake System - General Information, General Procedures).

Vehicles with manual transmission

5. Bleed the clutch hydraulic system.
   For additional information, refer to: Clutch System Bleeding (308-00 Manual Transmission/Transaxle and Clutch - General Information, General Procedures).
Hydraulic Brake Actuation - Brake Master Cylinder

V8 4.2L Petrol/V8 S/C 4.2L Petrol/2.5L NA V6 - AJV6/3.0L NA V6 - AJ27

Removal and Installation

**Removal**

1. **CAUTION**: If brake fluid comes into contact with the paintwork, the affected area must be immediately washed down with cold water.

   • **NOTE**: Make sure the brake fluid reservoir filler cap does not become contaminated.

   Remove the brake fluid reservoir.
   For additional information, refer to [Brake Fluid Reservoir](#) in this section.

2. Remove the brake booster/vacuum pipe.

3. **CAUTION**: Cap the brake hose to prevent loss of fluid and dirt ingress.

   Disconnect the master cylinder brake pipes.

4. Remove the dynamic stability control sensor electrical connector.

5. Remove the dynamic stability control sensor.
6. Remove the brake master cylinder.

**Installation**

1. **NOTE: Install new O-ring seals.**
   To install, reverse the removal procedure.

2. Tighten to 25 Nm.

3. Tighten to 17 Nm.

4. Bleed the brake system.
   For additional information, refer to Section [206-00 Brake System - General Information](#).
Removal

1. **CAUTION:** If brake fluid comes into contact with the paintwork, the affected area must be immediately washed down with cold water.

   • **NOTE:** Make sure the brake fluid reservoir filler cap does not become contaminated.

   Remove the brake fluid reservoir.
   For additional information, refer to: Brake Fluid Reservoir - V8 4.2L Petrol/V8 S/C 4.2L Petrol/2.5L NA V6 - AJV6/3.0L NA V6 - AJ27 (206-06 Hydraulic Brake Actuation, Removal and Installation).

2. **CAUTION:** Cap the brake hose to prevent loss of fluid and dirt ingress.

   Disconnect the master cylinder brake pipes.

3. Remove the brake master cylinder retaining nuts.

4. Remove the brake master cylinder.
   • Remove the brake master cylinder primary pressure transducer electrical connector.

Installation
1. NOTE: Install new O-ring seals.
   To install, reverse the removal procedure.

2. Tighten to 25 Nm.

3. Tighten to 17 Nm.

Power Brake Actuation - Brake Booster
Removal and Installation

Removal

All vehicles

1. Remove the brake master cylinder. For additional information, refer to: Brake Master Cylinder - V8 4.2L Petrol/V8 S/C 4.2L Petrol/2.5L NA V6 - AJV6/3.0L NA V6 - AJ27 (206-06 Hydraulic Brake Actuation, Removal and Installation).

2. Remove the cowl panel grille. For additional information, refer to: Cowl Panel Grille (501-02 Front End Body Panels, Removal and Installation).

Vehicles built up to VIN:N52206

3. Disconnect the brake booster pedal travel sensor and brake booster solenoid electrical connectors.

Vehicles built from VIN:N52207

4. NOTE: Vehicles with 3.0L engines only.

   Disconnect the brake booster vacuum electrical connector.

Vehicles with diesel engine

5. Detach the brake booster vacuum pipe.

All vehicles
6. Remove the brake booster retaining nut.

7. **NOTE:** The non-return valve and vacuum pipe assembly should be removed with the brake booster.

   Remove the brake booster retaining nuts.

8. Remove the brake booster.

---

**Installation**

1. **NOTE:** When renewing the brake booster, the non-return valve and vacuum pipe assembly should be installed prior to the brake booster installation.

   • **NOTE:** Replace the brake booster/pedal box gasket.

To install, reverse the removal procedure.

   • Tighten to 25 Nm.
Removal

1. Remove the oil filler cap.

2. Remove the engine cover.

3. Remove the cowl panel grille.
   For additional information, refer to: Cowl Panel Grille (501-02 Front End Body Panels, Removal and Installation).

4. Remove the engine compartment support.

5. Remove the engine compartment access panel.
6. Disconnect the brake vacuum pump hoses.

7. Remove the catalytic converter. For additional information, refer to: **Catalytic Converter - 2.7L V6 - TDV6** (309-00 Exhaust System, Removal and Installation).

8. Remove the EGR coolant pipe bracket retaining bolt.

9. Remove the EGR coolant pipe bracket retaining bolt.

10. Remove the crankcase breather pipe bracket retaining nut.
11. Remove the brake vacuum pump retaining stud.

12. Remove the high pressure fuel pipe bracket retaining bolt.

13. Remove the brake vacuum pump.

**Installation**

1. To install, reverse the removal procedure.
   - Apply silicone gasket sealant or equivalent meeting Jaguar specification.
   - The application of sealant must be 10mm square in two places. Install the brake vacuum pump immediately after applying the sealant.
   - The brake vacuum pump should be fitted directly to the engine without smearing the sealant or the seal.
2. **CAUTION:** Make sure the drive coupling is aligned with the camshaft coupling.

   Tighten to 23 Nm.

3. Tighten to 13 Nm.

4. Tighten to 13 Nm.

5. Tighten to 25 Nm.

</table>
The anti-lock control - stability assist system includes the:

- anti-lock brake system (ABS)
- dynamic stability control (DSC)
- emergency brake assist (EBA)
- traction control system (TCS)
- engine drag control - vehicles with Diesel engines

**Anti-lock Brake System (ABS)**

The anti-lock brake system (ABS) modulates brake pressure on each wheel independently to maintain vehicle stability during braking. The ABS continually monitors the rotational velocity of each wheel anytime the ignition switch is in the run position and determines if a tire is skidding when the brakes are applied. Only then does the ABS intervene to modulate the brake pressure to the skidding wheel. The modulation continues until the wheel rotates freely. The brake pressure is then restored and the modulate/restore cycle is repeated whenever skidding is detected. This cycle occurs at a rate of several times per second.

The ABS module is capable of detecting the following system conditions:

- hydraulic valve failure
- wheel speed sensor failure
- ABS power relay short circuit
- interconnect failures to the ABS sensors, power and ground to the ABS module
- over/under voltage conditions

The ABS provides self-diagnostics and displays failure messages via the ABS indicator in the instrument cluster. Failure of the ABS module, for whatever reason, will not compromise the normal operation of the brake system.

**Traction Control**

Traction control is an additional function added to the anti-lock control - stability control system. The vehicles driven wheels are continually monitored for individual wheel speed relative to the calculated vehicle reference speed. If wheel slip is detected the traction control system intervenes. This intervention will either be brake control and/or engine torque control, dependent on the situation detected. This control remains active until traction is re-established.

**Stability Assist**

Dynamic stability control (DSC) maximizes vehicle stability under all conditions. The DSC system compares actual vehicle course to that intended by the driver. If the intended course differs from the actual course due to either over steer and/or under steer conditions, the DSC system will brake individual wheels and/or reduce engine torque to bring the vehicle back to the driver's intended direction. By using a combined yaw rate sensor and lateral accelerometer, the vehicles rotational motion around its vertical axis and centrifugal forces generated while cornering are calculated to determine the vehicle's actual behavior. Using additional sensors for detecting steering wheel position and road wheel speed enables the system to recognize the driver's intentions.

Dynamic stability control is enabled/disabled via the DSC ON/OFF switch. When the switch is in the OFF position, the amber DSC warning lamp solidly illuminates within the instrument cluster message center. The DSC is automatically activated when the ignition is switched on. The DSC also provides failure messages via the instrument cluster message center.

**Emergency Brake Assist**

The emergency brake assist function allows the driver to enter ABS with greater speed and efficiency so that maximum braking is achieved sooner. This function is activated by the rate of application which is measured by the pedal travel sensor. Above a certain threshold of application the EBA assists the driver into ABS, thus reducing the stopping distance.

**Engine Drag Control - Vehicles with Diesel engine**

The ABS/DSC module functionality includes engine braking control on cars fitted with the diesel engine. On certain road surfaces, downshifting or throttle lift-off can cause excessive engine braking at the driven wheels. Engine braking control responds to these conditions by increasing the engine torque in order to reduce undesirable engine braking forces and to help maintain maximum vehicle stability.

Engine braking control functions in conjunction with ABS and therefore it cannot be turned off by the DSC control switch. The engine braking control system provides self-diagnostics and displays failure messages via the ABS indicator in the instrument cluster. Failure of the engine braking control system, for whatever reason, will not compromise the normal operation of the brake system.
The ABS modulates brake pressure on each wheel independently to maintain vehicle stability during braking. The ABS continually monitors the rotational velocity of each wheel during driving and determines if a tire is skidding when the brakes are applied. Only then does the ABS intervene to modulate the brake pressure to the skidding wheel. The modulation continues until the wheel rotates freely. The brake pressure is then restored and the modulate/restore cycle is repeated whenever skidding is detected. This cycle occurs at a rate of several times per second.

The ABS/dynamic stability control module is capable of detecting the following system conditions:

- hydraulic valve failure
- wheel speed sensor failure
- ABS power relay short circuit
- interconnect failures to the ABS sensors, power and ground to the ABS module
- over/under voltage conditions.

The ABS provides self-diagnostics and displays failure messages through the ABS warning indicator in the instrument cluster. Failure of the ABS module, for whatever reason, will not compromise the normal operation of the brake system.

The dynamic stability control system includes the:
The dynamic stability control system manages the braking system to enhance the driver control of the vehicle.

The dynamic stability control system continually monitors the steering wheel angle, master cylinder brake pressure, front and rear wheel speeds and vehicle lateral/yaw rate acceleration.

The dynamic stability control module supports speed control and stability assist functions.

The lateral/yaw rate sensor supplies a signal to the dynamic stability control module, via a serial link, which monitors the vehicles rate of acceleration from its central axis in a sideways direction, and also the vehicles angular rotation around it's central axis.

The driver input parameters are continually monitored by the steering wheel rotation sensor and the HCU master cylinder pressure sensor.

Dynamic stability control is enabled/disabled through the traction control ON/OFF switch.

Self-diagnosis of the dynamic stability control system is provided through the instrument cluster and message center.

Traction control is an additional function added to the ABS/dynamic stability control system. The vehicles driven wheels are continually monitored for wheel spin relative to the calculated reference speed and to each other. If wheel spin is detected, the traction control function intervenes independently of the driver, applying brake pressure to the spinning wheel and reducing the engine drive torque supply. Meanwhile, brake pressure is modulated by the traction control until traction is re-established. Traction control brake actuation is diminished above 40 kph (25 mile/h). Above this speed, traction control relies primarily on engine torque reduction.

Traction control is enabled/disabled through the traction control ON/OFF switch. When the switch is in the OFF position, the amber traction control warning lamp solidly illuminates within the instrument cluster message center. The traction control is automatically activated when the ignition is switched on. Self-diagnosis of the traction control system is also provided through the instrument cluster and message center.

The traction control brake intervention is automatically disabled whenever the brakes exceed a temperature limit. The traction brake intervention will remain disabled until the brakes have cooled.

**Anti-Lock Control - Stability Assist - Anti-Lock Control - Stability Assist**

**VIN Range: M45255->N52206**

**Diagnosis and Testing**

**Principle of operation**

The anti-lock control - stability assist system includes:

- anti-lock brake system (ABS)
- yaw/acceleration control
- emergency brake assist
- traction control

**Anti-lock Brake System (ABS)**

The anti-lock brake system (ABS) modulates brake pressure on each wheel independently to maintain vehicle stability during braking. The ABS continually monitors the rotational velocity of each wheel anytime the ignition switch is in the run position and determines if a tire is skidding when the brakes are applied. Only then does the ABS intervene to modulate the brake pressure to the skidding wheel. The modulation continues until the wheel rotates freely. The brake pressure is then restored and the modulate/restore cycle is repeated whenever skidding is detected. This cycle occurs at a rate of several times per second.

The ABS module is capable of detecting the following system conditions:

- hydraulic valve failure
- wheel speed sensor failure
- ABS power relay short circuit
- interconnect failures to the ABS sensors, power and ground to the ABS module
- over/under voltage conditions

The ABS provides self-diagnostics and displays failure messages via the ABS indicator in the instrument cluster. Failure of the ABS module, for whatever reason, will not compromise the normal operation of the brake system.

**Traction Control**

Traction control is an additional function added to the anti-lock control - stability assist system. The vehicles driven wheels are continually monitored for wheel spin relative to the calculated reference speed and to each other. If wheel spin is detected, the traction control function intervenes, applying brake pressure to the slipping wheel and reducing the engine drive torque supply. Meanwhile, brake pressure is modulated by the traction control until traction is re-established. Traction control brake actuation is diminished above 40 km/h (25 mph). Above this speed traction control relies primarily on engine torque reduction.

The traction control brake intervention is automatically disabled whenever the brakes exceed a temperature limit. The traction control brake intervention will remain disabled until the brakes have cooled, irrespective of ignition switch position or ignition switch cycling.

**Stability Assist**

Dynamic stability control (DSC) maximizes vehicle stability under all conditions. The DSC system compares actual vehicle course to that intended by the driver. If the intended course differs from the actual course due to over steer or under steer conditions, the DSC system will brake individual wheels and reduce engine torque to bring the vehicle back to the driver's intended direction. By using a combined yaw rate sensor and lateral accelerometer, the vehicles rotational motion around its vertical axis and centrifugal forces generated while cornering are calculated to determine the vehicle's actual behavior. Using additional sensors for detecting steering wheel position and road wheel speed enables the system to recognize the driver's intentions.

Dynamic stability control is enabled/disabled via the DSC ON/OFF switch. When the switch is in the OFF position, the amber DSC warning lamp solidly illuminates within the instrument cluster message center. The DSC is automatically activated when the ignition switch is switched on. The DSC also provides failure messages via the instrument cluster message center.

**Emergency Brake Assist**

The emergency brake assist function allows the driver to enter ABS with greater speed and efficiency so that maximum braking is achieved sooner. Using the information received from the wheel speed sensors, brake pedal travel switch, master cylinder pressure transducer, master cylinder active booster solenoid and the yaw rate sensor and accelerometer, the ABS module detects whether more braking pressure can be applied in relation to how much braking pressure the driver is applying in an emergency braking situation.

**Inspection and Verification**

1. **Verify the customer concern.**
2. **Confirm if the ABS warning light was illuminated, or still is.**
   - **NOTE:** An intermittent fault may allow the warning light to go off. This does not necessarily mean the fault is not present. Some warnings will appear to clear when the ignition is cycled. This is often because the warning has flagged as a result of one of the vehicle's on-board diagnostic routines having run to detect the fault. If the same routine is not run when the ignition is switched ON, the warning will not reflag until the routine does run.

3. **Visually inspect for obvious signs of mechanical or electrical damage.**

<tr>
<td>C2778</td>
<td>Yaw rate/Lateral accelerometer sensor cluster power supply failure</td>
<td>• Sensor supply voltage open circuit, short circuit to GROUND or B+, ABS/DSC module failure</td>
<td>For lateral/yaw rate sensor circuit tests, GO to Pinpoint Test G. Contact dealer technical support for advice on possible ABS/DSC module failure.</td>
</tr>
</tbody>
</table>
For CAN module circuit tests, refer to inspection and reconfiguration of modules.

Contact dealer technical support for advice on recalibration of the yaw rate sensor cluster.

CAUTION: When probing connectors to take measurements in the course of the pinpoint tests, use the adaptor kit, part number 3548-1358-00.

NOTE: When performing electrical voltage or resistance tests, always use a digital multimeter (DMM) accurate to 3 decimal places, and with an up-to-date calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.

NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

**Pinpoint Test A: C1095; PUMP MOTOR FAULT**

**NOTE:** Check connectors and pins for damage/corrosion (see visual inspection).

**TEST CONDITIONS**

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>A1: CHECK THE BATTERY POWER SUPPLY (1) TO THE ABS/DSC MODULE</td>
<td></td>
</tr>
<tr>
<td>1. Turn the ignition switch to the OFF position.</td>
<td></td>
</tr>
<tr>
<td>2. Disconnect the ABS/DSC module electrical connector FH103.</td>
<td></td>
</tr>
<tr>
<td>3. Measure the voltage between FH103, pin 01 (R) and GROUND.</td>
<td></td>
</tr>
</tbody>
</table>
Is the voltage less than 10 volts?

Yes
- REPAIR the circuit. This circuit includes the front power distribution fuse box (fuse 28). For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No
- GO to A2.

A2: CHECK THE BATTERY POWER SUPPLY (2) TO THE ABS/DSC MODULE

1 Measure the voltage between FH103, pin 32 (RW) and GROUND.

Is the voltage less than 10 volts?

Yes
- REPAIR the circuit. This circuit includes the front power distribution fuse box (fuse 31). For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No
- GO to A3.

A3: CHECK THE GROUND TO THE ABS/DSC MODULE

1 Measure the resistance between FH103, pins 16 and 47 (B) and GROUND.

Is the resistance greater than 5 ohms?

Yes
- REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No
- Contact dealer technical support for advice on possible ABS/DSC module failure.

PINPOINT TEST B: C1145; RIGHT HAND FRONT WHEEL SPEED SENSOR (WSS) ELECTRICAL FAILURE

* NOTE: Check connectors and pins for damage/corrosion (see visual inspection).

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>B1: CHECK THE WSS TO ABS/DSC MODULE SIGNAL CIRCUIT FOR HIGH RESISTANCE</td>

</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?

Yes
- REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No
- GO to B2.

B2: CHECK THE WSS TO ABS/DSC MODULE SIGNAL CIRCUIT FOR SHORT TO GROUND

1 Measure the resistance between FH103, pin 34 (WR) and GROUND.

Is the resistance less than 10,000 ohms?

Yes
- REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No
- GO to B3.

B3: CHECK THE WSS TO ABS/DSC MODULE SUPPLY CIRCUIT FOR HIGH RESISTANCE

1 Measure the resistance between FH103, pin 33 (YG) and FH116, pin 02 (YG).

Is the resistance greater than 5 ohms?

Yes
- REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No
- GO to B4.

B4: CHECK THE WSS TO ABS/DSC MODULE SUPPLY CIRCUIT FOR SHORT TO GROUND

1 Measure the resistance between FH103, pin 33 (YG) and GROUND.

Is the resistance less than 10,000 ohms?

Yes
- REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No
- INSTALL a new right-hand front wheel speed sensor.
  REFER to Front Wheel Speed Sensor - in this section.
  CLEAR the DTC. TEST the system for normal operation. If the DTC is repeated, contact dealer technical support for advice on possible ABS/DSC module failure.

PINPOINT TEST C: C1155; LEFT HAND FRONT WHEEL SPEED SENSOR (WSS) ELECTRICAL FAILURE

* NOTE: Check connectors and pins for damage/corrosion (see visual inspection).

<table>
<thead>
<tr>

</tbody>
</table>

Is the resistance greater than 5 ohms?

Yes
- REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No
- GO to C2.

C2: CHECK THE WSS TO ABS/DSC MODULE SIGNAL CIRCUIT FOR SHORT TO GROUND

1 Measure the resistance between FH103, pin 46 (Y) and GROUND.
Is the resistance less than 10,000 ohms?

Yes

REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No

GO to C3.

C3: CHECK THE WSS TO ABS/DSC MODULE SUPPLY CIRCUIT FOR HIGH RESISTANCE

1. Measure the resistance between FH103, pin 46 (Y) and FH115, pin 02 (Y).

Is the resistance greater than 5 ohms?

Yes

REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No

GO to C4.

C4: CHECK THE WSS TO ABS/DSC MODULE SUPPLY CIRCUIT FOR SHORT TO GROUND

1. Measure the resistance between FH103, pin 46 (Y) and GROUND.

Is the resistance less than 10,000 ohms?

Yes

REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No

INSTALL a new left-hand front wheel speed sensor.

REFER to Front Wheel Speed Sensor - in this section.

CLEAR the DTC. TEST the system for normal operation. If the DTC is repeated, contact dealer technical support for advice on possible ABS/DSC module failure.

PINPOINT TEST D : C1165; RIGHT HAND REAR WHEEL SPEED SENSOR (WSS) ELECTRICAL FAILURE

• NOTE: Check connectors and pins for damage/corrosion (see visual inspection).

TEST CONDITIONS

DETAILS/RESULTS/ACTIONS

D1: CHECK THE WSS TO ABS/DSC MODULE SIGNAL CIRCUIT FOR HIGH RESISTANCE

1. Turn the ignition switch to the OFF position.
2. Disconnect the ABS/DSC module electrical connector FH103.
3. Disconnect the WSS electrical connector RR01.
4. Measure the resistance between FH103, pin 43 (N) and RR01, pin 01 (N).

Is the resistance greater than 5 ohms?

Yes

REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No

GO to D2.

D2: CHECK THE WSS TO ABS/DSC MODULE SIGNAL CIRCUIT FOR SHORT TO GROUND

1. Measure the resistance between FH103, pin 43 (N) and GROUND.

Is the resistance less than 10,000 ohms?

Yes

REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No

GO to D3.

D3: CHECK THE WSS TO ABS/DSC MODULE SUPPLY CIRCUIT FOR HIGH RESISTANCE

1. Measure the resistance between FH103, pin 42 (B) and RR01, pin 01 (B).

Is the resistance greater than 5 ohms?

Yes

REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No

GO to D4.

D4: CHECK THE WSS TO ABS/DSC MODULE SUPPLY CIRCUIT FOR SHORT TO GROUND

1. Measure the resistance between FH103, pin 42 (B) and GROUND.

Is the resistance less than 10,000 ohms?

Yes

REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No

INSTALL a new right-hand rear wheel speed sensor.

REFER to Rear Wheel Speed Sensor - in this section.

CLEAR the DTC. TEST the system for normal operation. If the DTC is repeated, contact dealer technical support for advice on possible ABS/DSC module failure.

PINPOINT TEST E : C1175; LEFT HAND REAR WHEEL SPEED SENSOR (WSS) ELECTRICAL FAILURE

• NOTE: Check connectors and pins for damage/corrosion (see visual inspection).

TEST CONDITIONS

DETAILS/RESULTS/ACTIONS

E1: CHECK THE WSS TO ABS/DSC MODULE SIGNAL CIRCUIT FOR HIGH RESISTANCE

1. Turn the ignition switch to the OFF position.
2. Disconnect the ABS/DSC module electrical connector FH103.
3. Disconnect the WSS electrical connector RL01.
4. Measure the resistance between FH103, pin 36 (N) and RL01, pin 02 (N).

Is the resistance greater than 5 ohms?

Yes

REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No

GO to E2.

E2: CHECK THE WSS TO ABS/DSC MODULE SIGNAL CIRCUIT FOR SHORT TO GROUND

1. Measure the resistance between FH103, pin 36 (N) and GROUND.
Is the resistance less than 10,000 ohms?
Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
No
GO to E3.

E3: CHECK THE WSS TO ABS/DSC MODULE SUPPLY CIRCUIT FOR HIGH RESISTANCE
1. Measure the resistance between FH103, pin 37 (B) and RL01, pin 01 (B).

Is the resistance greater than 5 ohms?
Yes
REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
No
GO to E4.

E4: CHECK THE WSS TO ABS/DSC MODULE SUPPLY CIRCUIT FOR SHORT TO GROUND
1. Measure the resistance between FH103, pin 37 (B) and GROUND.

Is the resistance less than 10,000 ohms?
Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
No
INSTALL a new left-hand rear wheel speed sensor.
REFER to Rear Wheel Speed Sensor - in this section.
CLEAR the DTC. TEST the system for normal operation. If the DTC is repeated, contact dealer technical support for advice on possible ABS/DSC module failure.

PINPOINT TEST F : C1277, C1295; STEERING ANGLE SENSOR (SA SENSOR) 'A' AND 'B' CIRCUIT FAILURE

• NOTE: Check connectors and pins for damage/corrosion (see visual inspection).

TEST CONDITIONS

<table>
<thead>
<tr>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>DETAILS/RESULTS/ACTIONS</td>
</tr>
<tr>
<td>DETAILS/RESULTS/ACTIONS</td>
</tr>
</tbody>
</table>

F1: CHECK THE VOLTAGE SUPPLY TO THE STEERING ANGLE SENSOR
1. Disconnect the steering angle sensor electrical connector FC110.
2. Turn the ignition switch to the ON position.
3. Measure the voltage between FC110, pin 01 (R) and GROUND.

Is the voltage less than 10 volts?
Yes
GO to F2.
No
GO to F3.

F2: CHECK THE STEERING ANGLE SENSOR VOLTAGE SUPPLY CIRCUIT FOR HIGH RESISTANCE
1. Turn the ignition switch to the OFF position.
2. Disconnect the ABS/DSC module electrical connector FH103.
3. Measure the continuity between FH103, pin 07 (R) and FC110, pin 01 (R).

Is the resistance greater than 5 ohms?
Yes
REPAIR the high resistance circuit. This circuit includes the splice FCS18. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
No
Contact dealer technical support for advice on possible ABS/DSC module failure.

F3: CHECK THE STEERING ANGLE SENSOR GROUND SUPPLY CIRCUIT
1. Turn the ignition switch to the OFF position.
2. Reconnect the ABS/DSC module electrical connector FH103.
3. Disconnect the yaw/lateral rate sensor electrical connector CA236.
4. Turn the ignition switch to the ON position.
5. Measure the resistance between FC110, pin 04 (B) and GROUND.

Is the resistance greater than 5 ohms?
Yes
REPAIR the high resistance circuit. This circuit includes the splice FCS19. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
No
GO to F4.

F4: CHECK THE STEERING ANGLE SENSOR SIGNAL CIRCUIT 'A' FOR HIGH RESISTANCE
1. Turn the ignition switch to the OFF position.
2. Disconnect the ABS/DSC module electrical connector FH103.
3. Measure the resistance between FH103, pin 03 (G) and FC110 pin 03 (G).

Is the resistance greater than 5 ohms?
Yes
GO to F5.
No
REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

F5: CHECK THE STEERING ANGLE SENSOR SIGNAL CIRCUIT 'B' FOR HIGH RESISTANCE
1. Measure the resistance between FH103, pin 06 (Y) and FC110, pin 02 (Y).

Is the resistance greater than 5 ohms?
Yes
GO to F6.
No
REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

F6: CHECK THE STEERING ANGLE SENSOR SIGNAL CIRCUIT 'A' FOR SHORT TO GROUND
1. Measure the resistance between FC110, pin 03 (G) and GROUND.

Is the resistance less than 10,000 ohms?
Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
No
### F7: CHECK THE STEERING ANGLE SENSOR SIGNAL CIRCUIT 'B' FOR SHORT TO GROUND

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>

### PINPOINT TEST H: C1285; ACTIVE BOOSTER SOLENOID CIRCUIT FAILURE

- NOTE: Check connectors and pins for damage/corrosion (see visual inspection).

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>H1: CHECK THE ACTIVE BOOSTER SOLENOID SUPPLY VOLTAGE</td>
<td></td>
</tr>
<tr>
<td>Disconnect the active booster solenoid electrical connector, FH56.</td>
<td></td>
</tr>
</tbody>
</table>
Turn the ignition switch to the **ON** position.

Measure the voltage between FH56, pin 04 (WR) and GROUND.

Is the voltage less than 10 volts?

Yes

GO to H2.

No

GO to H4.

**H2: CHECK THE ACTIVE BOOSTER SOLENOID SUPPLY CIRCUIT FOR HIGH RESISTANCE**

1. Turn the ignition switch to the **OFF** position.
2. Disconnect the ABS/DSC module electrical connector FH103.
3. Measure the resistance between FH56, pin 04 (WR) and FH103, pin 17 (WR).

Is the resistance greater than 5 ohms?

Yes

REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No

GO to H3.

**H3: CHECK THE ACTIVE BOOSTER SOLENOID SUPPLY CIRCUIT FOR SHORT TO GROUND**

1. Measure the resistance between FH56 pin 04 (WR) and GROUND.

Is the resistance less than 10,000 ohms?

Yes

REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No

Contact dealer technical support for advice on possible ABS/DSC module failure.

**H4: CHECK THE ACTIVE BOOSTER SOLENOID SIGNAL CIRCUIT FOR HIGH RESISTANCE**

1. Disconnect the ABS/DSC module electrical connector FH103.
2. Measure the resistance between FH56, pin 03 (NR) and FH103, pin 31 (NR).

Is the resistance greater than 5 ohms?

Yes

REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No

GO to H5.

**H5: CHECK THE ACTIVE BOOSTER SOLENOID SIGNAL CIRCUIT FOR SHORT TO GROUND**

1. Measure the resistance between FH56, pin 03 (NR) and GROUND.

Is the resistance less than 10,000 ohms?

Yes

REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No

Contact dealer technical support for advice on possible active booster failure. CLEAR the DTC. TEST the system for normal operation. If the DTC is repeated, contact dealer technical support for advice on possible ABS/DSC module failure.

</tbody>
</table>
Is the resistance greater than 5 ohms?
Yes
    REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
    Contact dealer technical support for advice on possible ABS/DSC module failure.
No
    GO to J7.

J6: CHECK THE PRESSURE SENSOR GROUND CIRCUIT FOR SHORT TO B+

1. Measure the voltage between the pressure sensor electrical connector FH54, pin 01 (NW) and GROUND.

Is the voltage greater than 3 volts?
Yes
    REPAIR the circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
No
    GO to J7.

J7: CHECK THE PRESSURE SENSOR SIGNAL CIRCUIT FOR HIGH RESISTANCE

1. Measure the resistance between FH54, pin 02 (WB) and FH103, pin 20 (WB).

Is the resistance greater than 5 ohms?
Yes
    REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
No
    GO to J8.

J8: CHECK THE PRESSURE SENSOR SIGNAL CIRCUIT FOR SHORT TO GROUND

1. Measure the resistance between FH54, pin 02 (WB) and GROUND.

Is the resistance less than 10,000 ohms?
Yes
    REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
No
    GO to J9.

J9: CHECK THE PRESSURE SENSOR SIGNAL CIRCUIT FOR SHORT TO B+

1. Measure the voltage between FH54, pin 02 (WB) and GROUND.

Is the voltage greater than 5 volts?
Yes
    REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
No
    INSTALL a new pressure sensor.
    REFER to Brake Master Cylinder Primary Pressure Transducer - in this section.
    CLEAR the DTC. TEST the system for normal operation. If the DTC is repeated, contact dealer technical support for advice on possible ABS/DSC module failure.

</tbody>
</table>
K6: CHECK THE PEDAL TRAVEL SENSOR GROUND CIRCUIT FOR SHORT TO B+

1. Measure the voltage between FH11, pin 02 (WB) and GROUND.

   Is the voltage greater than 3 volts?
   - Yes: REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
   - No: GO to K7.

K7: CHECK THE PEDAL TRAVEL SENSOR SIGNAL CIRCUIT FOR HIGH RESISTANCE

1. Turn the ignition switch to the OFF position.
2. Disconnect the ABS/DSC module electrical connector FH103.
3. Measure the resistance between FH11, pin 03 (W) and FH103, pin 40 (W).

   Is the resistance greater than 5 ohms?
   - Yes: REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
   - No: GO to K8.

K8: CHECK THE PEDAL TRAVEL SENSOR SIGNAL CIRCUIT FOR SHORT TO GROUND

1. Measure the resistance between FH11, pin 03 (W) and GROUND.

   Is the resistance less than 10,000 ohms?
   - Yes: REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
   - No: GO to K9.

K9: CHECK THE PEDAL TRAVEL SENSOR SIGNAL SIGNAL CIRCUIT FOR SHORT TO B+

1. Measure the voltage between FH11, pin 03 (W) and GROUND.

   Is the voltage greater than 3 volts?
   - Yes: REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
   - No: Contact dealer technical support for advice on possible active booster failure.

PINPOINT TEST L: C1446; BRAKE LIGHT SWITCH CIRCUIT FAILURE

- NOTE: Check the brake light function before beginning pinpoint tests.
- NOTE: Check connectors and pins for damage/corrosion (see visual inspection).

TEST CONDITIONS DETAILS/RESULTS/ACTIONS

L1: CHECK THE BRAKE LIGHT SWITCH SUPPLY VOLTAGE

1. Disconnect the brake light switch electrical connector CA37.
2. Turn the ignition switch to the ON position.
3. Measure the voltage between CA37, pin 01 (NR) and GROUND.

   Is the voltage less than 10 volts?
   - Yes: REPAIR the circuit between the battery and the brake light switch electrical connector CA37, pin 01 (NR). This circuit includes the Primary junction fuse box (fuse 35). For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
   - No: GO to L2.

L2: CHECK THE BRAKE LIGHT SWITCH OUTPUT VOLTAGE

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery ground cable.
3. Disconnect the engine control module (ECM) electrical connector PI01.
4. Reconnect the battery ground cable.
5. Turn the ignition switch to the ON position.
6. Depress the brake pedal.
7. Measure the voltage between PI01, pin 08 (GO) and GROUND.

   Is the voltage less than 10 volts?
   - Yes: GO to L3.
   - No: Contact dealer technical support for advice on possible engine control module (ECM) failure.

L3: CHECK THE BRAKE LIGHT SWITCH OUTPUT CIRCUIT FOR HIGH RESISTANCE

1. Measure the resistance between CA37, pin 02 (GO), and PI01, pin 08 (GO).

   Is the resistance greater than 5 ohms?
   - Yes: REPAIR the high resistance circuit. This circuit includes the splice CAS22. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
   - No: INSTALL a new brake light switch. CLEAR the DTC. TEST the system for normal operation.
Overview

There are some changes for 2006 my, the most obvious of which when diagnosing the system is the change to 7-digit diagnostic trouble codes (DTCs) from the familiar 5-digit.

Refer to the DTC index in this section for guidance on how to use these codes with the Jaguar approved diagnostic system or a scan tool.

For information on the operation of the system, REFER to: Anti-Lock Control - Stability Assist - VIN Range: N52048->N99999 (206-09 Anti-Lock Control - Stability Assist, Description and Operation).

Inspection and Verification

1. Verify the customer concern.
2. Confirm if the ABS warning light was illuminated, or still is.
   • NOTE: An intermittent fault may allow the warning light to go off. This does not necessarily mean the fault is not present. Some warnings will appear to clear when the ignition is cycled. This is often because the warning has flagged as a result of one of the vehicle’s on-board diagnostic routines having run to detect the fault. If the same routine is not run when the ignition is switched ON, the warning will not reflag until the routine does run.
3. Visually inspect for obvious signs of mechanical or electrical damage.

<table>
<thead>
<tr>
<th>Mechanical</th>
<th>Electrical</th>
</tr>
</thead>
<tbody>
<tr>
<td>Brake fluid level</td>
<td>Warming light operation</td>
</tr>
<tr>
<td>Vacuum system</td>

</tr>
</tbody>
</table>

4. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
5. If the cause is not visually evident use the Jaguar approved diagnostic system or a scan tool to retrieve the fault codes before proceeding to the DTC index chart.

Fuse Identification Table

<table>
<thead>

</tbody>
</table>

DTC Index

• NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

</table>
3. Make sure the brake pedal is not pressed.
4. Measure the resistance between:
   | Brake switch connector CA037, component side | Brake switch connector CA037, component side |
   | Pin 01 | Pin 02 |
Is the resistance greater than 10 ohms?
Yes  Go to B2.
No   INSTALL a new brake switch. CLEAR the DTC, test the system for normal operation.

B2: CHECK THE OPERATION OF THE BRAKE SWITCH (PEDAL PRESSED)
1. Press the brake pedal.
2. Measure the resistance between:
   | Brake switch connector CA037, component side | Brake switch connector CA037, component side |
   | Pin 01 | Pin 02 |
Is the resistance greater than 10 ohms?
Yes  INSTALL a new brake switch. CLEAR the DTC, test the system for normal operation.
No   Go to B3.

B3: CHECK THE POWER SUPPLY TO THE BRAKE PEDAL SWITCH
1. Key on, engine off.
2. Measure the voltage between:
   | Brake switch connector CA037, harness side | Battery |
   | Pin 01 | Negative terminal |
Is the voltage less than 10 volts?
Yes  REPAIR the circuit between the brake switch and battery. This circuit includes fuse 35 of the primary junction box. For additional information, refer to the wiring diagrams. CLEAR the DTC, test the system for normal operation.
No   Go to B4.

B4: CHECK THE BRAKE SWITCH SIGNAL CIRCUIT FOR SHORT CIRCUIT TO GROUND
1. Key off.
2. Measure the resistance between:
   | Brake switch connector CA037, harness side | Battery |
   | Pin 02 | Negative terminal |
Is the resistance less than 100 Kohms?
Yes  REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC, test the system for normal operation.
No   Go to B5.

B5: CHECK THE BRAKE SWITCH SIGNAL CIRCUIT FOR SHORT CIRCUIT TO POWER
1. Measure the resistance between:
   | Brake switch connector CA037, harness side | Battery |
   | Pin 02 | Positive terminal |
Is the resistance less than 100 Kohms?
Yes  REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC, test the system for normal operation.
No   Go to B6.

B6: CHECK THE BRAKE SWITCH SIGNAL CIRCUIT FOR HIGH RESISTANCE
1. Disconnect the ECM electrical connector, FH300.
2. Measure the resistance between:
   | Brake switch connector CA037, harness side | ECM connector FH300, harness side |
   | Pin 02 | Pin 41 |
Is the resistance less than 10 ohms?
Yes  CHECK for CAN DTCs indicating a network fault.
No   REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

PINPOINT TEST C: MODULE SUPPLIES AND GROUNDS

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>C1: CHECK THE MODULE PUMP SUPPLY</td>
<td></td>
</tr>
</tbody>
</table>
ABS module connector, FH103

### Circuit Pin

- Valves supply: 32
- Batt supply: 02
- Ignition supply: 08
- Pump ground: 47
- Valve ground: 16

#### PINPOINT TEST D : LEFT HAND FRONT WHEEL SPEED SENSOR (WSS)

1. **Key off.**
2. Disconnect the ABS module connector, FH103.
3. Measure the voltage between:
   - FH103, harness side
   - Battery

<table>
<thead>
<tr>
<th>Pin</th>
<th>Voltage Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>01</td>
<td>9 to 15 volts</td>
</tr>
</tbody>
</table>

Is the voltage between 9 and 15 volts?
- **Yes**
  - **GO to C2.**
- **No**
  - REPAIR the supply circuit as necessary. This circuit includes fuse 29 of the front power distribution box. For additional information, refer to the wiring diagrams. Clear the DTC, test the system for normal operation.

**C2: CHECK THE MODULE VALVES SUPPLY**

1. Measure the voltage between:
   - FH103, harness side
   - Battery

<table>
<thead>
<tr>
<th>Pin</th>
<th>Voltage Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>32</td>
<td>9 to 15 volts</td>
</tr>
</tbody>
</table>

Is the voltage between 9 and 15 volts?
- **Yes**
  - **GO to C3.**
- **No**
  - REPAIR the supply circuit as necessary. This circuit includes fuse 04 of the front power distribution box. For additional information, refer to the wiring diagrams. Clear the DTC, test the system for normal operation.

**C3: CHECK THE MODULE BATT SUPPLY**

1. Measure the voltage between:
   - FH103, harness side
   - Battery

<table>
<thead>
<tr>
<th>Pin</th>
<th>Voltage Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>02</td>
<td>9 to 15 volts</td>
</tr>
</tbody>
</table>

Is the voltage between 9 and 15 volts?
- **Yes**
  - **GO to C4.**
- **No**
  - REPAIR the supply circuit as necessary. This circuit includes fuse 01 of the front power distribution box. For additional information, refer to the wiring diagrams. Clear the DTC, test the system for normal operation.

**C4: CHECK THE MODULE IGNITION SUPPLY**

1. **Key on, engine off.**
2. Measure the voltage between:
   - FH103, harness side
   - Battery

<table>
<thead>
<tr>
<th>Pin</th>
<th>Voltage Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>08</td>
<td>9 to 15 volts</td>
</tr>
</tbody>
</table>

Is the voltage between 9 and 15 volts?
- **Yes**
  - **GO to C5.**
- **No**
  - REPAIR the supply circuit as necessary. This circuit includes fuse 03 of the primary junction box. For additional information, refer to the wiring diagrams. Clear the DTC, test the system for normal operation.

**C5: CHECK THE PUMP GROUND**

1. **Key off.**
2. Measure the resistance between:
   - FH103, harness side
   - Battery

<table>
<thead>
<tr>
<th>Pin</th>
<th>Resistance</th>
</tr>
</thead>
<tbody>
<tr>
<td>47</td>
<td>&lt; 10 ohms</td>
</tr>
</tbody>
</table>

Is the resistance less than 10 ohms?
- **Yes**
  - **GO to C6.**
- **No**
  - REPAIR the ground circuit as necessary. For additional information, refer to the wiring diagrams. Clear the DTC, test the system for normal operation.

**C6: CHECK THE VALVE GROUND**

1. Measure the resistance between:
   - FH103, harness side
   - Battery

<table>
<thead>
<tr>
<th>Pin</th>
<th>Resistance</th>
</tr>
</thead>
<tbody>
<tr>
<td>16</td>
<td>&lt; 10 ohms</td>
</tr>
</tbody>
</table>

Is the resistance less than 10 ohms?
- **Yes**
  - Refer to the warranty policy and procedures manual if a module is suspect.
- **No**
  - REPAIR the ground circuit as necessary. For additional information, refer to the wiring diagrams. Clear the DTC, test the system for normal operation.
D1: CHECK THE WSS RETURN CIRCUIT FOR SHORT CIRCUIT TO GROUND

Left hand front wheel speed sensor, FH15

<table>
<thead>
<tr>
<th>Circuit</th>
<th>Pin</th>
</tr>
</thead>
<tbody>
<tr>
<td>WSS return</td>
<td>01</td>
</tr>
<tr>
<td>WSS signal</td>
<td>02</td>
</tr>
</tbody>
</table>

ABS module connector, FH103

<table>
<thead>
<tr>
<th>Circuit</th>
<th>Pin</th>
</tr>
</thead>
<tbody>
<tr>
<td>Left hand front WSS return</td>
<td>46</td>
</tr>
<tr>
<td>Left hand front WSS signal</td>
<td>45</td>
</tr>
</tbody>
</table>

1. Key off.
2. Disconnect the WSS connector, FH15.
3. Disconnect the ABS module connector, FH103.
4. Key on, engine off.
5. Measure the resistance between:
   - FH15, harness side Battery
   - Pin 01 Negative terminal

   Is the resistance greater than 100 Kohms?
   - Yes: GO to D2.
   - No: REPAIR the short circuit. For additional information, refer to the wiring diagrams. Clear the DTC, test the system for normal operation by driving the vehicle at more than 20 kph (12.5 mph) for more than 3 minutes.

D2: CHECK THE WSS RETURN CIRCUIT FOR SHORT CIRCUIT TO POWER

1. Measure the resistance between:
   - FH15, harness side Battery
   - Pin 01 Positive terminal

   Is the resistance greater than 100 Kohms?
   - Yes: GO to D3.
   - No: REPAIR the short circuit. For additional information, refer to the wiring diagrams. Clear the DTC, test the system for normal operation by driving the vehicle at more than 20 kph (12.5 mph) for more than 3 minutes.

D3: CHECK THE WSS RETURN CIRCUIT FOR HIGH RESISTANCE

1. Measure the resistance between:
   - FH15, harness side FH103, harness side
   - Pin 01 Pin 46

   Is the resistance less than 10 ohms?
   - Yes: GO to D4.
   - No: REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. Clear the DTC, test the system for normal operation by driving the vehicle at more than 20 kph (12.5 mph) for more than 3 minutes.

D4: CHECK THE WSS SIGNAL CIRCUIT FOR SHORT CIRCUIT TO POWER

1. Measure the resistance between:
   - FH15, harness side Battery
   - Pin 02 Positive terminal

   Is the resistance greater than 100 Kohms?
   - Yes: GO to D5.
   - No: REPAIR the short circuit. For additional information, refer to the wiring diagrams. Clear the DTC, test the system for normal operation by driving the vehicle at more than 20 kph (12.5 mph) for more than 3 minutes.

D5: CHECK THE WSS SIGNAL CIRCUIT FOR SHORT CIRCUIT TO GROUND
1. Measure the resistance between:
   - FH15, harness side
   - FH103, harness side

   Pin 02
   Pin 45

   Is the resistance greater than 100 Kohms?
   Yes
   No

   **GO to D6.**

   **REPAIR** the short circuit. For additional information, refer to the wiring diagrams. Clear the DTC, test the system for normal operation by driving the vehicle at more than 20 kph (12.5 mph) for more than 3 minutes.

---

**D6: CHECK THE WSS SIGNAL CIRCUIT FOR HIGH RESISTANCE**

1. Measure the resistance between:
   - FH15, harness side
   - Pin 02
   - FH103, harness side
   - Pin 45

   Is the resistance less than 10 ohms?
   Yes
   No

   **GO to D7.**

   **REPAIR** the high resistance circuit. For additional information, refer to the wiring diagrams. Clear the DTC, test the system for normal operation by driving the vehicle at more than 20 kph (12.5 mph) for more than 3 minutes.

---

**D7: CHECK THE WSS SIGNAL AND RETURN CIRCUITS FOR SHORT CIRCUIT TO EACH OTHER**

1. Measure the resistance between:
   - FH15, harness side
   - Pin 01
   - FH15, harness side
   - Pin 02

   Is the resistance greater than 100 Kohms?
   Yes
   An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the harness, suspect the following components:- WSS connector- WSS- ABS module connector- ABS module
   No
   **REPAIR** the short circuit. For additional information, refer to the wiring diagrams. Clear the DTC, test the system for normal operation by driving the vehicle at more than 20 kph (12.5 mph) for more than 3 minutes.

---

**PINPOINT TEST E : RIGHT HAND FRONT WHEEL SPEED SENSOR (WSS)**

**TEST CONDITIONS**

**DETAILS/RESULTS/ACTIONS**

**E1: CHECK THE WSS RETURN CIRCUIT FOR SHORT CIRCUIT TO GROUND**

Right hand front wheel speed sensor, FH16

<table>

Is the resistance greater than 100 Kohms?
Yes\n**GO to F5.**
No\nREPAIR the short circuit. For additional information, refer to the wiring diagrams. Clear the DTC, test the system for normal operation by driving the vehicle at more than 20 kph (12.5 mph) for more than 3 minutes.

**F5: CHECK THE WSS SIGNAL CIRCUIT FOR SHORT CIRCUIT TO GROUND**

Measure the resistance between:

<table>
<thead>
<tr>
<th>RL01, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>
F6: CHECK THE WSS SIGNAL CIRCUIT FOR HIGH RESISTANCE

1. Measure the resistance between:
   - RL01, harness side
   - FH103, harness side
   - Pin 02
   - Pin 36

   Is the resistance greater than 100 Kohms?
   - Yes
     - GO to F6.
   - No
     - REPAIR the short circuit. For additional information, refer to the wiring diagrams. Clear the DTC, test the system for normal operation by driving the vehicle at more than 20 kph (12.5 mph) for more than 3 minutes.

F7: CHECK THE WSS SIGNAL AND RETURN CIRCUITS FOR SHORT CIRCUIT TO EACH OTHER

1. Measure the resistance between:
   - RL01, harness side
   - RL01, harness side
   - Pin 01
   - Pin 02

   Is the resistance greater than 100 Kohms?
   - Yes
     - An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the harness, suspect the following components:- WSS connector- WSS- ABS module connector- ABS module
     - No
     - REPAIR the short circuit. For additional information, refer to the wiring diagrams. Clear the DTC, test the system for normal operation by driving the vehicle at more than 20 kph (12.5 mph) for more than 3 minutes.

PINPOINT TEST G : RIGHT HAND REAR WHEEL SPEED SENSOR (WSS)

TEST CONDITIONS DETAILS/RESULTS/ACTIONS

G1: CHECK THE WSS RETURN CIRCUIT FOR SHORT CIRCUIT TO GROUND

Right hand rear wheel speed sensor, RR01

<table>
<thead>
<tr>
<th>Circuit</th>
<th>Pin</th>
</tr>
</thead>
<tbody>
<tr>
<td>WSS return</td>
<td>01</td>

<td>43</td>
</tr>
</tbody>
</table>

1. Key off.
2. Disconnect the WSS connector, RR01.
3. Disconnect the ABS module connector, FH103.
4. Key on engine off.
5. Measure the resistance between:
   - RR01, harness side
   - Battery
   - Pin 01
   - Negative terminal

Is the resistance greater than 100 Kohms?
   - Yes
     - GO to G2.
   - No
     - REPAIR the short circuit. For additional information, refer to the wiring diagrams. Clear the DTC, test the system for normal operation by driving the vehicle at more than 20 kph (12.5 mph) for more than 3 minutes.

G2: CHECK THE WSS RETURN CIRCUIT FOR SHORT CIRCUIT TO POWER
Measure the resistance between:

<table>
<thead>
<tr>
<th>RR01, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 01</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

Yes  
**GO to G3.**

No  
REPAIR the short circuit. For additional information, refer to the wiring diagrams. Clear the DTC, test the system for normal operation by driving the vehicle at more than 20 kph (12.5 mph) for more than 3 minutes.

---

**G3: CHECK THE WSS RETURN CIRCUIT FOR HIGH RESISTANCE**

Measure the resistance between:

<table>
<thead>
<tr>
<th>RR01, harness side</th>
<th>FH103, harness side</th>

Is the resistance greater than 100 Kohms?

Yes  
An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the harness, suspect the following components:- WSS connector- WSS- ABS module connector- ABS module

No  
REPAIR the short circuit. For additional information, refer to the wiring diagrams. Clear the DTC, test the system for normal operation by driving the vehicle at more than 20 kph (12.5 mph) for more than 3 minutes.

---

**PINPOINT TEST H: BOOSTER PRESSURE SENSOR**

**TEST CONDITIONS**

**DETAILS/RESULTS/ACTIONS**

**H1: CHECK THE POWER SUPPLY TO THE BOOSTER PRESSURE SENSOR**
1. Key off.
2. Disconnect the booster pressure sensor connector, FH130.
3. Key on, engine off.
4. Measure the voltage between:
   
   **FH130, harness side** | **Battery**
   Pin 03                 | Negative terminal

   Is the voltage greater than 4 volts?
   Yes
   No
   GO to H4.
   GO to H2.

**H2: CHECK THE BOOSTER PRESSURE SENSOR POWER SUPPLY CIRCUIT FOR SHORT CIRCUIT TO GROUND**

Measure the resistance between:

**FH130, harness side** | **Battery**
Pin 03                 | Negative terminal

Is the resistance greater than 10 Kohms?
Yes
   GO to H3.
No
   REPAIR the short circuit. For additional information, refer to the wiring diagrams. Clear the DTC, test the system for normal operation by applying and releasing the brake pedal firmly three times with the engine running.

**H3: CHECK THE BOOSTER PRESSURE SENSOR POWER SUPPLY CIRCUIT FOR HIGH RESISTANCE**

Key off.
2. Disconnect the ABS module connector, FH103.
3. Measure the resistance between:

   **FH130, harness side** | **FH103, harness side**
   Pin 03                 | Pin 26

Is the resistance less than 10 ohms?
Yes
   An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness.
No
   REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. Clear the DTC, test the system for normal operation by applying and releasing the brake pedal firmly three times with the engine running.

**H4: CHECK THE GROUND CIRCUIT TO THE BOOSTER PRESSURE SENSOR**

Measure the resistance between:

**FH130, harness side** | **Battery**
Pin 02                 | Negative terminal

Is the resistance less than 10 ohms?
Yes
   GO to H8.
No
   GO to H5.

**H5: CHECK THE BOOSTER PRESSURE SENSOR GROUND CIRCUIT FOR SHORT CIRCUIT TO POWER**

Measure the resistance between:

**FH130, harness side** | **Battery**
Pin 02                 | Positive terminal
Is the resistance greater than 10 Kohms?
Yes  \textbf{GO to H7.}
No  \textbf{GO to H6.}

\textbf{H6: CHECK WHETHER THE SHORT CIRCUIT IS IN THE HARNESS OR THE MODULE}

1. Key off.
2. Disconnect the ABS module connector, FH103.
3. Key on, engine off.
4. Measure the resistance between:

\begin{tabular}{|l|l|}
\hline
FH130, harness side & Battery \\
\hline
Pin 02 & Positive terminal \\
\hline
\end{tabular}

Is the resistance greater than 10 Kohms?
Yes  Refer to the warranty policy and procedures manual if a module is suspect.
No  REPAIR the short circuit. For additional information, refer to the wiring diagrams. Clear the DTC, test the system for normal operation by applying and releasing the brake pedal firmly three times with the engine running.

\textbf{H7: CHECK THE BOOSTER PRESSURE SENSOR GROUND CIRCUIT FOR HIGH RESISTANCE}

1. Key off.
2. Disconnect the ABS module connector, FH103.
3. Key on, engine off.
4. Measure the resistance between:

\begin{tabular}{|l|l|}
\hline
FH130, harness side & FH103, harness side \\
\hline
Pin 02 & Pin 27 \\
\hline
\end{tabular}

Is the resistance less than 10 ohms?
Yes  An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the harness, suspect the following components:- Booster pressure sensor connector- ABS module connector- ABS module
No  REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. Clear the DTC, test the system for normal operation by applying and releasing the brake pedal firmly three times with the engine running.

\textbf{H8: CHECK THE BOOSTER PRESSURE SENSOR SIGNAL A CIRCUIT FOR SHORT CIRCUIT TO GROUND}

1. Measure the resistance between:

\begin{tabular}{|l|l|}
\hline
FH130, harness side & Battery \\
\hline
Pin 04 & Negative terminal \\
\hline
\end{tabular}

Is the resistance greater than 10 Kohms?
Yes  \textbf{GO to H10.}
No  \textbf{GO to H9.}

\textbf{H9: CHECK WHETHER THE SHORT CIRCUIT IS IN THE HARNESS OR THE MODULE}

1. Key off.
2. Disconnect the ABS module connector, FH103.
3. Key on, engine off.
4. Measure the resistance between:

\begin{tabular}{|l|l|}
\hline
FH130, harness side & Battery \\
\hline
Pin 04 & Negative terminal \\
\hline
\end{tabular}

Is the resistance greater than 10 Kohms?
Yes  Refer to the warranty policy and procedures manual if a module is suspect.
No  REPAIR the short circuit. For additional information, refer to the wiring diagrams. Clear the DTC, test the system for normal operation by applying and releasing the brake pedal firmly three times with the engine running.

\textbf{H10: CHECK THE BOOSTER PRESSURE SENSOR SIGNAL A CIRCUIT FOR SHORT CIRCUIT TO POWER}

1. Measure the resistance between:

\begin{tabular}{|l|l|}
\hline
FH130, harness side & Battery \\
\hline
Pin 04 & Positive terminal \\
\hline
\end{tabular}

Is the resistance greater than 10 Kohms?
Yes  \textbf{GO to H12.}
No  \textbf{GO to H11.}

\textbf{H11: CHECK WHETHER THE SHORT CIRCUIT IS IN THE HARNESS OR THE MODULE}

1. Key off.
2. Disconnect the ABS module connector, FH103.
3. Key on, engine off.
4. Measure the resistance between:

\begin{tabular}{|l|l|}
\hline
FH130, harness side & Battery \\
\hline
Pin 04 & Positive terminal \\
\hline
\end{tabular}

Is the resistance greater than 10 Kohms?
Yes  Refer to the warranty policy and procedures manual if a module is suspect.
No  REPAIR the short circuit. For additional information, refer to the wiring diagrams. Clear the DTC, test the system for normal operation by applying and releasing the brake pedal firmly three times with the engine running.

\textbf{H12: CHECK THE BOOSTER PRESSURE SENSOR SIGNAL B CIRCUIT FOR SHORT CIRCUIT TO GROUND}
Measure the resistance between:

FH130, harness side Battery

Pin 01 Negative terminal

Is the resistance greater than 10 Kohms?

Yes

GO to H14.

No

GO to H13.

H13: CHECK WHETHER THE SHORT CIRCUIT IS IN THE HARNESS OR THE MODULE

1. Key off.
2. Disconnect the ABS module connector, FH103.
3. Key on, engine off.
4. Measure the resistance between:

FH130, harness side Battery

Pin 01 Negative terminal

Is the resistance greater than 10 Kohms?

Yes

Refer to the warranty policy and procedures manual if a module is suspect.

No

REPAIR the short circuit. For additional information, refer to the wiring diagrams. Clear the DTC, test the system for normal operation by applying and releasing the brake pedal firmly three times with the engine running.

H14: CHECK THE BOOSTER PRESSURE SENSOR SIGNAL B CIRCUIT FOR SHORT CIRCUIT TO POWER

1. Measure the resistance between:

FH130, harness side Battery

Pin 01 Positive terminal

Is the resistance greater than 10 Kohms?

Yes

GO to H16.

No

GO to H15.

H15: CHECK WHETHER THE SHORT CIRCUIT IS IN THE HARNESS OR THE MODULE

1. Key off.
2. Disconnect the ABS module connector, FH103.
3. Key on, engine off.
4. Measure the resistance between:

FH130, harness side Battery

Pin 01 Positive terminal

Is the resistance greater than 10 Kohms?

Yes

Refer to the warranty policy and procedures manual if a module is suspect.

No

REPAIR the short circuit. For additional information, refer to the wiring diagrams. Clear the DTC, test the system for normal operation by applying and releasing the brake pedal firmly three times with the engine running.

H16: CHECK THE BOOSTER PRESSURE SENSOR SIGNAL A CIRCUIT FOR HIGH RESISTANCE

1. Key off.
2. Disconnect the ABS module connector, FH103.
3. Key on, engine off.
4. Measure the resistance between:

FH130, harness side  FH103, harness side

Pin 04  Pin 38

Is the resistance less than 10 ohms?

Yes

GO to H17.

No

REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. Clear the DTC, test the system for normal operation by applying and releasing the brake pedal firmly three times with the engine running.

H17: CHECK THE BOOSTER PRESSURE SENSOR SIGNAL B CIRCUIT FOR HIGH RESISTANCE

1. Measure the resistance between:

FH130, harness side  FH103, harness side

Pin 01  Pin 30

Is the resistance less than 10 ohms?

Yes

GO to H18.

No

REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. Clear the DTC, test the system for normal operation by applying and releasing the brake pedal firmly three times with the engine running.

H18: CHECK THE BOOSTER PRESSURE SENSOR SIGNAL A AND B CIRCUITS FOR SHORT CIRCUIT TO EACH OTHER

1. Measure the resistance between:

FH130, harness side  FH130, harness side

Pin 01  Pin 04

Is the resistance greater than 10 Kohms?

An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness.

No

REPAIR the short circuit. For additional information, refer to the wiring diagrams. Clear the DTC, test the system for normal operation by applying and releasing the brake pedal firmly three times with the engine running.

PINPOINT TEST I: STEERING WHEEL ROTATION SENSOR

TEST CONDITIONS

DETAILS/RESULTS/ACTIONS
I1: CHECK THE POWER SUPPLY TO THE STEERING WHEEL ROTATION SENSOR

Steering wheel rotation sensor, FC110

<table>
<thead>
<tr>
<th>Circuit</th>
<th>Pin</th>

<td>Sensor return</td>
<td>40</td>
</tr>
</tbody>
</table>

1. Key off.
2. Disconnect the steering wheel rotation sensor connector, FC110.
3. Key on, engine off.
4. Measure the voltage between:
   FC110, harness side Battery
   01 Negative terminal

Is the voltage greater than 4 volts?
Yes
   GO to I4.
No
   GO to I2.

I2: CHECK THE STEERING WHEEL ROTATION SENSOR POWER SUPPLY CIRCUIT FOR SHORT CIRCUIT TO GROUND

1. Measure the resistance between:
   FC110, harness side Battery
   01 Positive terminal

Is the resistance greater than 10 Kohms?
Yes
   GO to I3.
No
   REPAIR the short circuit. For additional information, refer to the wiring diagrams. Clear the DTC, test the system for normal operation by turning the steering from the center position to full right hand lock, to full left hand lock and back to the center position before road testing the vehicle on roads requiring steering input.

I3: CHECK THE STEERING WHEEL ROTATION SENSOR POWER SUPPLY CIRCUIT FOR HIGH RESISTANCE

1. Key off.
2. Disconnect the ABS module connector, FH103.
3. Measure the resistance between:
   FH110, harness side FH103, harness side
   Pin 01 Pin 05

Is the resistance less than 10 ohms?
Yes
   An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness.
No
   REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. Clear the DTC, test the system for normal operation by turning the steering from the center position to full right hand lock, to full left hand lock and back to the center position before road testing the vehicle on roads requiring steering input.

I4: CHECK THE GROUND CIRCUIT TO THE STEERING WHEEL ROTATION SENSOR

1. Measure the resistance between:
   FH110, harness side Battery
   Pin 04 Negative terminal

Is the resistance less than 10 ohms?
Yes
   GO to I8.
No
   GO to I5.

I5: CHECK THE STEERING WHEEL ROTATION SENSOR GROUND CIRCUIT FOR SHORT CIRCUIT TO POWER
Measure the resistance between:

FH110, harness side  Battery

Pin 04  Positive terminal

Is the resistance greater than 10 Kohms?

Yes  GO to I7.

No  GO to I6.

I6: CHECK WHETHER THE SHORT CIRCUIT IS IN THE HARNESS OR THE MODULE

1 Key off.
2 Disconnect the ABS module connector, FH103.
3 Key on, engine off.
4 Measure the resistance between:

FH110, harness side  Battery

Pin 04  Positive terminal

Is the resistance greater than 10 Kohms?

Yes  Refer to the warranty policy and procedures manual if a module is suspect.

No  REPAIR the short circuit. For additional information, refer to the wiring diagrams. Clear the DTC, test the system for normal operation by turning the steering from the center position to full right hand lock, to full left hand lock and back to the center position before road testing the vehicle on roads requiring steering input.

I7: CHECK THE STEERING WHEEL ROTATION SENSOR GROUND CIRCUIT FOR HIGH RESISTANCE

1 Key off.
2 Disconnect the ABS module connector, FH103.
3 Measure the resistance between:

FH110, harness side  FH103, harness side

Pin 04  Pin 40

Is the resistance less than 10 ohms?

Yes  An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness.

No  REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. Clear the DTC, test the system for normal operation by turning the steering from the center position to full right hand lock, to full left hand lock and back to the center position before road testing the vehicle on roads requiring steering input.

I8: CHECK THE STEERING WHEEL ROTATION SENSOR SIGNAL A CIRCUIT FOR SHORT CIRCUIT TO GROUND

1 Measure the resistance between:

FH110, harness side  Battery

Pin 03  Negative terminal

Is the resistance greater than 10 Kohms?

Yes  GO to I10.

No  GO to I9.

I9: CHECK WHETHER THE SHORT CIRCUIT IS IN THE HARNESS OR THE MODULE

1 Key off.
2 Disconnect the ABS module connector, FH103.
3 Key on, engine off.
4 Measure the resistance between:

FH110, harness side  Battery

Pin 03  Negative terminal

Is the resistance greater than 10 Kohms?

Yes  Refer to the warranty policy and procedures manual if a module is suspect.

No  REPAIR the short circuit. For additional information, refer to the wiring diagrams. Clear the DTC, test the system for normal operation by turning the steering from the center position to full right hand lock, to full left hand lock and back to the center position before road testing the vehicle on roads requiring steering input.

I10: CHECK THE STEERING WHEEL ROTATION SENSOR SIGNAL A CIRCUIT FOR SHORT CIRCUIT TO POWER

1 Measure the resistance between:

FH110, harness side  Battery

Pin 03  Positive terminal

Is the resistance greater than 10 Kohms?

Yes  GO to I12.

No  GO to I11.

I11: CHECK WHETHER THE SHORT CIRCUIT IS IN THE HARNESS OR THE MODULE
I12: CHECK THE STEERING WHEEL ROTATION SENSOR SIGNAL B CIRCUIT FOR SHORT CIRCUIT TO GROUND

1. Measure the resistance between:

   FH110, harness side  Battery

   Pin 02  Negative terminal

Is the resistance greater than 10 Kohms?

Yes  GO to I14.

No  GO to I13.

I13: CHECK WHETHER THE SHORT CIRCUIT IS IN THE HARNESS OR THE MODULE

1. Key off.
2. Disconnect the ABS module connector, FH103.
3. Key on, engine off.
4. Measure the resistance between:

   FH110, harness side  Battery

   Pin 02  Negative terminal

Is the resistance greater than 10 Kohms?

Yes  Refer to the warranty policy and procedures manual if a module is suspect.

No  REPAIR the short circuit. For additional information, refer to the wiring diagrams. Clear the DTC, test the system for normal operation by turning the steering from the center position to full right hand lock, to full left hand lock and back to the center position before road testing the vehicle on roads requiring steering input.

I14: CHECK THE STEERING WHEEL ROTATION SENSOR SIGNAL B CIRCUIT FOR SHORT CIRCUIT TO POWER

1. Measure the resistance between:

   FH110, harness side  Battery

   Pin 02  Positive terminal

Is the resistance greater than 10 Kohms?

Yes  GO to I16.

No  GO to I15.

I15: CHECK WHETHER THE SHORT CIRCUIT IS IN THE HARNESS OR THE MODULE

1. Key off.
2. Disconnect the ABS module connector, FH103.
3. Key on, engine off.
4. Measure the resistance between:

   FH110, harness side  Battery

   Pin 02  Positive terminal

Is the resistance greater than 10 Kohms?

Yes  Refer to the warranty policy and procedures manual if a module is suspect.

No  REPAIR the short circuit. For additional information, refer to the wiring diagrams. Clear the DTC, test the system for normal operation by turning the steering from the center position to full right hand lock, to full left hand lock and back to the center position before road testing the vehicle on roads requiring steering input.

I16: CHECK THE STEERING WHEEL ROTATION SENSOR SIGNAL A CIRCUIT FOR HIGH RESISTANCE

1. Key off.
2. Disconnect the ABS module connector, FH103.
3. Key on, engine off.
4. Measure the resistance between:

   FH110, harness side  FH103, harness side

   Pin 03  Pin 41

Is the resistance less than 10 ohms?

Yes  GO to I17.

No  REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. Clear the DTC, test the system for normal operation by turning the steering from the center position to full right hand lock, to full left hand lock and back to the center position before road testing the vehicle on roads requiring steering input.

I17: CHECK THE STEERING WHEEL ROTATION SENSOR SIGNAL B CIRCUIT FOR HIGH RESISTANCE

1. Measure the resistance between:

   FH110, harness side  FH103, harness side

   Pin 02  Pin 41

Is the resistance less than 10 ohms?

Yes  GO to I18.

No  REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. Clear the DTC, test the system for normal operation by turning the steering from the center position to full right hand lock, to full left hand lock and back to the center position before road testing the vehicle on roads requiring steering input.

I18: CHECK THE STEERING WHEEL ROTATION SENSOR SIGNAL A AND B CIRCUITS FOR SHORT CIRCUIT TO EACH OTHER
Measure the resistance between:

<table>
<thead>
<tr>
<th>FH110, harness side</th>
<th>FH110, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Pin 03</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

Yes

An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness.

No

REPAIR the short circuit. For additional information, refer to the wiring diagrams. Clear the DTC, test the system for normal operation by tuming the steering from the center position to full right hand lock, to full left hand lock and back to the center position before road testing the vehicle on roads requiring steering input.

#### PINPOINT TEST J : YAW RATE SENSOR AND ACCELEROMETER

</table>

1. Key off.
2. Disconnect the yaw rate sensor and accelerometer connector, CA236
3. Key on, engine off.
4. Measure the resistance between:

<table>
<thead>
<tr>
<th>CA236, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 03</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the voltage greater than 4 volts?

Yes

GO to J4.

No

GO to J2.

J2: CHECK THE YAW RATE SENSOR AND ACCELEROMETER POWER SUPPLY CIRCUIT FOR SHORT CIRCUIT TO GROUND

1. Measure the resistance between:

<table>
<thead>
<tr>
<th>CA236, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 03</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the resistance greater than 10 Kohms?

Yes

GO to J3.

No

REPAIR the short circuit. For additional information, refer to the wiring diagrams. Clear the DTC, test the system for normal operation by driving the vehicle to a speed greater than 20 Kph (12.5 mph) for more than 3 seconds.

J3: CHECK THE YAW RATE SENSOR AND ACCELEROMETER POWER SUPPLY CIRCUIT FOR HIGH RESISTANCE

1. Key off.
2. Disconnect the ABS module connector, FH103.
3. Measure the resistance between:

<table>
<thead>
<tr>
<th>CA236, harness side</th>
<th>FH103, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 03</td>
<td>Pin 22</td>
</tr>
</tbody>
</table>

Is the resistance less than 10 ohms?

Yes

An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness.

No

REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. Clear the DTC, test the system for normal operation by driving the vehicle to a speed greater than 20 Kph (12.5 mph) for more than 3 seconds.
J4: CHECK THE GROUND CIRCUIT TO THE YAW RATE SENSOR AND ACCELEROMETER

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA236, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 05 Negative terminal</td>
<td></td>
</tr>
</tbody>
</table>

Is the resistance less than 10 ohms?
Yes  **GO to J8.**  
No  **GO to J5.**

J5: CHECK THE YAW RATE SENSOR AND ACCELEROMETER GROUND CIRCUIT FOR SHORT CIRCUIT TO POWER

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA236, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 05 Positive terminal</td>
<td></td>
</tr>
</tbody>
</table>

Is the resistance greater than 10 Kohms?
Yes  **GO to J7.**  
No  **GO to J6.**

J6: CHECK WHETHER THE SHORT CIRCUIT IS IN THE HARNESS OR THE MODULE

1. Key off.
2. Disconnect the ABS module connector, FH103.
3. Key on, engine off.
4. Measure the resistance between:

<table>
<thead>
<tr>
<th>CA236, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 05 Positive terminal</td>
<td></td>
</tr>
</tbody>
</table>

Is the resistance greater than 10 Kohms?
Yes  Refer to the warranty policy and procedures manual if a module is suspect.  
No  REPAIR the short circuit. For additional information, refer to the wiring diagrams. Clear the DTC, test the system for normal operation by driving the vehicle to a speed greater than 20 Kph (12.5 mph) for more than 3 seconds.

J7: CHECK THE YAW RATE SENSOR AND ACCELEROMETER GROUND CIRCUIT FOR HIGH RESISTANCE

1. Key off.
2. Disconnect the ABS module connector, FH103.
3. Key on, engine off.
4. Measure the resistance between:

<table>
<thead>
<tr>
<th>CA236, harness side</th>
<th>FH103, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 05 Pin 29</td>
<td></td>
</tr>
</tbody>
</table>

Is the resistance less than 10 ohms?
Yes  An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness.  
No  REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. Clear the DTC, test the system for normal operation by driving the vehicle to a speed greater than 20 Kph (12.5 mph) for more than 3 seconds.

J8: CHECK THE YAW RATE SENSOR AND ACCELEROMETER CAN - CIRCUIT FOR SHORT CIRCUIT TO GROUND

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA236, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 01 Negative terminal</td>
<td></td>
</tr>
</tbody>
</table>

Is the resistance greater than 10 Kohms?
Yes  **GO to J10.**  
No  **GO to J9.**

J9: CHECK WHETHER THE SHORT CIRCUIT IS IN THE HARNESS OR THE MODULE

1. Key off.
2. Disconnect the ABS module connector, FH103.
3. Key on, engine off.
4. Measure the resistance between:

<table>
<thead>
<tr>
<th>CA236, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 01 Negative terminal</td>
<td></td>
</tr>
</tbody>
</table>

Is the resistance greater than 10 Kohms?
Yes  Refer to the warranty policy and procedures manual if a module is suspect.  
No  REPAIR the short circuit. For additional information, refer to the wiring diagrams. Clear the DTC, test the system for normal operation by driving the vehicle to a speed greater than 20 Kph (12.5 mph) for more than 3 seconds.

J10: CHECK THE YAW RATE SENSOR AND ACCELEROMETER CAN - CIRCUIT FOR SHORT CIRCUIT TO POWER

Measure the resistance between:

<table>
<thead>
<tr>
<th>CA236, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 01 Positive terminal</td>
<td></td>
</tr>
</tbody>
</table>

Is the resistance greater than 10 Kohms?
Yes  **GO to J12.**  
No  **GO to J11.**

J11: CHECK WHETHER THE SHORT CIRCUIT IS IN THE HARNESS OR THE MODULE

1. Key off.
2. Disconnect the ABS module connector, FH103.
3. Key on, engine off.
Measure the resistance between:

CA236, harness side | Battery
---|---
Pin 01 | Positive terminal

Is the resistance greater than 10 Kohms?

Yes

Refer to the warranty policy and procedures manual if a module is suspect.

No

REPAIR the short circuit. For additional information, refer to the wiring diagrams. Clear the DTC, test the system for normal operation by driving the vehicle to a speed greater than 20 Kph (12.5 mph) for more than 3 seconds.

J12: CHECK THE YAW RATE SENSOR AND ACCELEROMETER CAN + CIRCUIT FOR SHORT CIRCUIT TO GROUND

1. Measure the resistance between:

CA236, harness side | Battery
---|---
Pin 02 | Negative terminal

Is the resistance greater than 10 Kohms?

Yes

GO to J14.

No

GO to J13.

J13: CHECK WHETHER THE SHORT CIRCUIT IS IN THE HARNESS OR THE MODULE

1. Key off.
2. Disconnect the ABS module connector, FH103.
3. Key on, engine off.
4. Measure the resistance between:

CA236, harness side | Battery
---|---
Pin 02 | Negative terminal

Is the resistance greater than 10 Kohms?

Yes

Refer to the warranty policy and procedures manual if a module is suspect.

No

REPAIR the short circuit. For additional information, refer to the wiring diagrams. Clear the DTC, test the system for normal operation by driving the vehicle to a speed greater than 20 Kph (12.5 mph) for more than 3 seconds.

J14: CHECK THE YAW RATE SENSOR AND ACCELEROMETER CAN + CIRCUIT FOR SHORT CIRCUIT TO POWER

1. Measure the resistance between:

CA236, harness side | Battery
---|---
Pin 02 | Positive terminal

Is the resistance greater than 10 Kohms?

Yes

GO to J16.

No

GO to J15.

J15: CHECK WHETHER THE SHORT CIRCUIT IS IN THE HARNESS OR THE MODULE

1. Key off.
2. Disconnect the ABS module connector, FH103.
3. Key on, engine off.
4. Measure the resistance between:

CA236, harness side | Battery
---|---
Pin 02 | Positive terminal

Is the resistance greater than 10 Kohms?

Yes

Refer to the warranty policy and procedures manual if a module is suspect.

No

REPAIR the short circuit. For additional information, refer to the wiring diagrams. Clear the DTC, test the system for normal operation by driving the vehicle to a speed greater than 20 Kph (12.5 mph) for more than 3 seconds.

J16: CHECK THE YAW RATE SENSOR AND ACCELEROMETER CAN - CIRCUIT FOR HIGH RESISTANCE

1. Key off.
2. Disconnect the ABS module connector, FH103.
3. Key on, engine off.
4. Measure the resistance between:

CA236, harness side | FH103, harness side
---|---
Pin 01 | Pin 19

Is the resistance less than 10 ohms?

Yes

GO to J17.

No

REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. Clear the DTC, test the system for normal operation by driving the vehicle to a speed greater than 20 Kph (12.5 mph) for more than 3 seconds.

J17: CHECK THE YAW RATE SENSOR AND ACCELEROMETER CAN + CIRCUIT FOR HIGH RESISTANCE

1. Measure the resistance between:

CA236, harness side | FH103, harness side
---|---
Pin 02 | Pin 18

Is the resistance less than 10 ohms?

Yes

GO to J18.

No

REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. Clear the DTC, test the system for normal operation by driving the vehicle to a speed greater than 20 Kph (12.5 mph) for more than 3 seconds.

J18: CHECK THE YAW RATE SENSOR AND ACCELEROMETER CAN + AND - CIRCUITS FOR SHORT CIRCUIT TO EACH OTHER

1. Measure the resistance between:

CA236, harness side | CA236, harness side
---|---
Pin 02 | Pin 01
**PINPOINT TEST K : TRACTION CONTROL SWITCH**

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>

<tr>
<td>ABS module, FH103</td>
<td>Circuit</td>
</tr>
<tr>
<td>Traction control switch signal</td>
<td>04</td>
</tr>
</tbody>
</table>

1. Key off.
2. Disconnect the traction control switch connectors, FC113 and FC119.
3. Measure the resistance between:
   - FC113, component side Pin 04
   - FC113, component side Pin 08
4. Operate the switch.
5. Does the resistance decrease as the switch is operated?
   - Yes Go to K2.
   - No Install a new traction control switch. Clear the DTC, test the system for normal operation.

**K2: CHECK THE TRACTION CONTROL SWITCH SIGNAL**

1. Connect a 3 Amp fused jumper lead between:
   - FC113, harness side Pin 04
   - FC113, harness side Pin 08
2. Key on, engine off.
3. Using the Jaguar approved diagnostic system or a suitable scan tool, access the traction control status PID.
   - The format of this may vary from one tool to another.
4. Is the PID value displayed as active?
   - Yes An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness.
   - No Go to K3.

**K3: CHECK THE TRACTION CONTROL SWITCH GROUND CIRCUITS**

1. Measure the resistance between:
   - FC113, harness side Pin 08
   - Negative terminal
   - FC119, harness side Pin 04
   - Negative terminal
2. Are both resistances less than 10 ohms?
   - Yes Go to K5.
   - No Go to K4.

**K4: CHECK THE TRACTION CONTROL SWITCH GROUND CIRCUITS FOR SHORT CIRCUIT TO POWER**

1. Measure the resistance between:
   - FC113, harness side Pin 08
   - Positive terminal
   - FC119, harness side Pin 04
   - Positive terminal
Are both resistances greater than 10 Kohms?
- Yes
  - An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness.
  - REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. Clear the DTC, test the system for normal operation.
- No

### K5: CHECK THE TRACTION CONTROL SWITCH SIGNAL CIRCUIT FOR SHORT CIRCUIT TO POWER
1. Measure the resistance between:
   - FC113, harness side
   - Battery
   - Pin 04
   - Positive terminal
2. Is the resistance greater than 10 Kohms?
   - Yes
     - GO to K7.
   - No
     - GO to K6.

### K6: CHECK WHETHER THE SHORT CIRCUIT IS IN THE HARNESS OR THE MODULE
1. Key off.
2. Disconnect the ABS module connector, FH103.
3. Key on, engine off.
4. Measure the resistance between:
   - FC113, harness side
   - Battery
   - Pin 04
   - Positive terminal
5. Is the resistance greater than 10 Kohms?
   - Yes
     - Refer to the warranty policy and procedures manual if a module is suspect.
   - No
     - REPAIR the short circuit. For additional information, refer to the wiring diagrams. Clear the DTC, test the system for normal operation.

### K7: CHECK THE TRACTION CONTROL SWITCH SIGNAL CIRCUIT FOR SHORT CIRCUIT TO GROUND
1. Measure the resistance between:
   - FC113, harness side
   - Battery
   - Pin 04
   - Negative terminal
2. Is the resistance greater than 10 Kohms?
   - Yes
     - GO to K9.
   - No
     - GO to K8.

### K8: CHECK WHETHER THE SHORT CIRCUIT IS IN THE HARNESS OR THE MODULE
1. Key off.
2. Disconnect the ABS module connector, FH103.
3. Key on, engine off.
4. Measure the resistance between:
   - FC113, harness side
   - Battery
   - Pin 04
   - Negative terminal
5. Is the resistance greater than 10 Kohms?
   - Yes
     - Refer to the warranty policy and procedures manual if a module is suspect.
   - No
     - REPAIR the short circuit. For additional information, refer to the wiring diagrams. Clear the DTC, test the system for normal operation.

### K9: CHECK THE TRACTION CONTROL SWITCH SIGNAL CIRCUIT FOR HIGH RESISTANCE
1. Key off.
2. Disconnect the ABS module connector, FH103.
3. Key on, engine off.
4. Measure the resistance between:
   - FC113, harness side
   - FH103, harness side
   - Pin 04
   - Pin 04
5. Is the resistance less than 10 ohms?
   - Yes
     - An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness.
   - No
     - REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. Clear the DTC, test the system for normal operation.
Anti-Lock Control - Stability Assist - Anti-Lock Brake System (ABS) Module

Removal

1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 Battery, Mounting and Cables.
2. Disconnect the hydraulic control unit (HCU) electrical connector.
3. Detach the engine compartment battery junction box.
4. Remove the windshield washer reservoir. For additional information, refer to Section 501-16 Wipers and Washers.
5. Remove the anti-lock brake system (ABS) module.

Installation

1. To install, reverse the removal procedure.
Anti-Lock Control - Stability Assist - Brake Master Cylinder Pressure Transducer
Removal and Installation

Removal

All vehicles

WARNING: Brake fluid contains polyglycol ethers and polyglycols. Avoid contact with the eyes. Wash hands thoroughly after handling, as prolonged contact may cause irritation and dermatitis. If brake fluid contacts the eyes, flush the eyes with cold water or eyewash solution and seek medical attention. If taken internally do not induce vomiting, seek immediate medical attention. Failure to follow these instructions may result in personal injury.

1. Disconnect the battery.
   For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

All except vehicles with diesel engine

2. Disconnect the brake master cylinder pressure transducer electrical connector.

3. CAUTION: If brake fluid is spilt on the paintwork, the effected area must be immediately washed down with cold water.
   Remove the brake master cylinder pressure transducer.

Vehicles with diesel engine

4. Remove the brake master cylinder.
   For additional information, refer to: Brake Master Cylinder - 2.7L V6 - TdV6 (206-06 Hydraulic Brake Actuation, Removal and Installation).

5. CAUTION: If brake fluid is spilt on the paintwork, the effected area must be immediately washed down with cold water.
   Remove the brake master cylinder pressure transducer.

Installation

All except vehicles with diesel engine
1. To install, reverse the removal procedure.
   1. Tighten 30 Nm.

Vehicles with diesel engine

2. To install, reverse the removal procedure.
   1. Tighten 30 Nm.
Anti-Lock Control - Stability Assist - Brake Pedal Travel Sensor

VIN Range: M45255->N52206

Removal and Installation

1. Remove the cowl panel grille.
   For additional information, refer to: Cowl Panel Grille (501-02 Front End Body Panels, Removal and Installation).

Removal

⚠️ WARNING: Failure to carry out procedure may result in damage to the vehicle.

1. Depress brake pedal 20 times to remove vacuum from brake booster.
2. Remove the brake pedal travel sensor.
   - Disconnect the brake pedal travel sensor electrical connector.
   - Using a suitable pick, remove the spring clip.

Installation

1. Fit new spring clip to sensor housing, ensuring correct alignment.
2. Lubricate new seal with water and fit seal to the sensor.
3. Fit and fully seat new brake pedal travel sensor.
   - Connect the brake pedal travel sensor electrical connector.
4. Install the cowl panel grille.
   For additional information, refer to: Cowl Panel Grille (501-02 Front End Body Panels, Removal and Installation).
Anti-Lock Control - Stability Assist - Front Wheel Speed Sensor
Removal and Installation

Removal

1. Raise and support the vehicle.
   For additional information, refer to Section 100-02 Jacking and Lifting.
2. Detach the front wheel speed sensor.
   1. Remove the front wheel speed sensor retaining clip.
   2. Detach the front wheel speed sensor.
3. Detach the front fender splash shield.
4. Detach the front wheel speed sensor.
5. Remove the front wheel speed sensor.
   - Disconnect the electrical connector.

Installation

1. CAUTIONS:

  Make sure the wheel speed sensor locating tang is correctly seated in the hub assembly.
Make sure the front wheel speed sensor harness is correctly routed around the front suspension components.

To install, reverse the removal procedure.
Removal

1. **CAUTION:** Brake fluid contains polyglycol ethers and polyglycols. Avoid contact with the eyes. Wash hands thoroughly after handling, as prolonged contact may cause irritation and dermatitis. If brake fluid contacts the eyes, flush the eyes with cold water or eyewash solution and seek medical attention. If taken internally do not induce vomiting, seek immediate medical attention. Failure to follow these instructions may result in personal injury.

   • NOTE: To prevent the loss of brake fluid, apply the brake pedal hold-down tool and adjust to hold the brake pedal down 40 mm (1.6 in).

   Disconnect the battery ground cable.
   For additional information, refer to Section 414-01 Battery, Mounting and Cables.

2. Raise and support the vehicle.
   For additional information, refer to Section 100-02 Jacking and Lifting.

3. Connect a bleed pipe and bottle to the bleed nipple and loosen the bleed nipple.

4. Install the pedal hold-down tool.
   - Install the tool between the pedal and the seat frame.
   - Turn the tool hand-wheel to depress and hold the pedal 60 mm (2.4 in) from the 'Off' position
   - This will prevent loss of fluid from the reservoir through disconnected brake pipes.

5. Remove the bleed pipe and bottle.
   - Tighten the caliper bleed nipple.
   - Disconnect and remove the bleed pipe and bottle.
   - Install the bleed nipple dust cap.

6. **CAUTION:** If brake fluid is spilt on the paintwork, the effected area must be immediately washed down with cold water.

   Detach the hydraulic control unit (HCU) brake tubes.
7. Disconnect the HCU electrical connector.

8. Remove the HCU.

**Installation**

1. Install the HCU.
   - Tighten to 9 Nm.

2. Connect the HCU electrical connector.
3. **CAUTION:** If brake fluid is spilt on the paintwork, the effected area must be immediately washed down with cold water.

   Attach the HCU brake tubes.
   - Tighten to 17 Nm.

4. Connect the battery ground cable.
   For additional information, refer to Section 414-01 Battery, Mounting and Cables.

5. Bleed the ABS brake system.
   For additional information, refer to Section 206-00 Brake System - General Information.
Anti-Lock Control - Stability Assist - Hydraulic Control Unit (HCU) VIN Range: N52207->N99999

Removal and Installation

**Special Tool(s)**

<table>
<thead>
<tr>

**Removal**

All vehicles

1. **WARNING:** Brake fluid contains polyglycol ethers and polyglycols. Avoid contact with the eyes. Wash hands thoroughly after handling, as prolonged contact may cause irritation and dermatitis. If brake fluid contacts the eyes, flush the eyes with cold water or eyewash solution and seek medical attention. If taken internally do not induce vomiting, seek immediate medical attention. Failure to follow these instructions may result in personal injury.

• **NOTE:** To prevent the loss of brake fluid, apply the brake pedal hold-down tool and adjust to hold the brake pedal down 60 mm (2.4 inch).

   Disconnect the battery ground cable.
   For additional information, refer to: [Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures)].

2. Raise and support the vehicle.
   For additional information, refer to: [Lifting (100-02 Jacking and Lifting, Description and Operation)].

3. Connect brake bleed pipes and bottles to the left-hand front and the left-hand rear brake caliper bleed nipples and loosen the brake caliper bleed nipples.

4. Install pedal hold-down tool.
   • Install the tool between the brake pedal and the seat frame.
   • Turn the tool hand-wheel to press and hold the brake pedal 60 mm (2.4 inch) from the ‘Off’ position
   • This will prevent loss of fluid from the reservoir through disconnected brake tubes.

**Vehicles with standard brakes**

5. Remove the bleed pipes and bottles.
   • Tighten the left-hand front caliper bleed nipple.
     1. Tighten to 8 Nm.
   • Tighten the left-hand rear brake caliper bleed nipple.
     1. Tighten to 14 Nm.
   • Disconnect and remove the brake bleed pipes and bottles.
   • Install the bleed nipple dust caps.

**Vehicles with high performance brakes**

6. Remove the bleed pipes and bottles.
   • Tighten the left-hand front caliper bleed nipple.
     1. Tighten to 14 Nm.
   • Tighten the left-hand rear brake caliper bleed nipple.
     1. Tighten to 14 Nm.
   • Disconnect and remove the brake bleed pipes and bottles.
   • Install the bleed nipple dust caps.

**All vehicles**
7. Disconnect the hydraulic control unit (HCU) electrical connector.

8. CAUTIONS:

⚠️ If brake fluid is spilt on the paintwork, the effected area must be immediately washed down with cold water. Failure to follow this instruction may result in damage to the vehicle.

⚠️ To minimise brake fluid loss the brake tubes must be disconnected in the order shown. Failure to follow this instruction may result in damage to the vehicle.

⚠️ Cap the exposed brake tubes and ports to prevent loss of fluid and dirt ingress. Failure to follow this instruction may result in damage to the vehicle.

• NOTE: Using a suitable tool mark the position of the brake tubes to the HCU.

Disconnect the HCU brake tubes.

1. Disconnect the HCU primary and secondary circuit brake tubes.
2. Disconnect the HCU outlet brake tubes.

9. Remove the HCU.

Installation

1. NOTE: A new HCU does not come supplied with the HCU base bracket. The HCU base bracket should be removed and installed to the new HCU. The HCU base bracket securing bolts must be torqued if a new HCU is being installed to the vehicle.

   ● Tighten the three HCU base bracket securing bolts to 9 Nm.

   To install, reverse the removal procedure.
2. Tighten to 9 Nm.
3. **CAUTION:** Make sure the brake tubes are installed to the correct ports. Failure to follow this instruction may result in damage to the vehicle.

   Tighten to 17 Nm.

4. Bleed the anti-lock brake system (ABS).
   For additional information, refer to: [Brake System Bleeding - VIN Range: N52048->N99999](206-00 Brake System - General Information, General Procedures).
Anti-Lock Control - Stability Assist - Rear Wheel Speed Sensor
Removal and Installation

Removal

1. Raise and support the vehicle.
   For additional information, refer to Section 100-02 Jacking and Lifting.

2. **CAUTION:** Make sure the ignition is in the OFF position before disconnecting the rear wheel speed sensor electrical connector.
   Disconnect the rear wheel speed sensor electrical connector.

3. Remove the rear wheel speed sensor.

Installation

1. To install, reverse the removal procedure.
   1. Tighten to 9 Nm.
Anti-Lock Control - Stability Assist - Steering Wheel Rotation Sensor
Removal and Installation

Removal

1. Remove the steering wheel. For additional information, refer to Section 211-04 Steering Column.
2. Remove the instrument panel lower trim panel.

3. Detach the steering column lower shroud.

4. Remove the steering column lower shroud.
   - Disconnect the electrical connector.

5. Disconnect the steering wheel rotation sensor electrical connector.
6. Detach the steering wheel rotation sensor electrical wiring harness from the steering column.

7. Remove the steering wheel rotation sensor.

**Installation**

1. **NOTE:** Note the correct routing of the steering wheel rotation sensor electrical wiring harness.

   To install, reverse the removal procedure.
   - Tighten to 4 Nm.

2. Tighten to 3 Nm.
Anti-Lock Control - Stability Assist - Yaw Rate Sensor and Accelerometer
Removal and Installation

**Removal**

1. Disconnect the battery ground cable.
   For additional information, refer to Section [414-01 Battery, Mounting and Cables].
2. Remove the floor console.
   For additional information, refer to Section [501-12 Instrument Panel and Console].
3. Remove the floor console register duct.
4. Disconnect the electrical connector.
5. Remove the yaw rate sensor and accelerometer.

**Installation**

1. NOTE: If the yaw rate sensor and accelerometer appears damaged or is dropped during installation do not fit to vehicle.
   • NOTE: Make sure the yaw rate sensor and accelerometer is fitted the correct way around.
   To install, reverse the removal procedure.
   • Tighten to 7 Nm.

Steering System - General Information - Steering System

Description and Operation

The power steering system is a rack and pinion design, with an engine-driven pump providing the steering assistance. The system features variable steering assistance with vehicle speed and a variable ratio steering rack.

Absolute cleanliness must be observed when replenishing the fluid or dismantling any part of the system. New fluid from a sealed container must be used.

• NOTE: If the steering gear, pump or cooler are being replaced for leakage or noise related issues and there is no evidence of fluid contamination, there is no need to replace the reservoir.

In some cases where the fluid clearly contains particulate matter, and the system continues to function, flush the system with fresh fluid and replace the reservoir, as there is the possibility that the reservoir internal filter may be damaged or faulty.
Steering System - General Information - Steering System
Diagnosis and Testing

Inspection and Verification

1. Verify the customer concern by driving the vehicle.
2. Visually inspect for obvious signs of mechanical or electrical damage.

### Mechanical Inspection Chart

<table>
<thead>
<tr>
<th>Mechanical Checks</th>
</tr>
</thead>
<tbody>
<tr>
<td>- Incorrect tire pressure, loose wheel nuts, incorrect wheel alignment</td>
</tr>
<tr>
<td>- Loose tie-rods</td>
</tr>
<tr>
<td>- Loose damper and spring assemblies or ball joint</td>
</tr>
<tr>
<td>- Loose steering column shaft universal joints</td>
</tr>
<tr>
<td>- Loose pinch bolts on steering column shaft</td>
</tr>
<tr>
<td>- Loose steering gear assembly</td>
</tr>
<tr>
<td>- Check for external damage to the steering gear.</td>
</tr>
<tr>
<td>- Damaged tie-rods</td>
</tr>
<tr>
<td>CAUTION: If a steering gear assembly is returned under warranty with leaking seals, but there is also damage to the steering gear boot/boots the steering gear warranty will be invalid. This is due to the steering gear seals being damaged due to foreign materials entering the steering gear boot and damaging the steering gear seals thereafter.</td>
</tr>
<tr>
<td>- Damaged steering gear boot</td>
</tr>
<tr>
<td>- Damaged accessory drive belt</td>
</tr>
<tr>
<td>- Binding or misaligned steering column, pump or steering gear</td>
</tr>
<tr>
<td>- Incorrect fluid level</td>
</tr>
<tr>
<td>- Hose leaks or line restrictions</td>
</tr>
<tr>
<td>- Hose fouling bodywork</td>
</tr>
</tbody>
</table>

### Electrical Inspection Chart

<table>
<thead>
<tr>
<th>Electrical Checks/Tests</th>
</tr>
</thead>
<tbody>
<tr>
<td>- Make sure all connectors are in place (steering gear Servotronic solenoid and steering control module (SCM) - if applicable)</td>
</tr>
<tr>
<td>- Make sure all the fuses are in place and not blown</td>
</tr>
<tr>
<td>- DISCONNECT the steering gear transducer and the steering should become heavy</td>
</tr>
<tr>
<td>- TEST electrical values:</td>
</tr>
<tr>
<td>- Power Supply to the SCM = 12 Volts</td>
</tr>
<tr>
<td>- Steering gear transducer resistance 7.0 to 7.5 Ohms is normal (limits: less than 5 Ohms and greater than 9 Ohms would be declared unacceptable)</td>
</tr>
<tr>
<td>- Steering gear transducer voltage = 6 Volts</td>
</tr>
<tr>
<td>- Steering gear transducer current = 840 mA at 0 mph reducing to 0 mA at maximum speed</td>
</tr>
<tr>
<td>- RECONNECT all electrical items disturbed during testing</td>
</tr>
</tbody>
</table>

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. Check the power steering fluid condition. For additional information, REFER to Power Steering Fluid Condition Check in this section.
5. If the concern is not visually evident, verify the symptom and REFER to Steering Fault Diagnosis by Symptom Charts in this section.

Steering Relay Harness Connector
Steering Linkage Inspection and Backlash (Freeplay) Check

**CAUTION:** Steering gear boots must be handled carefully to avoid damage. Use new clamps when installing steering gear boots. Inspect the boots for cuts, deterioration, twisting or distortion. Check the steering gear boots to make sure they are tight. Install new boots or clamps as necessary.

- **NOTE:** The following steps must be carried out with assistance.
  1. With the wheels in the straight ahead position, gently turn the steering wheel to the left and the right to check for free play.
  2. Free play should be between 0 and 6 mm (0 and 0.24 in) at the steering wheel rim. If the free play exceeds this limit, either the ball joints are worn, the lower steering column joints are worn or the backlash of the steering gear is excessive.

**CAUTION:** DO NOT attempt to adjust the steering gear yoke. Failure to follow this instruction will result in the steering gear warranty to become invalid.

  3. The backlash of the steering gear cannot be adjusted, install a new steering gear. For additional information, REFER to Section 211-02 Power Steering.
  4. Grasp the steering wheel firmly and move it up and down and to the left and right without turning the wheel to check for column bearing wear, steering wheel or steering column. For additional information, REFER to Section 211-04 Steering Column.

Power Steering Fluid Condition Check

  1. Run the engine for 2 minutes.
  2. Check the power steering fluid system level.
  3. Observe the color and the odor. The color under normal circumstances should be dark reddish, not brown or black.
  4. Allow the fluid to drip onto a facial tissue and examine the stain.
  5. If evidence of solid material is found, the power steering fluid system should be drained for further inspection.
  6. If fluid contamination or steering component failure is confirmed by the sediment in the power steering fluid system, REFER to Steering Fault Diagnosis by Symptom Charts in this section.

Power Steering Pressure Test

Test Equipment
Item | Special Tool Number | Description
--- | --- | ---
1 | 211-011 | Pressure Gauge Hose
2 | 211-011-08 | Pump Return Hose
3 | 211-011-07 | Pump Return Hose Connector
4 | 211-011-03/2 | Test Equipment to High Pressure Hose Adaptor
5 | 211-011-03/1 | Pump High Pressure Outlet to Hose Adaptor
6 | 211-011-02 | Pump Adaptor to Control Valve Hose
7 | 211-011-01 | Control Valve
8 | 211-011 | Pressure Gauge
9 | - | 'O' Ring Seal

The measurement of the maximum system pressure, (which is governed by the pressure relief valve) is achieved by inserting the Service Tool (pressure gauge and adaptors) into the fluid circuit of the power steering system. Run the engine at idle speed, turn the steering from lock to lock and read the maximum pressure recorded on the gauge.

### Installing Test Equipment

To install the pressure test equipment:

- Place a suitable drain tray below the power steering pump.
- Install a hose clamp on the reservoir to pump hose prior to disconnecting any hoses, to avoid unnecessary loss of fluid.
- Disconnect the hose from the power steering pump high pressure outlet.
- Install the pump outlet to hose adaptor (5). Do not omit the 'O' ring seal (9).
- Connect the power steering pump adaptor to control valve hose (6) of the test equipment.
- Install the adaptor (4) in the high pressure hose previously removed from the power steering pump outlet.
- Connect the connector (3) of the test equipment hose (2) to the adaptor (4).
- Remove the hose clamp from the reservoir hose.
- Start the engine.

With the control valve (7) OPEN and the engine idling, the following system pressures may be checked:

- During turning.
- When the steering is held on full lock.
- With the steering at rest.

**CAUTIONS:**

- To avoid excessive heating of the power steering pump, do not close the valve for longer than 5 seconds maximum.
- Do not drive the vehicle with the test equipment installed.

With the control valve (7) CLOSED the power steering pump maximum output pressure can be checked.

### Removing Test Equipment

To remove the test equipment:

- Install a hose clamp on the reservoir to power steering pump hose.
- Removing the test equipment is a reversal of the installation instructions.
- Install a new 'O' ring seal (9) to the power steering pump high pressure outlet to hose connection.
- Install the original hose to the power steering pump.
- Remove the clamp from the reservoir to the power steering pump hose.
- Top-up the reservoir fluid.
- Bleed the power steering system. For additional information, REFER to Power Steering System Bleeding - in this section.

</tbody>
</table>
### Fluid leakage

**Condition**: Damaged fluid cap.
- **Possible Sources**: Damaged fluid cap.
- **Action**: INSTALL a new fluid cap.

**Condition**: Loose or damaged hose fittings.
- **Possible Sources**: Loose or damaged hose fittings.
- **Action**: TIGHTEN or INSTALL a new hose as necessary.

**Condition**: Leakage at power steering pump.
- **Possible Sources**: Leakage at power steering pump.
- **Action**: INSTALL a new power steering pump as necessary. For additional information, REFER to Section 211-02 Power Steering.

**Condition**: Leakage at steering hose to steering gear connection.
- **Possible Sources**: Leakage at steering hose to steering gear connection.
- **Action**: CHECK steering hose to steering gear connection for leakage. CHECK and TIGHTEN the steering hose to steering gear connection retaining bolts/bolts as necessary.

**Condition**: Power steering fluid leakage at O-ring seals.
- **Possible Sources**: Power steering fluid leakage at O-ring seals.
- **Action**: CHECK the power steering system for signs of steering fluid loss from O-ring seals. INSTALL new O-ring seals as necessary. BLEED the power steering system. For additional information, REFER to Section 211-00 Steering System - General Information.

**Condition**: Power steering fluid leakage from transfer pipes.
- **Possible Sources**: Power steering fluid leakage from transfer pipes.
- **Action**: CHECK the power steering system for signs of steering fluid loss from the transfer pipes. CHECK and TIGHTEN the transfer pipes if required, INSTALL new transfer pipes as necessary. BLEED the power steering system. For additional information, REFER to Section 211-00 Steering System - General Information.

**Condition**: Power steering fluid leakage from the steering gear.
- **Possible Sources**: Power steering fluid leakage from the steering gear.
- **Action**: CHECK the power steering gear for signs of fluid loss. INSTALL a new steering gear as necessary. For additional information, REFER to Section 211-02 Power Steering.

**Condition**: Power steering fluid leakage from steering gear boot.
- **Possible Sources**: Power steering fluid leakage from steering gear boot.
- **Action**: CHECK the power steering gear for signs of fluid loss. INSTALL a new steering gear as necessary. For additional information, REFER to Section 211-02 Power Steering.

### Functional

**Condition**: Free play at steering wheel
- **Possible Sources**: Excess play in the steering linkage.
- **Action**: CHECK the steering linkage for excess play. For additional information, REFER to the Steering Linkage Inspection and Backlash (Freeplay) Check in this section.

**Condition**: Steering wheel loose.
- **Possible Sources**: Steering wheel loose.
- **Action**: CHECK and TIGHTEN the steering wheel retaining bolt/bolts as necessary. For additional information, REFER to Section 211-04 Steering Column.

**Condition**: Lower steering column pinch bolt loose.
- **Possible Sources**: Lower steering column pinch bolt loose.
- **Action**: CHECK and TIGHTEN the lower steering column pinch bolts as necessary. For additional information, REFER to Section 211-04 Steering Column.

**Condition**: Excessive wear in lower steering column.
- **Possible Sources**: Excessive wear in lower steering column.
- **Action**: CHECK for lower steering column for wear in the universal joints. If wear is present, INSTALL a new lower steering column as necessary.

**Condition**: Wear in suspension joints.
- **Possible Sources**: Wear in suspension joints.
- **Action**: CHECK for excess wear in the front suspension joints. For additional information, REFER to Section 204-00 Suspension System - General Information.

**Condition**: Vehicle wanders from side to side on the road, when the vehicle is driven straight ahead and the steering wheel is held in a firm position.
- **Possible Sources**: Incorrect tire pressure or tire size.
- **Action**: CHECK and ADJUST the tire pressure. For additional information, REFER to Section 204-04 Wheels and Tires. INSTALL a new tire as necessary. For additional information, REFER to Section 204-04 Wheels and Tires.

- **Possible Sources**: Vehicle is unevenly or excessively loaded.
- **Action**: ADJUST the load evenly.

- **Possible Sources**: Loose/worn tie-rods.
- **Action**: INSTALL a new tie-rod end. For additional information, REFER to Section 211-03 Steering Linkage.

- **Possible Sources**: Steering gear bolts loose or damaged.
- **Action**: TIGHTEN or INSTALL new bolts.

- **Possible Sources**: Loose or worn suspension ball joint(s).
- **Action**: INSTALL a new suspension ball joint assembly. For additional information, REFER to Section 204-01 Front Suspension.

- **Possible Sources**: Steering column universal joint pinch bolt loose.
- **Action**: TIGHTEN the steering column universal joint pinch bolt. For additional information, REFER to Section 211-04 Steering Column.

- **Possible Sources**: Incorrect toe adjustment.
- **Action**: ADJUST as necessary. For additional information, REFER to Section 204-00 Suspension System - General Information.

**Description of General Steering System Noises**

**Boom**
Rhythmic sound like a drum roll or distant thunder. May cause pressure on the ear drum.

**Buzz**
Low-pitched sound, like a bee. Usually associated with vibrations.

**Chatter**
Rapidly repeating metallic sound.

**Chuckle**
Rapid noise that sounds like a stick against the spokes of a spinning bicycle wheel.

**Chirp**
High pitched rapidly repeating sound, like chirping birds.

**Click**
Light sound, like a ball point pen being clicked.

**Click/Thump**
Heavy metal-to-metal sound, like a hammer striking steel.

**Grind**
Abrasive sound, like a grinding wheel or sandpaper rubbing against wood.

**Groan/Moan**
Continuous, low-pitched humming sound.

**Groan/Howl**
Low, guttural sound, like an angry dog.

**Hiss**
Continuous sound like air escaping from a tire valve.

**Hum**
Continuous sound of varying frequencies, like a wire humming in the wind.

**Knock**
Heavy, loud repeating sound like a knock on a door.

**Ping**
Similar to knock, except at higher frequency.

**Rattle**
A sound suggesting looseness, such as marbles rolling around in a can.

**Roar**
Deep, long, prolonged sound like an animal, or winds and ocean waves.

**Rumble**
Low, heavy continuous sound like that made by wagons or thunder.

**Scrape**
Grating noise like one hard plastic rubbing part rubbing against another.

**Squeak**
High-pitched sound like rubbing a clean window.

**Squeal**
Continuous, high-pitched sound like running finger nails across a chalkboard.

**Tap**
Light, hammering sound like tapping pencil on edge of table. May be rhythmic or intermittent.

**Weep**
Continuous mid-range sound (lower frequency than squeal, higher frequency than groan).

**Whir/Whine**
High-pitched buzzing sound, like an electric motor or drill.

**Whistle**
Sharp, shrill sound, like wind passing a small opening.

### Description of Specific Steering System Noise Types

#### Belt Squeal
Belt squeal is a high frequency air-borne noise generated by slippage of the ribbed Vee belt on the power steering pump pulley. Squeal increases with system loading and at the end of lock.

#### Clonk
Clonk is a structure-borne noise heard as a loose-sounding rattle or vibration coming from the steering column. Clonk can be identified by driving and turning over cobblestones, rough roads, or high frequency bumps such as 25-50 mm tall tar strips. Clonk requires a tie-rod load impact.

#### Column Knock
Column knock is a loose-sounding rattle or vibration generated by the steering column shaft contacting other portions of the column assembly. The noise is both audible and tactile. Column knock is generated by driving over cobblestones or rough pavement. It is not necessary to turn the steering wheel to create this noise.

#### Column Rattle
Column rattle is a metallic sounding noise created when applying a highly impulsive force to the steering wheel. Column rattle is often used to combine the more general group of column noises including clonk and column knock. Column rattle noises can be caused by clonk, knock, loose column components, bonus parts etc. A series of parked, straight-line driving, and cornering test should be carried out to isolate the source/sources.

#### Grinding/Scrape
Grinding is a low frequency noise in the column when the steering wheel is turned. Is generally caused by interference between moving components such as the steering wheel to steering column shroud.

#### Grunt (Squawk)
Grunt is a "honking" sound elicited when coming off one of the steering stops. Grunt is generally excited during parking manoeuvres with a low to medium speed steering input.

#### Hiss (Swish)
Hiss or Valve Hiss is a high-frequency sound coming from the steering gear when the system is loaded. It is a rushing or "swish" noise that doesn't change frequency with RPM. Hiss is the general noise generated by the flow of hydraulic fluid through restrictions in the steering system. Restrictions include the rotary steering valve, power steering tubes, connectors, tuning orifices, etc. Hiss can be air-borne and structure-borne, but the structure-borne path through the steering intermediate shaft is usually dominant.

#### Moan (Groan)
Moan is the general structure-borne noise of the steering system. Moan is primarily transmitted to the driver via the body structure through the pump mount, engine mounts, power steering lines and power steering brackets. On some vehicles, moan is a load humming noise, often present when the wheel is turned and the system is loaded. It may change frequency with engine RPM and if the system is loaded or unloaded.

#### Rack Knock (Rack Slap)

⚠️ **CAUTION:** DO NOT attempt to adjust the steering gear yoke. Failure to follow this instruction will result in the steering gear warranty to become invalid.

Rack Knock is a rattle sound and steering wheel vibration caused by separation of the steering gear and pinion while driving over bumps. It...
is a structure-borne noise transmitted through the intermediate shaft and column. Rack knock can also be heard as a “thump” or impact noise that occurs with the vehicle stationary when the steering wheel is released from a loaded position and allowed to return to rest. Noise occurs with the engine on or off.

**Rattles**

Rattles are noises caused by knocking or hitting with components in the steering system. Steering rattles can occur in the engine compartment, the suspension, or the passenger compartment. Rattles can be caused by loose parts, movable and flexible parts, and improper clearances.

**Squeaks/Scrapes**

Squeaks/Scrapes are noises due to friction or component rubbing anywhere in the steering system. Squeaks/Scrapes have appeared in steering linkages and joints, in column components and in column and steering wheel trim parts.

**Weep**

Weep is an air-borne noise, occasionally generated when turning the steering across lock at a constant rate. When present on a vehicle the noise, once initiated can often be maintained across a large proportion of the available steering movement.

**Whistle**

Whistle is similar to hiss but is louder and of a higher frequency. It is also more of a pure tone noise than hiss. Whistle is air-borne and is generated by a high flow rate of hydraulic fluid through a small restriction.

**Zip**

Zip noise is the air-borne noise generated by power steering pump cavitation when power steering fluid does not flow freely through the suction hose from the reservoir to the pump. Zip primarily occurs during cold weather at start-up.

**Steering System Vibrations and Harshness**

**Buzz**

Buzz is a tactile rotary vibration felt in the steering wheel for slow steering inputs. Buzz can also be called a grinding feel and it is closely related to grunt and is caused by high system gain with low damping. Buzz is generally excited during parking manoeuvres with low to medium speed steering input.

**Buzz (Electrical)**

A different steering buzz can be caused by pulse width modulated (PWM) electric actuators used in variable assist steering systems. This buzz is felt by turning the ignition key to run without starting the engine and holding onto the steering wheel. In extreme cases, the buzz can be felt with the engine running also.

**Column/Steering Wheel Shake**

Column shake is a low frequency vertical vibration excited by primary engine vibrations.

**Nibble (Shimmy)**

Steering nibble is a rotary oscillation or vibration of the steering wheel, which can be excited at a specific vehicle speed. Nibble is driven by wheel and tire imbalance exciting a suspension recession mode, which then translates into steering gear travel and finally steering wheel nibble.

**Shudder (Judder)**

Shudder is a low frequency oscillation of the entire steering system (tire, wheels, steering gear and linkage, etc.) when the vehicle is steered during static-park or at low speeds. Shudder is very dependent on road surface.

**Torque Ripple**

Torque ripple is a concern with Electric Power Steering (EPS) systems. Torque ripple is most evident at static-park steering the wheel very slowly from lock to lock. Torque ripple is primarily caused by motor commutation.

**Torque/Velocity Variation (Phasing/Effort Cycling)**

Steering wheel torque variation occurring twice in one revolution is normally as a result of problems with the lower steering column (intermediate shaft), but foul conditions generally result in either constant stiffness or single point stiffness. Depending upon the orientation of the joints, the steering can feel asymmetric (torque falling off in one direction and rising in the other) or else it can simply have pronounced peaks and troughs as the steering moves from lock to lock.

**Wheel Fight (Kick Back)**

Wheel fight is excess feedback of sudden road forces through the steering system and back to the driver. It is evaluated at all vehicle speeds over cobblestones, rough roads, and potholes. The tires, wheels, and suspension generate forces into the steering systems. Steering friction, hydraulic damping, hydraulic compliance, mechanical compliance, steering ratio, and assist gain all affect how much is transmitted to the driver.

**Steering Linkage**

**CAUTION:** Steering gear boots must be handled carefully to avoid damage. Use new clamps when installing steering gear boots. Inspect the boots for cuts, deterioration, twisting or distortion. Check the steering gear boots to make sure they are tight. Install new boots or clamps as necessary.

- **NOTE:** The following steps must be carried out with assistance.
  1. With the wheels in the straight ahead position, gently turn the steering wheel to the left and the right to check for free play.
  2. Free play should be between 0 and 6 mm (0 and 0.24 in) at the steering wheel rim. If the free play exceeds this limit, either the...
3. **CAUTION: DO NOT attempt to adjust the steering gear yoke. Failure to follow this instruction will result in the steering gear warranty to become invalid.**

3. The backlash of the steering gear cannot be adjusted, install a new steering gear. For additional information, REFER to Section **211-02 Power Steering**.

4. Grasp the steering wheel firmly and move it up and down and to the left and right without turning the wheel to check for column bearing wear, steering wheel or steering column. For additional information, REFER to Section **211-04 Steering Column**.
1. NOTE: When filling the reservoir, make sure that the fluid is clean and not agitated prior to use. The fluid should be poured slowly into the reservoir to minimize the possibility of aeration. Fill the reservoir to the MAX mark.

2. NOTE: Do not start the engine. Turn the steering from lock to lock.
3. Check the fluid level. Fill the reservoir to the MAX mark if necessary. Start the engine and turn the steering from lock to lock.
4. Switch the engine off.
5. Check the fluid level. Fill the reservoir to the MAX mark if necessary.
6. Start the engine, turn the steering wheel from lock to lock. If excessive noise is apparent or shudder is evident through the steering wheel, repeat the bleed procedure.
Steering System - General Information - Power Steering System Flushing

General Procedures

• NOTE: If heavy steering or contamination within the power steering system is found, it is necessary to carry out the system flush procedure as detailed below. If any components have been replaced in the power steering system the procedure below must be carried out in full.

• NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

1. Remove the power steering fluid reservoir cap.
2. Using a suitable syringe, remove the power steering fluid from the power steering fluid reservoir.

3. CAUTION: Be prepared to collect escaping fluids.
   • NOTE: Note the orientation of the clip.
   
   Detach the power steering fluid reservoir.
   • Detach but do not remove the power steering fluid reservoir.
   • Release the power steering fluid return hose from the power steering fluid reservoir.
   • If a quick release coupling is fitted to the power steering return hose, release the power steering fluid return hose from the coupling by removing the clip.

4. CAUTION: Be prepared to collect escaping fluids.
   • NOTE: Make sure that all openings are sealed. Use new blanking caps.

   Using a suitable blanking cap, cap the power steering reservoir return pipe.

5. CAUTION: Be prepared to collect escaping fluids.
   • NOTE: Make sure the extended pipe is not kinked or twisted and is correctly secured with hose clips.

   Attach a suitable pipe to the power steering return hose to allow the fluid to drain.
6. **NOTE:** The suitable funnel should have the a capacity of 4 litres and O-ring seal

**NOTE:** The suitable funnel must be tightly sealed to the power steering fluid reservoir to avoid fluid leakage.

Install a suitable funnel onto the power steering fluid reservoir.

---

**7. WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle with the wheels just clear of the ground.

**8. CAUTIONS:**

⚠️ Steps 8 and 9 must be carried out within 2 - 3 seconds of each other. Failure to follow this instruction may result in damage to the power steering system.

⚠️ Be prepared to collect escaping fluids.

Using the suitable funnel, top up the power steering system with the specified fluid. Make sure the fluid level is maintained at two thirds full in the funnel.

**9. CAUTIONS:**

⚠️ Be prepared to collect escaping fluids.

⚠️ Do not allow the power steering fluid level in the power steering fluid reservoir to fall below the minimum power steering fluid level. Failure to follow this instruction may result in damage to the power steering system.

⚠️ Make sure the engine is switched off as soon as the full 4 litres of power steering fluid has entered the power steering fluid reservoir.

Flush the power steering system.

- Start the engine
- With assistance turn the steering slowly lock to lock 3 times at approximately 1 revolution every 5 seconds.
- Continue to flush the power steering system until 4 litres of power steering fluid has been added to the power steering reservoir. This should take approximately 30 seconds.
10. **CAUTION:** Be prepared to collect escaping fluids.

Remove the suitable funnel.

11. **CAUTION:** Be prepared to collect escaping fluids.

Remove the suitable pipe to the power steering return hose.

12. **CAUTION:** Be prepared to collect escaping fluids.

• **NOTE:** Note the orientation of the clip.

If a quick release coupling is fitted to the power steering return hose, connect the power steering fluid return hose to the coupling by installing the clip.

13. Install a new power steering fluid reservoir. For additional information, refer to: (211-02)

   Power Steering Fluid Reservoir - 4.2L/3.0L/2.7L Diesel (Removal and Installation),
   Power Steering Fluid Reservoir - 3.0L Diesel (Removal and Installation).

</table>
The vehicle uses a rack and pinion type, variable ratio steering gear with speed proportional servotronic. The power steering pump is belt driven on all model variants and the power steering oil cooler is of a tube and fin type and is mounted to the front of the cooling pack.

A variable steering rack ratio reduces the amount of turns from lock to lock to improve parking maneuvers without losing any steering feel at higher speeds.

The steering assistance decreases smoothly at a calibrated rate to increase the steering efforts required as vehicle speed increases. The steering efforts are controlled by the actuator position, which in turn is controlled electronically by the speed proportional servotronic curve which is incorporated within the Generic Electronic Module (GEM).

Absolute cleanliness must be observed when replenishing the fluid or dismantling any part of the system. New fluid from a sealed container must be used.

- **NOTE:** If the steering gear, pump or cooler are being replaced for leakage or noise related issues and there is no evidence of fluid contamination, there is no need to replace the reservoir.

In some cases where the fluid clearly contains particulate matter, and the system continues to function, flush the system with fresh fluid and replace the reservoir, as there is the possibility that the reservoir internal filter may be damaged or faulty.
Power Steering - Power Steering
Diagnosis and Testing

For additional information, refer to Section 211-00 Steering System - General Information.
Removal

1. Remove the air deflector.  
   For additional information, refer to: Air Deflector (501-02 Front End Body Panels, Removal and Installation).
2. Detach the steering gear.

3. Disconnect the power steering control valve actuator electrical connector.

4. Remove the power steering control valve actuator.
   - Drain the fluid into a suitable container.
   - Remove and discard the O-ring seals and filter.

Installation

1. To install, reverse the removal procedure.
   - Install new O-ring seals and filter.
2. **CAUTION:** Make sure both the retaining bolts are tightened an even number of turns.
   
   Tighten to 3 Nm.

3. Connect the power steering control valve actuator electrical connector.

4. Tighten to 100 Nm.

5. Install the air deflector.
   
   For additional information, refer to: [Air Deflector](501-02 Front End Body Panels, Removal and Installation).

6. Bleed the power steering system.
   
   For additional information, refer to: [Power Steering System Bleeding](211-00 Steering System - General Information, General Procedures).
Power Steering - Power Steering Control Valve Actuator
Vehicles Built Up To: 01/2004

Removal

1. Remove the air deflector.
   For additional information, refer to Section 501-02 Front End Body Panels.
2. Disconnect the actuator electrical connector.
3. Remove the actuator.
   - Drain the fluid into a suitable container.
   - Remove and discard the O-ring seals and filter.

Installation

1. To install, reverse the removal procedure.
   - Install new O-ring seals and filter.
2. **CAUTION:** Make sure both the retaining bolts are tightened an even number of turns.
   Tighten to 3 Nm.
3. Install the air deflector.
   For additional information, refer to Section 501-02 Front End Body Panels.
4. Bleed the power steering system.
   For additional information, refer to Section 211-00 Steering System -
Power Steering - Power Steering Fluid Cooler V8 4.2L Petrol / V8 S/C 4.2L Petrol / 2.5L NA V6 - AJV6 / 3.0L NA V6 - AJ27

Removal

All vehicles

1. Remove the Front Bumper Cover. For additional information, refer to: (501-19 Bumpers)
   Front Bumper Cover Insert - Vehicles Built From: 02/2004 (Removal and Installation),
   Front Bumper Cover Insert - Vehicles Built Up To: 01/2004 (Removal and Installation).

2. Remove the lower cowl.

3. Reposition the splash shield.
   - Remove the splash shield retaining clip.

4. CAUTIONS:
   - If power steering fluid comes into contact with the paintwork, the affected area must be immediately washed down with cold water.
   - Cap the power steering line to prevent loss of fluid and dirt ingress.
     Disconnect the power steering fluid cooler line.

Vehicles with supercharger
5. Remove power steering fluid cooler.

Vehicles without supercharger

6. NOTE: Left-hand shown, right-hand similar.

   Remove power steering fluid cooler.

Installation

1. To install, reverse the removal procedure.

2. Tighten to 7 Nm.

3. NOTE: If the cooler is being replaced for leakage or noise related issues and there is no evidence of fluid contamination, there is no need to replace the reservoir.

   In some cases where the fluid clearly contains particulate matter, and the system continues to function, flush the system with fresh fluid and replace the reservoir, as there is the possibility that the reservoir internal filter may be damaged or faulty.
Removal

1. Remove the retaining clip.

2. Detach the power steering fluid cooler hose.

3. Remove the radiator splash shield. For additional information, refer to: Radiator Splash Shield (501-02 Front End Body Panels, Removal and Installation).

4. Remove the lower cowl.

5. Remove the splash shield.
6. **CAUTIONS:**

![Image 8x685 to 236x832]

- If power steering fluid is spilt on the paintwork, the effected area must be immediately washed down with cold water. Failure to follow this instruction may result in damage to the vehicle.

![Image 276x755 to 299x774]

- To prevent dirt ingress into the power steering system, make sure suitable plugs are fitted to the power steering pump ports, feed hoses and pipes whenever they are disconnected. Failure to follow this instruction may result in damage to the vehicle.

   - Disconnect the power steering fluid cooler line.
   - Allow the power steering fluid to drain into a suitable container.

7. **NOTE:** Support the speed control module using tie straps.

   Detach the speed control module.

8. Remove the retaining nut.

9. **CAUTION:** Make sure the power steering fluid cooler hose does not damage the radiator foam surround during the power steering fluid cooler removal. Failure to follow this instruction may result in damage to the vehicle.

   Remove power steering fluid cooler.

**Installation**
1. **CAUTION**: Make sure the power steering fluid cooler hose does not damage the radiator foam surround during the power steering fluid cooler installation. Failure to follow this instruction may result in damage to the vehicle.

   To install, reverse the removal procedure.
   - Tighten to 7 Nm.

2. Tighten to 7 Nm.

3. **NOTE**: If the cooler is being replaced for leakage or noise related issues and there is no evidence of fluid contamination, there is no need to replace the reservoir.

   In some cases where the fluid clearly contains particulate matter, and the system continues to function, flush the system with fresh fluid and replace the reservoir, as there is the possibility that the reservoir internal filter may be damaged or faulty.
Power Steering - Power Steering Fluid Reservoir
Removal and Installation

Removal

All except vehicles with diesel engine

1. Remove the suspension turret trim panel.
   1. Detach the suspension turret trim panel.
   2. Remove the suspension turret trim panel.

Vehicles with diesel engine

2. Remove the air cleaner.
   For additional information, refer to: Air Cleaner (303-12C Intake Air Distribution and Filtering - 2.7L V6 - TdV6, Removal and Installation).

All vehicles

3. CAUTIONS:

   ! If power steering fluid is spilt on the paintwork, the effected area must be immediately washed down with cold water. Failure to follow this instruction may result in damage to the vehicle.

   ! To prevent dirt ingress into the power steering system, make sure suitable plugs are fitted to the power steering pump ports, feed hoses and pipes whenever they are disconnected. Failure to follow this instruction may result in damage to the vehicle.

   Detach the power steering reservoir.
   1. Remove the power steering reservoir retaining bolt.
   2. Detach the power steering reservoir.

4. CAUTIONS:

   ! If power steering fluid is spilt on the paintwork, the effected area must be immediately washed down with cold water. Failure to follow this instruction may result in damage to the vehicle.

   ! To prevent dirt ingress into the power steering system, make sure suitable plugs are fitted to the power steering pump ports, feed hoses and pipes whenever they are disconnected. Failure to follow this instruction may result in damage to the vehicle.

   Remove the power steering fluid reservoir.
   • NOTE: Drain fluid into a suitable container.
   • Detach the power steering fluid reservoir hoses.

Installation

1. To install, reverse the removal procedure.

2. Bleed the power steering system.
   For additional information, refer to: Power Steering System Bleeding (211-00 Steering System - General Information, General Procedures).
Removal

1. Remove the accessory drive belt.
   For additional information, refer to: Accessory Drive Belt - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27 (303-05 Accessory Drive, Removal and Installation).

2. Remove the air cleaner.
   For additional information, refer to: Air Cleaner (303-12A Intake Air Distribution and Filtering - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation).

3. Remove the left-hand front wheel and tire.
   For additional information, refer to: Wheel and Tire (204-04 Wheels and Tires, Removal and Installation).

4. Remove the air deflector.

5. Reposition the splash shield.
   - Remove the splash shield retaining clip.

6. Remove the power steering pump lower retaining bolts.

7. Lower the vehicle.
8. CAUTIONS:

⚠️ Cap the power steering line to prevent loses of fluid and dirt ingress.

⚠️ If power steering fluid comes into contact with the paintwork, the affected area must be immediately washed down with cold water.

• NOTE: Drain the fluid into a suitable container.

Disconnect the power steering reservoir to power steering pump supply line.

9. CAUTIONS:

⚠️ Cap the power steering lines to prevent loses of fluid and dirt ingress.

⚠️ If power steering fluid comes into contact with the paintwork, the affected area must be immediately washed down with cold water.

• NOTE: Drain the fluid into a suitable container.

Disconnect the power steering pump to steering gear supply line.

• Remove and discard the O-ring seal.

10. Remove the power steering pump.

---

**Installation**

1. NOTE: Install a new O-ring seal.

To install, reverse the removal procedure.

2. Tighten to 25 Nm.
3. Tighten to 25 Nm.

4. **NOTE:** If the steering pump is being replaced for leakage or noise related issues and there is no evidence of fluid contamination, there is no need to replace the reservoir.

In some cases where the fluid clearly contains particulate matter, and the system continues to function, flush the system with fresh fluid and replace the reservoir, as there is the possibility that the reservoir internal filter may be damaged or faulty.
Power Steering - Power Steering Pump 2.7L V6 - TdV6

Removal and Installation

**Special Tool(s)**

- Accessory belt detensioner.
- 303-703

**Removal**

1. Remove the air cleaner assembly. For additional information, refer to: [Air Cleaner](303-12C Intake Air Distribution and Filtering - 2.7L V6 - TdV6, Removal and Installation).

2. Remove the air deflector. For additional information, refer to: [Air Deflector](501-02 Front End Body Panels, Removal and Installation).

3. Detach the accessory drive belt.
   - 1. Using the special tool, rotate the accessory drive belt tensioner counter clockwise.
   - 2. Detach the accessory drive belt.

4. Lower the vehicle.
5. Remove the hose.

6. Remove the retaining clip.
7. **CAUTIONS:**

⚠️ Cap the power steering lines to prevent loss of fluid and dirt ingress. Failure to follow this instruction may result in damage to the components.

⚠️ If power steering fluid comes into contact with the paintwork, the affected area must be immediately washed down with cold water. Failure to follow this instruction may result in damage to the vehicle.

- **NOTE:** Drain the fluid into a suitable container.

Disconnect the power steering pump to steering gear pressure line.

- Remove and discard the O-ring seal.

8. Remove the power steering pump pulley.

9. Remove the power steering pump.

10. Reposition the spacer.

---

**Installation**
1. To install, reverse the removal procedure.
   - Tighten to 22 Nm.

2. Tighten to 20 Nm.

3. NOTE: Align the power steering pump to steering gear pressure line before tightening.
   - Tighten to 25 Nm.
   - Install new O-ring seal.

4. NOTE: If the steering pump is being replaced for leakage or noise related issues and there is no evidence of fluid contamination, there is no need to replace the reservoir.
   
   In some cases where the fluid clearly contains particulate matter, and the system continues to function, flush the system with fresh fluid and replace the reservoir, as there is the possibility that the reservoir internal filter may be damaged or faulty.
Power Steering - Power Steering Pump 2.7L V6 - TdV6
Removal and Installation

**Special Tool(s)**

| Accessory Belt Detensioner 303-703 |

**Removal**

1. Remove the air cleaner assembly. For additional information, refer to: Air Cleaner (303-12C Intake Air Distribution and Filtering - 2.7L V6 - TdV6, Removal and Installation).

2. Remove the air deflector. For additional information, refer to: Air Deflector (501-02 Front End Body Panels, Removal and Installation).

3. Detach the accessory drive belt.
   1. Using the special tool, rotate the accessory drive belt tensioner counter clockwise.
   2. Detach the accessory drive belt.

4. Lower the vehicle.

5. Detach the accessory drive belt from the power steering pump pulley.

6. **CAUTIONS:**
   - Cap the power steering lines to prevent loss of fluid and dirt ingress.
   - If power steering fluid comes into contact with the paintwork, the affected area must be immediately washed down with cold water.

   Disconnect the power steering pump to steering gear pressure line.
   - Remove and discard the O-ring seal.
7. Remove the power steering pump retaining bolts.

8. Reposition the power steering pump forwards.

9. CAUTIONS:
   - Cap the power steering lines to prevent loss of fluid and dirt ingress.
   - If power steering fluid comes into contact with the paintwork, the affected area must be immediately washed down with cold water.

Remove the power steering pump.
   - Detach the hose.

**Installation**

1. To install, reverse the removal procedure.
   - Tighten to 22 Nm.
2. Tighten to 22 Nm.
   - Install new O-ring seal.
   - Lubricate the new O-ring seal with power steering fluid.

3. NOTE: If the pump is being replaced for leakage or noise related issues and there is no evidence of fluid contamination, there is no need to replace the reservoir.

   In some cases where the fluid clearly contains particulate matter, and the system continues to function, flush the system with fresh fluid and replace the reservoir, as there is the possibility that the reservoir internal filter may be damaged or faulty.

**Removal**

**All vehicles**

1. Remove the left-hand front wheel and tire.
   For additional information, refer to: [Wheel and Tire](#) (204-04 Wheels and Tires, Removal and Installation).

2. Remove the air deflector.
   For additional information, refer to: [Air Deflector](#) (501-02 Front End Body Panels, Removal and Installation).

3. Remove the left-hand engine mount retaining nut.

4. Reposition the splash shield.
   - Remove the splash shield retaining clip.

5. **CAUTIONS:**
   - Cap the power steering line to prevent loss of fluid and dirt ingress.
   - If power steering fluid comes into contact with the paintwork, the affected area must be immediately washed down with cold water.
   - **NOTE:** Drain the fluid into a suitable container.
     Disconnect the power steering reservoir to power steering pump supply line.
6. Remove the air conditioning (A/C) compressor upper retaining bolts.

7. Lower the vehicle.

Vehicles without supercharger

8. Remove the throttle body. For additional information, refer to: (303-04B Fuel Charging and Controls - V8 4.2L Petrol/V8 S/C 4.2L Petrol)

Vehicles with supercharger

9. Remove the air cleaner outlet pipe. For additional information, refer to: Air Cleaner Outlet Pipe (303-12B Intake Air Distribution and Filtering - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Removal and Installation).

All vehicles

10. NOTE: Vehicles with supercharger shown, vehicles without supercharger similar.

Install the left-hand engine lifting eye.
11. NOTE: Vehicles with supercharger shown, vehicles without supercharger similar. Using the special tools, raise the engine to a suitable height.

12. Raise the vehicle.
13. Detach the A/C compressor.
   - Remove the A/C compressor lower retaining bolt.

14. Remove the power steering pump lower retaining bolts.

15. Lower the vehicle.
16. Detach the accessory drive belt.
   1. Rotate the accessory drive belt tensioner counter-clockwise.
   2. Use a 3/8 inch square drive bar to rotate the accessory drive belt tensioner.
   3. Detach the accessory drive belt.

17. CAUTIONS:

   ⚠ Cap the power steering lines to prevent loss of fluid and dirt ingress.

   ⚠ If power steering fluid comes into contact with the paintwork, the affected area must be immediately washed down with cold water.

   • NOTE: Drain the fluid into a suitable container.
   Disconnect the power steering pump to steering gear pressure line.
   • Remove and discard the O-ring seal.

18. Detach the wiring harness retaining clip from the power steering pump.

19. Detach the brake pipe retaining clamps.

20. Remove the power steering pump.
Installation

1. To install, reverse the removal procedure.
   - Install a new O-ring seal.

2. Tighten to 25 Nm.

3. Tighten to 25 Nm.

4. Tighten to 25 Nm.

5. Tighten to 25 Nm.
6. Tighten to 63 Nm.

7. NOTE: If the pump is being replaced for leakage or noise related issues and there is no evidence of fluid contamination, there is no need to replace the reservoir.

In some cases where the fluid clearly contains particulate matter, and the system continues to function, flush the system with fresh fluid and replace the reservoir, as there is the possibility that the reservoir internal filter may be damaged or faulty.
Removal

All vehicles

1. Center the steering wheel.
   - Lock in position, remove the ignition key.

2. NOTE: RH illustration shown, LH is similar.
   Release both tie rod end ball joints.
   1. Loosen the locknut.
   2. Release both track rods from tie rod ends, note the number of turns for installation.

3. Remove both tie-rod end lock nuts.

4. Remove the air deflector.
   For additional information, refer to: Air Deflector (501-02 Front End Body Panels, Removal and Installation).

5. Make sure the alignment mark on the steering gear pinion seal protection cover is central to the steering gear pinion casting.
6. Loosen the lower steering column pinch bolt.

Vehicles built up to 01/2004

7. Disconnect the power steering control valve actuator electrical connector.

All vehicles

8. Detach the lower steering column.
   • Remove the steering gear shaft pinch bolt.

9. CAUTIONS:
   
   ⚠️ Cap the power steering lines to prevent loss of fluid and dirt ingress.
   
   ⚠️ If power steering fluid comes into contact with the paintwork, the affected area must be immediately washed down with cold water.
   
   • NOTE: Drain the fluid into a suitable container.
   Disconnect the power steering supply and return lines.
   • Remove and discard the O-ring seals.
10. Detach the steering gear supply and return lines.

Vehicles built up to 01/2004

11. Remove the steering gear.

Vehicles built 02/2004 onwards

12. Detach the steering gear.

13. Disconnect the power steering control valve actuator electrical connector.
   - Remove the steering gear.

Installation

Vehicles built 02/2004 onwards
1. Install the steering gear.
   - Connect the power steering control valve actuator electrical connector.

2. Tighten to 100 Nm.

Vehicles built up to 01/2004

3. Install the steering gear.
   - Tighten to 100 Nm.

All vehicles

4. Attach the steering gear supply and return lines.
5. **NOTE**: Install new O-ring seals.
   
   Connect the power steering supply and return lines.
   
   - Tighten to 15 Nm.

6. Install the steering gear shaft pinch bolt.
   
   - Tighten to 35 Nm.

Vehicles built up to 01/2004

7. Connect the power steering control valve actuator electrical connector.

All vehicles

8. Tighten the lower steering column pinch bolt.
   
   - Tighten to 35 Nm.
9. Make sure the alignment mark on the steering gear pinion seal protection cover is central to the steering gear pinion casting.

10. Install the air deflector.
    For additional information, refer to: Air Deflector (501-02 Front End Body Panels, Removal and Installation).

11. Install both tie-rod end lock nuts.

12. Connect the tie rod end ball joints.
    1. Attach both tie rods to previously noted positions.
    2. Tighten the tie rod locking nut.

13. Carry out steering system bleed procedure.
    For additional information, refer to: Power Steering System Bleeding (211-00 Steering System - General Information, General Procedures).

14. NOTE: If the steering gear is being replaced for leakage or noise related issues and there is no evidence of fluid contamination, there is no need to replace the reservoir.

    In some cases where the fluid clearly contains particulate matter, and the system continues to function, flush the system with fresh fluid and replace the reservoir, as there is the possibility that the reservoir internal filter may be damaged or faulty.

15. If new steering gear has been installed carry out the front toe adjustment procedure.
    For additional information, refer to: Front Toe Adjustment (204-00 Suspension System - General Information, General Procedures).

Removal

All vehicles

1. Center the steering wheel.
   - Lock in position and remove the ignition key.

   2. Remove the air deflector.
      For additional information, refer to: Air Deflector (501-02 Front End Body Panels, Removal and Installation).

Vehicles built up to 01/2004

3. Disconnect the power steering control valve actuator electrical connector.
4. Detach the lower steering column.
   - Remove the steering gear shaft pinch bolt.

5. Detach the steering gear.

Vehicles built 02/2004 onwards

6. Disconnect the power steering control valve actuator electrical connector.

All vehicles

7. Using the special tools, remove the steering gear lower bushes.
8. Using the special tools, remove the steering gear upper bush.

**Installation**

All vehicles

1. **NOTE:** Apply a thin film of lubricant to the steering gear bushes.
   Using the special tools, install the steering gear lower bushes.

2. **NOTE:** Apply a thin film of lubricant to the steering gear bush.
   Using the special tool, install the steering gear upper bush.

Vehicles built 02/2004 onwards

3. Connect the power steering control valve actuator electrical connector.

All vehicles
4. Install the steering gear.
   - Tighten to 100 Nm.

5. Install the steering gear shaft pinch bolt.
   - Tighten to 35 Nm.

Vehicles built up to 01/2004

6. Connect the power steering control valve actuator electrical connector.

All vehicles

7. Install the air deflector.
   For additional information, refer to: Air Deflector (501-02 Front End Body Panels, Removal and Installation).

The left and right-hand tie-rod assemblies:

- Transmit steering forces from the steering gear to the wheel knuckles.
- Provide front road wheel toe setting by adjustment of the threaded outer tie-rod ends.

**NOTE:** Steering geometry adjustments must only be carried out with the vehicle on turn plates to allow the wheels to move during adjustment.

The left and right-hand steering rack boots:

- Are installed between the steering rack and the tie-rod ends.
- Are of the concertina type.
- Are to prevent the ingress of foreign matter.
Steering Linkage - Steering Linkage
Diagnosis and Testing

For additional information, refer to Section 211-00 Steering System - General Information
Steering Linkage - Steering Gear Boot
Removal and Installation

Removal

1. Remove the tie rod end. For additional information, refer to Tie-Rod End in this section.
2. Remove and discard the tie-rod boot outer retaining clamp.

3. Remove and discard the tie-rod boot inner retaining clamp.

4. CAUTION: Make sure the area is washed down thoroughly before removing the steering gear boot.
   Remove the tie-rod boot.

Installation

1. CAUTION: Make sure the tie-rod is clean before installing the steering gear boot.

   • NOTE: Install new retaining clamps.

   To install, reverse the removal procedure.
**Removal**

1. Remove the front wheel and tire. For additional information, refer to Section 204-04 Wheels and Tires.
2. Loosen the tie-rod end lock nut.

3. **CAUTION:** Prevent the tie-rod end ball joint ball pin from rotating. Failure to do so may result in damage to the tie-rod end ball joint boot.

   Remove the tie-rod end retaining nut.

4. **NOTE:** Make a note of the number of turns required to remove the tie-rod end.

   Remove the tie-rod end.

**Installation**

1. **NOTE:** Make sure the tie-rod end is installed on the tie-rod by the same amount of turns used to remove it.

   Install the tie-rod end.
2. CAUTIONS:

⚠️ Prevent the tie-rod end ball joint ball pin from rotating. Failure to do so may result in damage to the tie-rod end ball joint boot.

⚠️ Make sure the mating surfaces are free from dirt and lubricant.

Install the tie-rod end retaining nut.

- Tighten to 100 Nm.

3. Tighten the tie-rod end lock nut.

- Tighten to 55 Nm.

4. Check the front toe adjustment.

For additional information, refer to Section 204-00 Suspension System - General Information.

If you are re-using this fixing on a vehicle built prior to VIN N83337, then tighten to 25 Nm. If you are replacing a fixing, then you must tighten to 30 Nm.
The steering lock actuator is secured to the lower part of the adjustable steering column and consists of a locking pin and an electric motor. The electric motor has a hall effect sensor which detects lock and unlock states, this makes the lock actuator more sensitive for the time taken to lock and unlock. A bus controller chip has also been added to cope with the high integrity bus traffic. The column is locked and unlocked by inserting and removing the ignition key respectively. The instrument cluster provides control for the column adjustment by means of a power tilt/telescope switch on the side of the steering column lower shroud, memory recall and easy entry or exit.

The steering column is a tilt and telescopic type consisting of one electric motor to tilt and telescope the steering column. The steering column has 50mm of telescopic movement and 5 degrees of tilt adjust. The power tilt and telescope function allows the driver to manually set the steering column position by using the power tilt/telescope switch, regardless of the ignition switch position. When moving the column, the switch will only allow one directional movement at a time.

Crash load absorption is provided by a unique peeling tube mechanism. If an accident occurs and the driver is not wearing a safety belt the steering column must be replaced. The steering column must also be replaced if the air bag is deployed.

The steering column will need to be calibrated if the column or the instrument cluster is renewed. Calibration is carried out using the Jaguar Approved Diagnostic System. No routine maintenance of the steering wheel and driver airbag is required. Any setting of steering wheel for misalignment must be achieved by adjusting tie rods.
Steering Column - Steering Column
Diagnosis and Testing

For additional information, refer to Section 211-00 Steering System - General Information.
Removal

Vehicles with ignition switch lock cylinder interlock cable

1. Remove the transmission selector lever. For additional information, refer to Section 307-05 Automatic Transmission/Transaxle External Controls.

2. Detach the ignition switch lock cylinder interlock cable.

All vehicles

3. Remove the instrument panel lower trim.

4. Detach the steering column lower shroud.

5. Remove the steering column lower shroud.
6. **CAUTION:** If excessive force is used to remove the ignition switch lock cylinder shroud damage may occur to the instrument panel.

   Remove the ignition switch lock cylinder shroud.

7. **CAUTION:** If excessive force is used to remove the ignition switch lock cylinder housing damage may occur to the instrument panel.

   Detach the ignition switch lock cylinder housing.

8. Disconnect the electrical connector.

Vehicles with ignition switch lock cylinder interlock cable

9. **CAUTION:** Make sure the ignition switch lock cylinder interlock cable is not crimped.

   Remove the ignition switch lock cylinder housing.
   - Disconnect the electrical connector.

All vehicles
10. Remove the ignition switch lock cylinder housing.
   - Disconnect the electrical connector.

11. Remove the ignition switch lock cylinder.
   1. Turn ignition key to position one.
   2. Release the retaining tang.
   3. Remove the ignition switch lock cylinder.

Installation

Vehicles with ignition switch lock cylinder interlock cable

1. **CAUTION:** Make sure the ignition switch lock cylinder interlock cable is not crimped.

   Install the ignition switch lock cylinder housing.
   - Connect the electrical connector.

All vehicles

2. Install the ignition switch lock cylinder housing.
   - Connect the electrical connector.
3. Connect the electrical connector.

4. **CAUTION:** If excessive force is used to attach the ignition switch lock cylinder housing damage may occur to the instrument panel.

   Attach the ignition switch lock cylinder housing.

5. Install the ignition switch lock cylinder shroud.

6. Install the ignition switch lock cylinder.
   
   1. Turn ignition key to position one.
   2. Install the ignition switch lock cylinder.

7. Install the steering column lower shroud.
8. Attach the steering column lower shroud.
   - Tighten to 3 Nm.

9. Install the instrument panel lower trim.

Vehicles with ignition switch lock cylinder interlock cable

10. Attach the ignition switch lock cylinder interlock cable.

11. Install the transmission selector lever.
For additional information, refer to Section 307-05 Automatic Transmission/Transaxle External Controls.
Removal

1. If possible make sure that the steering column is fully lowered and fully extended.
2. Remove the clockspring. For additional information, refer to: Clockspring (501-20B Supplemental Restraint System, Removal and Installation).
3. Disconnect the steering wheel rotation sensor electrical connector.

4. Remove the steering wheel rotation sensor.

5. Detach the left-hand multifunction switch wiring harness.

6. Detach the right-hand multifunction switch wiring harness.
7. Detach the right-hand multifunction switch wiring harness.

8. Detach the left-hand multifunction switch wiring harness.

9. Disconnect the steering column electrical connector.

10. Remove the steering column pinch bolt.

11. NOTE: The position of the brake pedal crash bracket. 
    Detach the steering column.
    - Support the weight of the steering column.
12. Disconnect the steering column lock actuator electrical connector.

13. Remove the steering column.

**Installation**

1. If a new steering column is to be installed, record the eleven digit alpha numeric code from the attached bar code label.

2. **CAUTION:** Make sure the pinch bolt is correctly installed.

   Install the steering column.

3. Connect the steering column lock actuator electrical connector.
4. **WARNING:** Make sure the brake pedal crash bracket is correctly located. Failure to follow this instruction may result in personal injury.

**CAUTION:** Make sure the brake pedal crash bracket is correctly located. Failure to follow this instruction may result in component damage.

- **NOTE:** Tighten the retaining nuts in the sequence shown.

  Attach the steering column.
  - Tighten to 30 Nm.

5. Tighten to 35 Nm.

6. Connect the steering column electrical connector.

7. Attach the left-hand multifunction switch wiring harness.
8. Attach the right-hand multifunction switch wiring harness.

9. Attach the right-hand multifunction switch wiring harness.

10. Attach the left-hand multifunction switch wiring harness.

11. Install the steering wheel rotation sensor.

12. Connect the steering wheel rotation sensor electrical connector.
13. Install the clockspring. For additional information, refer to: Clockspring (501-20B Supplemental Restraint System, Removal and installation).

14. Carry out the steering column calibration application. For further information, refer to the Jaguar approved diagnostic system.
Removal

1. Remove the driver air bag module. For additional information, refer to: Driver Air Bag Module (501-20B Supplemental Restraint System, Removal and Installation).

2. Disconnect the electrical connector.

3. CAUTIONS:
   - Position the front wheels in a straight ahead position and centralize steering wheel. Failure to follow this instruction may result in damage to the clockspring.
   - Make sure no damage is occurred to the electrical connectors. Failure to follow this instruction may result in damage to the vehicle.
   - Remove the steering wheel.

4. CAUTIONS:
   - Failing to install the special tool to the clockspring may result in damage to the vehicle.
   - Do not allow the clockspring to unwind.
   - Install the special tool to the clockspring.

Installation

1. To install, reverse the removal procedure.
2. **CAUTION:** Make sure that the arrow on the cassette is centered and pointing vertically prior to the steering wheel installation. On removal of the special tool, keep the clockspring cables taught to prevent the cassette moving from the set position. Do not allow the clockspring to unwind. Failure to follow this instruction may result in damage to the component.

   Install the steering wheel.

3. **CAUTION:** Check the alignment arrow is still in the vertical position with the wheels straight ahead to make sure that the directional indicator cancellation is central.

   Tighten to 65 Nm.
Disassembly

1. Remove the Steering Column Lock Actuator. For additional information, refer to Section 211-05 Steering Column Switches.

2. Detach the wiring harness.

3. Detach the steering column electrical connector housing.

4. Remove the steering column electrical connector housing.
   - Disconnect the electrical connectors.

5. NOTE: Remove and discard the tilt solenoid retaining bolts.
   Remove the tilt solenoid.
   - Detach the tilt solenoid wiring harness.
6. **NOTE:** Remove and discard the telescopic solenoid retaining bolts.
   Remove the telescopic solenoid.
   - Remove and discard the retaining strap.

7. Remove the tilt/telescopic motor retaining pin.
   - Remove and discard the retaining pin and washers.

8. Remove and discard the telescopic housing retaining bolts.

9. **CAUTION:** Make sure the potentiometer sliders are fully disconnected. Failure to follow this instruction may result in component damage.
   Reposition the tilt/telescopic motor.

10. **NOTE:** The tilt/telescopic motor will only need to be rotated if the motor is inoperative.
    Rotate the tilt/telescopic motor as shown.
    - Press the telescopic solenoid engagement pin.
Assembly

1. **CAUTION:** Make sure the potentiometer sliders are correctly located. Failure to follow this instruction may result in component damage.
   
   Install the tilt/telescopic motor.
   - Reposition the tilt/telescopic motor to the steering column.

2. Install new telescopic housing retaining bolts.
   - Tighten to 8 Nm.

3. Install the supplied spacer between the tilt/telescopic motor and steering column.

4. Install a new tilt/telescopic motor retaining pin and washers.
5. NOTE: Install new tilt solenoid retaining bolts.
   Install the tilt solenoid.
   - Tighten to 1 Nm.
   - Attach the tilt solenoid wiring harness.

6. NOTE: Install new telescopic solenoid retaining bolts.
   Install the telescopic solenoid.
   - Tighten to 1 Nm.
   - Install a new retaining strap.

7. Install the steering column electrical connector housing.
   - Connect the electrical connectors.

8. Attach the steering column electrical connector housing.

9. Attach the wiring harness.

10. Install the Steering Column Lock Actuator.
    For additional information, refer to Section 211-05 Steering Column Switches.
Steering Column Switches - Steering Column Switches

The multifunction switch is situated on the steering column and consists of the wiper switch and the direction indicator/main beam switch.

Multifunction switch left-hand

The Multifunction switch LH is on the LH side of the steering column and controls the following functions.

Direction Indicators

The direction indicators:

- Operate when the ignition switch is in position II.
- Are operated by moving the multifunction switch up or down until it latches in position, to indicate a right or left turn respectively.
- Can be operated while the multifunction switch is held against spring pressure before reaching the latch position.
- Cancel automatically upon completion of a turn. The multifunction switch then returns to the center position.

An audible ticking and a flashing green warning lamp on the instrument cluster indicate that the direction indicators are operating. If an indicator bulb fails, the warning lamp and ticking operate at twice the normal rate and a message will appear on the instrument cluster message center.

Side Lamps

The Side Lamp function is operated by rotating the multifunction switch collar one position counter clockwise this will then activate the side lamps.

Head Lamps

The Head Lamp function is operated by rotating the multifunction switch collar two positions counter clockwise this will then activate the head lamps.

Main Beam

The Main Beam multifunction switch has one pull and one push position. Pulling the main beam multifunction switch toward the driver will cause the main beam lamps to flash. The main beam lamps can be flashed with the ignition on or off and will remain activated as long as the multifunction switch is held.

Pushing the multifunction switch away from the driver to the latch position will operate main beam lamps continuously if the head lamps are on.

Auto Lamps

The Auto Lamp function is operated by rotating the multifunction switch collar to the auto position. The head lamps will then operate automatically when the sunload sensor detects low light levels.

Exit Delay
The Exit Delay time can be varied by rotating the multifunction switch collar. Turning the collar clockwise will decrease the exit delay time and turning the collar counter clockwise will increase the exit delay time. The head lamps will stay for a set period of time ranging from 10 seconds to 2 minutes.

**Trip Function**
If the Trip Function switch is pressed once, a menu in the instrument cluster message center will be displayed and cycle though an option menu. Pushing and holding the switch resets the mileage calculated in a trip cycle. The trip mileage is displayed in the instrument cluster message center.

**Multifunction switch right-hand**
The Multifunction switch right-hand is on the right-hand side of the steering column and controls the following functions.

**Flick Wipe**
Flick wipe operation:
- Is obtained by pulling the multifunction switch towards the driver.
- Features a single wipe at normal speed if the multifunction switch is released immediately.
- Features continuous wipe action at fast speed while the multifunction switch position is held.

**Intermittent Wipe**
In the intermittent wipe position:
- The wiper operates intermittently, with a variable time delay between wipes.
- The time delay can be varied by rotating the multifunction switch collar, turning the collar clockwise will increase the wiper time delay and turning the collar counter clockwise will decrease the wiper time delay. The switch has 7 positions and wiper delay varies between 3-18 seconds on non-auto rain sensing and has 7 positions on auto rain sensing vehicles with 6-18 seconds wiper delay.

**Slow Speed Wiper**
In the slow speed position:
- The wiper operates continuously at slow speed.

**High Speed Wiper**
In the high speed position:
- The wiper operates continuously at high speed.

**Windscreen Wash/Wipe**
The wash/wipe function:
- Is operated by the button at the end of the multifunction switch.
- Operates the washers and wiper, while the button is pressed, for up to 18 seconds.
- Provides an additional three sweeps of the wiper after the button is released.
- Wash function is disabled if the 'Washer Fluid Low' message is displayed, but wipe operation is still available.

**Head lamp Power Wash (if equipped)**
The headlamp power wash function:
- Operates only when the head lamps are on and the windscreen wash/wipe button is pressed.
- Provides two short bursts of approximately 3 seconds apart to the head lamps.
- The powerwash cycle will continue for up to 20 seconds if the wash/wipe button is held.

The headlamp powerwash will operate the first time the wash/wipe button is pressed and thereafter every sixth succeeding wash/wipe operation.

**Moisture Sensitive Wiping (if equipped)**
The moisture sensitive wiping function:
- Operates if the collar on the multifunction is set to the auto position.
- Operates if the transmission is in gear.
- Operates if moisture on the windscreen is detected.
- Operates the wipers at varied speeds depending on the amount of moisture detected on the windscreen.
- Operates the wipers at varied speeds depending on the speed of the vehicle.
The complexity of the electronics involved with the various electronic control modules and the multiplexed communication networks, preclude the use of workshop general electrical test equipment. Therefore, reference should be made to the Jaguar approved diagnostic system.

The Jaguar approved diagnostic system systematically tests and analyses all functions of the multifunction switch. Where a fault involving the multifunction switch is indicated by the Jaguar approved diagnostic system, before installing new components, some basic diagnostic methods may be necessary to confirm that connections are good and that wiring is not damaged.
**Steering Column Switches - Steering Column Lock Actuator**

**Removal and Installation**

<table>
<thead>
<tr>
<th>Special Tool(s)</th>
</tr>
</thead>
<tbody>
<tr>
<td>5 point security torx bit</td>
</tr>
<tr>
<td>418-535</td>
</tr>
</tbody>
</table>

**Removal**

1. Remove the steering column. For additional information, refer to Section 211-04 Steering Column.
2. Remove the steering column lock actuator.
   - Using the special tool, remove the steering column lock actuator retaining bolts.

**Installation**

1. To install, reverse the removal procedure.
   - Tighten to 9 Nm.
Removal

1. Remove the steering column lower cowl.
   - Remove the 2 screws.
   - If installed, disconnect the steering column and foot pedal control switch electrical connector.

2. Remove the steering column upper cowl.
   - Remove the 3 screws.

3. Remove the steering column multifunction switch.
   - Depress the 2 clips.
   - Disconnect the electrical connector.

Installation

1. **CAUTION:** Make sure the electrical harness is not trapped during the installation.

To install, reverse the removal procedure.
Removal

1. Remove the instrument panel lower trim.

2. Detach the steering column lower shroud.

3. Remove the steering column lower shroud.

4. Remove the steering column upper shroud.
5. Disconnect the steering column multifunction switch RH electrical connector.

6. Remove the steering column multifunction switch RH switch.

**Installation**

1. To install, reverse the removal procedure.
2. Tighten to 3 Nm.
Since diagnosis and testing actually begins when repairs are taken on, the following procedure is recommended.

1. **Verify the customer concern by operating the system.**
   - **Visual Inspection Chart**
     | Mechanical |
     |-----------------|
     | ○ Coolant leaks |
     | ○ Oil leaks |
     | ○ Leaks in the fuel system |
     | ○ Visibly damaged or worn parts |
     | ○ Loose or missing nuts or bolts |

2. **Visually inspect for obvious signs of mechanical damage or electrical damage. If the concern cannot be reproduced, carry out a road test and/or visual check with the aid of the following table.**

3. **If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.**

4. **If the concern is not visually evident, verify the symptom and refer to the Symptom Chart.**

### Component Tests

**Engine Oil Leaks**

- NOTE: Before installing new gaskets or oil seals, make sure that the fault is clearly established.

If the oil leak cannot be identified clearly by a visual inspection, carry out an UV test:

#### Fluorescent Oil Additive Method

1. Clean the engine with a suitable cleaning fluid (brake cleaner).
2. Drain the engine oil and refill with recommended oil, premixed with Diesel Engine Oil Dye or equivalent. Use a minimum 14.8 ml (0.5 ounce) to a maximum 29.6 ml (1 ounce) of fluorescent additive to all engines. If oil is not premixed, fluorescent additive must first be added to the crankcase.
3. Run engine for 15 minutes. Stop the engine and inspect all seal and gasket areas for leaks using a 12 Volt Master UV Diagnostic Inspection Kit or equivalent. A clear bright yellow or orange area will identify leak. For extremely small leaks, several hours may be required for the leak to appear.
4. As necessary, pressurize the main oil gallery system to locate leaks due to incorrectly sealed, loose or cocked plugs. If the flywheel bolts leak oil, look for sealer on the threads.
5. Repair all leaks as necessary.

**Compression Test**

#### General Remarks

- NOTE: Removing fuses and disconnecting electrical components causes the engine control module (ECM) to log an error message. After the measurements have been carried out this error message should be cleared from memory by connecting to the Jaguar Approved Diagnostic System.

- NOTE: Only check the compression pressure with the valves set to the prescribed clearance (if this can be adjusted).

The compression pressure should be checked with the engine at operating temperature.

#### Check The Compression Pressure

**WARNING:** On manual transmissions shift the transmission into neutral. On automatic transmission vehicles, select "P". Failure to follow these instructions may result in personal injury.
1. Remove the fuel pump relay.
2. Start the engine - the engine will start, run for a few seconds then stall.
3. Remove the spark plugs.
4. Install the compression tester.
5. Install an auxiliary starter switch in the starting circuit. With the ignition switch OFF, using the auxiliary starter switch, crank the engine a minimum of five compression strokes and record the highest reading. Note the approximate number of compression strokes required to obtain the highest reading.
6. Repeat the test on each cylinder, cranking the engine approximately the same number of compression strokes.
7. Install the components in reverse order, observing the specified tightening torques.
8. Reset the ECM fault memory.

**Interpretation of the Results**

The indicated compression pressure are considered within specification if the lowest reading cylinder is within 75% of the highest reading.

**CAUTION:** If engine oil is sprayed into the combustion chamber, after carrying out the measurement run the engine at 2000 rpm for about 15 minutes, in order to burn the oil and prevent damage to the catalytic converter.

If the measurement on one or more cylinders is much lower than the specified value, spray some engine oil into the combustion chamber and repeat the compression measurement.

If the reading greatly improves then the piston rings are damaged.

If the reading stays the same then the cause is either damaged valve seats or valve stem seals.

If the measurements for two cylinders next to each other are both too low then it is very likely that the cylinder head gasket between them is burnt through. This can also be recognized by traces of engine oil in the coolant and/or coolant in the engine oil.

**Excessive Engine Oil Consumption**

The amount of oil an engine uses will vary with the way the vehicle is driven in addition to normal engine-to-engine variation. This is especially true during the first 16,100 km (10,000 miles) when a new engine is being broken in or until certain internal components become conditioned. Vehicles used in heavy-duty operation may use more oil. The following are examples of heavy-duty operation:

- Trailer towing applications.
- Severe loading applications.
- Sustained high speed operation.

Engines need oil to lubricate the following internal components:

- Cylinder block cylinder walls.
- Pistons and piston rings.
- Intake and exhaust valve stems.
- Intake and exhaust valve guides.
- All internal engine components.

When the pistons move downward, a thin film of oil is left on the cylinder walls. As the vehicle is operated, some oil is also drawn into the combustion chambers past the intake and exhaust valve stem seals and burned.

The following is a partial list of conditions that can affect oil consumption rates:

- Engine size.
- Operator driving habits.
- Ambient temperatures.
- Quality and viscosity of oil.

Operation under varying conditions can frequently be misleading. A vehicle that has been run for several thousand miles on short trips or in below-freezing ambient temperatures may have consumed a "normal" amount of oil. However, when checking the engine oil level, it may measure up to the full mark on the oil level indicator due to dilution (condensation and fuel) in the engine crankcase. The vehicle then might be driven at high speeds on the highway where the condensation and fuel boil off. The next time the engine oil is checked it may appear that a liter of oil was used in about 160 km (100 miles) per liter oil consumption rate is about 2,400 km (1,500 miles) per liter.

Make sure the selected engine oil meets Jaguar specification and the recommended API performance category "SG" and SAE viscosity grade as shown in the vehicle Owner's Guide. It is also important that the engine oil is changed at the intervals specified for the typical operating conditions.

**Oil Consumption Test**

The following diagnostic procedure is used to determine the source of excessive oil consumption.

- **NOTE:** Oil use is normally greater during the first 16,100 km (10,000 miles) of service. As mileage increases, oil use decreases. Vehicles in normal service should get at least 16,000 km (10,000 miles) per liter. High speed driving, towing, high ambient temperature and other factors may result in greater oil use.

1. Define excessive consumption, such as the number of miles driven per liter of oil used. Also determine customer's driving habits, such as sustained high speed operation, towing, extended idle and other considerations.
2. Verify that the engine has no external oil leaks as described under Engine Oil Leaks.
3. Verify that the engine has the correct oil level.
4. Verify that the engine is not being run in an overfilled condition. Check the oil level at least five minutes after a hot shutdown with the vehicle parked on a level surface. In no case should the level be above the top of the cross-hatched area and the letter "F" in FULL. If significantly overfilled, carry out step 5, sub steps 1 through 4.
5. Carry out an oil consumption test:
1. Drain engine oil and fill with one liter less than the recommended amount.
2. Run the engine for three minutes (10 minutes if cold), and allow oil to drain back for at least five minutes with vehicle parked on level surface.
3. Remove the oil level indicator and wipe clean. (Do not wipe with anything contaminated with silicone compounds.) Install the oil level indicator making sure to seat the oil level indicator firmly in the oil level indicator tube. Remove the oil level indicator and draw a mark on the back (unmarked) surface at the indicated oil level. (This level should be about the same as the ADD mark on the face of the oil level indicator.)
4. Add one liter of oil. Start the engine and allow to idle for at least two minutes. Shut off the engine and allow the engine oil to drain back for at least five minutes. Mark the oil level dipstick, using the procedure above. (This level may range from slightly below the top of the cross-hatched area to slightly below the letter "F" in FULL.
5. Record the vehicles mileage.
6. Instruct the customer to drive the vehicle as usual and:
   1. Check the oil level regularly at intervals of 160-240 km (100-150 miles).
   2. Return to the service point when the oil level drops below the lower (ADD) mark on the oil level indicator.
   3. Add only full liters of the same oil in an emergency. Note the mileage at which the oil is added.
7. Check the oil level under the same conditions and at the same location as in steps 3 and 4.
   1. Measure the distance from the oil level to the UPPER mark on the oil level indicator and record.
   2. Measure the distance between the two scribe marks and record.
   3. Divide the first measurement by the second.
   4. Divide the distance driven during the oil test by the result. This quantity is the approximate oil consumption rate in kilometers per liter or in mile per quart.
   5. If the oil consumption rate is unacceptable go to Step 6.
6. Check the positive crankcase ventilation (PCV) system. Make sure the system is not plugged.
7. Check for plugged oil drain-back holes in the cylinder head and cylinder block.
8. If the condition still exists after carrying out the above tests go to step 9.
9. Carry out a cylinder compression test. Refer to the procedure in this section: Compression Test. This can help determine the source of oil consumption such as valves, piston rings or other areas.
11. Worn or damaged internal engine components can cause excessive oil consumption. Small deposits of oil on the tips of the spark plugs can be a clue to internal oil consumption.

**Intake Manifold Vacuum Test**

Bring the engine to normal operating temperature. Connect a vacuum gauge or equivalent to the intake manifold. Run the engine at the specified idle speed.

The vacuum gauge should read between 51-74 kPa (15-22 in-Hg) depending upon the engine condition and the altitude at which the test is performed. Subtract 4.0193 kPa (1 in-Hg) from the specified reading for every 304.8 m (1,000 feet) of elevation above sea level.

The reading should be steady. As necessary, adjust the gauge damper control (where used) if the needle is fluttering rapidly. Adjust damper until needle moves easily without excessive flutter.

**Interpreting Vacuum Gauge Readings**

A careful study of the vacuum gauge reading while the engine is idling will help pinpoint trouble areas. Always conduct other appropriate tests before arriving at a final diagnostic decision. Vacuum gauge readings, although helpful, must be interpreted carefully.

Most vacuum gauges have a normal band indicated on the gauge face.

The following are potential gauge readings. Some are normal; others should be investigated further.
1. **NORMAL READING**: Needle between 51-74 kPa (15-22 in-Hg) and holding steady.

2. **NORMAL READING DURING RAPID ACCELERATION**: When the engine is rapidly accelerated (dotted needle), the needle will drop to a low (not to zero) reading. When the throttle is suddenly released, the needle will snap back up to a higher than normal figure.

3. **NORMAL FOR HIGH-LIFT CAMSHAFT WITH LARGE OVERLAP**: The needle will register as low as 51 kPa (15 in-Hg) but will be relatively steady. Some oscillation is normal.

4. **WORN RINGS OR DILUTED OIL**: When the engine is accelerated (dotted needle), the needle drops to 0 kPa (0 in-Hg). Upon deceleration, the needle runs slightly above 74 kPa (22 in-Hg).

5. **STICKING VALVES**: When the needle (dotted) remains steady at a normal vacuum but occasionally flicks (sharp, fast movement) down and back about 13 kPa (4 in-Hg), one or more valves may be sticking.

6. **BURNED OR BENT VALVES**: A regular, evenly-spaced, downscale flicking of the needle indicates one or more burned or damaged valves. Insufficient hydraulic valve tappet or hydraulic lash adjuster clearance will also cause this reaction.

7. **POOR VALVE SEATING**: A small but regular downscale flicking can mean one or more valves are not seating correctly.

8. **WORN VALVE GUIDES**: When the needle oscillates over about a 13 kPa (4 in-Hg) range at idle speed, the valve guides could be worn. As engine speed increases, the needle will become steady if guides are responsible.

9. **WEAK VALVE SPRINGS**: When the needle oscillation becomes more violent as engine RPM is increased, weak valve springs are indicated. The reading at idle could be relatively steady.

10. **LATE VALVE TIMING**: A steady but low reading could be caused by late valve timing.

11. **IGNITION TIMING RETARDING**: Retarded ignition timing will produce a steady but somewhat low reading.

12. **INSUFFICIENT SPARK PLUG GAP**: When spark plugs are gapped too close, a regular, small pulsation of the needle can occur.

13. **INTAKE LEAK**: A low, steady reading can be caused by an intake manifold or throttle body gasket leak.

14. **BLOWN HEAD GASKET**: A regular drop of fair magnitude can be caused by a blown head gasket or warped cylinder head to cylinder block surface.

15. **RESTRICTED EXHAUST SYSTEM**: When the engine is first started and is idled, the reading may be normal, but as the engine RPM is increased, the back pressure caused by a clogged muffler, kinked tail pipe or other concerns will cause the needle to slowly drop to 0 kPa (0 in-Hg). The needle then may slowly rise. Excessive exhaust clogging will cause the needle to drop to a low point even if the engine is only idling.

When vacuum leaks are indicated, search out and correct the cause. Excess air leaking into the system will upset the fuel mixture and cause concerns such as rough idle, missing on acceleration or burned valves. If the leak exists in an accessory such as the power brake booster, the unit will not function correctly. Always repair vacuum leaks.
Inspection and Verification

1. Verify the customer concern. Concerns have been separated into **Leaks** and **noise vibration and harshness (NVH)** for ease of use.

2. Visually inspect for obvious signs of mechanical or electrical damage.

   2. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

3. If the concern is not visually evident, verify the symptom and refer to the Symptom Chart.

### Visual Inspection Chart

Check the engine oil pressure, go to Pinpoint Test for your own equipment when performing any tests.

**NOTE:** Where reference is made to 'suitable equipment', this refers to standard workshop equipment. Refer to the operating instructions.

### Pinpoint tests

**NOTE:** Where reference is made to 'suitable equipment', this refers to standard workshop equipment. Refer to the operating instructions for your own equipment when performing any tests.

### Pinpoint Test A: Check the Cylinder Compressions

**WARNING:** Only compression testers able to read the higher compression pressures found in diesel engines should be used. Failure to follow this instruction may result in personal injury.

**NOTE:** Where possible, compression testing should be carried out on an engine at operating temperature.

**TEST CONDITIONS**

</tbody>
</table>

### Pinpoint Test A: Carry Out a Dry Cylinder Compression Test

**A1: Carry Out a Dry Cylinder Compression Test**

1. Make sure the parking brake is applied and that the selector lever is in neutral (or park for vehicles with automatic transmission).
2. Turn the ignition switch to the OFF position.
3. Remove the starter relay.
4. Disconnect the starter motor solenoid connector.
5. Connect a suitable remote starter device to the starter motor solenoid.
6. Remove the glow plugs, REFER to: Glow Plugs (303-07C Glow Plug System, Removal and Installation).
7. Install adaptor 303-1131 in place of the glow plug in the first cylinder to be tested.
8. Connect a suitable compression tester to the adaptor. See warning above.
9. Using the remote starter device, crank the engine a minimum of five revolutions.
10. Record the compression figure and the number of revolutions taken to reach it.
11. Repeat steps 7 - 10 above for the remaining cylinders, cranking the engine for a similar number of revolutions each time.
12. Compare the compression figures across all the cylinders.

Are the compression figures within 10% of each other?

**Yes**

- Unless the compression figures are universally very low (experience will indicate this), check for other causes for the customer complaint.

**No**
**A2: CARRY OUT A WET CYLINDER COMPRESSION TEST**

**CAUTION:** If engine oil is introduced into the cylinders, run the engine at 2,000 rpm for a minimum of ten minutes after completing testing to prevent damage to the catalytic converters. Failure to follow this instruction may result in damage to the vehicle.

1. Using a suitable oil can with a flexible spout, introduce a small amount of clean engine oil into the cylinder just before testing, such that the oil is able to run between the piston and the cylinder bore.

2. Repeat steps 7 - 10 from the test above, introducing oil into each cylinder just before testing.

3. Compare the compression figures across all the cylinders.

   Is the compression figure higher than the dry test?

   - Yes: A higher figure following the introduction of oil may indicate a worn or damaged cylinder bore, piston and/or piston rings. Disassembly would be required to confirm this.
   - No: If the compression figure is unaffected by the introduction of oil, but the figure is still less than 90% of the other cylinders, this may indicate a burnt and/or sticking valve, leaking head gasket, etc. Disassembly would be required to confirm this.

   Clear any DTCs which may have been induced by the test.

**PINPOINT TEST B : OIL CONSUMPTION TEST**

**NOTE:** Oil consumption will vary, depending on a number of factors. New engines will normally use more oil than 'run-in' engines, although a guideline would be to expect 16,000 Km (10,000 mls) per liter.

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>B1: CHECK FOR EXCESSIVE OIL CONSUMPTION</td>
<td></td>
</tr>
</tbody>
</table>

1. Start the engine and allow it to run until it reaches operating temperature.
2. Make sure the vehicle is parked on a level surface and switch off.
3. Allow to settle for at least five minutes.
4. Check the oil level.
5. Check the level, if necessary, and record the reading and mileage in the vehicle history.
6. Make sure that the owner/driver is aware that a test is being carried out, and that they should not top-up their oil level for the duration of the test, but should check the level every 160-240 Km (100-150 miles).
7. When the oil level reaches the ADD mark, the customer should bring the vehicle in to be checked.
8. Top-up the oil to the level at the beginning of the test and record the amount of oil needed to do so, and the mileage covered in the course of the test.
9. From this, the consumption can be calculated, and a decision made as to whether or not the consumption is considered excessive.

   Is the consumption excessive for the mileage and/or use?

   - Yes: Disassembly will be required to check the components indicated in the symptom chart.
   - No: No further action is necessary.

**PINPOINT TEST C : CHECK THE ENGINE OIL PRESSURE**

**NOTE:** Check and, if necessary, top-up the engine oil level before beginning this test.

**NOTE:** Where reference is made to 'suitable equipment', this refers to standard workshop equipment. Refer to the operating instructions for your own equipment when performing any tests.

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>C1: CHECK FOR LOW ENGINE OIL PRESSURE</td>
<td></td>
</tr>
</tbody>
</table>

1. Remove the oil pressure sensor, REFERENCE: Engine Oil Pressure (EOP) Sensor (303-14C Electronic Engine Controls - 2.7L V6 - TdV6, Removal and Installation).
2. Connect a suitable oil pressure gauge in place of the oil pressure sensor.
3. Start the engine and check for leaks at the gauge connection.
4. Allow the engine to idle and monitor the oil pressure.
5. Raise the engine speed to 2,500 rpm and monitor the oil pressure.

   Is the oil pressure less than 0.50 bar (7.25 psi) between idle and 2,500 rpm?

   - Yes: GO to C2.
   - No: GO to C3.

| C2: CHECK FOR LOW ENGINE OIL PRESSURE AT ENGINE SPEEDS GREATER THAN 2,500 RPM | |

1. Raise the engine speed to above 2,500 rpm and monitor the oil pressure.

   Is the oil pressure less than 1.0 bar (14.5 psi) at engine speeds greater than 2,500 rpm?

   - Yes: Pressure this low may indicate a problem with: oil pump, filtering, clearances within the engine. Check if there are any other indications of engine faults (noise, etc), refer to the symptom chart above.
   - No: GO to C3.

| C3: CHECK FOR HIGH ENGINE OIL PRESSURE | |

1. Monitor the engine oil pressure at varying engine speeds.

   Does the oil pressure reach 4.0 bar (58 psi)?

   - Yes: Pressure high may indicate a blockage in the lubrication system. If this is not resolved, high oil pressure will lead to engine oil leaks and other failures.
   - No: If the oil pressure stays in the band between 0.50 bar (7.25 psi) and 1.0 bar (14.5 psi) this would be considered normal.
General Procedures

1. Inspect bearings for the following defects.
   1. Cratering - fatigue failure
   2. Spot polishing - incorrect seating.
   3. Imbedded dirt engine oil.
   4. Scratching - dirty engine oil.
   5. Base exposed - poor lubrication.
   7. One edge worn - journal tapered or bearing not seated.
1. **NOTE:** Make sure that the following stages are followed exactly. The tappets or followers must be removed to carry out this measurement.

- **NOTE:** Make sure that the camshaft is to specification.
- **NOTE:** The bearing caps and journals should be free from engine oil and dirt.

Position on a length of plastigage on the bearing cap.
- Insert the camshaft, without lubrication, into the cylinder head.
- Position a plastigage strip, which should be equal to the width of the bearing cap, on the bearing journal.

2. Install the camshaft bearing caps.
   - Follow the relevant tightening sequence.

3. **NOTE:** Do not strike the bearing caps.

Remove the camshaft bearing caps.
   - Follow the relevant loosening sequence.

4. Using the special tool, read off the measurement.
   - Compare the width of plastigage with the plastigage scale.
   - The value that is read off is the bearing clearance.
   - If the values are not to specification install a new camshaft.
1. Determine the diameter of the camshaft journals.
   - Using a micrometer measure the diameter at 90 degrees intervals to determine if the journals are out-of-round.
   - Measure at two different points on the journal to determine if there is any tapering.
   - If the measurements are out of the specified range, install a new camshaft.
1. NOTE: Make sure that the camshaft is to specification.

Using the special tool, measure the end play.

- Slide the camshaft in both directions. Read and note the maximum and minimum values on the dial indicator gauge.
  1. End play = maximum value minus minimum value.
- If the measurement is out of specification, install new components.
1. Measure the diameter (1) and diameter (2) with a vernier caliper. The difference in measurements is the lobe lift.
1. Inspect camshaft lobes for pitting or damage in the active area. Minor pitting is acceptable outside the active area.
1. **CAUTION:** Do not use a caustic cleaning solution or damage to connecting rods may occur.

Mark and separate the parts and clean with solvent. Clean the oil passages.
1. Measure the bearing bore in two directions. The difference is the connecting rod bore out-of-round. Verify the out-of-round is within specification.

2. Measure the bearing bore diameter in two directions. Verify the bearing bore is within specification.
1. Using the Dial Indicator Gauge with Brackets, measure the end play.
   • Measure the end play by lifting the crankshaft using a lever.
   • If the value is out of the specification, install new thrust half rings to take up the end float and repeat the measurement.
Engine System - General Information - Crankshaft Main Bearing Journal Clearance
2.5L NA V6 - AJV6/3.0L NA V6 - AJ27

General Procedures

1. The main bearing machine codes are displayed on the crankshaft (1) and the cylinder block (2).

2. NOTE: Main bearing number 1 relates to the front of the engine.

Read the identification numbers from the crankshaft (1).

- The first two numbers represent the code for main bearing number 1.
- The second pair of numbers represents the code for main bearing number 2.
- The third pair of numbers represents the code for main bearing number 3.
- The last pair of numbers represents the code for main bearing number 4.
3. NOTE: Main bearing number 1 relates to the front of the engine.

Read the identification numbers on the cylinder block (2).

- The first two numbers represent the code for main bearing number 1.
- The second pair of numbers represents the code for main bearing number 2.
- The third pair of numbers represents the code for main bearing number 3.
- The last pair of numbers represents the code for main bearing number 4.

4. Using the select fit chart, for each main bearing match the crankshaft code (1) and the block code (2) with it's corresponding column or row. By reading across the crankshaft code row (1) and down the block code column (2) select the correct grade bearing for each main.

- **1 Crankshaft code.**
- **2 Block code.**

5. E.g. if the crankshaft code is *8580* and the Block code is *0609*, main bearing 1 should be assembled with a grade 1 bearing, as determined by the intersection of the number 06 block column (2) and the number 85 crankshaft row (1).

- Main bearing 2, 3 and 4 would all be assemble with a grade 2.
Engine System - General Information - Crankshaft Main Bearing Journal Clearance

**General Procedures**

**CAUTION:** THESE PROCEDURES SHOULD NOT BE CARRIED OUT DURING THE MANUFACTURERS WARRANTY PERIOD.

1. **NOTE:** Example - *PJEAL* - Crankshaft Main Journal Diameter.

   Read the grade letters from LEFT to RIGHT = FRONT to REAR of engine eg. for this example engine, the crank journal at the front of the engine is grade P, and at the rear is grade L.

   - The selection of main bearing shells is described in the following chart.

2. **NOTE:** Example - *ABAA* - Crankshaft (Big End Bearing) Crankpin Diameter

   - **NOTE:** For vehicles built up to 2002 MY.

   - **NOTE:** If the crankshaft main bearing carrier retaining bolts have been marked with a center punch dot, they must be discarded and new bolts installed.

   Read the grade letters from LEFT to RIGHT = FRONT to REAR of engine eg. for this example engine, the crankpin at the front of the engine is grade A and at the rear is also grade A.

   - Grade A = 56,000 to 55,994 mm (Bearing Shell Color Code - Blue).
   - Grade B = 55,994 to 55,988 mm (Bearing Shell Color Code - Green).
   - Grade C = 55,988 to 55,982 mm (Bearing Shell Color Code - Yellow).

3. **NOTE:** Example - *ABAA* - Crankshaft (Big End Bearing) Crankpin Diameter

   - **NOTE:** For vehicles built from 2002 MY.

   - **NOTE:** If the crankshaft main bearing carrier retaining bolts have been marked with a center punch dot, they must be discarded and new bolts installed.

   Read the grade letters from LEFT to RIGHT = FRONT to REAR of engine eg. for this example engine, the crankpin at the front of the engine is grade A and at the rear is also grade A.

   - Grade A = 53,000 to 52,994 mm (Bearing Shell Color Code - Blue).
   - Grade B = 52,994 to 52,988 mm (Bearing Shell Color Code -...
4. NOTE: Example - *21222122* - Cylinder Bore and Piston

The cylinder bore grades read from LEFT to RIGHT as follows:
- Bank 2 - Cylinder 1, Bank 2 - Cylinder 2, Bank 2 - Cylinder 3, Bank 2 - Cylinder 4, Bank 1 - Cylinder 4,
- Bank 1 - Cylinder 3, Bank 1 - Cylinder 2, Bank 1 - Cylinder 1.
- (Note, in earlier publications Bank 1 was described as A-Bank and Bank 2 as B-Bank)
  - Grade 1 Bore = 85,990 to 86,000 mm.
  - Grade 2 Bore = 86,000 to 86,010 mm.
  - Grade 3 Bore = 86,010 to 86,020 mm.

5. NOTE: Example - *WPPNN* - Crankshaft Main Bearing Bore in Cylinder Block

Read the grade letters from LEFT to RIGHT = FRONT to REAR of engine eg. for this example engine, the crank journal bore at the front of the engine is grade W, and at the rear is grade N.
- The selection of main bearing shells is described in the following JOURNAL DIAMETER AND MAIN BEARING BORE CHART.

6. JOURNAL DIAMETER AND MAIN BEARING BORE CHART

7. NOTE: THIS PROCEDURE SHOULD ONLY BE CARRIED OUT WHEN
REPLACING MAIN BEARING SHELLS.

• NOTE: Refer to the JOURNAL DIAMETER AND MAIN BEARING BORE CHART in step 6 for tolerance and bearing information.

The number in each diagonal band represents a PAIR of color coded main bearing shells which must be used with a specific journal, depending on the combination of journal diameter and crankshaft bore diameter. The color codes for each band are as follows:

1. Blue / Green and Blue / Green
2. Blue / Green and Blue
3. Blue and Blue
4. Blue and Green
5. Green and Green
6. Green and Yellow
7. Yellow and Yellow

Consider crankshaft journal 5 (from the example grade markings on the cylinder block) - the cylinder block bore is Grade N and the crankshaft journal diameter is Grade L. From the chart, it will be seen that the point of intersection is in Band 4 which equates to one Blue shell and one Green shell.

When the appropriate pair of color codes have been selected for a journal, either color may be installed to the cylinder block or to the bedplate, but, the shell which is to be installed to the cylinder block must have an oil groove and the shell which is to be installed to the bedplate must be plain.

8. NOTE: THIS PROCEDURE SHOULD ONLY BE CARRIED OUT WHEN A REPLACEMENT CRANKSHAFT OR CYLINDER BLOCK HAS BEEN FITTED.

• NOTE: Refer to the JOURNAL DIAMETER AND MAIN BEARING BORE CHART in step 6 for tolerance and bearing information.

The thickness grade of all main bearing shells are to be selected to give a total running clearance of not less than 0.022 mm or greater than 0.040 mm.

- Each bearing bore in the block/bedplate assembly should be measured at two mutually perpendicular diameters 45° to the vertical in the middle of the bearing.
- The minimum diameter of the two is to be used.
- Each crankshaft main bearing journal should be measured dynamically at a point in line with the middle of each bearing.
- When the appropriate pair of color codes have been selected for a journal, either color may be installed to the cylinder block or to the bedplate, but, the shell which is to be installed to the cylinder block must have an oil groove and the shell which is to be installed to the bedplate must be plain.
1. **NOTE:** The main bearing caps or lower crankcase must be in place and tightened to the specified torque; however, the bearing shells should not be installed.

Measure the cylinder bore with an internal micrometer.

- Carry out the measurements in different directions and at different heights to determine if there is any out-of-roundness or tapering.
- If the measurement is out of the specified range, hone out the cylinder block or install a new block.
1. Measure the cylinder block/cylinder head distortion.
   - Using the special tool, measure the mating face distortion.
   - If the value is not to specification rework the mating face.
Engine System - General Information - Exhaust Manifold Cleaning and Inspection

General Procedures

1. Inspect the cylinder head joining flanges of the exhaust manifold for evidence of exhaust gas leaks.
2. Inspect the exhaust manifold for cracks, damaged gasket surfaces, or other damage that would make it unfit for further use.
Engine System - General Information - Piston Inspection

General Procedures

1. **CAUTION:** Do not use any aggressive cleaning fluid or a wire brush to clean the piston.

   Carry out a visual inspection.
   - Clean the piston skirt, pin bush, ring grooves and crown and check for wear or cracks.
   - If there are signs of wear on the piston skirt, check whether the connecting rod is twisted or bent.
1. NOTE: The piston and piston pin are a matched pair. Do not mix up the components.

Measure the piston pin diameter.

- Measure the diameter in two directions.
- If the values are not to specification, install a new piston and a new piston pin.
Engine System - General Information - Piston Pin to Bore Diameter

General Procedures

1. NOTE: The piston and piston pin form a matched pair. Do not mix up the components.

   Measure the diameter of the piston pin bore.
   - Measure the diameter in two directions.
   - If the values are not to specification, install both a new piston and a new piston pin.
1. **CAUTION:** Do not mix up the piston rings. Install the piston rings in the same position and location.

Using the Feeler Gauge, measure the piston ring gap.

- The values given in the specification refer to a gauge ring used during production.
1. **NOTE:** The piston ring must protrude from the piston groove. To determine the piston ring clearance, insert the Feeler Gauge right to the back of the groove, behind the wear ridge.

   Using the Feeler Gauge, measure the piston ring clearance.
1. Using a vernier gauge, measure the free length of each valve spring. Verify the length is within specification.
1. Using a micrometer measure the diameter of the valve stems.
   - If the measurements are not to specification, install a new valve.
General Procedures

CAUTION: The compressed air line supply pressure must be between 3.5 and 12 bar (50 and 175 psi) for the smoke test equipment to function correctly. Do not exceed this pressure. Failure to follow this instruction may result in damage to the smoke test equipment.

• NOTE: The vehicle battery must be in good condition and fully charged before carrying out this procedure.
• NOTE: On vehicles with 3.0L TDV6, it will be necessary to insert smoke at both air cleaner outlet pipes independently if the right hand turbocharger and associated hoses are to be tested.
• NOTE: In some cases it may be necessary to remove undertrays, trim or engine covers to obtain access to all potential leak locations.
• NOTE: Some variation in the illustrations may occur, but the essential information is always correct.
• NOTE: For further information regarding operation of the test equipment refer to the manufacturers operators manual supplied with the kit.

1.  

   WARNING: Use an additional support to prevent the hood from falling if the smoke test equipment is secured to the hood. Failure to follow this instruction may result in personal injury.

   Install the smoke test equipment to a suitable location under the hood.

2.  

   Connect a suitable compressed air line to the smoke test equipment.

3.  

   Connect the smoke test equipment positive power cable to the battery positive terminal.

4.  

   WARNING: Do not connect the smoke test equipment negative cable to the battery negative terminal.

   Connect the smoke test equipment negative cable to a suitable body ground point.

5.  

   NOTE: A flashing green light indicates low battery voltage. In this case, place the battery on charge and make sure that the battery is fully charged before using the smoke test equipment.

   Observe the power indicator lamp on the smoke test equipment. Make sure that a continuous green light is displayed.
6. **NOTE:** In some cases it may be necessary to remove the air cleaner(s) to allow access to the air cleaner outlet pipes.

**NOTE:** In some cases it will be necessary to cap one of the air cleaner outlet pipes. Use the blanking caps supplied in the kit to cap the open orifice.

Disconnect the air cleaner outlet pipe(s).

7. **NOTE:** Make sure the smoke test equipment adapter is a good fit to the air cleaner outlet pipe. This must be an air tight seal.

Connect the smoke test equipment supply hose to the air cleaner outlet pipe.

1. Install the appropriate adapter to the air cleaner outlet pipe.

2. Connect the smoke test equipment supply hose to the adapter link hose.

8. **NOTE:** The flow control valve must be in the fully open position.

**NOTE:** Smoke is produced for 5 minutes. The smoke test equipment will automatically switch off after this period of time.

Switch the smoke test equipment on.

9. Remove the oil filler cap, and observe until a constant flow of smoke is visible leaving the oil filler orifice. Install the oil filler cap.

10. **NOTE:** The longer smoke is allowed to exit from a leak, the more fluorescent dye will be deposited at a leak location.

Using the torch supplied in the kit set to white light, look for escaping smoke. Alternatively, use the ultraviolet light to look for fluorescent dye deposits at the source of a leak.

A = refer to the procedure for correct torque sequence
The 2.5 and 3.0 litre 24 valve V6 engine has four overhead camshafts and are driven by two timing chains. The engine incorporates electronic engine management with distributorless ignition system, sequential electronic fuel injection. It also has two catalytic converters in the exhaust system which includes two oxygen sensors and two catalytic monitor sensors.

Viewed from the driving position, the right-hand cylinder bank is numbered 1 to 3, from the front of the vehicle and the left-hand cylinder bank are numbered 4 to 6, from the front of the vehicle.

The engines include the following:

- Vehicles fitted with 2.5L engine 10.3:1 Compression ratio.
- Vehicles fitted with 3.0L engine 10.5:1 Compression ratio.
- 3 Stage variable geometry intake manifold.
- Lightweight valve gear.
- Unique camshaft lift and duration.
- Twin knock sensor engine management control.
- Fully variable camshaft timing (VCT) system.
- Twin mass flywheel (manual transmission).

### Variable Intake System (V.I.S).

The variable intake system consists of a three stage upper intake manifold assembly, two position electronically driven gate valves and an engine management powertrain control system.

The engine control module (ECM) switches the intake manifold tuning valves between fully open and fully closed at calibrated engine speeds.

The intake manifold efficiency is therefore increased which will also increase the engine torque and engine performance.

### Variable Camshaft Timing (VCT)

Oil is supplied to the front of each VCT actuator via the spider bracket assembly which contains the VCT actuator solenoid, supply oil galleries and timing chain guide. Oil pressure advances and retards the camshaft timing which is controlled by the engine management system via a solenoid valve mounted on top of the oil feed spider assembly. Camshaft timing, dependant on engine speed, load and oil temperature can be optimised over the adjustment range of 30 degrees.

### Engine Lubrication System

The engine lubrication system is of the force-feed type in which oil is supplied under full pressure to the:

- Crankshaft main bearings.
- Crankshaft thrust main bearing.
- Connecting rod bearings.
- Valve shims.
- Camshaft bearings.
- Variable camshaft timing.

All other parts are lubricated by gravity flow or splash of the oil.

### Oil Pump

The rotary oil pump develops the oil pressure:
- The oil pump is located at the front of the crankshaft.
- The oil pump is driven by the crankshaft.
- A full flow oil filter is externally mounted on the oil filter housing.

If the filter element should become blocked a spring-loaded bypass valve will open and allow an uninterrupted flow of oil to the engine.
Engine - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27 - Engine

Diagnosis and Testing

For additional information, refer to Section 303-00 Engine System - General Information.
Engine - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27 - Valve Clearance Adjustment

General Procedures

1. Remove the left-hand valve cover.
   For additional information, refer to Valve Cover LH in this section.

2. Remove the right-hand valve cover.
   For additional information, refer to Valve Cover RH in this section.

3. Turn the crankshaft pulley clockwise to position the relevant camshaft lobe 180 degrees to the shim being replaced.

4. Remove the camshaft bearing cap.

5. Install the special tool.
   - Making sure the legs of the tool are in contact with the edge of the valve bucket, compress the bucket.

6. Use compressed air to remove the shims that require replacing.
   - Blow compressed air between the shim edge and bucket to dislodge the shim.

7. Use the following formula to calculate the required shim thickness.
   - Original shim thickness + measured clearance - desired clearance = required shim thickness.

8. Apply a light coat of engine oil to the replacement shim(s) and install.

9. Install the left-hand valve cover.
   For additional information, refer to Valve Cover LH in this section.

10. Install the right-hand valve cover.
    For additional information, refer to Valve Cover RH in this section.
1. Remove the left-hand valve cover. For additional information, refer to Valve Cover—LH.

2. Remove the right-hand valve cover. For additional information, refer to Valve Cover—RH.

3. **CAUTIONS:**

   - Rotating the crankshaft in a counterclockwise direction may cause engine damage. Crankshaft journals are directionally machined. Rotating the crankshaft counterclockwise can raise burrs on bearing surfaces, reducing engine life.

   - Camshaft lobes must be 180 degrees away from each valve tappet or valve clearance will be incorrect.

   Rotate the engine clockwise to position the camshaft lobe away from the shim surface.

4. Using the feeler gauge set, measure the clearance between the camshaft and the shim surface. Record and check the readings. For additional information, refer to Section 303-00 Engine System - General Information.

   Adjust the clearances as necessary. For additional information, refer to Valve—Clearance Adjustment.

5. Install the right-hand valve cover. For additional information, refer to Valve Cover—RH.

6. Install the left-hand valve cover. For additional information, refer to Valve Cover—LH.
**Removal**

1. Remove the timing drive components.
   For additional information, refer to [Timing Drive Components] in this section.

2. Remove the camshaft bearing caps evenly.

3. Remove the camshafts.

**Installation**

1. NOTE: Lubricate the camshafts and the camshaft bearing caps with oil meeting Jaguar specification prior to installation.

   Install the camshafts.

2. CAUTION: Do not install the cylinder head camshaft journal thrust caps until the camshaft journal caps are installed or damage to the thrust caps may occur.

   Install the camshaft bearing caps in their original position.
   - Install the camshaft bearing cap retaining bolts evenly.
   - Tighten the retaining bolts in the sequence shown to 10 Nm.

3. Carry out a valve clearance check. For additional information, refer to [Valve Clearance Check].

4. Install the timing drive components.
   For additional information, refer to [Timing Drive Components] in this section.
### Crankshaft Front Seal

#### Removal

1. Remove the crankshaft pulley.  
   For additional information, refer to [Crankshaft Pulley](#) in this section.  
2. Using the special tool, remove and discard crankshaft front seal.

#### Installation

1. Using the special tools, install the crankshaft front oil seal.  
   - Lubricate the seal lip with clean engine oil.

2. Install the crankshaft vibration damper.  
   For additional information, refer to [Crankshaft Pulley](#) in this section.

### Removal

1. Disconnect the battery ground cable. For additional information, refer to Section [414-01 Battery, Mounting and Cables](#).
2. Carry out the cooling system draining procedure. For additional information, refer to Section [303-03A Engine Cooling / 303-03B Supercharger Cooling / 303-03C Engine Cooling](#).
3. Remove the accessory drivebelt.
   1. Rotate the belt tensioner counter-clockwise.
      1. Use a 3/8 inch square drive bar to rotate the belt tensioner.
   2. Remove the accessory drivebelt.
4. Lower the vehicle.
5. Remove the throttle body. For additional information, refer to Section [303-04A Fuel Charging and Controls / 303-04B Fuel Charging and Controls / 303-04C Fuel Charging and Controls / 303-04D Fuel Charging and Controls - Turbocharger](#).
6. Disconnect the radiator top coolant hose.

7. Disconnect the coolant hose from the top coolant hose assembly.

8. Disconnect the hose assembly from the water pump and lower hose.

9. Remove the hose assembly.

10. Install the special tool.
11. Remove the crankshaft pulley retaining bolt.

12. Install the special tool.

13. Using the special tools, remove the crankshaft pulley.

**Installation**

1. Using the special tools, install the crankshaft pulley.
   - Coat the crankshaft pulley keyway with silicone gasket sealant meeting Jaguar specification.
   - Coat the sealing surfaces of the crankshaft pulley with silicone gasket sealant meeting Jaguar specification.
2. Install the special tool.

3. Install the crankshaft pulley bolt.
   - Torque to 120 Nm.
   - Loosen the bolt (minimum 1 turn).
   - Torque to 50 Nm.
   - Angle Torque to 90°.

4. Install the hose assembly.

5. Install the hose assembly to the water pump and lower hose.

6. Install the coolant hose to the housing assembly.
7. Connect the radiator top coolant hose.

8. Install the throttle body. For additional information, refer to Section 303-04A Fuel Charging and Controls / 303-04B Fuel Charging and Controls / 303-04C Fuel Charging and Controls / 303-04D Fuel Charging and Controls - Turbocharger.

9. Raise the vehicle.

10. Install the accessory drivebelt.

   1. Rotate the belt tensioner counter-clockwise.
      1. Use a 3/8 inch square drive bar to rotate the belt tensioner.
   2. Install the accessory drivebelt.

11. Lower the vehicle.

12. Connect the battery ground cable. For additional information, refer to Section 414-01 Battery, Mounting and Cables.

13. Carry out the cooling system filling and bleeding procedure. For additional information, refer to Section 303-03A Engine Cooling / 303-03B Supercharger Cooling / 303-03C Engine Cooling.

Removal

Vehicles With Manual Transmission

1. Remove the flywheel. For additional information, refer to Flywheel - Manual Transmission.

Vehicles With Automatic Transmission

2. Remove the flexplate. For additional information, refer to Flexplate - Automatic Transmission.

All Vehicles

3. **CAUTION:** Avoid scratching or damaging the oil seal sealing surfaces on the crankshaft and cylinder block.

   Using the special tools, remove the crankshaft rear main oil seal.

Installation

All Vehicles

1. Clean and inspect the crankshaft rear oil seal sealing surfaces.
2. Lubricate the crankshaft flange, the crankshaft rear oil bore seal, and the oil seal lip.
   - Use engine assembly lubricant or equivalent meeting Jaguar specification ESR-M99C80-A.
3. NOTE: Alternate bolt tightening to correctly seat the crankshaft rear oil seal until it is flush with the cylinder block.

Using the special tools, install the crankshaft rear oil seal.

Vehicles With Automatic Transmission

4. Install the flexplate. For additional information, refer to Flexplate — Automatic Transmission.

Vehicles With Manual Transmission

5. Install the flywheel. For additional information, refer to Flywheel — Manual Transmission.
Removal

RH and LH Cylinder Heads

1. Remove the left-hand and right-hand camshafts. For additional information, refer to Camshafts LH in this section.

2. Disconnect the coolant temperature (ECT) electrical connector.

3. Disconnect the fuel pressure regulator electrical connector and vacuum hose.

4. Remove the fuel supply manifold and lower intake manifold.
   - Remove and discard the lower intake manifold gaskets.

5. Remove the coolant crossover tube.
   - Discard the 'O' ring seals.

6. Remove the catalytic converters. For additional information, refer to Section 309-00 Exhaust System.
7. Remove the oil level indicator tube.
   1. Remove the retaining nut.
   2. Remove the oil level indicator tube.

8. Detach the engine harness earth strap from the rear of the left-hand cylinder head.

**RH and LH Cylinder Heads**

9. **NOTE:** Remove the retaining bolts in the indicated sequence.

   Remove the cylinder head. (left-hand shown, right-hand similar).
   - Remove and discard the cylinder head gasket.

10. Clean and inspect the cylinder head and cylinder block.
    For additional information, refer to Section 303-00 Engine System - General Information.

**Installation**

**RH and LH Cylinder Heads**

1. **NOTE:** The head gaskets must be installed over the cylinder head to block dowels.

   Install a new cylinder head gasket.

2. **CAUTION:** Use care when installing the cylinder head. Damage to the cylinder block and or the cylinder head may result.
   - **NOTE:** Make sure the cylinder head is installed in its original position.
   - **NOTE:** Tighten the retaining bolts in the indicated sequence in six stages.

   Install the cylinder head and install new cylinder head retaining bolts and washers.
   - Stage 1: tighten to 30 Nm.
   - Stage 2: tighten 90 degrees.
   - Stage 3: loosen 360 degrees.
   - Stage 4: tighten to 30 Nm.
   - Stage 5: tighten 90 degrees.
   - Stage 6: tighten 90 degrees.

**Cylinder Head-LH**

3. Attach the engine harness earth strap to the rear of the left-hand cylinder head.
4. Install the oil level indicator tube.
   - Tighten to 10 Nm.

RH and LH Cylinder Heads

5. Install the catalytic converters.
   For additional information, refer to Section 309-00 Exhaust System.

6. NOTE: Install new 'O' ring seals.
   Install the coolant crossover tube.
   - Tighten to 10 Nm.

7. NOTE: Install new lower intake manifold gaskets.
   Install the fuel supply manifold and lower intake manifold.
   - Tighten to 10 Nm.

8. Connect the fuel pressure regulator electrical connector and vacuum hose.
9. Connect the ECT electrical connector.

10. Install the left-hand and right-hand camshafts. For additional information, refer to Camshafts LH in this section.

**Removal**

1. Remove the left-hand valve cover.  
   For additional information, refer to Valve Cover LH in this section.

2. Remove the right-hand valve cover.  
   For additional information, refer to Valve Cover RH in this section.

3. Remove the oil pan.  
   For additional information, refer to Oil Pan in this section.

4. Carry out the cooling system draining procedure. For additional information, refer to Section 303-03A Engine Cooling / 303-03B Supercharger Cooling / 303-03C Engine Cooling.

5. Remove the accessory drivebelt.
   1. Rotate the belt tensioner counter-clockwise.  
      1. Use a 3/8 inch square drive bar to rotate the belt tensioner.  
   2. Remove the accessory drivebelt.

6. Lower the vehicle.
7. Disconnect the radiator top coolant hose.

8. Disconnect the coolant hose from the top coolant hose assembly.

9. Disconnect the hose assembly from the water pump and lower hose.

10. Remove the hose assembly.

11. Install the special tool.
12. Remove the crankshaft pulley retaining bolt.

13. Install the special tool.

14. Using the special tools, remove the crankshaft pulley.

15. Remove the crankshaft front seal. For additional information, refer to Crankshaft Front Seal in this section.

16. Detach the coolant hose.

17. Remove the coolant hose.
18. Remove the water pump.

19. Detach the fuel supply manifold retaining bolt.

20. Remove the accessory drive belt tensioner.

21. Detach the engine harness from the right-hand idler pulley.
   - Detach the splash shield.
   - Detach the engine harness from the right-hand idler pulley.

22. Remove the right-hand idler pulley.
23. Remove the left-hand idler pulley.

24. Remove the power steering pump upper retaining bolts.

25. Raise the vehicle.
26. Reposition the splash shield.
   - Remove the splash shield retaining clip.

27. Detach the power steering pump.

28. Lower the vehicle.
29. Disconnect the crankshaft position (CKP) sensor electrical connector.

30. NOTE: Right-hand camshaft position sensor shown, left-hand similar.
   Disconnect the camshaft position sensors.

31. Remove the engine front cover
   • Remove and discard the engine front cover gaskets.

**Installation**

1. Install new engine front cover gaskets.
2. NOTE: Prior to applying sealer clean the front cover to engine block and cylinder head sealing surfaces with metal surface cleaner. Apply a 6 mm diameter dot of silicone sealant meeting Jaguar specification to the indicated locations.

3. NOTE: The engine front cover retaining bolts numbered 3, 4, 10 and 11 are longer than the retaining bolts numbered 1, 2, 5, 6, 7, 8, 9, 12, 13, 15 and 16. The retaining bolt numbered 14 is a retaining bolt with a stud head. Install the engine front cover, completing the tightening sequence.
   - Tighten to 25 Nm.

4. NOTE: Right-hand camshaft position sensor shown, left-hand similar. Connect the camshaft position sensors.

5. Disconnect the crankshaft position (CKP) sensor electrical connector.

6. Raise the vehicle.
7. Attach the power steering pump.
   - Tighten to 25 Nm.
8. Reposition the splash shield.
   - Install the splash shield retaining clip.

9. Install the power steering pump upper retaining bolts.
   - Tighten to 25 Nm.

10. Install the left-hand idler pulley.
    - Tighten to 25 Nm.

11. Install the right-hand idler pulley.
    - Tighten to 25 Nm.

12. Attach the engine splash shield.
    - Attach the engine harness to the right-hand idler pulley.
    - Attach the engine splash shield.
13. Install the accessory drive belt tensioner.
   - Tighten to 45 Nm.

14. Attach the fuel supply manifold retaining bolt.

15. Install the water pump.
   - Tighten to 25 Nm.

16. Install the coolant hose.

17. Attach the coolant hose.
18. Install a new crankshaft front seal. For additional information, refer to **Crankshaft Front Seal** in this section.

19. Using the special tools, install the crankshaft pulley.
   - Coat the crankshaft pulley keyway with silicone gasket sealant meeting Jaguar specification.
   - Coat the sealing surfaces of the crankshaft pulley with silicone gasket sealant meeting Jaguar specification.

20. Install the special tool.

21. Install the crankshaft pulley bolt.
   - Torque to 120 Nm.
   - Loosen the bolt (minimum 1 turn).
   - Torque to 50 Nm.
   - Angle Torque to 90°.

22. Install the hose assembly.
23. Install the hose assembly to the water pump and lower hose.

24. Install the coolant hose to the housing assembly.

25. Connect the radiator top coolant hose.

26. Raise vehicle.
27. Install the accessory drivebelt.
   1. Rotate the belt tensioner counter-clockwise.
      1. Use a 3/8 inch square drive bar to rotate the belt tensioner.
   2. Install the accessory drivebelt.

28. Install the oil pan. For additional information, refer to Oil Pan in this section.

29. Lower the vehicle.

30. Install the left-hand valve cover. For additional information, refer to Valve Cover LH in this section.

31. Install the right-hand valve cover. For additional information, refer to Valve Cover RH in this section.

32. Carry out the cooling system feeling and bleeding procedure. For additional information, refer to Section 303-03A Engine Cooling / 303-03B Supercharger Cooling / 303-03C Engine Cooling.

33. Refill the engine with oil.

Removal

1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 Battery, Mounting and Cables.

2. Remove the cowl vent screen. For additional information, refer to Section 501-02 Front End Body Panels.

3. Remove the engine compartment support.

4. Detach the right-hand valve cover wiring harness.

5. Disconnect the left-hand ignition coils electrical connectors.
6. Detach the left-hand valve cover wiring harness.

7. Remove the dipstick tube retaining bolt.
   - Reposition the dipstick tube.

8. **NOTE**: Left-hand shown, right-hand similar.
   Loosen the exhaust manifold retaining nut.

9. **NOTE**: Left-hand shown, right-hand similar.
   Install the special tool to the exhaust manifold.
   - Install the retaining bolt.

10. **NOTE**: Left-hand shown, right-hand similar.
    Install the retaining bolt.
11. Install the special tool support bars to the special tool.

12. Install the special tool.

13. Remove the left-hand catalytic converter. For additional information, refer to Section 309-00 Exhaust System.

14. Remove the steering gear shaft pinch bolt.

15. Detach the steering gear.

16. Secure the steering gear.
17. NOTE: Left-hand shown, right-hand similar.
Remove the engine mount retaining nut.

18. Lower the vehicle.

19. Using the special tools, raise the engine to a suitable height.

20. Raise the vehicle.

21. **WARNING:** Do not remove the front subframe retaining bolts. Failure to follow this procedure may result in personal injury.
   Loosen the front subframe retaining bolts to enable the engine mount to be removed.

22. NOTE: Left-hand shown, right-hand similar.
Remove the engine mount.

**Installation**
1. **CAUTION:** Make sure the engine mount locators are correctly aligned on installation. Failure to follow this procedure may result in damage to the vehicle.
   • **NOTE:** Left-hand shown, right-hand similar.
   Install the engine mount.
   • Tighten to 55 Nm (+/- 15%).

2. Carry out the Underbody Misalignment Check. For additional information, refer to Section 502-00 Uni-Body, Subframe and Mounting System.

3. Lower the vehicle.

4. **CAUTION:** Make sure the engine mounts locate into the correct position when the engine is repositioned. Failure to follow this procedure may result in damage to the vehicle.
   Using the special tools, lower the engine.

5. Raise the vehicle.

6. **NOTE:** Left-hand shown, right-hand similar.
   Install the engine mounts retaining nut.
   • Tighten to 63 Nm (+/- 15%).

7. Detach the steering gear.
8. Attach the steering gear.
   • Tighten to 100 Nm.

9. Install the steering gear shaft pinch bolt.
   • Tighten to 35 Nm.

10. Install the left-hand catalytic converter.
     For additional information, refer to Section 309-00 Exhaust System.

11. Lower the vehicle.

12. Remove the special tool.

13. Remove the special tool support bars from the special tool.
14. NOTE: Left-hand shown, right-hand similar.
Remove the retaining bolt.

15. NOTE: Left-hand shown, right-hand similar.
Remove the retaining bolt.
- Remove the special tool from the exhaust manifold.

16. NOTE: Left-hand shown, right-hand similar.
Install the exhaust manifold retaining nut.
- Tighten to 25 Nm.

17. Install the dipstick tube retaining bolt.
- Tighten to 10 Nm.

18. Attach the left-hand valve cover wiring harness.
19. Connect the left-hand ignition coils electrical connectors.

20. Attach the right-hand valve cover wiring harness.

21. Install the engine compartment support.
   - Tighten to 25 Nm.

22. Install the cowl vent screen. For additional information, refer to Section 501-02 Front End Body Panels.

23. Connect the battery ground cable. For additional information, refer to Section 414-01 Battery, Mounting and Cables.
Removal

1. Remove the left-hand catalytic converter.
   For additional information, refer to: Catalytic Converter - V8 4.2L Petrol/V8 S/C 4.2L Petrol/2.5L NA V6 - AJV6/3.0L NA V6 - AJ27 (309-00 Exhaust System, Removal and Installation).

2. Lower the vehicle.

3. Detach the left-hand valve cover wiring harness.

4. Remove the dipstick tube retaining bolt.
   ● Reposition the dipstick tube.

5. Remove the left-hand exhaust manifold heat shield.

6. Raise the vehicle.
7. NOTE: Engine shown removed for clarity.
   • NOTE: When an exhaust manifold retaining stud is removed, it must be replaced with a new retaining stud and nut.
   Remove the left-hand exhaust manifold lower retaining nuts.

8. Lower the vehicle.
9. NOTE: Engine shown removed for clarity.
   • NOTE: When an exhaust manifold retaining stud is removed, it must be replaced with a new retaining stud and nut.
   Remove the left-hand exhaust manifold.
   • Remove and discard the left-hand exhaust gasket.

**Installation**

1. NOTE: Engine shown removed for clarity.
   • NOTE: When a new exhaust manifold retaining stud is installed, tighten to 9 Nm.
   • NOTE: Tighten the exhaust manifold retaining nuts in the sequence shown.
   To install, reverse the removal procedure.
   • Install a new left-hand exhaust manifold gasket.
   • Tighten to 20 Nm.
2. Tighten to 10 Nm.

3. Tighten to 10 Nm.
Engine - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27 - Exhaust Manifold LHVIN Range: N52048->N99999

In-vehicle Repair

**Removal**

All vehicles

1. Remove the engine cover.

2. Remove the left-hand exhaust manifold heat shield.

Vehicles with secondary air injection (AIR)

3. Disconnect the secondary air injection (AIR) control valve to exhaust manifold tube.
4. NOTE: Engine shown removed for clarity.
   • NOTE: When an exhaust manifold retaining stud is removed, it must be replaced with a new retaining stud and nut.
   Remove the left-hand exhaust manifold upper retaining nuts.

5. Remove the left-hand catalytic converter.
   For additional information, refer to: Catalytic Converter - V8 4.2L Petrol/V8 S/C 4.2L Petrol/2.5L NA V6 - AJV6/3.0L NA V6 - AJ27 (309-00 Exhaust System, Removal and Installation).

6. NOTE: Engine shown removed for clarity.
   • NOTE: When an exhaust manifold retaining stud is removed, it must be replaced with a new retaining stud and nut.
   Remove the left-hand exhaust manifold.
   • Remove and discard the left-hand exhaust manifold gasket.

---

**Installation**

**All vehicles**

1. NOTE: Engine shown removed for clarity.
   • NOTE: When a new exhaust manifold retaining stud is installed, tighten to 9 Nm.
   • NOTE: Tighten the exhaust manifold retaining nuts in the sequence shown.

   To install, reverse the removal procedure.
   • Install a new left-hand exhaust manifold gasket.
   • Tighten to 20 Nm.

**Vehicles with secondary air injection (AIR)**

2. Tighten to 35 Nm.
3. Tighten to 10 Nm.
Removal

1. Remove the automatic transmission. For additional information, refer to Section 307-01 Automatic Transmission/Transaxle.

2. Detach the accessory drivebelt.
   1. Rotate the belt tensioner counter-clockwise.
   2. Use a 3/8 inch square drive bar to rotate the belt tensioner.
   3. Detach the accessory drivebelt.

3. Install the special tool.

4. NOTE: Prevent the flexplate from rotating.
   Remove the flexplate.

Installation

1. NOTE: Make sure the crankshaft and flexplate mating faces are clean before installation.
   • NOTE: The flexplate will only locate in one position.
   • NOTE: Tighten the retaining bolts working diagonally.
   Install the flexplate.
   • Prevent the flexplate from rotating.
2. Remove the special tool.

3. Attach the accessory drivebelt.
   1. Rotate the belt tensioner counter-clockwise.
      1. Use a 3/8 inch square drive bar to rotate the belt tensioner.
   2. Attach the accessory drivebelt.

4. Install the automatic transmission.
   For additional information, refer to Section 307-01 Automatic Transmission/Transaxle.
Engine - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27 - Flywheel
In-vehicle Repair

Removal

1. Remove the clutch disc and pressure plate. For additional information, refer to Section 308-01 Clutch.
2. Detach the accessory drivebelt.
   1. Rotate the belt tensioner counter-clockwise.
   2. Use a 3/8 inch square drive bar to rotate the belt tensioner.
   2. Detach the accessory drivebelt.
3. Install the special tool.
4. NOTE: Prevent the flywheel from rotating.
   Remove the flywheel.

Installation

1. NOTE: Make sure the crankshaft and flywheel mating faces are clean before installation.
   • NOTE: The flywheel will only locate in one position.
   • NOTE: Tighten the retaining bolts working diagonally.
   Install the flywheel.
   • Prevent the flywheel from rotating.
2. Remove the special tool.

3. Attach the accessory drivebelt.
   1. Rotate the belt tensioner counter-clockwise.
      1. Use a 3/8 inch square drive bar to rotate the belt tensioner.
   2. Attach the accessory drivebelt.

4. Install the clutch disc and pressure plate.
   For additional information, refer to Section 308-01 Clutch.
Removal

1. WARNINGS:

⚠️ Never remove the coolant expansion tank pressure cap under any circumstances while the engine is operating. Failure to follow this instruction may result in personal injury.

⚠️ To avoid hot coolant or steam blowing out of the cooling system, use extreme care when removing the coolant expansion tank pressure cap. Wait until the engine has cooled down, then insulate the coolant pressure cap with a suitable cloth and slowly loosen the coolant expansion tank pressure cap until the cooling system pressure is released. Do not remove the coolant expansion tank pressure cap. Step back while the pressure is released from the system. When all of the pressure has been released slowly remove the coolant expansion tank pressure cap (still with the suitable cloth in position) from the coolant expansion tank. Failure to follow this instruction may result in personal injury.

Release the cooling system pressure.
- Remove the coolant expansion tank pressure cap.

2. Remove the air cleaner outlet pipe.

For additional information, refer to: [Air Cleaner Outlet Pipe - VIN Range: N52048->N99999 (303-12A Intake Air Distribution and Filtering - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation)](303-12A Intake Air Distribution and Filtering - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation).

3. Remove the engine cover.

4. Disconnect the throttle motor electrical connector.

5. Disconnect the throttle position sensor (TPS) electrical connector.
6. Disconnect the positive crankcase ventilation (PCV) hose.

7. **NOTE:** Cap the coolant hoses to minimize coolant loss.  
   Detach the coolant hoses from the throttle body.

8. Detach the engine wiring harness from the intake manifold side retaining bracket.

9. Detach the intake manifold right-hand side retaining bracket.

10. Loosen the intake manifold right-hand side retaining bracket.
11. Detach the intake manifold front retaining bracket.

12. Loosen the intake manifold front retaining bracket.

13. Detach the coolant temperature sensor wiring harness.

14. Remove the engine cover front retaining bracket.

15. Detach the evaporative emission canister purge valve transfer pipe.
16. Remove the engine cover left-hand side retaining bracket.

17. Remove the fuel pressure sensor bracket retaining bolt.

18. Detach the fuel pressure sensor bracket.

19. Detach the intake manifold.

20. NOTE: The evaporative emission canister purge valve transfer pipe is attached to the induction manifold by a quick release coupling. Disconnect the evaporative emission canister purge valve transfer pipe.
21. Disconnect the manifold absolute pressure (MAP) sensor electrical connector.

22. Disconnect the fuel pressure sensor vacuum hose.

23. NOTE: Left-hand intake manifold tuning (IMT) valve shown, right-hand (IMT) valve similar.
   Disconnect the IMT valves electrical connectors.

24. Disconnect the fuel pressure regulator vacuum hose.

25. Disconnect the brake booster vacuum hose.
26. Remove the intake manifold.

Installation

1. NOTE: Install new intake manifold gaskets.
- NOTE: The intake manifold retaining bolts in position 1, 4 and 5 are longer than the retaining bolts in position 2, 3 and 6.
- NOTE: Do not fully tighten the retaining bolts.

Install the intake manifold.

2. Connect the brake booster vacuum hose.

3. Connect the fuel pressure regulator vacuum hose.
4. NOTE: Left-hand intake manifold tuning (IMT) valve shown, right-hand (IMT) valve similar.
   Connect the IMT valves electrical connectors.

5. Connect the fuel pressure sensor vacuum hose

6. Connect the manifold absolute pressure (MAP) sensor electrical connector.

7. NOTE: The evaporative emission canister purge valve transfer pipe is attached to the induction manifold by a quick release coupling.
   Connect the evaporative emission canister purge valve transfer pipe.

8. NOTE: The intake manifold retaining bolts in position 1, 4 and 5 are longer than the retaining bolts in position 2, 3 and 6.
   Reposition the intake manifold.
   • Tighten to 10 Nm.
   • Complete the tightening sequence.
9. Install the fuel pressure sensor bracket retaining bolt.

10. Attach the fuel pressure sensor bracket.

11. Install the engine cover left-hand side retaining bracket.

12. Attach the evaporative emission canister purge valve transfer pipe.

13. Install the engine cover front retaining bracket.
14. Attach the coolant temperature sensor wiring harness.

15. Attach the intake manifold front retaining bracket.

16. Fully tighten the intake manifold front retaining bracket.

17. Fully tighten the intake manifold right-hand side retaining bracket.

18. Fully tighten the intake manifold right-hand side retaining bracket.
19. Attach the engine wiring harness to the intake manifold side retaining bracket.

20. **NOTE**: Un-cap the coolant hoses.
    Attach the coolant hoses to the throttle body.

21. Connect the positive crankcase ventilation (PCV) hose.

22. Connect the throttle position sensor (TPS) electrical connector.

23. Connect the throttle motor electrical connector.
24. Install the engine cover.

25. Install the air cleaner outlet pipe. For additional information, refer to: Air Cleaner Outlet Pipe - VIN Range: N52048->N99999 (303-12A Intake Air Distribution and Filtering - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation).

26. Fill the cooling system up to the MAX mark on the coolant expansion tank using a fifty percent mixture of Jaguar Premium Cooling System Fluid or equivalent, meeting Jaguar specification WSS M97B44-D and fifty percent water.
Engine - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27 - Lower Intake Manifold

In-vehicle Repair

Removal

1. Remove the intake manifold.
   For additional information, refer to: Intake Manifold (303-01A Engine - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, In-vehicle Repair).

2. Disconnect the spring lock coupling.
   For additional information, refer to: Spring Lock Couplings (310-00 Fuel System - General Information, General Procedures).

3. Disconnect the fuel charging wiring harness.

4. NOTE: Fuel may still be present in the fuel injection supply manifold.
   • NOTE: Remove and discard the lower intake manifold O-ring seals.
   Remove the lower intake manifold.

Installation

1. NOTE: Install new O-ring seals.
   • NOTE: Tighten in the sequence shown.
   To install, reverse the removal procedure.
   • Tighten the retaining bolts in the sequence shown.
   • Tighten to 10 Nm.
**Removal**

1. Carry out the cooling system draining procedure. For additional information, refer to Section 303-03A Engine Cooling / 303-03B Supercharger Cooling / 303-03C Engine Cooling.

2. Remove the left-hand engine mount. For additional information, refer to Engine Mount in this section.

3. Drain the engine oil.

4. Remove and discard the engine oil filter.

5. Disconnect the coolant hoses.

6. Remove the oil filter housing.
   
   1. Remove the center oil filter housing retaining bolt.
      
      1. Discard the 'O' ring seal.
      
      2. Remove the oil filter housing.

7. Remove the oil cooler.

   - Remove and discard the oil cooler O-ring seal.

**Installation**
1. Install the oil cooler.
   - Install a new oil cooler O-ring seal.
   - Tighten to 58 Nm.

2. **NOTE:** Install a new ‘O’ ring seal.
   Install the oil filter housing.
   1. Loosely install the oil filter housing retaining bolts.
   2. Loosely install the center oil filter housing retaining bolt.
   3. Install the oil filter housing.

3. **NOTE:** Tighten the bolts in the indicated sequence.
   Tighten all bolts to 25 Nm.
   1. Tighten to 155 Nm.
   2. Tighten to 40 Nm + 90 degrees.

4. Connect the coolant hoses.

5. Install a new engine oil filter.
6. Install the left-hand engine mount.  
   For additional information, refer to Engine Mount in this section.

7. NOTE: Install a new sealing washer to oil pan drain plug
   Install the oil pan drain plug
   • Tighten to 24 Nm.

8. Lower the vehicle.
9. Refill the engine with oil.
10. Carry out the coolant fill and bleeding procedure.
Engine - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27 - Oil Pan

Removal

All Vehicles

1. Disconnect the battery ground cable. For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

2. Open the bonnet.

3. Raise the oil level indicator approximately 100 mm.

4. **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

   Raise and support the vehicle.

5. Remove the air deflector. For additional information, refer to: Air Deflector (501-02 Front End Body Panels, Removal and Installation).

6. Detach the accessory drive belt from the air conditioning (A/C) compressor and generator pulleys.
   - Using a 3/8 inch square drive bar, rotate the accessory drive belt tensioner counter-clockwise.

7. **NOTE:** A/C compressor supply and return lines shown removed for clarity.

   Detach the A/C compressor.
   - Using a suitable tie strap, tie the A/C compressor aside.

8. Detach the generator.
   - Using a suitable tie strap, tie the generator aside.

9. Drain the engine oil.
10. Detach the power steering hose.

11. Detach the steering gear.

12. Secure the steering gear.

13. **NOTE**: Left-hand shown, right-hand similar.
   Remove the engine mounts lower retaining nuts.

**Vehicles with Automatic Transmission**

14. Detach the automatic transmission fluid cooler tubes retaining bracket.
15. CAUTIONS:

⚠️ The engine and transmission must not be supported on the transmission oil pan. Failure to follow this instruction may result in damage to the vehicle.

⚠️ Take steps to prevent damage to the transmission casing.

Support the engine and transmission using a suitable transmission jack or axle stand.
- Position the support on the transmission bell housing behind the oil pan.

Remove the bolt securing the secondary air injection (AIR) tube to the oil pan.

17. NOTE: Where fitted.

Remove the bolt securing the support bracket to the oil pan.

18. WARNING: Do not remove the subframe retaining bolts. Failure to follow this procedure may result in personal injury.

Loosen the front and rear subframe retaining bolts to enable the oil pan to be removed.
19. Remove the oil pan rear retaining bolts.

20. Remove the oil pan.
   - Remove and discard the oil pan gasket.
   - Clean and inspect the oil pan and cylinder block sealing surfaces using metal surface cleaner or equivalent meeting Jaguar specification.

Installation

All Vehicles

1. NOTE: Apply a 10 mm dot of silicone gasket and sealant meeting Jaguar specification to the engine block and front cover mating surface.
   - NOTE: Install a new gasket.
   - NOTE: Loosely install the oil pan to transmission housing bolts.
   - NOTE: Tighten all oil pan retaining bolts with in six minutes of applying the sealer.

   Install the oil pan.
   - Complete the tightening sequence.
   - Tighten to 25 Nm.

2. Install the oil pan rear retaining bolts.
   - Tighten to 45 Nm.
3. **NOTE: Left-hand shown, right-hand similar.**
   Install the special tool.

4. **NOTE: Left-hand shown, right-hand similar.**
   Tighten the front subframe rear retaining bolts.
   - Tighten to 80 Nm + 240°.

5. **NOTE: Left-hand shown, right-hand similar.**
   Remove the special tool.

6. **NOTE: Left-hand shown, right-hand similar.**
   Tighten the front subframe front retaining bolts.
   - Tighten to 150 Nm + 240°.

7. **NOTE: Where fitted.**
   Install the bolt securing the support bracket to the oil pan.
   - Tighten to 10 Nm.
8. NOTE: Where fitted.
   Install the bolt securing the AIR tube to the oil pan.
   • Tighten to 10 Nm.

Vehicles with Automatic Transmission
9. Attach the automatic transmission fluid cooler tubes retaining bracket.
   • Tighten to 10 Nm.

All Vehicles
10. Remove the engine and transmission support.
11. NOTE: Left-hand shown, right-hand similar.
   Install the engine mounts lower retaining nuts.
   • Tighten to 63 Nm.

12. Detach the steering gear.
13. Attach the steering gear.
   - Tighten to 100 Nm.

14. Attach the power steering hose.
   - Tighten to 10 Nm.

15. NOTE: Install a new sealing washer to oil pan drain plug
   Install the oil pan drain plug.
   - Tighten to 24 Nm.

16. Attach the generator.
   - Cut and remove the tie strap supporting the generator.
   - Tighten to 48 Nm.

17. NOTE: A/C compressor supply and return lines shown removed for clarity.
   Attach the A/C compressor.
   - Cut and remove the tie strap supporting the A/C compressor.
   - Tighten to 25 Nm.
18. Attach the accessory drive belt.
   • Rotate the accessory drive belt tensioner counter-clockwise.

19. Install the air deflector.
    For additional information, refer to: Air Deflector (501-02 Front End Body Panels, Removal and Installation).

20. Connect the battery ground cable.
    For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

21. Refill the engine with oil.
Removal

1. Remove the timing drive components. For additional information, refer to Timing Drive Components in this section.

2. NOTE: Engine inverted for clarity.

   Remove the oil pump tube.

3. Remove the oil pump.
   - Remove and discard the O-ring seal.
   - Inspect the oil pump for damage and wear.

Installation

1. CAUTIONS:

   ⚠️ Install the oil pump flush to the cylinder block for correct sealing.

   ⚠️ Rotate the inner rotor of the oil pump to align with the flats on the crankshaft before installation.

   Install the oil pump.
   - Tighten to 10 Nm.

2. NOTE: Engine inverted for clarity.

   Install the oil pump tube.
   - Install a new O-ring seal.
   - Tighten to 10 Nm.
3. **NOTE:** Engine inverted for clarity.
   Tighten to 5 Nm + 45°.

4. Install the timing drive components.
   For additional information, refer to [Timing Drive Components] in this section.
Removal

1. Remove the engine front cover.
   For additional information, refer to: Engine Front Cover (303-01A Engine - 2.5L NA V6 - AJ26/3.0L NA V6 - AJ27, In-vehicle Repair).

2. Remove the spark plugs.

3. **NOTE:** Note the position of the crankshaft position (CKP) sensor pulse wheel during removal. It must be returned to its original position during installation.

   Remove the crankshaft position (CKP) sensor pulse wheel.

4. **CAUTION:** Do not rotate the crankshaft counterclockwise. The timing chains may bind causing engine damage.

   Install the crankshaft pulley retaining bolt and washer.

5. **CAUTION:** Do not rotate the crankshaft counterclockwise. The timing chains may bind causing engine damage.

   Rotate the crankshaft clockwise until the crankshaft keyway is at the 7 O'clock position, the alignment mark on the right-hand intake camshaft sprocket is at the 1 O'clock position and the alignment mark on the right-hand exhaust camshaft sprocket is at the 8 O'clock position.

6. Release the timing chain tensioner ratchet.
7. NOTE: Keep the timing chain tensioner ratchet released.
   Reposition the timing chain tensioner plunger.

8. Retain the timing chain tensioner plunger.

9. Remove the right-hand timing chain tensioner.

10. Remove the right-hand timing chain outer guide.

11. Remove the right-hand timing chain.
12. **CAUTION:** Inspect and replace the O-ring seal if necessary. Remove the right-hand timing chain inner guide.

13. **CAUTION:** Do not rotate the crankshaft counterclockwise. The timing chains may bind causing engine damage.

Rotate the crankshaft clockwise until the crankshaft keyway is at the 11 O'clock position, the alignment mark on the left-hand intake camshaft sprocket is at the 9 O'clock position and the alignment mark on the left-hand exhaust camshaft sprocket is at the 2 O'clock position.

14. **NOTE:** Right-hand bank shown, left-hand bank similar.

Release the timing chain tensioner ratchet.

15. **NOTE:** Right-hand bank shown, left-hand bank similar.

• **NOTE:** Keep the timing chain tensioner ratchet released.

Reposition the timing chain tensioner plunger.

16. **NOTE:** Right-hand bank shown, left-hand bank similar.

Retain the timing chain tensioner plunger.
17. Remove the left-hand timing chain tensioner.

18. Remove the left-hand timing chain inner guide.

19. Remove the left-hand timing chain.

20. **CAUTION:** Inspect and replace the O-ring seal if necessary.
    
    Remove the left-hand timing chain outer guide.

21. **CAUTION:** Make sure the crankshaft keyway is at the 9 O’clock position before any further engine repairs are carried out.
    
    Remove the crankshaft pulley retaining bolt and washer.
22. Remove the crankshaft sprocket.

Installation

1. **NOTE:** Make sure the crankshaft sprocket timing marks are facing outwards.
   
   Install the crankshaft sprocket.

2. **CAUTION:** Make sure the crankshaft keyway is at the 9 O'clock position before the camshaft positions are aligned.
   
   Install the crankshaft pulley retaining bolt and washer.

3. Rotate the left-hand intake camshaft clockwise until the camshaft sprocket alignment mark is at the 9 O'clock position and rotate the left-hand exhaust camshaft sprocket clockwise until the camshaft sprocket alignment mark is at the 2 O'clock position.
4. Rotate the right-hand intake camshaft clockwise until the camshaft sprocket alignment mark is at the 5 O'clock position and rotate the right-hand exhaust camshaft sprocket clockwise until the camshaft sprocket alignment mark is at the 12 O'clock position.

5. Rotate the crankshaft clockwise until the keyway is at the 11 O'clock position.

6. CAUTIONS:

⚠️ Inspect and replace the O-ring seal if necessary.

⚠️ Make sure the O-ring seal is correctly installed.

Install the left-hand timing chain outer guide.

- Tighten the retaining bolts in the sequence shown in two stages.
- Stage 1: Tighten bolt 1 to 25 Nm.
- Stage 2: Tighten bolts 2 to 25 Nm.

7. CAUTIONS:

⚠️ Make sure the crankshaft keyway is at the 11 O'clock position, the alignment mark on the left-hand intake camshaft sprocket is at the 9 O'clock position and the alignment mark on the left-hand exhaust camshaft sprocket is at the 2 O'clock position.

⚠️ Make sure the timing chain alignment marks are correctly positioned to the crankshaft sprocket and camshaft sprocket alignment marks.

⚠️ Make sure the timing chain slack is on the tensioned side of the timing chain.

Install the left-hand timing chain.

8. Install the left-hand timing chain inner guide.
9. **CAUTION:** Do not manually adjust the timing chain tensioner.

Install the left-hand timing chain tensioner.

- Tighten to 25 Nm.

10. **CAUTION:** Do not manually adjust the timing chain tensioner.

Make sure the left-hand timing chain alignment marks have remained correctly positioned to the camshaft sprocket and crankshaft sprocket alignment marks.

11. **CAUTION:** Do not manually adjust the timing chain tensioner.

Remove the timing chain tensioner retaining pin.

12. **CAUTION:** Do not rotate the crankshaft counterclockwise. The timing chains may bind causing engine damage.

Rotate the crankshaft clockwise until the crankshaft keyway is at the 3 O’clock position.

13. **CAUTIONS:**

- Inspect and replace the O-ring seal if necessary.
- Make sure the O-ring seal is correctly installed.

Install the right-hand timing chain inner guide.

- Tighten the retaining bolts in the sequence shown in two stages.
- Stage 1: Tighten bolt 1 to 25 Nm.
- Stage 2: Tighten bolts 2 to 25 Nm.
14. CAUTIONS:

- Make sure the crankshaft keyway is at the 3 O'clock position, the alignment mark on the right-hand intake camshaft sprocket is at the 5 O'clock position and the alignment mark on the right-hand exhaust camshaft sprocket is at the 12 O'clock position.

- Make sure the timing chain alignment marks are correctly positioned to the crankshaft sprocket and camshaft sprocket alignment marks.

- Make sure the timing chain slack is on the tensioned side of the timing chain.

Install the right-hand timing chain.

15. Install the right-hand timing chain outer guide.

16. CAUTION: Do not manually adjust the timing chain tensioner.

Install the right-hand timing chain tensioner.
- Tighten to 25 Nm.

17. CAUTION: Do not manually adjust the timing chain tensioner.

Remove the timing chain tensioner retaining pin.

18. CAUTIONS:

- Make sure the right-hand timing chain alignment marks have remained correctly positioned to the camshaft sprocket and crankshaft sprocket alignment marks.

- Do not manually adjust the timing chain tensioner.

Make sure all the timing chain alignment marks are in the positions shown.
19. **CAUTION:** Do not rotate the crankshaft counterclockwise. The timing chains may bind causing engine damage.

- **NOTE:** Rotate the crankshaft using hand tools only

Rotate the crankshaft two complete turns clockwise to make sure the valves and pistons do not clash.

20. **CAUTION:** Do not rotate the crankshaft counterclockwise. The timing chains may bind causing engine damage.

Remove the crankshaft pulley retaining bolt and washer.

21. **CAUTIONS:**

- Make sure the CKP sensor pulse wheel is correctly installed with the missing tooth aligned to the crankshaft keyway.

- Make sure the CKP sensor pulse wheel is correctly installed with the teeth pointing outwards.

Install the CKP sensor pulse wheel.

22. Install the spark plugs.

- Tighten to 15 Nm.

23. Install the engine front cover.

For additional information, refer to: [Engine Front Cover (303-01A Engine - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, In-vehicle Repair)].
**Removal**

1. Remove the left-hand on-plug coils. For additional information, refer to Section 303-07A Engine Ignition / 303-07B Engine Ignition / 303-07C Glow Plug System.

2. Detach the left-hand valve cover wiring harness.

3. Detach the engine breather tube.

4. Detach the engine wiring harness retaining bracket.

5. Remove the valve cover.

**Installation**
1. NOTE: Apply a 5mm diameter bead of silicone gasket sealant or equivalent meeting Jaguar specification on the half round gaskets and apply an 8mm diameter on the two places where the cylinder head and front cover join.

To install, reverse the removal procedure.
- Install new valve cover gaskets.
- Complete the tightening sequence.
- Tighten to 10 Nm.
In-vehicle Repair

Removal

1. Remove the intake manifold. For additional information, refer to Intake Manifold in this section.
2. Remove the right-hand on-plug coils. For additional information, refer to Section 303-07A Engine Ignition / 303-07B Engine Ignition / 303-07C Glow Plug System.
3. Detach the right-hand valve cover wiring harness.

4. Remove the intake manifold rear retaining bracket.

5. Detach the engine wiring harness retaining bracket.

6. Remove the valve cover.

Installation
1. NOTE: Apply a 5mm diameter bead of silicone gasket sealant or equivalent meeting Jaguar specification on the half round gaskets and apply an 8mm diameter on the two places where the cylinder head and front cover join.

To install, reverse the removal procedure.

- Install new valve cover gaskets.
- Complete the tightening sequence.
- Tighten to 10 Nm.

### Removal

**Vehicles with automatic transmission**

1. Remove the automatic transmission assembly.
   
   For additional information, refer to Section [307-01 Automatic Transmission/Transaxle](#).

**Vehicles With Manual Transmission**

2. Remove the manual transmission. For additional information, refer to Section [308-03A Manual Transmission/Transaxle / 308-03B Manual Transmission/Transaxle](#).

**All vehicles**

3. Lower the vehicle.

4. Carry out the air conditioning recovery procedure.
   
   For additional information, refer to Section [412-00 Climate Control System - General Information](#).

5. Remove the cabin air filter.
   
   For additional information, refer to Section [412-01 Air Distribution and Filtering](#).

6. Remove the air cleaner assembly. For additional information, refer to Section [303-12A Intake Air Distribution and Filtering / 303-12B Intake Air Distribution and Filtering / 303-12C Intake Air Distribution and Filtering](#).

7. Remove the engine compartment support.
8. Remove the cabin air filter housing retaining nut.

9. Remove the cabin air filter housing.

10. Remove the engine compartment panel.

11. Raise the vehicle.

12. Remove the passenger side front wheel and tire assembly.

13. Remove the fender splash shield.
14. Disconnect the engine harness ground strap.

15. Lower the vehicle

16. NOTE: The engine control module (ECM) electrical connector retaining bolt remains captive in the electrical connector
   Disconnect the ECM electrical connector.

17. NOTE: The main engine harness electrical connector retaining bolt remains captive in the electrical connector
   Disconnect the engine wiring harness electrical connectors.
   1. Loosen the engine harness main electrical connector retaining bolt.
   2. Disconnect the engine wiring harness electrical connectors.

18. Reposition the engine wiring harness from the vehicle body.

19. Disconnect the evaporative emission canister purge valve to intake manifold hose.
20. Disconnect the fuel supply manifold spring lock coupling. For additional information, refer to Section 310-00 Fuel System - General Information.

21. Remove the cooling module. For additional information, refer to Section 303-03A Engine Cooling / 303-03B Supercharger Cooling / 303-03C Engine Cooling.

22. Detach the ground cable.

23. NOTE: Brake booster vacuum hose is attached to the induction manifold by a quick release coupling.
   Detach the brake booster vacuum hose from the induction manifold.

24. CAUTIONS:

   - Cap the power steering line to prevent loses of fluid and dirt ingress.

   - If power steering fluid comes into contact with the paintwork, the affected area must be immediately washed down with cold water.

   • NOTE: Drain the fluid into a suitable container.

   Disconnect the power steering reservoir to power steering pump supply line.
25. **CAUTIONS:**

⚠️ Cap the power steering lines to prevent loses of fluid and dirt ingress.

⚠️ If power steering fluid comes into contact with the paintwork, the affected area must be immediately washed down with cold water.

• **NOTE:** Drain the fluid into a suitable container.
  - Disconnect the power steering pump to steering gear supply line.
    - Remove and discard the O-ring seal.

26. Detach the right-hand valve cover wiring harness.

27. Disconnect the left-hand ignition coils electrical connectors.

28. Detach the left-hand valve cover wiring harness.

29. Remove the dipstick tube retaining bolt.
  - Reposition the dipstick tube.
30. NOTE: Left-hand shown, Right-hand similar.
Loosen the exhaust manifold retaining nut.

31. NOTE: Left-hand shown, Right-hand similar.
Install the special tool to the exhaust manifold.
- Install the retaining bolt.

32. NOTE: Left-hand shown, Right-hand similar.
Install the retaining bolt.

33. Install the special tool support bars to the special tool.

34. Install the special tool.

35. Raise the vehicle.
36. Detach the accessory drive belt.
   1. Rotate the accessory drive belt tensioner counter-clockwise.
      1. Use a 3/8 inch square drive bar to rotate the accessory drive belt tensioner.
   2. Detach the accessory drive belt.

37. Detach the generator battery positive cable protective cover.

38. Remove the battery positive cable retaining nut.

39. Disconnect the A/C compressor supply and return lines.
    - Remove and discard the A/C compressor O-ring seals.
    - Cap the exposed ports.

40. Reposition the A/C compressor supply and return lines away from the engine.
41. Detach the power steering hose.

42. Reposition the power steering hose away from the engine.

43. NOTE: Left-hand engine mount lower retaining bolt shown, right-hand similar.

Remove the engine mounts lower retaining bolts.

44. Detach the automatic transmission oil cooler tubes bracket.

45. Reposition the automatic transmission oil cooler tubes away from the engine.

46. Detach the automatic transmission wiring harness.

47. Reposition the automatic transmission wiring harness away from the engine.

All Vehicles

48. Lower the vehicle.
49. Remove the special tool.

50. Remove the engine assembly.
   - Using the special tools, install a suitable floor crane.
## Engine - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27 - Engine

### Disassembly

**Disassembly**

1. Disconnect the throttle motor electrical connector.

2. Disconnect the throttle position sensor.
3. Disconnect the positive crankcase ventilation (PCV) hose.

4. Disconnect the electrical connectors.

5. Disconnect the fuel pressure regulator vacuum hose.

6. Remove the fuel pressure regulator bracket.

7. Detach the intake manifold front retaining bracket.
8. Detach the engine wiring harness from the intake manifold rear retaining bracket.

9. Detach the intake manifold rear retaining bracket.

10. NOTE: The evaporative emission canister purge valve transfer pipe is attached to the induction manifold by a quick release coupling. Disconnect the evaporative emission canister purge valve transfer pipe.

11. Remove the intake manifold.

12. Remove and discard the intake manifold gaskets.
13. Remove the engine breather hose.

14. Remove the evaporative emission purge valve hose.

15. Disconnect the oil cooler coolant hoses.

16. Remove the coolant hose.

17. Remove the coolant hose.
18. Disconnect the electrical connectors.

19. Detach the engine harness.

20. Detach engine harness.

21. Remove the rear knock sensor.
   1. Detach the knock sensor wiring harness.
   2. Remove the rear knock sensor.

22. Disconnect the right-hand camshaft position sensor.
23. Detach the engine harness retaining bracket.

24. Detach the engine harness.

25. Disconnect the right-hand ignition coils.

26. Detach the engine harness.

27. Disconnect the left-hand camshaft position sensor.
28. Disconnect the left-hand ignition coils.

29. Disconnect the engine wiring harness electrical connectors.

30. Remove the engine wiring harness.

31. Remove the ignition coils.

32. Remove the lower intake manifold and injector supply manifold.
33. Remove and discard the lower intake manifold gaskets.

34. Remove the left-hand knock sensor.

35. Remove the accessory drive belt.
   1. Use a 3/8 inch drive bar to release the accessory drive belt tensioner.
   2. Remove the accessory drive belt.

36. Remove the right-hand idler pulley.

37. Remove the generator.
38. Remove the power steering pump.

39. Remove the air conditioning (A/C) compressor.

40. Remove the A/C compressor mounting bracket.

41. Remove the oil level indicator tube.
   1. Remove and discard the O-ring seal.

42. NOTE: Right-hand shown, Left-hand similar.
    Remove the exhaust manifold heat shields.
43. NOTE: Right-hand shown, Left-hand similar.
Remove the exhaust manifolds.

44. Remove the flywheel.
   - Prevent the engine from rotating.

45. Remove the engine rear backing plate.

46. Remove the oil filter housing assembly.
   - Remove and discard the O-ring seal.

47. Remove the engine oil pressure and oil temperature sensors.
48. Remove the coolant crossover tube.
   • Remove and discard the O-ring seals.

49. Remove the water pump and coolant hose assembly.
   1. Detach the hose.
   2. Remove the water pump and coolant hose assembly.

50. Remove the accessory drive belt tensioner.

51. Install the special tool, loosen the crankshaft pulley retaining bolt.

52. Install the special tool.
53. Using the special tool, remove the crankshaft vibration damper.

54. Remove the left-hand idler pulley.

55. Remove the oil pan.
   - Remove and discard the oil pan gasket.
   - Clean and inspect the oil pan and cylinder block sealing surfaces using Metal surface cleaner or equivalent meeting Jaguar specification.

56. NOTE: Right-hand shown, left-hand similar.
    Remove the valve covers.

57. Remove the engine front cover
    - Remove and discard the engine front cover gaskets.
58. Remove the crankshaft position (CKP) sensor pulse wheel.

59. **CAUTION:** Do not rotate the crankshaft counterclockwise. The timing chains may bind causing engine damage.

   Install the crankshaft pulley retaining bolt and washer.

60. **CAUTION:** Do not rotate the crankshaft counterclockwise. The timing chains may bind causing engine damage.

   Rotate the crankshaft clockwise until the crankshaft keyway is at the 7 O'clock position, the alignment mark on the right-hand intake camshaft sprocket is at the 1 O'clock position and the alignment mark on the right-hand exhaust camshaft sprocket is at the 8 O'clock position.

61. **CAUTION:** Do not rotate the crankshaft counterclockwise. The timing chains may bind causing engine damage.

   Remove the crankshaft pulley retaining bolt and washer.

62. Remove the right-hand timing chain tensioner.
63. Remove the right-hand timing chain outer guide.

64. Remove the right-hand timing chain.

65. Remove the right-hand timing chain inner guide.

66. Remove the crankshaft outer sprocket.

67. **CAUTION:** Do not rotate the crankshaft counterclockwise. The timing chains may bind causing engine damage.

   Install the crankshaft pulley retaining bolt and washer.
68. **CAUTION:** Do not rotate the crankshaft counterclockwise. The timing chains may bind causing engine damage.

Rotate the crankshaft clockwise until the crankshaft keyway is at the 11 O'clock position, the alignment mark on the left-hand intake camshaft sprocket is at the 9 O'clock position and the alignment mark on the left-hand exhaust camshaft sprocket is at the 2 O'clock position.

69. **CAUTION:** Do not rotate the crankshaft counterclockwise. The timing chains may bind causing engine damage.

Remove the crankshaft pulley retaining bolt and washer.

70. Remove the left-hand timing chain tensioner.

71. Remove the left-hand timing chain inner guide.

72. Remove the left-hand timing chain.
73. Remove the left-hand timing chain outer guide.

74. Remove the crankshaft inner sprocket.

75. Remove the RH exhaust camshaft bearing cap bolts evenly.
   - Remove the exhaust camshaft bearing caps.

76. Remove the RH exhaust camshaft.

77. Remove the RH inlet camshaft bearing cap bolts evenly.
   - Remove the inlet camshaft bearing caps.
78. Remove the RH inlet camshaft.

79. Remove the LH exhaust camshaft bearing cap bolts evenly.
   - Remove the exhaust camshaft bearing caps.

80. Remove the LH exhaust camshaft.

81. Remove the LH inlet camshaft bearing cap bolts evenly.
   - Remove the inlet camshaft bearing caps.

82. Remove the LH inlet camshaft.
83. NOTE: Remove the bolts in the indicated sequence.
Remove the RH cylinder head.
  • Discard the gasket.

84. NOTE: Remove the bolts in the indicated sequence.
Remove the LH cylinder head.
  • Discard the gasket.

85. Remove the engine coolant housing.
  • Discard the 'O' ring seals.

86. NOTE: Engine inverted for clarity.
Remove the oil pump tube.

87. Remove the oil pan baffle.
88. Remove the oil pump.
   • Remove and discard the O-ring seal.
   • Inspect the oil pump for damage and wear.

89. **CAUTION:** Pistons, connecting rods and connecting rod bearings should be numbered to make sure they are reassembled in the same position.
   • **NOTE:** Mark the position of the connecting rod caps to the connecting rods to make sure correct insulation.
   • **NOTE:** Discard the connecting rod bolts after removal.
   Remove the connecting rod bolts, the connecting rod caps and the lower connecting rod bearings.

90. Inspect the tops of the cylinder bores. As necessary remove ridge and carbon build up from each cylinder.

91. **CAUTION:** Use appropriate protection to prevent damage to the crankshaft bearing journals and cylinder bore surfaces.
   Install special tools to the connecting rods.

92. **CAUTION:** Care should be taken not to damage the connecting rod and cap joint face surfaces or possible engine damage may occur. Avoid contaminating the fracture joint surfaces with dirt or grease.
   • **NOTE:** Reattach the connecting rods and caps after removal to avoid mismatch.
   Remove the pistons.
   • Rotate the crankshaft to locate pistons at the bottom of travel.
   • Push the piston, connecting rod and upper bearing through the top of the cylinder.

93. **NOTE:** Remove the lower cylinder block bolts in the indicated sequence.
   Remove the lower cylinder block.
94. NOTE: Mark the position of the upper and lower crankshaft main bearing and the crankshaft thrust bearing for reassembly.

Remove the lower crankshaft bearings.

1. Remove the lower crankshaft thrust main bearing.
2. Remove the lower crankshaft main bearings.

95. CAUTION: Avoid damage to any crankshaft bearing surfaces.

• NOTE: Never remove any pipe plugs or dowels unless they are to be newly installed or the cylinder block is to be washed.

Remove the crankshaft.

○ Discard the crankshaft rear main oil seal.

96. Remove the upper crankshaft main bearings.

97. Clean the cylinder block with a soap and water solution. Dry the cylinder block completely with compressed air.
Disassembly

1. **CAUTION:** If the cylinder head valve components are to be reused, mark position of the valve components to make sure they are reassembled in the same position.

   Remove the bucket tappet and shim assemblies.

2. Using the special tool, compress the valve springs.
   - Remove the valve collets.

3. Remove the valve spring retainers and valve springs.
   1. Remove the valve spring retainers.
   2. Remove the valve springs.
   3. Remove the valve stem oil seals.

4. Remove the valves from the cylinder heads.
   1. Remove the intake valves.
   2. Remove the exhaust valves.

5. Inspect the cylinder heads and the related components.
   For additional information, refer to Section 303-00 Engine System.
General Information.

6. Remove the pipe plugs and alignment dowels as necessary to clean the cylinder heads.

Assembly

1. **WARNING:** Eye protection is required during use of compressed air. Failure to follow these instructions may result in personal injury.

   **CAUTION:** The cylinder head surface finish is measured in microns. For correct head gasket sealing, avoid any contact of finish with metallic objects.

   Clean gasket material, dirt and foreign material from cylinder heads. Wash with a suitable soap and water solution and dry completely using compressed air if pipe plugs have been removed.

2. Install the pipe plugs and alignment dowels to cylinder heads.

   • Apply pipe sealant to plugs prior to installation.

3. **NOTE:** Lubricate the valve stems before assembly.

   Install the valves into the cylinder heads.
   1. Install the intake valves.
   2. Install the exhaust valves.

4. Install the valve spring retainers and valve springs.

   1. Install the valve stem oil seals.
   2. Install the valve springs.
   3. Install the valve spring retainers.

5. Using the special tool, compress the valve springs.

   • Install the valve collets.
6. Install the bucket tappet and shim assemblies.
Engine - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27 - Piston
Disassembly and Assembly of Subassemblies

Disassembly

1. NOTE: Mark the pistons to the original connecting rods to make sure correct installation in the same cylinders from which they were removed.

   Remove the top compression ring.

2. Remove the second compression ring.

3. Remove the first oil control ring.

4. Remove the oil control spacer ring.

5. Remove the second oil control ring.
6. **WARNING:** The retaining rings have a tendency to spring out during removal. Cover the end of the pin bore with a hand or a rag when removing the retaining ring. Eye protection should be worn. Failure to follow these instructions may result in personal injury.

Remove the retaining clips.

7. Remove the piston pin and the connecting rod from the piston.

8. Clean and inspect the connecting rod and the piston. For additional information, refer to Section 303-00 Engine System - General Information.

Assembly

1. Install the piston pin.
   - Lubricate the piston pin and piston bore.

2. Install the retaining clips.

3. Check the piston ring end gap. For additional information, refer to Section 303-00 Engine System - General Information.

4. Lubricate the piston and piston rings.
5. Install the second oil control ring.

6. Install the oil control spacer ring.

7. Install the first oil control ring.

8. Install the second compression ring.
   - The top of the second compression ring has a "0" marked on it. Position this side of the ring towards the top of the piston.

9. Install the top compression ring.
   - The top compression ring can be installed with either side up.
1. **CAUTION:** Use only plastic scraper when removing old gasket material.

   Clean all the mating faces and reusable parts thoroughly and check for damage.
   
   - If gasket material remains on the cylinder head after cleaning, use a plastic tipped scraper to remove remaining material.

2. **NOTE:** Never remove pipe plugs or alignment dowels unless they are to be serviced.

   Reseal oil passage blanking plugs, as necessary.

3. **NOTE:** The main bearings are precision selective fit. For additional information, refer to Section 303-00 Engine System - General Information.

   Install the upper crankshaft thrust washer.
   
   - Align assembly tab on thrust bearing to machining spot face on cylinder block.
4. Install the upper crankshaft main bearings.
   - Lubricate the bearings and thrust washer.

5. **CAUTION:** Avoid damage to any crankshaft journal bearing surfaces.
   Install the crankshaft.

6. **NOTE:** Push the crankshaft rearward prior to installation of upper thrust bearings.
   - **NOTE:** Visually inspect the bearings to verify that the bearing oiling holes align with cylinder block oil feed holes.
   Install the lower crankshaft bearings into the cylinder block.
   1. Install the lower crankshaft thrust main bearing into lower cylinder block.
   2. Install the lower crankshaft main bearings into lower cylinder block.
      - Lubricate the bearings and thrust washer.

7. **NOTE:** Sealant application must stop 6 mm from the rear crankshaft bore on each side.
   - **NOTE:** Install lower cylinder block and tighten all bolts to specification within four minutes of applying sealer.
   Apply a bead of sealant to the cylinder block housing.
   - Use Silicone gasket and sealant.

8. **CAUTION:** Make sure all dowels are fully seated into lower cylinder block prior to tightening the bolts.
   - **NOTE:** Before installing the bolts lightly seat the crankshaft forward.
   - **NOTE:** Do not lubricate the lower cylinder block bolts.
   - **NOTE:** Loosely install the lower cylinder block bolts.
   - **NOTE:** Do not rotate crankshaft until all bolts are tightened to specification.
   - **NOTE:** Bolts must be tightened within 4 minutes of applying sealant.
   Install the lower cylinder block on the cylinder block.
   - Push crankshaft rearward to seat the crankshaft thrust washer.
9. **CAUTION:** Bolts 1 through 16 are tighten-to-yield and must be replaced.

- **NOTE:** Tighten the bolts in the indicated sequence in four stages.

  Complete the tightening sequence.

  - Stage 1: Bolts 1-8, 25 Nm
  - Stage 2: Bolts 9-16, 40 Nm
  - Stage 3: Bolts 1-16, 90°
  - Stage 4: Bolts 17-22, 25 Nm

  Verify the crankshaft rotates freely.

10. Remove excess sealant which may squeeze out at the front cover sealing surface.
11. **NOTE:** Alternate bolt tightening to correctly seat the crankshaft rear oil seal until it is flush with the cylinder block.

Using the special tools, install the crankshaft rear oil seal.

12. **CAUTION:** Use appropriate protection to prevent damage to the crankshaft bearing journals and cylinder bore surfaces.

Install special tools to the connecting rods.

- Position the crankshaft journal at the bottom of the stroke.

13. **NOTE:** Make sure the piston ring gaps are positioned at different locations opposite the thrust side of the piston before installation.

- **NOTE:** Install pistons with arrow to front of engine.

Using the special tool compress the rings and install the piston and connecting rod.

- Lubricate all piston components.

14. **CAUTIONS:**

- When assembling the connecting rods and connecting rod caps, it is imperative that bearing slots and tangs be located on the same side of the connecting rods.

- Connecting rod bolts are torqued to yield and must be replaced.

- **NOTE:** Remove the special tools from the connecting rods.

- **NOTE:** Tighten the bolts in the indicated sequence in three stages.

  Position the connecting rod cap on the appropriate connecting rod.

  - Stage 1: 23 Nm
  - Stage 2: 43 Nm
  - Stage 3: 105°

15. Rotate the crankshaft to check correct operation.

16. **CAUTIONS:**

- Install the oil pump flush to the cylinder block for correct sealing.

- Rotate the inner rotor of the oil pump to align with the flats on the crankshaft before installation.

Install the oil pump.

- Tighten to 10 Nm.
17. **CAUTION:** Oil pan baffle nuts are tightened to yield and must not be reused.

- **NOTE:** Tighten the bolts in the indicated sequence in two stages.
  
  Install the oil pan baffle.
  
  - Stage 1: 5 Nm
  - Stage 2: 45°

18. **NOTE:** Engine inverted for clarity.

  Install the oil pump tube.
  
  - Install a new O-ring seal.
  - Tighten to 10 Nm.

19. **NOTE:** Engine inverted for clarity.

  Tighten to 5 Nm + 45°.

20. Install the engine coolant housing.

  - Install new 'O' ring seals.
  - Tighten to 25 Nm.

21. Position the crankshaft.

  - Turn the crankshaft until the key is in the 11 o'clock position.
  - Remove the crankshaft pulley bolt and washer.
22. Install a new cylinder head gasket (LH shown - RH similar).
   1. Make sure the cylinder head dowels are correctly located.
   2. Install a new cylinder head gasket.

23. NOTE: Install the bolts in the indicated sequence.
   Install the LH cylinder head.
   - Tighten to 30 Nm.
   - Tighten 90°.
   - Loosen 360°.
   - Tighten to 30 Nm.
   - Tighten 90°.
   - Tighten 90°.

24. NOTE: Install the bolts in the indicated sequence.
   Install the RH cylinder head.
   - Tighten to 30 Nm.
   - Tighten 90°.
   - Loosen 360°.
   - Tighten to 30 Nm.
   - Tighten 90°.
   - Tighten 90°.

25. Install the LH inlet camshaft.

26. CAUTION: Do not install the cylinder head camshaft journal thrust caps until the camshaft journal caps are installed or damage to the thrust caps may occur.
   • NOTE: Lubricate the camshafts and the camshaft bearing caps with oil WSE-M2C908-A or equivalent meeting Jaguar specification prior to installation.
   - Install the LH inlet camshaft bearing cap bolts evenly.
     - Install the inlet camshaft bearing caps.
     - Tighten to 10 Nm.
27. Install the LH exhaust camshaft.

28. **CAUTION:** Do not install the cylinder head camshaft journal thrust caps until the camshaft journal caps are installed or damage to the thrust caps may occur.

- **NOTE:** Lubricate the camshafts and the camshaft bearing caps with oil WSE-M2C908-A or equivalent meeting Jaguar specification prior to installation.

  Install the LH exhaust camshaft bearing cap bolts evenly.
  - Install the exhaust camshaft bearing caps.

29. Install the RH inlet camshaft.

30. Install the RH inlet camshaft bearing cap bolts evenly.
  - Install the inlet camshaft bearing caps.

31. Install the RH exhaust camshaft.
32. Install the RH exhaust camshaft bearing cap bolts evenly.
   - Install the exhaust camshaft bearing caps.

33. Rotate the right-hand intake camshaft clockwise until the camshaft sprocket alignment mark is at the 5 O’clock position and rotate the right-hand exhaust camshaft sprocket clockwise until the camshaft sprocket alignment mark is at the 12 O’clock position.

34. Install the crankshaft inner sprocket.

35. Install the left-hand timing chain outer guide.
   - Tighten the retaining bolts in the sequence shown in two stages.
   - Stage 1: Tighten bolt 1 to 25 Nm.
   - Stage 2: Tighten bolts 2 to 25 Nm.

36. CAUTIONS:
   - Make sure the crankshaft keyway is at the 11 O’clock position, the alignment mark on the left-hand intake camshaft sprocket is at the 9 O’clock position and the alignment mark on the left-hand exhaust camshaft sprocket is at the 2 O’clock position.
   - Make sure the timing chain alignment marks are correctly positioned to the crankshaft sprocket and camshaft sprocket alignment marks.
   - Make sure the timing chain slack is on the tensioned side of the timing chain.

Install the left-hand timing chain.
37. Install the left-hand timing chain inner guide.

38. **CAUTION:** Use suitable protective covers on the vice jaws to protect the timing chain tensioner.

   Secure the left-hand timing chain tensioner in the vice jaws.

39. **CAUTION:** During timing chain tensioner compression, do not release the ratchet stem until the timing chain tensioner piston is fully bottomed in its bore or damage to the ratchet stem will result.

   Using a suitable tool, hold the left-hand timing chain tensioner ratchet lock mechanism away from the ratchet stem.

40. **NOTE:** The timing chain tensioner piston should retract with minimal force. If binding occurs, reposition the timing chain tensioner to eliminate side loading.

   Slowly compress the left-hand timing chain tensioner.

41. **NOTE:** The retaining tool must remain in the timing chain tensioner until the timing chain tensioner is installed to the engine with the piston bottomed in the bore.

   Using a suitable tool, retain the left-hand timing chain tensioner piston.
42. Install the left-hand timing chain tensioner.
   • Tighten to 25 Nm.

43. Release the tension in the left-hand timing chain tensioner.
   • Remove the retaining tool.

44. Make sure the left-hand timing chain alignment marks have remained correctly positioned to the camshaft sprocket and crankshaft sprocket alignment marks.

45. **CAUTION:** Do not rotate the crankshaft counterclockwise. The timing chains may bind causing engine damage.

   Install the crankshaft pulley retaining bolt and washer.

46. **CAUTION:** Do not rotate the crankshaft counterclockwise. The timing chains may bind causing engine damage.

   Rotate the crankshaft clockwise until the crankshaft keyway is at the 3 O'clock position.

47. **CAUTION:** Do not rotate the crankshaft counterclockwise. The timing chains may bind causing engine damage.

   Remove the crankshaft pulley retaining bolt and washer.
48. Install the crankshaft outer sprocket.

49. Install the right-hand timing chain inner guide.
   - Tighten the retaining bolts in the sequence shown in two stages.
   - Stage 1: Tighten bolt 1 to 25 Nm.
   - Stage 2: Tighten bolts 2 to 25 Nm.

50. CAUTIONS:
   - Make sure the crankshaft keyway is at the 3 O'clock position, the alignment mark on the right-hand intake camshaft sprocket is at the 5 O'clock position and the alignment mark on the right-hand exhaust camshaft sprocket is at the 12 O'clock position.
   - Make sure the timing chain alignment marks are correctly positioned to the crankshaft sprocket and camshaft sprocket alignment marks.
   - Make sure the timing chain slack is on the tensioned side of the timing chain.
   - Install the right-hand timing chain.

51. Install the right-hand timing chain outer guide.

52. **CAUTION:** Use suitable protective covers on the vice jaws to protect the timing chain tensioner.
    - Secure the right-hand timing chain tensioner in the vice jaws.
53. **CAUTION:** During timing chain tensioner compression, do not release the ratchet stem until the timing chain tensioner piston is fully bottomed in its bore or damage to the ratchet stem will result.

Using a suitable tool, hold the right-hand timing chain tensioner ratchet lock mechanism away from the ratchet stem.

54. **NOTE:** The timing chain tensioner piston should retract with minimal force. If binding occurs, reposition the timing chain tensioner to eliminate side loading.

Slowly compress the right-hand timing chain tensioner.

55. **NOTE:** The retaining tool must remain in the timing chain tensioner until the timing chain tensioner is installed to the engine with the piston bottomed in the bore.

Using a suitable tool, retain the right-hand timing chain tensioner piston.

56. Install the right-hand timing chain tensioner.

- Tighten to 25 Nm.

57. Release the tension in the right-hand timing chain tensioner.

- Remove the retaining tool.
58. **CAUTION:** Make sure the right-hand timing chain alignment marks have remained correctly positioned to the camshaft sprocket and crankshaft sprocket alignment marks.

Make sure all the timing chain alignment marks are in the positions shown.

59. **CAUTION:** Do not rotate the crankshaft counterclockwise. The timing chains may bind causing engine damage.

Install the crankshaft pulley retaining bolt and washer.

60. **CAUTION:** Do not rotate the crankshaft counterclockwise. The timing chains may bind causing engine damage.

Check the engine valve timing is correctly set.

- Rotate the crankshaft two complete turns clockwise. Make sure the alignment marks on the camshaft sprockets are in the positions shown when the crankshaft keyway is at the 11 O'clock position.

61. **CAUTION:** Do not rotate the crankshaft counterclockwise. The timing chains may bind causing engine damage.

Remove the crankshaft pulley retaining bolt and washer.

62. **NOTE:** Make sure the CKP sensor pulse wheel is correctly installed with the teeth pointing outwards.

Install the CKP sensor pulse wheel.
63. Carry out a valve clearance check. For additional information, refer to Valve Clearance Check in this section.

64. Install new front timing cover gaskets.

65. NOTE: Prior to applying sealer clean the front cover to engine block and cylinder head sealing surfaces with metal surface cleaner.

Apply a 6 mm diameter dot of silicone sealant meeting Jaguar specification to the indicated locations.

66. NOTE: The engine front cover retaining bolts numbered 3, 4, 10 and 11 are longer than the retaining bolts numbered 1, 2, 5, 6, 7, 8, 9, 12, 13, 15 and 16. The retaining bolt numbered 14 is a retaining bolt with a stud head.

Install the engine front cover, completing the tightening sequence.

- Tighten to 25 Nm.

67. NOTE: Apply an 10 mm dot of silicone gasket and sealant meeting Jaguar specification to the engine block and front cover mating surface.

- NOTE: Loosely install the oil pan to transmission housing bolts.
- NOTE: Tighten all oil pan retaining bolts with in six minutes of applying the sealer.

Install the oil pan rear retaining bolts.

- Complete the tightening sequence.
- Tighten to 25 Nm.
68. **NOTE:** Right-hand shown, left-hand similar.

Install the valve covers.
- Complete the tightening sequence.
- Tighten to 10 Nm.

69. Install the left-hand idler pulley.
- Tighten to 25 Nm.

70. Using the special tools, install the crankshaft pulley.
- Coat the crankshaft pulley keyway with silicone gasket sealant meeting Jaguar specification.
- Coat the sealing surfaces of the crankshaft pulley with silicone gasket sealant meeting Jaguar specification.

71. Install the crankshaft pulley retaining bolt.
- Torque to 120 Nm.
- Loosen the bolt (minimum 1 turn).
- Torque to 50 Nm.
- Angle Torque to 90°.

72. Install the accessory drive belt tensioner.
- Tighten 45 Nm.
73. Install the water pump and coolant hose assembly.
   1. Attach the hose.
   2. Install the water pump and coolant hose assembly.
      ● Tighten to 25 Nm.

74. NOTE: Install new coolant crossover O-ring seals.
    Install the coolant crossover tube.
    ● Tighten to 10 Nm,

75. Install the engine oil pressure and oil temperature sensors.
    ● Tighten to 14Nm.

76. NOTE: Install new O-ring seals.
    Install the oil filter housing assembly.
    ● Tighten all oil filter housing retaining bolts to 25 Nm.

77. Tighten the oil filter housing assembly retaining bolts in sequence.
    1. Tighten to 150 Nm.
    2. Tighten to 40 Nm + 90 degrees.
78. Install the engine rear backing plate.

79. Install the flywheel.
   - Prevent the engine from rotating.
   - Tighten to 80 Nm.

80. NOTE: Right-hand shown, Left-hand similar.
    Install the exhaust manifolds.
    - Tighten to 25 Nm.

81. NOTE: Right-hand shown, Left-hand similar.
    Install the exhaust manifold heat shields.
    - Tighten to 10 Nm.

82. NOTE: Install a new O-ring seal.
    Install the oil level indicator tube.
83. Install the A/C compressor mounting bracket.
   - Tighten to 25 Nm.

84. Install the air conditioning (A/C) compressor.
   - Tighten to 25 Nm.

85. Install the power steering pump.
   - Tighten to 25 Nm.

86. Install the generator.
   - Tighten to 48 Nm.

87. Install the right-hand idler pulley.
   - Tighten to 25 Nm.
88. Install the accessory drive belt.
   1. Use a 3/8 inch drive bar to release the accessory drive belt tensioner.
   2. Install the accessory drive belt.

89. Install the left-hand knock sensor.
   • Tighten to 25 Nm.

90. Install new lower intake manifold gaskets.

91. Install the lower intake manifold and injector supply manifold.
   • Tighten to 10 Nm.

92. Install the ignition coils.
   • Tighten to 10 Nm.
93. Install the engine wiring harness.
   - Tighten to 10 Nm.

94. Connect the engine wiring harness electrical connectors.

95. Connect the left-hand ignition coils.

96. Connect the left-hand camshaft position sensor.

97. Attach the engine harness.
98. Connect the right-hand ignition coils.

99. Attach the engine harness.

100. Attach the engine harness retaining bracket.

101. Disconnect the right-hand camshaft position sensor.

102. Install the rear knock sensor.
   1. Attach the knock sensor wiring harness.
   2. Install the rear knock sensor.
   ● Tighten to 25 Nm.
103. Attach engine harness.

104. Attach the engine harness.

105. Connect the electrical connectors.

106. Install the coolant hose.

107. Install the coolant hose.
108. Connect the oil cooler coolant hoses.

109. Install the evaporative emission purge valve hose.

110. Install the engine breather hose.

111. Install new intake manifold gaskets.

112. NOTE: The intake manifold retaining bolts in position 1, 2, 3 and are longer than the retaining bolts in position 4, 5 and 6.

To install, reverse the removal procedure.
- Install new intake manifold gaskets.
- Tighten to 10 Nm.
113. Connect the evaporative emission canister purge valve transfer pipe.

114. Attach the intake manifold rear retaining bracket.
   - Tighten to 10 Nm.

115. Attach the engine wiring harness from the intake manifold rear retaining bracket.

116. Attach the intake manifold front retaining bracket.
   - Tighten to 10 Nm.

117. Install the fuel pressure regulator bracket.
   - Tighten to 10 Nm.
118. Tighten to 7 Nm.

119. Connect the fuel pressure regulator vacuum hose.

120. Connect the electrical connectors.

121. Connect the positive crankcase ventilation (PCV) hose.

122. Connect the throttle position sensor.
123. Connect the throttle motor electrical connector.

### Installation

**All Vehicles**

1. **NOTE:** Make sure all wiring harnesses and oil pipes are suitably positioned for engine installation.

   - Install the engine assembly.
   - Make sure engine mounts are correctly located
   - Remove the floor Crane.

2. Install the special tool.

3. Raise the vehicle.

**Vehicles With Automatic Transmission**
4. Attach the automatic transmission wiring harness.

5. Attach the automatic transmission oil cooler tubes bracket.
   - Tighten to 10 Nm.

6. NOTE: Left-hand engine mount lower retaining bolt shown, right-hand similar.
   Install the engine mounts lower retaining bolts.
   - Tighten to 63 Nm.

7. Attach the power steering hose.
   - Tighten to 10 Nm.

8. NOTE: Un-cap the exposed ports.
   Install new A/C compressor O-ring seals.
   - Lubricate the new O-rings with A/C refrigerant oil.
9. Connect the A/C compressor supply and return lines.

10. Install the battery positive cable retaining nut.
    - Tighten to 12 Nm.

11. Attach the generator battery positive cable protective cover.

12. Attach the accessory drive belt.
    1. Rotate the accessory drive belt tensioner counter-clockwise.
       1. Use a 3/8 inch square drive bar to rotate the accessory drive belt tensioner.
    2. Attach the accessory drive belt.

13. Lower the vehicle.
14. Remove the special tool.
15. Remove the special tool.

16. **NOTE**: Left-hand shown, Right-hand similar.
Install the exhaust manifold retaining nut.
- Tighten to 25 Nm.

17. Install the dipstick tube retaining bolt.
- Tighten to 10 Nm.

18. Attach the left-hand valve cover wiring harness.

19. Connect the left-hand ignition coils electrical connectors.
20. Attach the right-hand valve cover wiring harness.

21. **NOTE:** Un-cap the power steering pump exposed ports.
Install new power steering pump supply line O-ring seal.

22. **CAUTION:** If power steering fluid comes into contact with the paintwork, the affected area must be immediately washed down with cold water.
Connect the power steering pump to steering gear supply line.

23. **CAUTION:** If power steering fluid comes into contact with the paintwork, the affected area must be immediately washed down with cold water.
Connect the power steering reservoir to power steering pump supply line.

24. Attach the brake booster vacuum hose from the induction manifold.
25. Attach the ground cable.

26. Install the cooling module. For additional information, refer to Section 303-03A Engine Cooling / 303-03B Supercharger Cooling / 303-03C Engine Cooling.

27. NOTE: Install new O-ring seals.

   Connect the fuel supply manifold spring lock coupling. For additional information, refer to Section 310-00 Fuel System - General Information.

28. Connect the evaporative emission canister purge valve to intake manifold hose.

29. Connect the engine wiring harness electrical connectors.

   1. Align the engine harness main electrical connector retaining bolt.
   2. Connect the engine wiring harness electrical connectors.
30. Connect the engine control module (ECM) electrical connector.
   - Tighten to 6 Nm.

31. Raise the vehicle.

32. Connect the engine harness ground strap.

33. Install the fender splash shield.

34. Install the passenger side front wheel and tire assembly.
   - Tighten to 128 Nm.

35. Lower the vehicle.
36. Install the engine compartment panel.
   - Tighten the retaining nuts to 10 Nm.

37. Install the cabin air filter housing.
   - Tighten to 10 Nm.

38. Install the cabin air filter housing retaining nut.
   - Tighten to 10 Nm.

39. Install the engine compartment support.
   - Tighten to 25 Nm.

40. Install the air cleaner assembly. For additional information, refer to Section 303-12A Intake Air Distribution and Filtering / 303-12B Intake Air Distribution and Filtering / 303-12C Intake Air Distribution and Filtering.

41. Install the cabin air filter.
   For additional information, refer to Section 412-01 Air Distribution and Filtering.

42. Carry out the air conditioning evacuation and charging procedure.
   For additional information, refer to Section 412-00 Climate Control System - General Information.

43. Raise the vehicle.

Vehicles With Manual Transmission

44. Install the manual transmission. For additional information, refer to Section 308-03A Manual Transmission/Transaxle / 308-03B Manual Transmission/Transaxle.

Vehicles with automatic transmission

45. Install the automatic transmission assembly.
   For additional information, refer to Section 307-01 Automatic Transmission/Transaxle.

A = refer to the procedure for the correct torque sequence
The 4.2L engine consists of an eight cylinder 90 degree 'Enclosed V' configuration liquid cooled aluminium cylinder block with dry cast liners.

Viewed from the driving position, the right-hand cylinder bank is designated A-bank and the left-hand cylinder bank as B-bank.

**Cylinder Block Drain Plug**

The coolant drain plug is located on the rear left side of the cylinder block.

On vehicles supplied with a cold climate package (i.e. vehicles operating in conditions regularly below -30ºC) a cylinder block heater unit is fitted instead of the drain plug.

**Knock Sensors**

Two knock sensors are fitted to the cylinder block on the inboard side of each cylinder bank. The electrical connector of each sensor is secured to the left-hand engine cover bracket.

These piezo-electric sensors provide inputs to the ECM to indicate the detection and location of detonation during combustion.

**Crankshaft**
The cast iron crankshaft has undercut and rolled fillets for improved strength and six counter-balance weights make sure low levels of vibration from the four throw, five bearing configuration.

The main bearing shells are aluminium/tin split plain type. An oil groove in the top half of each bearing transfers oil into the crankshaft oilway drillings for lubrication of the connecting rod bearings. A lead/bronze thrust washer is fitted on each side of the top half of the center main bearing.

The crankshaft rear oil seal is lipped and is a press fit in the interface of the bedplate to cylinder block.

A torsional vibration crankshaft damper pulley is bolted to the front of the crankshaft.

**Connecting Rods and Pistons**

The connecting rods are manufactured from sinter-forged steel and have fracture-split bearing caps. The opposing sides of each connecting rod being fractured at the bearing horizontal center line.

The cylinder position is etched on adjoining sides of the joint to identify matching connecting rods and bearing caps. The connecting rod bearing shells are lead/bronze, split plain bearings.

The pistons are open ended skirt design with small recesses for valve clearance and flat upper surfaces to reduce heat absorption. Three piston rings, two compression and one oil control, are fitted to each piston. Each piston is fitted on a gudgeon pin which is in a lead/bronze bush fitted in the connecting rod.

**Timing Gear**
Multi link primary and single link secondary chains drive the camshafts of each cylinder bank. The primary chains transmit the drive from sprocket on the crankshaft to a sprocket on each intake camshaft. The secondary chains transmit the drive from a second, smaller sprocket on the intake camshaft to a sprocket on the exhaust camshaft.

Each chain has a hydraulic tensioner operated by the engine lubricating system. A jet of oil from the end of each tensioner lubricates the chains. The primary chain tensioners act on pivoting flexible tensioner blades, the secondary chain tensioners act directly on the chains.

A woodruff key locates the drive sprocket on the crankshaft and these are retained in position by the crankshaft damper pulley.

The variable valve timing units and the exhaust camshaft sprockets are non-interference. They are clamped in place on the camshafts by the retaining bolt and clamping plate/washer.
The aluminium-alloy timing cover accommodates the crankshaft front oil seal. Poly-acrylic seal in-groove gaskets seal the joint between the timing cover and the front face of the engine.

**Cylinder Heads and Valve Gear**

Cylinder heads are unique to each cylinder bank and are secured, using deep seated bolts, to the cylinder block. Two hollow dowels align each cylinder head with the cylinder block.

Each cylinder head gasket consists of a silicon beaded composite gasket with metal eyelets for the cylinder bores.

Each cylinder head incorporates dual overhead camshafts operating four valves per cylinder via solid aluminium-alloy valve lifters. A steel
shim in the top of each lifter allows adjustment of valve clearances.

Collets, valve collars and spring seats locate the valve springs on the intake and exhaust valves. Valve stem seals are integrated into the spring seats.

Four 14mm spark plugs are located in a recess on the center-line of each cylinder head. For additional information, refer to Section 303-07A Engine Ignition / 303-07B Engine Ignition / 303-07C Glow Plug System.

**Camshafts**

The chilled cast iron camshafts are each retained by five aluminium alloy caps - location numbers 0 to 4 for the intake camshaft and 5 to 9 for the exhaust camshaft from the front.

A machined flat near the front of each camshaft enables the camshafts to be locked during the valve timing procedure.

**Camshaft Sensor**

The camshaft sensors are fitted to the rear of each cylinder head and are triggered by four toothed sensing rings fitted to the rear of the intake camshaft. The camshaft sensors are variable reluctance sensors that provides an input to the ECM of intake camshaft position.

**Camshaft Covers**

The valve covers are made from thermoplastic plastic; the right-hand bank cover incorporates an outlet for the part load engine breather.

The left-hand bank cover incorporates the engine oil filler cap and an outlet for the full load engine breather. Identical oil separators are incorporated inside the top of each cover. Each oil separator comprises a wire gauze packing in an open ended enclosure below the breather outlet.

**Bedplate**

VUJ0001974
This is a structural casting bolted to the bottom of the cylinder block to retain the crankshaft and to further improve overall rigidity.

Main bearing clearance changes due to expansion are minimized by means of iron inserts cast into the bedplate main bearing supports.

Two hollow dowels align the bedplate with the cylinder block and the joint is sealed by a continuous bead of sealant.

**Engine Mountings**

The engine is mounted at two points. At the front, on each side of the engine, there is a mounting bracket with a Hydramount mounted to the subframe.

**Engine Lubrication**

Oil is drawn from the reservoir in the oil pan and pressurized by the oil pump. The output from the oil pump is then filtered and distributed through the internal oil passages.

Where an oil cooler is fitted, the oil is cooled before entering the filter.

All moving parts are lubricated either by pressure or splash oil. Pressurized oil is also provided for operation of the variable valve timing units and the timing gear chain tensioners.

All of the oil system components are installed on the structural sump.

Oil is returned to the oil pan under gravity through large drain holes in the cylinder heads and the engine block to make sure quick return of the oil.

**Oil Pick-Up**

The plastic moulded oil pick-up is attached to the underside of the structural sump. It is immersed in the oil reservoir to provide a supply to the oil pump during all normal vehicle attitudes. A castellated inlet allows the supply to be maintained after any deformation of the sump pan (e.g. after grounding). A mesh screen in the inlet prevents debris from entering the oil system.

**Oil Pressure Switch**

Installed at the right front of the structural sump, the oil pressure switch connects a ground input to the instrument cluster when oil pressure is present. This switch operates at a pressure of 0,15 to 0,41 bar (2.2 to 5.9 lbf/in²).

**Oil Pump**

The oil pump is fitted at the front of the engine and is driven directly by the crankshaft. The inlet and outlet ports align with oil passages in the bedplate, with a rubber coated metal gasket to seal the pump to bedplate interface.

An integral pressure relief valve regulates pump outlet pressure at 4,5 bar (65.25 lbf/in²).

**Oil Pan**

The oil pan/sump comprises an aluminium-alloy structural sump bolted to the bedplate and a pressed steel pan with integral sump plug, bolted to the structural sump.

**Oil Filler Cap**

The oil filler cap is located on the top of the left-hand bank valve cover.

**Windage Tray**
A windage tray attached to the top of the structural sump isolates the oil pan from the disturbed air flow, caused by the rotation of the crankshaft; preventing oil aeration and improving oil drainage.

**Crankcase Ventilation**

The engine is ventilated through a part-load and a full-load breather; one on each valve cover. These flexible plastic hoses incorporate O-ring seals and quick release connectors.

The part-load breather ventilates the left-hand valve cover (left-hand bank) and feeds onto the throttle body adaptor and the purge valve. This breather is connected between the oil separator in the cover and the induction elbow.

The full-load breather ventilates the right-hand cover (right-hand bank) and is connected between the oil separator in the cover and the air intake duct between the mass air flow (MAF) sensor and the throttle body.

The MAF sensor unit combines the two sensors: one for air flow and one for air inlet temperature. It is a hot wire sensor that provides an input which is (approximately) proportional to the mass air flow into the engine.

Each valve cover oil separator consists of wire gauze packed into an open ended enclosure in the top of the cover, below the breather outlet.

**Ignition System**

The 14mm spark plugs, one per cylinder, locate in recesses along the center-line of each cylinder head. The on-plug ignition coils are secured to the valve covers.

**Variable Valve Timing (VVT)**

![Variable Valve Timing System Diagram]

</tr>
</tbody>
</table>

The variable valve timing system improves both low speed and high speed engine performance, engine idle quality and exhaust emissions. It is an infinitely variable system operating on the intake camshafts only. There is the equivalent of 48º of crankshaft movement between the retarded and advanced positions. Engine oil pressure operates the system under the control of the ECM.
Engine - V8 4.2L Petrol/V8 S/C 4.2L Petrol - Engine

Diagnosis and Testing

For additional information, refer to Section 303-00 Engine System - General Information
Engine - V8 4.2L Petrol/V8 S/C 4.2L Petrol - Valve Clearance Adjustment

General Procedures

1. Remove the left-hand valve cover. For additional information, refer to: (303-01B)
   - Valve Cover LH - VIN Range: G00442->G45170 (In-vehicle Repair),
   - Valve Cover LH - VIN Range: G45171->G99999 (In-vehicle Repair).
2. Remove the right-hand valve cover. For additional information, refer to: (303-01B)
   - Valve Cover RH - VIN Range: G00442->G45170 (In-vehicle Repair),
   - Valve Cover RH - VIN Range: G45171->G99999 (In-vehicle Repair).
3. Use a cloth to wipe away as much oil as possible from the tappet and shim.
4. CAUTIONS:
   - Rotating the crankshaft in a counterclockwise direction may cause engine damage. Crankshaft journals are directionally machined. Rotating the crankshaft counterclockwise can raise burrs on bearing surfaces, reducing engine life.
   - Camshaft lobes must be 180 degrees away from each valve tappet or the valve clearance will be incorrect.
   Rotate the engine clockwise to position the camshaft lobe away from the shim surface.
5. Install the base plate of the valve clearance adjusting tool to the relevant cylinder head using the bolts supplied.
   - Secure the tool to the valve cover retaining holes.
6. CAUTION: Do not rotate the crankshaft while the attachment is installed to the base plate.
   Install the attachment of the tool to the base plate to remove the relevant shims.
   1. Adjust the fingers of the attachment to the highest position.
   2. Install the attachment to the base plate.
   3. Tighten the retaining screws to secure the attachment to the base plate.
7. **NOTE:** Use a mirror to help locating the fingers of the special tool as access is restricted. Position the fingers on the outer edges of the tappet. Make sure the recessed step on each finger locates on the edge of the tappet.

8. Tighten the special tool to compress the valve springs.

9. **WARNING:** The following operations require the use of compressed air. Always wear suitable eye protection.

10. **CAUTION:** Do not use a magnet to remove shims. Failure to follow these instructions may result in damage to the vehicle.

11. **NOTE:** Two shims within each procedure are possible to be replaced using the special tool.

    Use the following formula to calculate the required shim thickness.
    - Original shim thickness + measured shim clearance - desired clearance = required shim thickness.

12. **CAUTION:** Do not use a magnet to install shims. Failure to follow these instructions may result in damage to the vehicle.

    • **NOTE:** Shims must be fitted with the size markings facing the tappet, not the camshaft.

    Apply a light coat of engine oil to the replacement shim(s) and install.

13. Loosen the special tool to allow the valve springs to return to their normal position.

14. Using the feeler gauge set, measure the clearance between the camshaft and the shim surface. Record and check the readings. For additional information, refer to: [Valve Clearance Check](303-01B)
14. When the valve clearance is correct, remove the attachment from the base plate and repeat the procedure for the following two valves to be adjusted.

15. Install the right-hand valve cover. For additional information, refer to:

(303-01B)

Valve Cover RH - VIN Range: G00442->G45170 (In-vehicle Repair),
Valve Cover RH - VIN Range: G45171->G99999 (In-vehicle Repair).

16. Install the left-hand valve cover. For additional information, refer to:

(303-01B)

Valve Cover LH - VIN Range: G00442->G45170 (In-vehicle Repair),
Valve Cover LH - VIN Range: G45171->G99999 (In-vehicle Repair).
1. Remove the left-hand valve cover. For additional information, refer to: (303-01B)
   Valve Cover LH - VIN Range: G00442->G45170 (In-vehicle Repair),
   Valve Cover LH - VIN Range: G45171->G99999 (In-vehicle Repair).

2. Remove the right-hand valve cover. For additional information, refer to: (303-01B)
   Valve Cover RH - VIN Range: G00442->G45170 (In-vehicle Repair),
   Valve Cover RH - VIN Range: G45171->G99999 (In-vehicle Repair).

3. CAUTIONS:
   - Rotating the crankshaft in a counterclockwise direction may cause engine damage. Crankshaft journals are directionally machined. Rotating the crankshaft counterclockwise can raise burrs on bearing surfaces, reducing engine life.
   - Camshaft lobes must be 180 degrees away from each valve tappet or the valve clearance will be incorrect.
     Rotate the engine clockwise to position the camshaft lobe away from the shim surface.

4. Using the feeler gauge set, measure the clearance between the camshaft and the shim surface. Record and check the readings. For additional information, refer to: Valve Clearance Check (303-01B Engine - V8 4.2L Petrol/V8 S/C 4.2L Petrol, General Procedures). Adjust the clearances as necessary.

5. Install the right-hand valve cover. For additional information, refer to: (303-01B)
   Valve Cover RH - VIN Range: G00442->G45170 (In-vehicle Repair),
   Valve Cover RH - VIN Range: G45171->G99999 (In-vehicle Repair).

6. Install the left-hand valve cover. For additional information, refer to: (303-01B)
   Valve Cover LH - VIN Range: G00442->G45170 (In-vehicle Repair),
   Valve Cover LH - VIN Range: G45171->G99999 (In-vehicle Repair).

### Removal

**All vehicles**

1. Remove the air deflector.
   
   For additional information, refer to: [Air Deflector](501-02 Front End Body Panels, Removal and Installation).

2. Disconnect the crankshaft position (CKP) sensor electrical connector.

3. Remove the CKP sensor.
4. Install the special tool.

5. Remove the engine front cover. For additional information, refer to: Engine Front Cover - VIN Range: M45255->N52047 (303-01B Engine - V8 4.2L Petrol/V8 S/C 4.2L Petrol, In-vehicle Repair).

Vehicles without supercharger

6. Remove the right-hand variable camshaft timing oil control unit housing.
   - Remove and discard the O-ring seals.

All vehicles

7. Install the special tool to the left-hand cylinder head.

8. Install the special tool to the right-hand cylinder head.
9. Install the special tool to the left-hand cylinder head.

10. Remove the primary timing chain tensioner assembly.

11. Remove the primary timing chain tensioner guide.

12. Remove the primary timing chain.

13. Remove the secondary timing chain tensioner retaining bolts.
14. Remove the camshaft sprockets.
   - Remove the secondary timing chain tensioner and secondary timing chain from the camshaft sprockets.

15. Remove the camshaft setting tool.

16. Remove the camshaft bearing caps.
   - Remove the camshaft bearing cap retaining bolts evenly and in stages.
   - Remove the camshaft bearing caps. Note their orientation and markings, each is marked with its position (a number) and orientation (an arrow).

17. Remove the right-hand exhaust camshaft.

18. Remove the camshaft bearing caps.
   - Remove the camshaft bearing cap retaining bolts evenly and in stages.
   - Remove the camshaft bearing caps. Note their orientation and markings, each is marked with its position (a number) and orientation (an arrow).
19. Remove the right-hand intake camshaft.

**Installation**

All vehicles

1. **NOTE:** Make sure all components are clean.

   Apply oil (EP-90) to the camshaft and bearing surfaces, as follows:
   - To the upper face of each bearing surface in the cylinder head.
   - To the upper face of each bearing surface in each bearing cap.
   - On the cam lobes ONLY, not on the base circle area.

2. Install the right-hand inlet camshaft.

3. **CAUTION:** Alternate bolt tightening to correctly seat the camshaft bearing caps.

   Install the camshaft bearing cap bolts evenly.
   - Tighten to 10 Nm.
4. NOTE: Make sure all components are clean.
   Apply oil (EP-90) to the camshaft and bearing surfaces, as follows:
   - To the upper face of each bearing surface in the cylinder head.
   - To the upper face of each bearing surface in each bearing cap.
   - On the cam lobes ONLY, not on the base circle area.

5. Install the right-hand exhaust camshaft.

6. **CAUTION:** Alternate bolt tightening to correctly seat the camshaft bearing caps.
   Install the camshaft bearing cap bolts evenly.
   - Tighten to 10 Nm.

7. Install the camshaft setting tool.

8. **CAUTIONS:**
   - Do not tighten the camshaft sprocket retaining bolts.
   - Make sure the secondary timing chain and camshaft sprockets are free to rotate.
   Install the camshaft sprockets.
   - Install the secondary timing chain tensioner and secondary timing chain to the camshaft sprockets.
9. Install the secondary timing chain tensioner retaining bolts.
   - Tighten to 12 Nm.

10. Install the special tool to the exhaust camshaft sprocket.
    - Reposition the camshaft sprockets for the most advantageous position for use of the tool.

11. **CAUTION:** Make sure the timing chain slack is on the tensioned side of the timing chain.
    - Install the primary timing chain.
      - Install the primary chain over the crankshaft sprocket and the intake sprocket.

12. Install the primary timing chain tensioner guide.
    - Tighten to 12 Nm.

13. **CAUTION:** Use suitable protective covers on the vice jaws to protect the timing chain tensioner.
    - Secure the right-hand timing chain tensioner in the vice jaws.
14. **CAUTION:** During timing chain tensioner compression, do not release the ratchet stem until the timing chain tensioner piston is fully bottomed in its bore or damage to the ratchet stem will result.

Using a suitable tool, hold the right-hand timing chain tensioner ratchet lock mechanism away from the ratchet stem.

15. **NOTE:** The timing chain tensioner piston should retract with minimal force. If binding occurs, reposition the timing chain tensioner to eliminate side loading.

Slowly compress the right-hand timing chain tensioner.

16. **NOTE:** The retaining tool must remain in the timing chain tensioner until the timing chain tensioner is installed to the engine with the piston bottomed in the bore.

Using a suitable tool, retain the right-hand timing chain tensioner piston.

17. Install the primary timing chain tensioner assembly.

- Tighten to 12 Nm.

18. Release the tension in the right-hand timing chain tensioner.

- Remove the retaining tool.

19. **CAUTIONS:**

- **WARNING:** While applying the opposing force to sprocket and chain, tighten the sprocket bolt.

- **Make sure that a new bolt is installed.**

Using the special tool, apply force to the tool in an anti-clockwise direction to tension the primary timing chain on its drive side.

- Tighten to 20 Nm + 90 deg.
20. **CAUTIONS:**

- While applying the opposing force to sprocket and chain, tighten the sprocket bolt.
- Make sure that a new bolt is installed.

Using the special tool apply force to the tool in an anti-clockwise direction.
- Tighten to 20 Nm + 90 deg.

21. Remove the special tool from the right-hand cylinder head.

22. Remove the special tool from the left-hand cylinder head.

23. Install the right-hand variable camshaft timing oil control unit housing.

- Install new O-ring seals.
- Tighten to 22 Nm.

**Vehicles without supercharger**

24. Carry out the valve clearance check.
   For additional information, refer to: Valve Clearance Check (303-01B Engine - V8 4.2L Petrol/V8 S/C 4.2L Petrol, General Procedures).

25. Install the engine front cover.
   For additional information, refer to: Engine Front Cover - VIN Range: M45255->N52047 (303-01B Engine - V8 4.2L Petrol/V8 S/C 4.2L Petrol, In-vehicle Repair).
26. Remove the special tool.

27. Install the CKP sensor.

28. Connect the CKP sensor electrical connector.

29. Install the air deflector.
   For additional information, refer to: Air Deflector (501-02 Front End Body Panels, Removal and Installation).
**Engine - V8 4.2L Petrol/V8 S/C 4.2L Petrol - Camshafts RHVIN Range: N52048->N99999**

In-vehicle Repair

**Removal**

1. Remove the engine front cover. For additional information, refer to: Engine Front Cover - VIN Range: N52048->N99999 (303-01B Engine - V8 4.2L Petrol/V8 S/C 4.2L Petrol, In-vehicle Repair).
2. Raise the vehicle.
3. Disconnect the crankshaft position (CKP) sensor electrical connector.
4. Remove the CKP sensor.
5. Install the special tool.

6. Lower the vehicle.

7. Remove the right-hand variable camshaft timing oil control unit housing.
   - Remove and discard the O-ring seals.

8. Install the special tool to the left-hand cylinder head.

9. Install the special tool to the right-hand cylinder head.
10. Remove the primary timing chain tensioner assembly.

11. Remove the primary timing chain tensioner guide.

12. Remove the primary timing chain.

13. Remove the secondary timing chain tensioner retaining bolts.

14. Remove the camshaft sprockets.
   - Remove the secondary timing chain tensioner and secondary timing chain from the camshaft sprockets.
15. Remove the camshaft setting tool.

16. Remove the camshaft bearing caps.
   - Remove the camshaft bearing cap retaining bolts evenly and in stages.
   - Remove the camshaft bearing caps. Note their orientation and markings, each is marked with its position (a number) and orientation (an arrow).

17. Remove the right-hand exhaust camshaft.

18. Remove the camshaft bearing caps.
   - Remove the camshaft bearing cap retaining bolts evenly and in stages.
   - Remove the camshaft bearing caps. Note their orientation and markings, each is marked with its position (a number) and orientation (an arrow).

19. Remove the right-hand intake camshaft.
Installation

1. NOTE: Make sure all components are clean.
Apply oil (EP-90) to the camshaft and bearing surfaces, as follows:
- To the upper face of each bearing surface in the cylinder head.
- To the upper face of each bearing surface in each bearing cap.
- On the cam lobes ONLY, not on the base circle area.

2. Install the right-hand inlet camshaft.

3. CAUTION: Alternate bolt tightening to correctly seat the camshaft bearing caps.
Install the camshaft bearing cap bolts evenly.
- Tighten to 10 Nm.

4. NOTE: Make sure all components are clean.
Apply oil (EP-90) to the camshaft and bearing surfaces, as follows:
- To the upper face of each bearing surface in the cylinder head.
- To the upper face of each bearing surface in each bearing cap.
- On the cam lobes ONLY, not on the base circle area.

5. Install the right-hand exhaust camshaft.
6. **CAUTION:** Alternate bolt tightening to correctly seat the camshaft bearing caps.
   
   Install the camshaft bearing cap bolts evenly.
   - Tighten to 10 Nm.

7. Install the camshaft setting tool.

8. Using a suitable tool, retain the right-hand timing chain tensioner piston.

9. **CAUTIONS:**
   - **Do not tighten the camshaft sprocket retaining bolts.**
   - **Make sure the secondary timing chain and camshaft sprockets are free to rotate.**

   Install the camshaft sprockets.
   - Install the secondary timing chain tensioner and secondary timing chain to the camshaft sprockets.

10. Install the secondary timing chain tensioner retaining bolts.
    - Tighten to 12 Nm.
11. Release the tension in the right-hand timing chain tensioner.
   - Remove the retaining tool.

12. Install the timing chain tensioning tool 303-532 to the exhaust camshaft sprocket.
   - Reposition the camshaft sprockets for the most advantageous position for use of the tool.

13. **CAUTION:** Make sure the timing chain slack is on the tensioned side of the timing chain.
    Install the primary timing chain.
    - Install the primary chain over the crankshaft sprocket and the intake sprocket.

    - Tighten to 12 Nm.

15. **CAUTION:** During timing chain tensioner compression, do not release the ratchet stem until the timing chain tensioner piston is fully bottomed in its bore or damage to the ratchet stem will result.
    Using a suitable tool, hold the right-hand timing chain tensioner ratchet lock mechanism away from the ratchet stem.

16. **NOTE:** The timing chain tensioner piston should retract with minimal force. If binding occurs, reposition the timing chain tensioner to eliminate side loading.
    Slowly compress the right-hand timing chain tensioner.
17. NOTE: The retaining tool must remain in the timing chain tensioner until the timing chain tensioner is installed to the engine with the piston bottomed in the bore.

Using a suitable tool, retain the right-hand timing chain tensioner piston.

18. Install the primary timing chain tensioner assembly.
   - Tighten to 12 Nm.

19. Release the tension in the right-hand timing chain tensioner.
   - Remove the retaining tool.

20. CAUTIONS:

   - While applying the opposing force to sprocket and chain, tighten the sprocket bolt.
   - Make sure that a new bolt is installed.

   Using the special tool, apply force to the tool in an anti-clockwise direction to tension the primary timing chain on its drive side.
   - Tighten to 20 Nm + 90 deg.

21. CAUTIONS:

   - While applying the opposing force to sprocket and chain, tighten the sprocket bolt.
   - Make sure that a new bolt is installed.

   Using the special tool, apply force to the tool in an anti-clockwise direction.
   - Tighten to 20 Nm + 90 deg.
22. Remove the special tool from the right-hand cylinder head.

23. Remove the special tool from the left-hand cylinder head.

24. Install the right-hand variable camshaft timing oil control unit housing.
   - Install new O-ring seals.
   - Tighten to 22 Nm.

25. Raise the vehicle.

26. Remove the special tool.

27. Install the CKP sensor.
   - Tighten to 10 Nm.
28. Connect the CKP sensor electrical connector.

29. Lower the vehicle.

30. Carry out the valve clearance check.
    For additional information, refer to: Valve Clearance Check (303-01B
    Engine - V8 4.2L Petrol/V8 S/C 4.2L Petrol, General Procedures).

31. Install the engine front cover.
    For additional information, refer to: Engine Front Cover - VIN Range:
    N52048->N99999 (303-01B Engine - V8 4.2L Petrol/V8 S/C 4.2L Petrol,
    In-vehicle Repair).

Removal

All vehicles

1. Remove the cooling fan motor and shroud.
   For additional information, refer to: Cooling Fan Motor and Shroud (303-03A Engine Cooling - V8 4.2L Petrol/V8 S/C 4.2L Petrol/2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation).

2. Remove the accessory drive belt.
   For additional information, refer to: Accessory Drive Belt - 4.2L (303-05, Removal and Installation).

Vehicles without supercharger

3. NOTE: Place a suitable container underneath the filter to prevent oil spillage.
   Using the special tool, remove and discard the oil filter element.
4. Detach the oil cooler.
   • Remove and discard the O-ring seal.

5. Lower the vehicle

6. **CAUTION:** Under no circumstances should special tool 303-645 be used in the following operations to lock the crankshaft. Failure to follow this instruction may result in damage to the vehicle.
   • **NOTE:** The crankshaft pulley retaining bolt will be very tight.
     Using special tools, retain the crankshaft pulley.
     • Remove and discard the crankshaft pulley retaining bolt.

7. Remove the special tools.

8. **NOTE:** The crankshaft pulley will be very tight.
   Using special tools, remove the crankshaft pulley.
   • Collect the locking ring.
   • Remove and discard the O-ring seal.

9. Remove the special tools.

10. Remove the crankshaft front seal.
    For additional information, refer to: [Crankshaft Front Seal](#) (303-01B Engine - V8 4.2L Petrol/V8 S/C 4.2L Petrol, In-vehicle Repair).

11. **NOTE:** Check crankshaft pulley and locking ring for damage.
    Clean all crankshaft pulley mating faces.

---

**Installation**

All vehicles

1. Install a new crankshaft front seal.
   For additional information, refer to: [Crankshaft Front Seal](#) (303-01B Engine - V8 4.2L Petrol/V8 S/C 4.2L Petrol, In-vehicle Repair).
2. Install a new O-ring seal to the crankshaft pulley.
   - Lubricate the new O-ring seal.

3. **CAUTIONS:**

   - The screw thread in the crankshaft must be cleaned out before a new crankshaft pulley retaining bolt is installed. Failure to follow this instruction may result in damage to the vehicle.

   - A new crankshaft pulley retaining bolt must be used. Failure to follow this instruction may result in damage to the vehicle.
     - Loosely install a new crankshaft pulley retaining bolt.
     - Install the crankshaft pulley and locking ring to the crankshaft.

4. **CAUTION:** Under no circumstances should the special tool 303-645 be used in the following operations to lock the crankshaft. Failure to follow this instruction may result in damage to the vehicle.

   - Using special tools, retain the crankshaft pulley.
   - Tighten the crankshaft pulley retaining bolt to 320 Nm.

5. Remove the special tools.

6. Raise the vehicle.

7. Attach the oil cooler.
   - Install a new O-ring seal.
   - Tighten to 55 Nm.

8. **NOTE:** Apply a suitable amount of clean engine oil to lubricate the oil filter O-ring seal.

   - Using special tool, install a new oil filter.
   - Tighten to 18 Nm.

9. Install the accessory drive belt.
    For additional information, refer to: Accessory Drive Belt - 4.2L (303-05, Removal and Installation).

10. Install the cooling fan motor and shroud.
    For additional information, refer to: Cooling Fan Motor and Shroud (303-03A Engine Cooling - V8 4.2L Petrol/V8 S/C 4.2L Petrol/2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation).

11. Check and top up the engine oil to the correct level on the oil level indicator.
Removal

1. Remove the flexplate. For additional information, refer to Flexplate in this section.

2. Install the special tool.

3. Reposition the special tool retaining nuts.

4. Using the special tool pierce the seal face and provide a pilot hole for the self-tapping screws.
5. Loosen the special tool retaining nuts.

6. CAUTION: To prevent damage to special tool do not tighten screws more than one and a half turns.
   Install the special tool self-tapping screws.

7. Using the special tool remove and discard the crankshaft rear seal.

Installation

1. NOTE: Make sure all components are clean and dry.
   Make sure the transit sleeve is correctly in place and install the new seal over the crankshaft. Do not use any lubricant on the seal, the transit sleeve or the crankshaft.

2. Carefully remove the transit sleeve, leaving the seal in place.

3. Install the special tool to the crankshaft.
4. Reposition the nuts to hold the special tool against the crankshaft rear seal. Check that the crankshaft rear seal and the special tool are parallel to the rear of the engine.

5. **CAUTION:** Alternate nut tightening to correctly seat the crankshaft rear seal.

   Using the special tool, install the crankshaft rear seal.

6. Remove the special tool from the crankshaft.
   - Check that the seal is located correctly.

7. Install the flexplate.
   For additional information, refer to Flexplate in this section.
Engine - V8 4.2L Petrol/V8 S/C 4.2L Petrol - Cylinder Head LHVIN Range: M45255->N52047

Removal

All vehicles

⚠️ CAUTION: If a replacement cylinder head is to be installed to a vehicle with variable camshaft timing (VCT) the cylinder head must have the oil gallery blind rivet removed before installation.

1. Remove the air deflector.
   For additional information, refer to: Air Deflector (501-02 Front End Body Panels, Removal and Installation).
2. Disconnect the crankshaft position sensor electrical connector.
3. Remove the crankshaft position sensor.
4. Remove the special tool.

5. Remove the engine front cover.
   For additional information, refer to: Engine Front Cover - VIN Range: N52048->N99999 (303-01B Engine - V8 4.2L Petrol/V8 S/C 4.2L Petrol, In-vehicle Repair).

Vehicles without supercharger

6. Remove the right-hand variable camshaft timing oil control unit housing.
   - Remove and discard the O-ring seals.

7. Remove the left-hand variable camshaft timing oil control unit housing.
   - Remove and discard the O-ring seals.

8. Install the special tool to the left-hand cylinder head.
9. Install the special tool to the Right-hand cylinder head.

10. **CAUTION:** Make sure the secondary timing chain and camshaft sprockets are free to rotate.
    
    Loosen the camshaft sprockets.

11. Remove the primary timing chain tensioner assembly.

12. Remove the primary timing chain tensioner guide.

13. Remove the primary timing chain.
14. Remove the primary timing chain guide.

15. Remove the primary timing chain tensioner assembly.

16. Remove the primary timing chain tensioner guide.

17. Remove the primary timing chain.

18. Remove the primary timing chain tensioner guide.
19. Remove the secondary timing chain tensioner retaining bolts.

20. Remove the camshaft sprockets.
   - Remove the secondary timing chain tensioner and secondary timing chain from the camshaft sprockets.

21. Remove the camshaft setting tool.

22. Remove the camshaft bearing caps.
    - Remove the camshaft bearing cap retaining bolts evenly and in stages.
    - Remove the camshaft bearing caps. Note their orientation and markings, each is marked with its position (a number) and orientation (an arrow).

23. Remove the left-hand exhaust camshaft.
24. Remove the camshaft bearing caps.
   - Remove the camshaft bearing cap retaining bolts evenly and in
     stages.
   - Remove the camshaft bearing caps. Note their orientation and
     markings, each is marked with its position (a number) and
     orientation (an arrow).

25. Remove the left-hand inlet camshaft.

26. CAUTIONS:

   The bolts can only be used twice, mark the bolts with a center punch.
   If two punch marks are visible, discard the bolts.

   Vehicles fitted with Polydrive cylinder head bolts, the cylinder head
   bolts must be removed using a 10 mm Polydrive socket or a 10 mm Allen
   key. Failure to follow this instruction may result in damage to the
   component.

   Remove the left-hand cylinder head.
   - Remove the bolts in the indicated sequence.
   - Remove and discard the gasket.

27. CAUTION: Only use a plastic scrapper to clean off old gasket.

   Remove the cylinder head gasket.
   - Clean the gasket mating faces.
   - Clean the cylinder head locating dowels.

Installation

All vehicles
1. **CAUTIONS:**

⚠️ If a replacement cylinder head is to be installed to a vehicle with VCT the cylinder head must have the oil gallery blind rivet removed before installation.

⚠️ Make sure that all debris is removed from the cylinder head and cylinder head oil gallery.

Vehicles fitted with VCT: Remove the blind rivet from the VCT oil gallery.

- **NOTE:** The centre bore of the blind rivet is 6 mm (0.24 inch) diameter.
- Identify the VCT oil supply gallery and the 8 mm (0.31 inch) blind rivet.
- Using a suitable 3 mm (0.12 inch) punch release the centre of the blind rivet until it is released from the outer part of the blind rivet.
- Using a suitable extraction tool, remove the remaining part of the blind rivet.

2. Clean the component mating faces.

3. Check cylinder head face for distortion, across the center and from corner to corner.

4. For cylinder head face distortion data, refer to specifications. For additional information, refer to: Specifications (303-01B Engine - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Specifications).

5. **NOTE:** For cylinder head with distortion above the maximum allowance, the cylinder head material must be measured.

Measure the cylinder head material.

- Check measurement from the centre of the exhaust dowel to the cylinder head face as shown.
- If the measurement is less than 51.88 mm the cylinder head requires replacement.
6. **CAUTION:** Vehicles fitted with Polydrive cylinder head bolts, the cylinder head bolts must be installed using a 10 mm Polydrive socket or a 10 mm Allen key. Failure to follow this instruction may result in damage to the component.

   • **NOTE:** Tighten the bolts 1 to 10 in the sequence shown.
   
   Install the left-hand cylinder head.
   
   1. Tighten bolts 1 to 10 to 20 Nm.
   2. Tighten bolts 1 to 10 to 35 Nm.
   3. Tighten bolts 1 to 10 to 90°.
   4. Tighten bolts 1 to 10 to 90°.
   5. Tighten bolts 11 to 12 to 25 Nm.

7. **NOTE:** Make sure all components are clean.

   Apply oil (EP-90) to the camshaft and bearing surfaces, as follows:
   
   • To the upper face of each bearing surface in the cylinder head.
   • To the upper face of each bearing surface in each bearing cap.
   • On the cam lobes ONLY, not on the base circle area.

8. Install the left-hand inlet camshaft.

9. **CAUTION:** Alternate bolt tightening to correctly seat the camshaft bearing caps.

   Install the camshaft bearing cap bolts evenly.
   
   • Tighten to 10 Nm.

10. Install the left-hand exhaust camshaft.
11. **CAUTION:** Alternate bolt tightening to correctly seat the camshaft bearing caps.

Install the camshaft bearing cap bolts evenly.
- Tighten to 10 Nm.

12. Install the camshaft setting tool.

13. **CAUTIONS:**

   - Do not tighten the camshaft sprocket retaining bolts.
   - Make sure the secondary timing chain and camshaft sprockets are free to rotate.

Install the camshaft sprockets.
- Install the secondary timing chain tensioner and secondary timing chain to the camshaft sprockets.

- Tighten to 12 Nm.

15. Install the timing chain tensioning tool 303-532 to the exhaust camshaft sprocket.
- Reposition the camshaft sprockets for the most advantageous position for use of the tool.
16. Install the primary timing chain tensioner guide.
   - Tighten to 12 Nm.

17. **CAUTION:** Make sure the timing chain slack is on the tensioned side of the timing chain.

   Install the primary timing chain.
   - Install the primary chain over the crankshaft sprocket and the intake sprocket.

18. Install the primary timing chain tensioner guide.
   - Tighten to 12 Nm.

19. **CAUTION:** Use suitable protective covers on the vice jaws to protect the timing chain tensioner.

   Secure the left-hand timing chain tensioner in the vice jaws.

20. **CAUTION:** During timing chain tensioner compression, do not release the ratchet stem until the timing chain tensioner piston is fully bottomed in its bore or damage to the ratchet stem will result.

   Using a suitable tool, hold the left-hand timing chain tensioner ratchet lock mechanism away from the ratchet stem.

21. **NOTE:** The timing chain tensioner piston should retract with minimal force. If binding occurs, reposition the timing chain tensioner to eliminate side loading.
Slowly compress the left-hand timing chain tensioner.

22. NOTE: The retaining tool must remain in the timing chain tensioner until the timing chain tensioner is installed to the engine with the piston bottomed in the bore.

Using a suitable tool, retain the left-hand timing chain tensioner piston.

23. Install the primary timing chain tensioner assembly.
   - Tighten to 12 Nm.

24. Release the tension in the left-hand timing chain tensioner.
   - Remove the retaining tool.

25. CAUTIONS:
   - While applying the opposing force to sprocket and chain, tighten the sprocket bolt.
   - Make sure that a new bolt is installed.

Using the special tool apply force to the tool in an anti-clockwise direction to tension the primary timing chain on its drive side.
   - Tighten to 20 Nm + 90 deg.

26. CAUTIONS:
   - While applying the opposing force to sprocket and chain, tighten the sprocket bolt.
   - Make sure that a new bolt is installed.

Using the special tool apply force to the tool in an anti-clockwise direction.
   - Tighten to 20 Nm + 90 deg.
27. Install the primary timing chain guide.
   - Tighten to 12 Nm.

28. **CAUTION:** Make sure the timing chain slack is on the tensioned side of the timing chain.
    
    Install the primary timing chain.
    
    - Install the primary chain over the crankshaft sprocket and the intake sprocket.

29. Install the primary timing chain tensioner guide.
    
    - Tighten to 12 Nm.

30. **CAUTION:** Use suitable protective covers on the vice jaws to protect the timing chain tensioner.
    
    Secure the right-hand timing chain tensioner in the vice jaws.

31. **CAUTION:** During timing chain tensioner compression, do not release the ratchet stem until the timing chain tensioner piston is fully bottomed in its bore or damage to the ratchet stem will result.
    
    Using a suitable tool, hold the right-hand timing chain tensioner ratchet lock mechanism away from the ratchet stem.

32. **NOTE:** The timing chain tensioner piston should retract with minimal force. If binding occurs, reposition the timing chain tensioner to eliminate side loading.
33. NOTE: The retaining tool must remain in the timing chain tensioner until the timing chain tensioner is installed to the engine with the piston bottomed in the bore.

Using a suitable tool, retain the right-hand timing chain tensioner piston.

34. Install the primary timing chain tensioner assembly.
   - Tighten to 12 Nm.

35. Release the tension in the right-hand timing chain tensioner.
   - Remove the retaining tool.

36. CAUTIONS:
   - While applying the opposing force to sprocket and chain, tighten the sprocket bolt.
   - Make sure that a new bolt is installed.

Using the special tool apply force to the tool in an anti-clockwise direction to tension the primary timing chain on its drive side.
   - Tighten to 20 Nm + 90 deg.

37. CAUTIONS:
   - While applying the opposing force to sprocket and chain, tighten the sprocket bolt.
   - Make sure that a new bolt is installed.

Using the special tool apply force to the tool in an anti-clockwise direction.
   - Tighten to 20 Nm + 90 deg.
38. Remove the special tool to the Right-hand cylinder head.

39. Remove the special tool to the left-hand cylinder head.

### Vehicles without supercharger

40. Install the left-hand variable camshaft timing oil control unit housing.
   - Install new O-ring seals.
   - Tighten to 22 Nm.

41. Install the right-hand variable camshaft timing oil control unit housing.
   - Install new O-ring seals.
   - Tighten to 22 Nm.

### All vehicles
42. Remove the special tool.

43. Install the crankshaft position sensor.

44. Connect the crankshaft position sensor electrical connector.

45. Install the air deflector.
   For additional information, refer to: Air Deflector (501-02 Front End Body Panels, Removal and Installation).

46. Install the engine front cover.
   For additional information, refer to: Engine Front Cover - VIN Range: N5204B->N99999 (303-01B Engine - V8 4.2L Petrol/V8 S/C 4.2L Petrol, In-vehicle Repair).

47. Carry out the valve clearance check.
   For additional information, refer to: Valve Clearance Check (303-01B Engine - V8 4.2L Petrol/V8 S/C 4.2L Petrol, General Procedures).
Engine - V8 4.2L Petrol/V8 S/C 4.2L Petrol - Cylinder Head LHVIN Range: N52048->N99999

Removal

All vehicles

⚠️ CAUTION: If a replacement cylinder head is to be installed to a vehicle with variable camshaft timing (VCT) the cylinder head must have the oil gallery blind rivet removed before installation.

1. Remove the air deflector.
   For additional information, refer to: Air Deflector (501-02 Front End Body Panels, Removal and Installation).

2. Disconnect the crankshaft position (CKP) sensor electrical connector.

3. Remove the CKP sensor.
4. Install the special tool.

Vehicles without supercharger
5. Remove the intake manifold.
   For additional information, refer to: Intake Manifold - VIN Range: N52048->N99999 (303-01B Engine - V8 4.2L Petrol/V8 S/C 4.2L Petrol, In-vehicle Repair).

Vehicles with supercharger
6. Remove the charge air cooler.
   For additional information, refer to: Charge Air Cooler (303-12B Intake Air Distribution and Filtering - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Removal and Installation).
7. NOTE: Left-hand shown, right-hand similar.
   Remove the lower intake manifold.

All vehicles
8. Remove the engine front cover.
   For additional information, refer to: Engine Front Cover - VIN Range: N52048->N99999 (303-01B Engine - V8 4.2L Petrol/V8 S/C 4.2L Petrol, In-vehicle Repair).
9. Remove the right-hand variable camshaft timing oil control unit housing.
   - Remove and discard the O-ring seals.

10. Remove the left-hand variable camshaft timing oil control unit housing.
    - Remove and discard the O-ring seals.
11. Install the special tool to the left-hand cylinder head.

12. Install the special tool to the right-hand cylinder head.

13. Remove the primary timing chain tensioner assembly.

14. Remove the primary timing chain tensioner guide.

15. Remove the primary timing chain.
16. **CAUTION:** Make sure the secondary timing chain and camshaft sprockets are free to rotate.

Loosen the camshaft sprockets.

17. Remove the primary timing chain guide.

18. Remove the primary timing chain tensioner assembly.

19. Remove the primary timing chain tensioner guide.

20. Remove the primary timing chain.
21. Remove the primary timing chain tensioner guide.

22. Remove the secondary timing chain tensioner retaining bolts.

23. Remove the camshaft sprockets.
   - Remove the secondary timing chain tensioner and secondary timing chain from the camshaft sprockets.

24. Remove the camshaft setting tool.

25. Remove the camshaft bearing caps.
   - Remove the camshaft bearing cap retaining bolts evenly and in stages.
   - Remove the camshaft bearing caps. Note their orientation and markings, each is marked with its position (a number) and orientation (an arrow).
26. Remove the left-hand exhaust camshaft.

27. Remove the camshaft bearing caps.
   - Remove the camshaft bearing cap retaining bolts evenly and in stages.
   - Remove the camshaft bearing caps. Note their orientation and markings, each is marked with its position (a number) and orientation (an arrow).

28. Remove the left-hand inlet camshaft.

29. CAUTIONS:
   - The bolts can only be used twice, mark the bolts with a center punch. If two punch marks are visible, discard the bolts.
   - Vehicles fitted with Polydrive cylinder head bolts, the cylinder head bolts must be removed using a 10 mm Polydrive socket or a 10 mm Allen key. Failure to follow this instruction may result in damage to the component.

      Remove the left-hand cylinder head.
      - Remove the bolts in the indicated sequence.

30. CAUTION: Only use a plastic scraper to clean off old gasket.

      Remove the cylinder head gasket.
      - Clean the gasket mating faces.
31. **CAUTION:** Only use a plastic scraper to clean off old gasket.

Clean the cylinder head locating dowels.

32. Clean and inspect the cylinder head and cylinder block.

For additional information, refer to: [Cylinder Head Distortion](#) (303-00 Engine System - General Information, General Procedures).

**Installation**

All vehicles

1. **CAUTIONS:**

- If a replacement cylinder head is to be installed to a vehicle with VCT the cylinder head must have the oil gallery blind rivet removed before installation.

- Make sure that all debris is removed from the cylinder head and cylinder head oil gallery.

Vehicles fitted with VCT: Remove the blind rivet from the VCT oil gallery.

- **NOTE:** The centre bore of the blind rivet is 6 mm (0.24 inch) diameter.

- Identify the VCT oil supply gallery and the 8 mm (0.31 inch) blind rivet.

- Using a suitable 3 mm (0.12 inch) punch release the centre of the blind rivet until it is released from the outer part of the blind rivet.

- Using a suitable extraction tool, remove the remaining part of the blind rivet.

2. Clean the component mating faces.

3. Check cylinder head face for distortion, across the center and from corner to corner.

4. For cylinder head face distortion data, refer to specifications.

For additional information, refer to: [Specifications](#) (303-01B Engine - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Specifications).
5. NOTE: For cylinder head with distortion above the maximum allowance, the cylinder head material must be measured. Measure the cylinder head material.

- Check measurement from the centre of the exhaust dowel to the cylinder head face as shown.
- If the measurement is less than 51.88 mm the cylinder head requires replacement.

6. CAUTION: The head gasket must be installed over the cylinder block dowels. Install a new cylinder head gasket.

7. NOTE: Tighten the bolts 1 to 10 in the sequence shown. Install the left-hand cylinder head.

1. Tighten bolts 1 to 10 to 20 Nm.
2. Tighten bolts 1 to 10 to 35 Nm.
3. Tighten bolts 1 to 10 to 90°.
4. Tighten bolts 1 to 10 to 90°.
5. Tighten bolts 11 to 12 to 25 Nm.

8. NOTE: Make sure all components are clean. Apply oil (EP-90) to the camshaft and bearing surfaces, as follows:

- To the upper face of each bearing surface in the cylinder head.
- To the upper face of each bearing surface in each bearing cap.
- On the cam lobes ONLY, not on the base circle area.
9. Install the left-hand inlet camshaft.

10. **CAUTION:** Alternate bolt tightening to correctly seat the camshaft bearing caps.
    Install the camshaft bearing cap bolts evenly.
    - Tighten to 10 Nm.

11. Install the left-hand exhaust camshaft.

12. **CAUTION:** Alternate bolt tightening to correctly seat the camshaft bearing caps.
    Install the camshaft bearing cap bolts evenly.
    - Tighten to 10 Nm.

13. Install the camshaft setting tool.
14. CAUTIONS:

⚠️ Do not tighten the camshaft sprocket retaining bolts.

⚠️ Make sure the secondary timing chain and camshaft sprockets are free to rotate.

Install the camshaft sprockets.

- Install the secondary timing chain tensioner and secondary timing chain to the camshaft sprockets.

15. Using a suitable tool, retain the left-hand timing chain tensioner piston.

16. Install the secondary timing chain tensioner retaining bolts.

- Tighten to 12 Nm.

17. Release the tension in the left-hand timing chain tensioner.

- Remove the retaining tool.

18. Install the timing chain tensioning tool 303-532 to the exhaust camshaft sprocket.

- Reposition the camshaft sprockets for the most advantageous position for use of the tool.
19. Install the primary timing chain tensioner guide.
   - Tighten to 12 Nm.

20. **CAUTION:** Make sure the timing chain slack is on the tensioned side of the timing chain.

    Install the primary timing chain.
    - Install the primary chain over the crankshaft sprocket and the intake sprocket.

21. Install the primary timing chain tensioner guide.
    - Tighten to 12 Nm.

22. **CAUTION:** During timing chain tensioner compression, do not release the ratchet stem until the timing chain tensioner piston is fully bottomed in its bore or damage to the ratchet stem will result.

    Using a suitable tool, hold the left-hand timing chain tensioner ratchet lock mechanism away from the ratchet stem.

23. **NOTE:** The timing chain tensioner piston should retract with minimal force. If binding occurs, reposition the timing chain tensioner to eliminate side loading.

    Slowly compress the left-hand timing chain tensioner.
24. NOTE: The retaining tool must remain in the timing chain tensioner until the timing chain tensioner is installed to the engine with the piston bottomed in the bore.

   Using a suitable tool, retain the left-hand timing chain tensioner piston.

25. Install the primary timing chain tensioner assembly.
   - Tighten to 12 Nm.

26. Release the tension in the left-hand timing chain tensioner.
   - Remove the retaining tool.

27. CAUTIONS:

   ! While applying the opposing force to sprocket and chain, tighten the sprocket bolt.

   ! Make sure that a new bolt is installed.

   Using the special tool, apply force to the tool in an anti-clockwise direction to tension the primary timing chain on its drive side.
   - Tighten to 20 Nm + 90 deg.

28. CAUTIONS:

   ! While applying the opposing force to sprocket and chain, tighten the sprocket bolt.

   ! Make sure that a new bolt is installed.

   Using the special tool, apply force to the tool in an anti-clockwise direction.
   - Tighten to 20 Nm + 90 deg.
29. Install the primary timing chain guide.
   - Tighten to 12 Nm.

30. **CAUTION:** Make sure the timing chain slack is on the tensioned side of the timing chain.

   Install the primary timing chain.
   - Install the primary chain over the crankshaft sprocket and the intake sprocket.

31. Install the primary timing chain tensioner guide.
   - Tighten to 12 Nm.

32. **CAUTION:** During timing chain tensioner compression, do not release the ratchet stem until the timing chain tensioner piston is fully bottomed in its bore or damage to the ratchet stem will result.

   Using a suitable tool, hold the right-hand timing chain tensioner ratchet lock mechanism away from the ratchet stem.

33. **NOTE:** The timing chain tensioner piston should retract with minimal force. If binding occurs, reposition the timing chain tensioner to eliminate side loading.

   Slowly compress the right-hand timing chain tensioner.
34. NOTE: The retaining tool must remain in the timing chain tensioner until the timing chain tensioner is installed to the engine with the piston bottomed in the bore.

Using a suitable tool, retain the right-hand timing chain tensioner piston.

35. Install the primary timing chain tensioner assembly.
   - Tighten to 12 Nm.

36. Release the tension in the right-hand timing chain tensioner.
   - Remove the retaining tool.

37. CAUTIONS:

⚠️ While applying the opposing force to sprocket and chain, tighten the sprocket bolt.

⚠️ Make sure that a new bolt is installed.

Using the special tool apply force to the tool in an anti-clockwise direction to tension the primary timing chain on its drive side.
   - Tighten to 20 Nm + 90 deg.

38. CAUTIONS:

⚠️ While applying the opposing force to sprocket and chain, tighten the sprocket bolt.

⚠️ Make sure that a new bolt is installed.

Using the special tool, apply force to the tool in an anti-clockwise direction.
   - Tighten to 20 Nm + 90 deg.
39. Remove the special tool from the right-hand cylinder head.

40. Remove the special tool from the left-hand cylinder head.

41. Install the left-hand variable camshaft timing oil control unit housing.
   - Install new O-ring seals.
   - Tighten to 22 Nm.

42. Install the right-hand variable camshaft timing oil control unit housing.
   - Install new O-ring seals.
   - Tighten to 22 Nm.

43. Raise the vehicle.
44. Remove the special tool.
45. Install the CKP sensor.
   - Tighten to 10 Nm.

46. Connect the CKP sensor electrical connector.

Vehicles with supercharger

47. Install the lower intake manifold.
   - Tighten to 22 Nm.

48. Install the charge air cooler.
   For additional information, refer to: Charge Air Cooler (303-12B Intake Air Distribution and Filtering - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Removal and Installation).

Vehicles without supercharger

49. Install the intake manifold.
   For additional information, refer to: Intake Manifold - VIN Range: N52048->N99999 (303-01B Engine - V8 4.2L Petrol/V8 S/C 4.2L Petrol, In-vehicle Repair).

All vehicles

50. Carry out the valve clearance check.
   For additional information, refer to: Valve Clearance Check (303-01B Engine - V8 4.2L Petrol/V8 S/C 4.2L Petrol, General Procedures).

51. Install the engine front cover.
   For additional information, refer to: Engine Front Cover - VIN Range: N52048->N99999 (303-01B Engine - V8 4.2L Petrol/V8 S/C 4.2L Petrol, In-vehicle Repair).
Removal

All vehicles
1. Remove the cooling fan motor and shroud. For additional information, refer to Section 303-03A Engine Cooling / 303-03B Supercharger Cooling / 303-03C Engine Cooling.
2. Remove the left-hand valve cover. For additional information, refer to Valve Cover LH in this section.
3. Remove the right-hand valve cover. For additional information, refer to Valve Cover RH in this section.

Vehicles without supercharger
4. Remove the oil cooler. For additional information, refer to Oil Cooler in this section.

Vehicles with supercharger
5. Remove the supercharger drive belt. For additional information, refer to Section 303-05 Accessory Drive.

All vehicles
6. Remove power steering pump. For additional information, refer to Section 211-02 Power Steering.
7. Remove the air conditioning compressor. For additional information, refer to Section 412-03 Air Conditioning.
8. Remove the water pump pulley.

9. Remove the accessory drive belt idler pulley.

Vehicles with supercharger
10. Remove supercharger drive belt tensioner. For additional information, refer to Section 303-05 Accessory Drive.

All vehicles
11. Remove the power steering pump mounting bracket.

12. Detach the engine harness.

13. **CAUTION:** Under no circumstances should the crankshaft setting peg 303-645 be used in the following operations to lock the crankshaft.

   Using special tools, retain the crankshaft pulley.
   - Remove and discard the crankshaft pulley bolt.

14. Remove the special tools.

15. Using special tools, remove the crankshaft pulley.
   - Collect the locking ring.
   - Remove and discard the O-ring seal.

16. Remove the special tools.
17. Remove the engine front cover.
   - Remove and discard all the seals.

**Installation**

All vehicles

1. Install new seals to the timing cover.
   1. Install the new seal to the inner groove on the face of the timing cover.
   2. Install the new seal to the outer groove on the face of the timing cover.

2. Apply sealant to the eight joints on the engine face.
   - Sealant beads to be 3mm diameter and 12mm long. Cut the nozzle of the sealant tube to produce a 3 mm (0.12 in) bead. (Install and tighten the securing bolts within twenty minutes of sealant application).
3. Install the timing cover.
   - Tighten in the sequence shown.
   - Tighten to 13 Nm.

4. **NOTE:** Check crankshaft pulley and locking ring for damage.
   Clean all crankshaft pulley mating faces.

5. **CAUTIONS:**
   - The screw thread in the crankshaft must be cleaned out before a new crankshaft pulley bolt is installed.
   - A new crankshaft pulley bolt must be used.
   - Install, but do not tighten, a new crankshaft pulley retaining bolt.
     - Install the crankshaft pulley and locking ring to the crankshaft.

6. **CAUTION:** Under no circumstances should the crankshaft setting peg 303-645 be used in the following operations to lock the crankshaft.
   - Using special tools, retain the crankshaft pulley.
     - Tighten the crankshaft pulley retaining bolt to 375 Nm.

7. Remove the special tools.
8. Attach the engine harness.

9. Install the power steering pump mounting bracket.
   - Tighten to 25 Nm.

All vehicles

10. Install the accessory drive belt idler pulley.
    - Tighten to 25 Nm.

11. Install the water pump pulley.
    - Tighten to 10 Nm + 45°.

12. Install the air conditioning compressor.
    For additional information, refer to Section 412-03 Air Conditioning.

13. Install power steering pump.
    For additional information, refer to Section 211-02 Power Steering.

Vehicles with supercharger

14. Install the supercharger drive belt.
    For additional information, refer to Section 303-05 Accessory Drive.

Vehicles without supercharger

15. Install the oil cooler.
    For additional information, refer to Oil Cooler in this section.
16. Install the left-hand valve cover. For additional information, refer to Valve Cover LH in this section.

17. Install the right-hand valve cover. For additional information, refer to Valve Cover RH in this section.

18. Remove the cooling fan motor and shroud. For additional information, refer to Section 303-03A Engine Cooling / 303-03B Supercharger Cooling / 303-03C Engine Cooling.
Engine - V8 4.2L Petrol/V8 S/C 4.2L Petrol - Engine Front Cover
VIN Range: N52048->N99999
In-vehicle Repair

Removal

All vehicles

1. Remove the left-hand valve cover. For additional information, refer to: Valve Cover LH - VIN Range: N52048->N99999 (303-01B Engine - V8 4.2L Petrol/V8 S/C 4.2L Petrol, In-vehicle Repair).

2. Remove the right-hand valve cover. For additional information, refer to: Valve Cover RH - VIN Range: N52048->N99999 (303-01B Engine - V8 4.2L Petrol/V8 S/C 4.2L Petrol, In-vehicle Repair).

3. Remove the crankshaft pulley. For additional information, refer to: Crankshaft Pulley (303-01B Engine - V8 4.2L Petrol/V8 S/C 4.2L Petrol, In-vehicle Repair).

Vehicles without supercharger

4. Remove the oil cooler. For additional information, refer to: Oil Cooler - Vehicles Without: Supercharger (303-01B Engine - V8 4.2L Petrol/V8 S/C 4.2L Petrol, In-vehicle Repair).

Vehicles with supercharger

5. Disconnect the coolant hose.

6. Disconnect the coolant hose.
7. Disconnect the coolant hose.

8. Disconnect the engine coolant temperature (ECT) sensor electrical connector.

9. Disconnect the coolant hose.

10. Disconnect the coolant hose.
11. Detach the coolant assembly.

12. Remove the coolant assembly.
   - Disconnect the coolant hose.
   - Remove and discard the O-ring seals.

13. Remove the water pump pulley.
   - Using a suitable tool, retain the water pump pulley.

14. Remove the air conditioning (A/C) compressor. For additional information, refer to: (412-03 Air Conditioning)

   Air Conditioning (A/C) Compressor - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27 (Removal and Installation),
   Air Conditioning (A/C) Compressor - V8 4.2L Petrol/V8 S/C 4.2L Petrol (Removal and Installation).

15. CAUTIONS:

   • Cap the power steering line to prevent loss of fluid and prevent dirt ingress.

   • If power steering fluid comes into contact with the paintwork, the affected area must be immediately washed down with cold water.

   • NOTE: Drain the fluid into a suitable container.

   Disconnect the power steering reservoir to power steering pump supply line.
16. Remove the power steering pump lower retaining bolts.

17. Disconnect the secondary air injection (AIR) control valve to exhaust manifold tube.

18. Lower the vehicle.

19. **CAUTIONS:**

   - **WARNING:** Cap the power steering lines to prevent loss of fluid and prevent dirt ingress.
   - **WARNING:** If power steering fluid comes into contact with the paintwork, the affected area must be immediately washed down with cold water.
   - **NOTE:** Drain the fluid into a suitable container.
   
   Disconnect the power steering pump to steering gear high-pressure line.

20. Remove the power steering pump.

21. Remove the accessory drive belt idler pulley.
Vehicles with supercharger

22. Remove the supercharger belt idler pulley and bracket assembly.

23. Remove the supercharger belt tensioner.

All vehicles

24. NOTE: Vehicles with supercharger shown, vehicles without supercharger similar.
   Disconnect the AIR control valve to exhaust manifold tube.

25. NOTE: Vehicles with supercharger shown, vehicles without supercharger similar.
   Reposition the AIR control valve and bracket assembly.
   - Remove the retaining bolts.

Vehicles with supercharger
26. Disconnect the AIR control valve to exhaust manifold tube.

27. Remove the AIR control valve to exhaust manifold tube.

All vehicles

28. Remove the power steering pump mounting bracket.

29. Detach the engine harness.
30. Remove the engine front cover.
  - Remove and discard all the seals.

Installation

All vehicles

1. Install new seals to the timing cover.
   1. Install the new seal to the inner groove on the face of the timing cover.
   2. Install the new seal to the outer groove on the face of the timing cover.

2. Apply sealant to the eight joints on the engine face.
   - Sealant beads to be 3mm diameter and 12mm long. Cut the nozzle of the sealant tube to produce a 3 mm (0.12 in) bead. (Install and tighten the securing bolts within twenty minutes of sealant application).
3. Install the timing cover.
   - Tighten in the sequence shown.
   - Tighten to 12 Nm.

4. Attach the engine harness.

5. Install the power steering pump mounting bracket.
   - Tighten to 25 Nm.

Vehicles with supercharger
6. Install the AIR control valve to exhaust manifold tube.

7. Connect the AIR control valve to exhaust manifold tube.
   - Tighten to 35 Nm.

All vehicles

8. NOTE: Vehicles with supercharger shown, vehicles without supercharger similar.
   Reposition the AIR control valve and bracket assembly.
   - Tighten to 8 Nm.

9. NOTE: Vehicles with supercharger shown, vehicles without supercharger similar.
   Connect the AIR control valve to exhaust manifold tube.
   - Tighten to 35 Nm.

Vehicles with supercharger
10. Install the supercharger belt tensioner.
   - Tighten to 40 Nm.

11. Install the supercharger belt idler pulley and bracket assembly.
   - Tighten to 9 Nm.

12. Install the accessory drive belt idler pulley.
   - Tighten to 61 Nm.

13. Install the power steering pump.
   - Tighten to 25 Nm.
14. **NOTE:** Remove the blanking caps.
   Connect the power steering pump to steering gear high-pressure line.
   - Install a new O-ring seal.
   - Tighten to 25 Nm.

15. Raise the vehicle.
16. Connect the AIR control valve to exhaust manifold tube.
   - Tighten to 35 Nm.

17. Install the power steering pump lower retaining bolts.
   - Tighten to 25 Nm.

18. **NOTE:** Remove the blanking caps.
    Connect the power steering reservoir to power steering pump supply line.

19. Install the A/C compressor. For additional information, refer to:
    (412-03 Air Conditioning)
    
    Air Conditioning (A/C) Compressor - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27 (Removal and Installation),
    Air Conditioning (A/C) Compressor - V8 4.2L Petrol/V8 S/C 4.2L Petrol (Removal and Installation).
20. Install the water pump pulley.
   - Using a suitable tool, retain the water pump pulley.
   - Tighten to 10 Nm + 45°.

Vehicles with supercharger

21. Install the coolant assembly.
   - Install new O-ring seals.
   - Connect the coolant hose.

22. Attach the coolant assembly.
   - Tighten to 9 Nm.

23. Connect the coolant hose.
24. Connect the coolant hose.

25. Connect the ECT sensor electrical connector.

26. Connect the coolant hose.

27. Connect the coolant hose.
28. Connect the coolant hose.

Vehicles without supercharger

29. Install the oil cooler.
For additional information, refer to: Oil Cooler - Vehicles Without: Supercharger (303-01B Engine - V8 4.2L Petrol/V8 S/C 4.2L Petrol, In-vehicle Repair).

All vehicles

30. Install the crankshaft pulley.
For additional information, refer to: Crankshaft Pulley (303-01B Engine - V8 4.2L Petrol/V8 S/C 4.2L Petrol, In-vehicle Repair).

31. Install the right-hand valve cover.
For additional information, refer to: Valve Cover RH - VIN Range: N52048->N99999 (303-01B Engine - V8 4.2L Petrol/V8 S/C 4.2L Petrol, In-vehicle Repair).

32. Install the left-hand valve cover.
For additional information, refer to: Valve Cover LH - VIN Range: N52048->N99999 (303-01B Engine - V8 4.2L Petrol/V8 S/C 4.2L Petrol, In-vehicle Repair).
Removal

Vehicles without supercharger

1. Remove the throttle body. For additional information, refer to Section 303-04A Fuel Charging and Controls / 303-04B Fuel Charging and Controls / 303-04C Fuel Charging and Controls / 303-04D Fuel Charging and Controls - Turbocharger.

Vehicles with supercharger

2. Remove the air cleaner outlet pipe. For additional information, refer to Section 303-12A Intake Air Distribution and Filtering / 303-12B Intake Air Distribution and Filtering / 303-12C Intake Air Distribution and Filtering.

All vehicles

3. NOTE: Vehicles with 4.2L engine without supercharger shown, vehicles with 4.2L engine with supercharger similar.

Install the special tools.
4. NOTE: Vehicles with 4.2L engine with supercharger shown, vehicles with 4.2L engine without supercharger similar.
   • NOTE: Left-hand shown, Right-hand similar.
   Install the special tool.

5. Remove the air deflector.
   For additional information, refer to Section 501-02 Front End Body Panels.

6. Remove the steering gear shaft pinch bolt.

7. Detach the steering gear.
8. Secure the steering gear.

9. Remove the engine mount retaining nut.

10. Lower the vehicle.
11. NOTE: Vehicles with 4.2L engine with supercharger shown, vehicles with 4.2L engine without supercharger similar.
   • NOTE: Left-hand shown, Right-hand similar.
   Using the special tools, raise the engine to a suitable height.

12. Raise the vehicle.
13. Remove the engine mount and bracket assembly.

14. Remove the engine mount.

**Installation**

1. **CAUTION:** Make sure the engine mount location peg is correctly located into the engine bracket. Failure to follow this instruction may result in damage to the vehicle.

   To install, reverse the removal procedure.
   - Tighten to 55 Nm (+/- 15%).

2. Tighten to 40 Nm (+/- 15%).

3. Tighten to 100 Nm.
4. Tighten to 35 Nm.

5. Tighten to 63 Nm (+/- 15%).
Removal

1. Remove the exhaust system.
   For additional information, refer to Section 309-00 Exhaust System.
2. Remove the right-hand exhaust manifold heat shield
3. Detach the exhaust gas recirculation (EGR) valve.
   • Remove and discard the retaining nuts and gasket.
4. Remove the right-hand exhaust manifold heat shield/gasket retaining bolt.
5. NOTE: New exhaust manifold retaining studs must be fitted if the old studs are removed.
   Remove the exhaust manifold.
   • Remove and discard the retaining nuts and heat shield/gasket.

Installation
1. **CAUTIONS:**

- When all retaining nuts have been torqued, re-torque all retaining nuts to 25 Nm.
- Ensure exhaust manifold and heat shield/gasket is correctly aligned to cylinder head and studs.

Install the exhaust manifold.
- Install new retaining nuts and a new heat shield/gasket.
- Tighten to 25 Nm.

2. Install the right-hand exhaust manifold heat shield/gasket retaining bolt.
   - Tighten to 50 Nm.

3. Attach the exhaust gas recirculation (EGR) valve.
   - Install new retaining nuts and a new gasket.
   - Tighten to 22 Nm.

4. Install the right-hand exhaust manifold heat shield.
   - Tighten to 3 Nm.

5. Install the exhaust system.
   For additional information, refer to Section [309-00 Exhaust System](#).
Engine - V8 4.2L Petrol/V8 S/C 4.2L Petrol - Exhaust Manifold RHVIN Range: N52048->N99999
In-vehicle Repair

Removal

Right-hand drive vehicles

1. Center the steering wheel.
   - Lock in position, remove the ignition key.

All vehicles

2. Remove the right-hand exhaust manifold heat shield upper retaining bolts.

3. Remove the right-hand catalytic converter.
   For additional information, refer to: Catalytic Converter - V8 4.2L Petrol/V8 S/C 4.2L Petrol/2.5L NA V6 - AJV6/3.0L NA V6 - AJ27 (309-00 Exhaust System, Removal and Installation).

Right-hand drive vehicles

4. Remove the steering gear coupling upper pinch bolt

5. Remove the steering gear coupling.
   - Remove the steering gear coupling lower pinch bolt.

All vehicles
6. Remove the right-hand exhaust manifold heat shield.

7. Disconnect the secondary air injection (AIR) control valve to exhaust manifold tube from the left-hand exhaust manifold.

8. NOTE: Engine shown removed for clarity.
   Detach the exhaust gas recirculation (EGR) valve.
   - Remove and discard the retaining nuts and gasket.

9. NOTE: Engine shown removed for clarity.
   Remove the right-hand exhaust manifold heat shield/gasket retaining bolt.

10. Remove the exhaust manifold.
    - Remove and discard the retaining bolts and heat shield/gasket.
Installation
All vehicles

1. **CAUTION:** Make sure that the exhaust manifold and heat shield/gasket is correctly aligned to cylinder head.
   Install the exhaust manifold.
   - Loosely install new retaining bolts and a new heat shield/gasket.

2. Tighten the exhaust manifold retaining bolts to 25 Nm.

3. **NOTE:** Engine shown removed for clarity.
   Install the right-hand exhaust manifold heat shield/gasket retaining bolt.
   - Tighten to 50 Nm.

4. **NOTE:** Engine shown removed for clarity.
   Attach the EGR valve.
   - Install new retaining nuts and a new gasket.
   - Tighten to 22 Nm.
5. Connect the AIR control valve to exhaust manifold tube.
   - Tighten to 35 Nm.

6. Install the right-hand exhaust manifold heat shield
   - Tighten to 3 Nm.

Right-hand drive vehicles

7. Install the steering gear coupling.
   - Tighten the steering gear coupling lower pinch bolt to 35 Nm.

8. Install the steering gear coupling upper pinch bolt.
   - Tighten to 35 Nm.

All vehicles

9. Install the right-hand catalytic converter.
   For additional information, refer to: Catalytic Converter - V8 4.2L Petrol/V8 S/C 4.2L Petrol/2.5L NA V6 - AJ27/3.0L NA V6 - AJ27 (309-00 Exhaust System, Removal and Installation).
10. Install the right-hand exhaust manifold heat shield upper retaining bolts.
   - Tighten to 3 Nm.
**Engine - V8 4.2L Petrol/V8 S/C 4.2L Petrol - Flexplate**

**In-vehicle Repair**

**Removal**

1. Remove the automatic transmission. For additional information, refer to: Transmission - V8 4.2L Petrol/V8 S/C 4.2L Petrol (307-01 Automatic Transmission/Transaxle, Removal).

2. **CAUTION:** The bolts can only be used 3 times, mark the bolts with a center punch. If 2 punch marks are visible, discard the bolts.
   - **NOTE:** Prevent the flexplate from rotating.
     - Remove the flexplate.
       - Remove the 8 bolts.

**Installation**

1. **NOTE:** Make sure the crankshaft and flexplate mating faces are clean before installation.
   - **NOTE:** The flexplate will only locate in one position.
   - **NOTE:** Install, but do not tighten, the flexplate retaining bolts.
     - Install the flexplate.
       - Prevent the flexplate from rotating.

2. **NOTE:** Tighten the retaining bolts working diagonally.
   - Tighten to 15 Nm.

3. **NOTE:** Tighten the retaining bolts working diagonally.
   - Tighten to 110 Nm.

4. Install the automatic transmission. For additional information, refer to: Transmission - V8 4.2L Petrol/V8 S/C 4.2L Petrol (307-01 Automatic Transmission/Transaxle, Installation).
Removal

1. Remove the cowl vent screen. For additional information, refer to Section 501-02 Front End Body Panels.

2. Remove the air cleaner outlet pipe. For additional information, refer to Section 303-12A Intake Air Distribution and Filtering / 303-12B Intake Air Distribution and Filtering / 303-12C Intake Air Distribution and Filtering.

3. Remove the engine compartment brace.

4. NOTE: Left-hand shown, right-hand similar.

Remove the on-plug coil covers.

5. Disconnect the throttle potentiometer (TP) electrical connector.

6. Disconnect the throttle motor electrical connector.
7. **NOTE**: Cap the coolant system hose to minimize coolant loss
   Disconnect the throttle body coolant hose.

8. Disconnect the knock sensors (KS) electrical connectors.

9. Remove the left-hand engine cover bracket.

10. Detach the left-hand engine wiring harness.

11. Disconnect the left-hand fuel injector electrical connectors.
12. Detach the fuel line.
For additional information, refer to Section 310-00 Fuel System -
General Information.

13. Detach the left-hand camshaft position sensor electrical connector.

14. Disconnect the coolant temperature sensor electrical connector.

15. Remove the right-hand engine cover bracket.

16. Remove the positive crankcase ventilation (PCV) valve.
17. Disconnect the fuel pressure regulator electrical connector.

18. Disconnect the exhaust gas recirculation (EGR) valve electrical connector.

19. **NOTE:** Cap the coolant hose.
   Disconnect the exhaust gas recirculation (EGR) valve coolant hose.

20. Detach the right-hand engine wiring harness.

21. Disconnect the right-hand fuel injector electrical connectors.
22. Disconnect the fuel temperature sensor electrical connector.

23. Disconnect the right-hand camshaft position (CMP) sensor.

24. Detach the brake booster vacuum pipe.

25. Disconnect the manifold absolute pressure (MAP) sensor electrical connector.

26. Detach the engine wiring harness.
27. Detach the exhaust gas recirculation (EGR) valve tube.
   - Remove and discard the gasket.

28. Remove the intake manifold.
   - Remove and discard the gaskets.

Installation

1. Install the intake manifold.
   - Install new gaskets.
   - Tighten to 22 Nm.

2. Attach the exhaust gas recirculation (EGR) valve tube.
   - Install a new gasket.
3. Attach the engine wiring harness.
   - Tighten to 10 Nm.

4. Connect the manifold absolute pressure (MAP) sensor electrical connector.

5. Connect the right-hand camshaft position (CMP) sensor.

6. Connect the fuel temperature sensor electrical connector.

7. Attach the brake booster vacuum pipe.
8. Connect the right-hand fuel injector electrical connectors.

9. Attach the right-hand engine wiring harness.

10. NOTE: Remove the cap from the coolant hose.
    Connect the exhaust gas recirculation (EGR) valve coolant hose.

11. Connect the exhaust gas recirculation (EGR) valve electrical connector.

12. Connect the fuel pressure regulator electrical connector.
13. Install the positive crankcase ventilation (PCV) pipe.

14. Install the right-hand engine cover bracket.
   - Tighten to 6 Nm.

15. Connect the coolant temperature sensor electrical connector.

16. Attach the left-hand camshaft position sensor electrical connector.

17. Connect the fuel line.
   - Install new O-ring seals.
   - Attach the fuel line retaining clip.
18. Connect the left-hand fuel injector electrical connectors.

19. Attach the left-hand engine wiring harness.

20. Install the left-hand engine cover bracket.
   - Tighten to 6 Nm.

21. Connect the knock sensor (KS) electrical connectors.

22. NOTE: Remove the cap from the coolant hose.
    Connect the throttle body coolant hose.
23. Connect the throttle motor electrical connector.

24. Connect the throttle potentiometer (TP) electrical connector.

25. Install the engine compartment brace.
   - Tighten to 18 Nm.

26. Install the air cleaner outlet pipe. For additional information, refer to Section 303-12A Intake Air Distribution and Filtering / 303-12B Intake Air Distribution and Filtering / 303-12C Intake Air Distribution and Filtering.

27. Install the cowl vent screen.
   For additional information, refer to Section 501-02 Front End Body Panels.

28. Check and top up the cooling system.
Engine - V8 4.2L Petrol/V8 S/C 4.2L Petrol - Intake Manifold
VIN Range: N52048->N99999

In-vehicle Repair

Removal

1. Remove the cowl panel grille.
   For additional information, refer to: Cowl Panel Grille (501-02 Front End Body Panels, Removal and Installation).

2. Remove the air cleaner outlet pipe.
   For additional information, refer to: Air Cleaner Outlet Pipe (303-12B Intake Air Distribution and Filtering - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Removal and Installation).

3. Remove the engine compartment brace.

4. Disconnect the supressor electrical connector.

5. Remove the engine cover right-hand bracket.

6. Disconnect the fuel pressure regulator electrical connector.
7. Disconnect the fuel temperature sensor electrical connector.

8. Remove the exhaust gas recirculation (EGR) valve retaining bolts.

9. Disconnect the brake booster vacuum pipe.

10. Disconnect the secondary air injection (AIR) vacuum line.

11. Remove the positive crankcase ventilation (PCV) valve.
12. Disconnect the throttle body electrical connector.

13. Disconnect the evaporative emission vent hose.

14. **WARNING:** When relieving cooling system pressure, cover the expansion tank cap with a thick cloth to prevent the possibility of scalding. Failure to follow these instructions may result in personal injury.

   Remove the coolant expansion tank cap.

15. **NOTE:** Cap the coolant hose to minimize coolant loss.

   Disconnect the throttle body coolant hose.

16. Disconnect the engine coolant temperature (ECT) sensor electrical connector.
17. Disconnect the evaporative emission cannister purge valve electrical connector.

18. Detach the knock sensor (KS) electrical connector.

19. Reposition the engine cover left-hand bracket.

20. Disconnect the KS electrical connector.

21. NOTE: Left-hand shown, right-hand similar.
Remove the on-plug coil covers.
22. NOTE: Right-hand shown, left-hand similar.
Detach the engine wiring harness.

23. NOTE: Right-hand shown, left-hand similar.
Disconnect the fuel injector electrical connectors.

24. Disconnect the fuel line.
For additional information, refer to: Spring Lock Couplings (310-00 Fuel System - General Information, General Procedures).

- Release the retaining clip.
- Remove and discard the O-ring seals.

25. Detach the left-hand camshaft position sensor electrical connector.

26. Disconnect the right-hand camshaft position (CMP) sensor.
27. Disconnect the manifold absolute pressure (MAP) sensor electrical connector.

28. Detach the engine wiring harness.

29. Remove the intake manifold.
- Remove and discard the gaskets.

**Installation**

1. **CAUTION:** Make sure that all gasket mating faces are clean and dry.

   Install the intake manifold.
   - Install new gaskets.
   - Tighten to 22 Nm.
2. Attach the engine wiring harness.
   - Tighten to 10 Nm.

3. Connect the MAP sensor electrical connector.

4. Connect the right-hand CMP sensor.

5. Attach the left-hand CMP sensor electrical connector.

6. Connect the fuel line.
   For additional information, refer to: Spring Lock Couplings (310-00 Fuel System - General Information, General Procedures).
   - Install new O-ring seals.
   - Secure the retaining clip.
7. NOTE: Right-hand shown, left-hand similar.
   Connect the fuel injector electrical connectors.

8. NOTE: Right-hand shown, left-hand similar.
   Attach the engine wiring harness.

9. NOTE: Left-hand shown, right-hand similar.
   Install the on-plug coil covers.

10. Connect the KS electrical connector.

11. Reposition the engine cover left-hand bracket.
    - Tighten to 6 Nm.
12. Attach the KS electrical connector.

13. Connect the evaporative emission cannister purge valve electrical connector.

14. Connect the ECT sensor electrical connector.

15. NOTE: Remove the blanking caps. Connect the throttle body coolant hose.

16. Install the coolant expansion tank cap.

17. Connect the evaporative emission vent hose.
18. Connect the throttle body electrical connector.

19. Install the PCV valve.

20. Connect the AIR vacuum line.

21. Connect the brake booster vacuum pipe.

22. Install the EGR valve retaining bolts.
   - Tighten to 10 Nm.
23. Connect the fuel temperature sensor electrical connector.

24. Connect the fuel pressure regulator electrical connector.

25. Install the engine cover right-hand bracket.
   - Tighten to 6 Nm.

26. Connect the supressor electrical connector.

27. Install the engine compartment brace.
   - Tighten to 18 Nm.
28. Install the air cleaner outlet pipe.  
For additional information, refer to: Air Cleaner Outlet Pipe (303-12B Intake Air Distribution and Filtering - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Removal and Installation).

29. Install the cowl panel grille.  
For additional information, refer to: Cowl Panel Grille (501-02 Front End Body Panels, Removal and Installation).

30. Check and top up the cooling system.
Removal

1. Remove the radiator splash shield. For additional information, refer to: Radiator Splash Shield (501-02 Front End Body Panels, Removal and Installation).

2. NOTE: Left-hand shown, right-hand similar.

disconnect the adaptive cruise control (ACC) electrical connector.

3. NOTE: Left-hand shown, right-hand similar.

   • NOTE: Place a suitable container underneath the oil cooler to prevent oil spillage.

   • NOTE: Install blanking caps to the exposed ports.

      Detach the oil cooler lines.

         • Remove and discard the oil cooler O-ring seals.

4. NOTE: Left-hand shown, right-hand similar.

Remove the oil cooler.

Installation

1. NOTE: Left-hand shown, right-hand similar.

To install, reverse the removal procedure.

   • Tighten to 10 Nm.
2. NOTE: Left-hand shown, right-hand similar.
   Tighten to 10 Nm.

3. Check and fill the engine oil to the correct level on the oil level indicator.
Removal

Vehicles with supercharger

1. Remove the radiator splash shield. For additional information, refer to Section 501-02 Front End Body Panels.

2. Detach the oil cooler lines.
   - Remove and discard the oil cooler O rings.

3. Remove the oil cooler.

Vehicles without supercharger

4. Drain the cooling system. For additional information, refer to Section 303-03A Engine Cooling / 303-03B Supercharger Cooling / 303-03C Engine Cooling.

5. Lower the vehicle.

6. Disconnect the oil cooler hose.

7. Raise the vehicle.
8. Remove the air deflector.

9. **NOTE:** Place a suitable container underneath filter to prevent oil spillage.
   Remove and discard the oil filter element.

10. Disconnect the oil cooler hose.

11. Remove the oil cooler.
    - Remove and discard the O-ring.

**Installation**

Vehicles without supercharger
1. Install the oil cooler.
   - Install a new O-ring seal.
   - Tighten to 55 Nm.

2. Connect the oil cooler hose.

3. NOTE: Apply a suitable amount of clean engine oil to lubricate the oil filter O-ring seal.
   - Install a new oil filter.
   - Tighten to 18 Nm.

4. Install the air deflector.

5. Lower the vehicle.

6. Connect the oil cooler hose.
7. Carry out cooling system filling and bleeding procedure. For additional information, refer to Section 303-03A Engine Cooling / 303-03B Supercharger Cooling / 303-03C Engine Cooling.

Vehicles with supercharger

8. Install the oil cooler.
   - Tighten to 7 Nm.

9. Install the oil cooler lines.
   - Install new oil cooler O rings.

10. Install the radiator splash shield.
    For additional information, refer to Section 501-02 Front End Body Panels.
**Engine - V8 4.2L Petrol/V8 S/C 4.2L Petrol - Oil Pan**

**In-vehicle Repair**

**Removal**

1. Remove the air deflector.  
   For additional information, refer to: [Air Deflector](501-02 Front End Body Panels, Removal and Installation).

2. Drain the engine oil.  
   - Place suitable container under the vehicle.  
   - Remove the drain plug and drain the engine oil.

3. Remove the oil pan.  
   - Remove and discard the gasket.

**Installation**

1. **NOTE:** Make sure all surfaces are clean.  
   Install the oil pan gasket to the oil pan extension.

2. Install the oil pan.  
   - Install, but do not fully tighten the retaining bolts.

3. **NOTE:** A new oil pan is supplied with the drain plug installed. Check that the drain plug is tightened to 25 Nm.  
   Tighten the retaining bolts in the indicated sequence in two stages.  
   - Stage 1: bolts 1 to 7, tighten to 5 Nm.  
   - Stage 2: bolts 1 to 17, tighten to 12 Nm.
4. Install the air deflector. For additional information, refer to: **Air Deflector** *(501-02 Front End Body Panels, Removal and Installation)*.

5. Check and top-up the engine oil.
Engine - V8 4.2L Petrol/V8 S/C 4.2L Petrol - Oil Pan Extension

In-vehicle Repair

Removal

1. Remove the engine front cover. For additional information, refer to:
   (303-01B Engine - V8 4.2L Petrol/V8 S/C 4.2L Petrol)
   Engine Front Cover - VIN Range: M45255->N52047 (In-vehicle Repair),
   Engine Front Cover - VIN Range: N52048->N99999 (In-vehicle Repair).

2. Remove the oil pan.
   For additional information, refer to: Oil Pan (303-01B Engine - V8 4.2L Petrol/V8 S/C 4.2L Petrol, In-vehicle Repair).

3. Disconnect the engine oil temperature sensor electrical connector.

4. Disconnect the engine oil pressure sensor electrical connector.

5. Remove the oil filter housing.
   - Remove and discard the O-ring seal.
   - Using suitable blanking plugs, blank the exposed ports.

6. Remove the oil strainer.
   - Remove and discard the O-ring seal.
7. Detach the right-hand heated oxygen sensor (HO2S) electrical connector retaining bracket.
   - Remove the retaining bolt.

8. Detach the engine wiring harness.

9. Disconnect the crankshaft position (CKP) sensor electrical connector.

10. Remove the CKP sensor.

11. Remove the transmission bell housing to oil pan retaining bolts.
    - Detach the engine ground cable.
12. Detach the left-hand HO2S electrical connector retaining bracket.
   - Remove the retaining bolt.

13. Detach the engine wiring harness.

14. Detach the transmission fluid cooler pipes.
   - Remove the retaining nut.

15. Remove the oil pan extension.
Installation

1. **NOTE:** Use only a plastic scraper when removing old gasket material.
   
   Clean all the mating faces and reusable parts thoroughly and check for damage.

2. **NOTE:** It is important that the oil pan extension is bolted to the bedplate within 20 minutes of applying the RTV sealant.

   Apply a continuous bead of RTV sealant (Loctite 5699) 3 mm diameter, around the flange as indicated.

3. **NOTE:** It is important that the oil pan extension is bolted to the bedplate within 20 minutes of applying the RTV sealant.

   Apply a continuous bead of RTV sealant (Loctite 5699) 2 mm diameter, around the diverter valve flange as indicated.

4. **NOTE:** Tighten the retaining bolts in the indicated sequence.

   Install the oil pan extension to the bedplate.
   
   1. Tighten to 21 Nm.
5. Attach the transmission fluid cooler pipes.
   - Install the retaining nut.
   - Tighten to 10 Nm.

6. Attach the engine wiring harness.

7. Attach the left-hand HO2S electrical connector retaining bracket.
   - Install the retaining bolt.
   - Tighten to 10 Nm.
8. Install the transmission bell housing to oil pan retaining bolts.
   - Attach the engine ground cable.
   - Tighten to 48 Nm.

9. Install the CKP sensor.
   - Tighten to 10 Nm.

10. Connect the CKP sensor electrical connector.

11. Attach the engine wiring harness.

12. Attach the right-hand HO2S electrical connector retaining bracket.
    - Install the retaining bolt.
    - Tighten to 10 Nm.
13. Install the oil strainer.
   - Install a new O-ring seal.
   - Tighten to 12 Nm.

14. Install the oil filter housing.
   - Remove the blanking plugs.
   - Install a new O-ring seal.
   - Tighten to 21 Nm.

15. Connect the engine oil pressure sensor electrical connector.

16. Connect the engine oil temperature sensor electrical connector.

17. Install the oil pan.
    For additional information, refer to: Oil Pan (303-01B Engine - V8 4.2L Petrol/V8 S/C 4.2L Petrol, In-vehicle Repair).

18. Install the engine front cover. For additional information, refer to:
    Engine Front Cover - VIN Range: M45255->N52047 (In-vehicle Repair),
    Engine Front Cover - VIN Range: N52048->N99999 (In-vehicle Repair).

</tr>
</tbody>
</table>

## Removal

**All vehicles**

1. Remove the oil pan.  
   For additional information, refer to [Oil Pan](#) in this section.
2. Remove the oil strainer.
   - Remove and discard the O-ring seal.
3. Disconnect the crankshaft position sensor electrical connector.
4. Remove the crankshaft position sensor.
5. Remove the special tool.

6. Remove the engine front cover. For additional information, refer to Engine Front Cover in this section.

Vehicles without supercharger

7. Remove the right-hand variable camshaft timing oil control unit housing.
   - Remove and discard the O-ring seals.

8. Remove the left-hand variable camshaft timing oil control unit housing.
   - Remove and discard the O-ring seals.

9. Install the special tool to the left-hand cylinder head.
10. Install the special tool to the Right-hand cylinder head.

11. **CAUTION:** Make sure the secondary timing chain and camshaft sprockets are free to rotate.

   Loosen the camshaft sprockets.

12. Remove the primary timing chain tensioner assembly.

13. Remove the primary timing chain tensioner guide.

14. Remove the primary timing chain.
15. Remove the primary timing chain guide.

16. Remove the primary timing chain tensioner assembly.

17. Remove the primary timing chain tensioner guide.

18. Remove the primary timing chain.

19. Remove the primary timing chain tensioner guide.
20. **CAUTION:** Make sure the secondary timing chain and camshaft sprockets are free to rotate.

Loosen the camshaft sprockets.

21. Remove the oil pump.

- Remove and discard the gasket.

---

**Installation**

All vehicles

1. Install the oil pump.
   - Install a new gasket.
   - Tighten to 12 Nm.

2. Install the timing chain tensioning tool 303-532 to the exhaust camshaft sprocket.
   - Reposition the camshaft sprockets for the most advantageous position for use of the tool.
3. Install the primary timing chain tensioner guide.
   - Tighten to 12 Nm.

4. **CAUTION:** Make sure the timing chain slack is on the tensioned side of the timing chain.
   Install the primary timing chain.
   - Install the primary chain over the crankshaft sprocket and the intake sprocket.

5. Install the primary timing chain tensioner guide.
   - Tighten to 12 Nm.

6. **CAUTION:** Use suitable protective covers on the vice jaws to protect the timing chain tensioner.
   Secure the left-hand timing chain tensioner in the vice jaws.

7. **CAUTION:** During timing chain tensioner compression, do not release the ratchet stem until the timing chain tensioner piston is fully bottomed in its bore or damage to the ratchet stem will result.
   Using a suitable tool, hold the left-hand timing chain tensioner ratchet lock mechanism away from the ratchet stem.

8. **NOTE:** The timing chain tensioner piston should retract with minimal force. If binding occurs, reposition the timing chain tensioner to eliminate
side loading.

Slowly compress the left-hand timing chain tensioner.

9. NOTE: The retaining tool must remain in the timing chain tensioner until the timing chain tensioner is installed to the engine with the piston bottomed in the bore.

Using a suitable tool, retain the left-hand timing chain tensioner piston.

10. Install the primary timing chain tensioner assembly.

- Tighten to 12 Nm.

11. Release the tension in the left-hand timing chain tensioner.

- Remove the retaining tool.

12. CAUTION: While applying the opposing force to sprocket and chain, tighten the sprocket bolt.

Using the special tool apply force to the tool in an anti-clockwise direction to tension the primary timing chain on its drive side.

- Tighten to 120 Nm.

13. CAUTION: While applying the opposing force to sprocket and chain, tighten the sprocket bolt.

Using the special tool apply force to the tool in an anti-clockwise direction.

- Tighten to 120 Nm.
   - Tighten to 12 Nm.

15. CAUTION: Make sure the timing chain slack is on the tensioned side of the timing chain.

   Install the primary timing chain.
   - Install the primary chain over the crankshaft sprocket and the intake sprocket.

16. Install the primary timing chain tensioner guide.
   - Tighten to 12 Nm.

17. CAUTION: Use suitable protective covers on the vice jaws to protect the timing chain tensioner.

   Secure the right-hand timing chain tensioner in the vice jaws.

18. CAUTION: During timing chain tensioner compression, do not release the ratchet stem until the timing chain tensioner piston is fully bottomed in its bore or damage to the ratchet stem will result.

   Using a suitable tool, hold the right-hand timing chain tensioner ratchet lock mechanism away from the ratchet stem.

19. NOTE: The timing chain tensioner piston should retract with minimal force. If binding occurs, reposition the timing chain tensioner to eliminate
side loading.

Slowly compress the right-hand timing chain tensioner.

20. **NOTE:** The retaining tool must remain in the timing chain tensioner until the timing chain tensioner is installed to the engine with the piston bottomed in the bore.

Using a suitable tool, retain the right-hand timing chain tensioner piston.

21. Install the primary timing chain tensioner assembly.
   - Tighten to 12 Nm.

22. Release the tension in the left-hand timing chain tensioner.
    - Remove the retaining tool.

23. **CAUTION:** While applying the opposing force to sprocket and chain, tighten the sprocket bolt.

   Using the special tool apply force to the tool in an anti-clockwise direction to tension the primary timing chain on its drive side.
   - Tighten to 120 Nm.

24. **CAUTION:** While applying the opposing force to sprocket and chain, tighten the sprocket bolt.

   Using the special tool apply force to the tool in an anti-clockwise direction.
   - Tighten to 120 Nm.
25. Remove the special tool to the Right-hand cylinder head.

26. Remove the special tool to the left-hand cylinder head.

Vehicles without supercharger

27. Install the left-hand variable camshaft timing oil control unit housing.
   - Install new O-ring seals.
   - Tighten to 22 Nm.

28. Install the right-hand variable camshaft timing oil control unit housing.
   - Install new O-ring seals.
   - Tighten to 22 Nm.

All vehicles
29. Install the oil strainer.
   - Install new O-ring seals.
   - Tighten to 12 Nm.

30. Install the oil pan.
   For additional information, refer to Oil Pan in this section.

31. Remove the special tool.

32. Install the crankshaft position sensor.

33. Connect the crankshaft position sensor electrical connector.

34. Install the air deflector. For additional information, refer to Section 501-20A Safety Belt System / 501-20B Supplemental Restraint System.

35. Install the engine front cover.
   For additional information, refer to Engine Front Cover in this section.
Removal

1. Remove the oil pan. For additional information, refer to: Oil Pan (303-01B Engine - V8 4.2L Petrol/V8 S/C 4.2L Petrol, In-vehicle Repair).

2. Remove the oil strainer.
   - Remove and discard the O-ring seal.

3. Disconnect the crankshaft position (CKP) sensor electrical connector.

4. Remove the CKP.
5. Install the special tool.

6. Remove the engine front cover. For additional information, refer to: Engine Front Cover - VIN Range: N52048->N99999 (303-01B Engine - V8 4.2L Petrol/V8 S/C 4.2L Petrol, In-vehicle Repair).

7. Remove the right-hand variable camshaft timing oil control unit housing.
   - Remove and discard the O-ring seals.

8. Remove the left-hand variable camshaft timing oil control unit housing.
   - Remove and discard the O-ring seals.

9. Install the special tool to the left-hand cylinder head.
10. Install the special tool to the right-hand cylinder head.

11. **CAUTION:** Make sure the secondary timing chain and camshaft sprockets are free to rotate.

   Loosen the camshaft sprockets.

12. Remove the primary timing chain tensioner assembly.

13. Remove the primary timing chain tensioner guide.

14. Remove the primary timing chain.
15. Remove the primary timing chain guide.

16. Remove the primary timing chain tensioner assembly.

17. Remove the primary timing chain tensioner guide.

18. Remove the primary timing chain.

19. Remove the primary timing chain tensioner guide.
20. **CAUTION:** Make sure the secondary timing chain and camshaft sprockets are free to rotate.

Loosen the camshaft sprockets.

---

21. Remove the oil pump.
   - Remove and discard the gasket.

---

**Installation**

1. Install the oil pump.
   - Install a new gasket.
   - Tighten to 12 Nm.

2. Install the special tool to the exhaust camshaft sprocket.
   - Reposition the camshaft sprockets for the most advantageous position for use of the tool.
3. Install the primary timing chain tensioner guide.
   - Tighten to 12 Nm.

4. **CAUTION:** Make sure the timing chain slack is on the tensioned side of the timing chain.

   Install the primary timing chain.
   - Install the primary chain over the crankshaft sprocket and the intake sprocket.

5. Install the primary timing chain tensioner guide.
   - Tighten to 12 Nm.

6. **CAUTION:** Use suitable protective covers on the vice jaws to protect the timing chain tensioner.

   Secure the left-hand timing chain tensioner in the vice jaws.

7. **CAUTION:** During timing chain tensioner compression, do not release the ratchet stem until the timing chain tensioner piston is fully bottomed in its bore or damage to the ratchet stem will result.

   Using a suitable tool, hold the left-hand timing chain tensioner ratchet lock mechanism away from the ratchet stem.

8. **NOTE:** The timing chain tensioner piston should retract with minimal force. If binding occurs, reposition the timing chain tensioner to eliminate
side loading.
Slowly compress the left-hand timing chain tensioner.

9. NOTE: The retaining tool must remain in the timing chain tensioner until the timing chain tensioner is installed to the engine with the piston bottomed in the bore.

Using a suitable tool, retain the left-hand timing chain tensioner piston.

10. Install the primary timing chain tensioner assembly.
    - Tighten to 12 Nm.

11. Release the tension in the left-hand timing chain tensioner.
    - Remove the retaining tool.

12. CAUTION: While applying the opposing force to sprocket and chain, tighten the sprocket bolt.

    Using the special tool, apply force to the tool in an anti-clockwise direction to tension the primary timing chain on its drive side.
    - Tighten to 120 Nm.

13. CAUTION: While applying the opposing force to sprocket and chain, tighten the sprocket bolt.

    Using the special tool, apply force to the tool in an anti-clockwise direction.
    - Tighten to 120 Nm.
   - Tighten to 12 Nm.

15. **CAUTION**: Make sure the timing chain slack is on the tensioned side of the timing chain.

   Install the primary timing chain.
   - Install the primary chain over the crankshaft sprocket and the intake sprocket.

16. Install the primary timing chain tensioner guide.
   - Tighten to 12 Nm.

17. **CAUTION**: Use suitable protective covers on the vice jaws to protect the timing chain tensioner.

   Secure the right-hand timing chain tensioner in the vice jaws.

18. **CAUTION**: During timing chain tensioner compression, do not release the ratchet stem until the timing chain tensioner piston is fully bottomed in its bore or damage to the ratchet stem will result.

   Using a suitable tool, hold the right-hand timing chain tensioner ratchet lock mechanism away from the ratchet stem.

19. **NOTE**: The timing chain tensioner piston should retract with minimal force. If binding occurs, reposition the timing chain tensioner to eliminate
side loading.

20. **NOTE:** The retaining tool must remain in the timing chain tensioner until the timing chain tensioner is installed to the engine with the piston bottomed in the bore.

Using a suitable tool, retain the right-hand timing chain tensioner piston.

21. Install the primary timing chain tensioner assembly.

- Tighten to 12 Nm.

22. Release the tension in the left-hand timing chain tensioner.

- Remove the retaining tool.

23. **CAUTION:** While applying the opposing force to sprocket and chain, tighten the sprocket bolt.

Using the special tool, apply force to the tool in an anti-clockwise direction to tension the primary timing chain on its drive side.

- Tighten to 120 Nm.

24. **CAUTION:** While applying the opposing force to sprocket and chain, tighten the sprocket bolt.

Using the special tool, apply force to the tool in an anti-clockwise direction.

- Tighten to 120 Nm.
25. Remove the special tool from the right-hand cylinder head.

26. Remove the special tool from the left-hand cylinder head.

27. Install the left-hand variable camshaft timing oil control unit housing.
   - Install new O-ring seals.
   - Tighten to 22 Nm.

28. Install the right-hand variable camshaft timing oil control unit housing.
   - Install new O-ring seals.
   - Tighten to 22 Nm.

29. Install the engine front cover.
For additional information, refer to: Engine Front Cover - VIN Range: M45255->N52047 (303-01B Engine - V8 4.2L Petrol/V8 S/C 4.2L Petrol, In-vehicle Repair).
30. Remove the special tool.

31. Install the CKP sensor.

32. Connect the CKP sensor electrical connector.

33. Install the oil strainer.
   - Install new O-ring seals.
   - Tighten to 12 Nm.

34. Install the oil pan.
    For additional information, refer to: Oil Pan (303-01B Engine - V8 4.2L Petrol/V8 S/C 4.2L Petrol, In-vehicle Repair).

**Removal**

1. Remove the air deflector. For additional information, refer to: Air Deflector (501-02 Front End Body Panels, Removal and Installation).
2. Disconnect the crankshaft position (CKP) sensor electrical connector.
3. Remove the CKP sensor.
4. Install the special tool.

5. Remove the valve cover. For additional information, refer to: (303-01B Engine - V8 4.2L Petrol/V8 S/C 4.2L Petrol)

Valve Cover LH - VIN Range: M45255->N52047 (In-vehicle Repair),
Valve Cover LH - VIN Range: N52048->N99999 (In-vehicle Repair),
Valve Cover RH - VIN Range: M45255->N52047 (In-vehicle Repair),
Valve Cover RH - VIN Range: N52048->N99999 (In-vehicle Repair).

6. NOTE: Left-hand shown, right-hand similar.

Install the special tool to the left-hand cylinder head.

7. NOTE: Left-hand shown, right-hand similar.

Using the special tool, remove the exhaust camshaft sprocket retaining bolt.

8. NOTE: Left-hand shown, right-hand similar.

Remove the secondary timing chain tensioner retaining bolts.
9. NOTE: Left-hand shown, right-hand similar.
Remove the secondary timing chain tensioner.
  1. Reposition the exhaust camshaft sprocket and secondary timing chain.
  2. Remove the secondary timing chain tensioner.

**Installation**

1. NOTE: Left-hand shown, right-hand similar.
Install the secondary timing chain tensioner.
  1. Install the secondary timing chain tensioner.
  2. Reposition the exhaust camshaft sprocket and secondary timing chain.

2. NOTE: Left-hand shown, right-hand similar.
Install the secondary timing chain tensioner retaining bolts.
  • Tighten to 12 Nm.

3. Release the tension in the secondary timing chain tensioner.
  • Remove the retaining tool.

4. CAUTION: Make sure that a new bolt is installed.
• NOTE: Left-hand shown, right-hand similar.
Using the special tools, install the exhaust camshaft sprocket retaining bolt.
  • Tighten to 20 Nm + 90 deg.
5. NOTE: Left-hand shown, right-hand similar.
   Remove the special tool.

6. Install the valve cover. For additional information, refer to: (303-01B
   Engine - V8 4.2L Petrol/V8 S/C 4.2L Petrol)
   Valve Cover LH - VIN Range: M45255->N52047 (In-vehicle Repair),

**Removal**

**All vehicles**

1. Remove the engine front cover. For additional information, refer to: Engine Front Cover - VIN Range: M45255->N52047 (303-01B Engine - V8 4.2L Petrol/V8 S/C 4.2L Petrol, In-vehicle Repair).

2. Remove the spark plugs.

3. Remove the air deflector. For additional information, refer to: Air Deflector (501-02 Front End Body Panels, Removal and Installation).

4. Disconnect the crankshaft position sensor electrical connector.

5. Remove the crankshaft position sensor.
6. CAUTIONS:

⚠️ Make sure the spark plugs are removed to enable the engine to rotate freely.

⚠️ Do not rotate the crankshaft counterclockwise. The timing chains may bind causing engine damage.

⚠️ Rotate the crankshaft clockwise to position the engine to top dead center (TDC) No. 1 cylinder.

Install the special tool 303-645.

Vehicles without supercharger

7. Remove the right-hand variable camshaft timing oil control unit housing.
   - Remove and discard the O-ring seals.

8. Remove the left-hand variable camshaft timing oil control unit housing.
   - Remove and discard the O-ring seals.

All vehicles

9. Install the special tool to the left-hand cylinder head.
10. Install the special tool to the Right-hand cylinder head.

11. Remove the primary timing chain tensioner assembly.

12. Remove the primary timing chain tensioner guide.

13. Remove the primary timing chain.

14. Remove the primary timing chain guide.
15. Remove the secondary timing chain tensioner retaining bolts.

16. Remove the camshaft sprockets.
   - Remove the secondary timing chain tensioner and secondary timing chain from the camshaft sprockets.

17. Remove the primary timing chain tensioner assembly.

18. Remove the primary timing chain tensioner guide.

19. Remove the primary timing chain.
20. Remove the crankshaft sprocket.

21. Remove the primary timing chain tensioner guide.

22. Remove the secondary timing chain tensioner retaining bolts.

23. Remove the camshaft sprockets.
   - Remove the secondary timing chain tensioner and secondary timing chain from the camshaft sprockets.

**Installation**

All vehicles
1. **CAUTIONS:**

⚠️ Do not tighten the camshaft sprocket retaining bolts.

⚠️ Make sure the secondary timing chain and camshaft sprockets are free to rotate.

Install the camshaft sprockets.
- Install the secondary timing chain tensioner and secondary timing chain to the camshaft sprockets.

2. Install the secondary timing chain tensioner retaining bolts.
- Tighten to 12 Nm.

3. Install the timing chain tensioning tool 303-532 to the exhaust camshaft sprocket.
- Reposition the camshaft sprockets for the most advantageous position for use of the tool.

4. Install the primary timing chain tensioner guide.
- Tighten to 12 Nm.

5. Install the crankshaft sprocket.
6. **CAUTION:** Make sure the timing chain slack is on the tensioned side of the timing chain.

   Install the primary timing chain.
   - Install the primary chain over the crankshaft sprocket and the intake sprocket.

7. Install the primary timing chain tensioner guide.
   - Tighten to 12 Nm.

8. **CAUTION:** Use suitable protective covers on the vice jaws to protect the timing chain tensioner.

   Secure the left-hand timing chain tensioner in the vice jaws.

9. **CAUTION:** During timing chain tensioner compression, do not release the ratchet stem until the timing chain tensioner piston is fully bottomed in its bore or damage to the ratchet stem will result.

   Using a suitable tool, hold the left-hand timing chain tensioner ratchet lock mechanism away from the ratchet stem.

10. **NOTE:** The timing chain tensioner piston should retract with minimal force. If binding occurs, reposition the timing chain tensioner to eliminate side loading.

    Slowly compress the left-hand timing chain tensioner.
11. NOTE: The retaining tool must remain in the timing chain tensioner until the timing chain tensioner is installed to the engine with the piston bottomed in the bore.

   Using a suitable tool, retain the left-hand timing chain tensioner piston.

12. Install the primary timing chain tensioner assembly.
   • Tighten to 12 Nm.

13. Release the tension in the left-hand timing chain tensioner.
   • Remove the retaining tool.

14. CAUTIONS:

   ! While applying the opposing force to sprocket and chain, tighten the sprocket bolt.

   ! Make sure that a new bolt is installed.

   Using the special tool apply force to the tool in an anti-clockwise direction to tension the primary timing chain on its drive side.
   • Tighten to 20 Nm + 90 deg.

15. CAUTIONS:

   ! While applying the opposing force to sprocket and chain, tighten the sprocket bolt.

   ! Make sure that a new bolt is installed.

   Using the special tool apply force to the tool in an anti-clockwise direction.
   • Tighten to 20 Nm + 90 deg.
16. **CAUTIONS:**

- Do not tighten the camshaft sprocket retaining bolts.
- Make sure the secondary timing chain and camshaft sprockets are free to rotate.

Install the camshaft sprockets.
- Install the secondary timing chain tensioner and secondary timing chain to the camshaft sprockets.

17. Install the secondary timing chain tensioner retaining bolts.
- Tighten to 12 Nm.

18. Install the timing chain tensioning tool 303-532 to the exhaust camshaft sprocket.
- Reposition the camshaft sprockets for the most advantageous position for use of the tool.

19. Install the primary timing chain guide.
- Tighten to 12 Nm.

20. **CAUTION:** Make sure the timing chain slack is on the tensioned side of the timing chain.

Install the primary timing chain.
- Install the primary chain over the crankshaft sprocket and the intake sprocket.
21. Install the primary timing chain tensioner guide.
   - Tighten to 12 Nm.

22. CAUTION: Use suitable protective covers on the vice jaws to protect the timing chain tensioner.

   Secure the right-hand timing chain tensioner in the vice jaws.

23. CAUTION: During timing chain tensioner compression, do not release the ratchet stem until the timing chain tensioner piston is fully bottomed in its bore or damage to the ratchet stem will result.

   Using a suitable tool, hold the right-hand timing chain tensioner ratchet lock mechanism away from the ratchet stem.

24. NOTE: The timing chain tensioner piston should retract with minimal force. If binding occurs, reposition the timing chain tensioner to eliminate side loading.

   Slowly compress the right-hand timing chain tensioner.

25. NOTE: The retaining tool must remain in the timing chain tensioner until the timing chain tensioner is installed to the engine with the piston bottomed in the bore.

   Using a suitable tool, retain the right-hand timing chain tensioner piston.
26. Install the primary timing chain tensioner assembly.
   - Tighten to 12 Nm.

27. Release the tension in the right-hand timing chain tensioner.
   - Remove the retaining tool.

28. **CAUTIONS:**

   - While applying the opposing force to sprocket and chain, tighten the sprocket bolt.
   - Make sure that a new bolt is installed.

   Using the special tool apply force to the tool in an anti-clockwise direction to tension the primary timing chain on its drive side.
   - Tighten to 20 Nm + 90 deg.

29. **CAUTIONS:**

   - While applying the opposing force to sprocket and chain, tighten the sprocket bolt.
   - Make sure that a new bolt is installed.

   Using the special tool apply force to the tool in an anti-clockwise direction.
   - Tighten to 20 Nm + 90 deg.

30. Remove the special tool to the Right-hand cylinder head.
31. Remove the special tool to the left-hand cylinder head.

Vehicles without supercharger

32. Install the left-hand variable camshaft timing oil control unit housing.
   - Install new O-ring seals.
   - Tighten to 22 Nm.

33. Install the right-hand variable camshaft timing oil control unit housing.
   - Install new O-ring seals.
   - Tighten to 22 Nm.

All vehicles

34. Remove the special tool.
35. Install the crankshaft position sensor.

36. Connect the crankshaft position sensor electrical connector.

37. Install the air deflector. For additional information, refer to: Air Deflector (501-02 Front End Body Panels, Removal and Installation).

38. Install the spark plugs.

39. Install the engine front cover. For additional information, refer to: Cylinder Head LH - VIN Range: M45255->N52047 (303-01B Engine - V8 4.2L Petrol/V8 S/C 4.2L Petrol, In-vehicle Repair).
**Engine - V8 4.2L Petrol/V8 S/C 4.2L Petrol - Timing Drive Components**

**VIN Range:** N52048->N99999

### In-vehicle Repair

### Removal

1. Remove the engine front cover. For additional information, refer to: Engine Front Cover - VIN Range: N52048->N99999 (303-01B Engine - V8 4.2L Petrol/V8 S/C 4.2L Petrol, In-vehicle Repair).
2. Remove the spark plugs.
3. Raise the vehicle.
4. Disconnect the crankshaft position (CKP) sensor electrical connector.
5. Remove the CKP sensor.
6. **CAUTIONS:**

⚠️ Make sure the spark plugs are removed to enable the engine to rotate freely.

⚠️ Do not rotate the crankshaft counterclockwise. The timing chains may bind causing engine damage.

⚠️ Rotate the crankshaft clockwise to position the engine to top dead center (TDC) No. 1 cylinder

Install the special tool 303-645.

7. Lower the vehicle.

8. Remove the right-hand variable camshaft timing oil control unit housing.
   - Remove and discard the O-ring seals.

9. Remove the left-hand variable camshaft timing oil control unit housing.
   - Remove and discard the O-ring seals.

10. Install the special tool to the left-hand cylinder head.

11. Install the special tool to the right-hand cylinder head.
12. Remove the primary timing chain tensioner assembly.

13. Remove the primary timing chain tensioner guide.

14. Remove the primary timing chain.

15. Remove the primary timing chain guide.

16. Remove the secondary timing chain tensioner retaining bolts.
17. Remove the camshaft sprockets.
   - Remove the secondary timing chain tensioner and secondary timing chain from the camshaft sprockets.

18. Remove the primary timing chain tensioner assembly.

19. Remove the primary timing chain tensioner guide.

20. Remove the primary timing chain.

21. Remove the crankshaft sprocket.
22. Remove the primary timing chain tensioner guide.

23. Remove the secondary timing chain tensioner retaining bolts.

24. Remove the camshaft sprockets.
   - Remove the secondary timing chain tensioner and secondary timing chain from the camshaft sprockets.

**Installation**

1. Using a suitable tool, retain the left-hand timing chain tensioner piston.
2. **CAUTIONS:**

⚠️ **Do not tighten the camshaft sprocket retaining bolts.**

⚠️ **Make sure the secondary timing chain and camshaft sprockets are free to rotate.**

Install the camshaft sprockets.

- Install the secondary timing chain tensioner and secondary timing chain to the camshaft sprockets.

3. Install the secondary timing chain tensioner retaining bolts.

   - Tighten to 12 Nm.

4. Release the tension in the left-hand timing chain tensioner.

   - Remove the retaining tool.

5. Install the timing chain tensioning tool 303-532 to the exhaust camshaft sprocket.

   - Reposition the camshaft sprockets for the most advantageous position for use of the tool.

6. Install the primary timing chain tensioner guide.

   - Tighten to 12 Nm.
7. Install the crankshaft sprocket.

8. **CAUTION:** Make sure the timing chain slack is on the tensioned side of the timing chain.
   - Install the primary timing chain.
     - Install the primary chain over the crankshaft sprocket and the intake sprocket.

9. Install the primary timing chain tensioner guide.
   - Tighten to 12 Nm.

10. **CAUTION:** During timing chain tensioner compression, do not release the ratchet stem until the timing chain tensioner piston is fully bottomed in its bore or damage to the ratchet stem will result.
    - Using a suitable tool, hold the left-hand timing chain tensioner ratchet lock mechanism away from the ratchet stem.

11. **NOTE:** The timing chain tensioner piston should retract with minimal force. If binding occurs, reposition the timing chain tensioner to eliminate side loading.
    - Slowly compress the left-hand timing chain tensioner.
12. NOTE: The retaining tool must remain in the timing chain tensioner until the timing chain tensioner is installed to the engine with the piston bottomed in the bore.

Using a suitable tool, retain the left-hand timing chain tensioner piston.

13. Install the primary timing chain tensioner assembly.
   - Tighten to 12 Nm.

14. Release the tension in the left-hand timing chain tensioner.
   - Remove the retaining tool.

15. CAUTIONS:
   - While applying the opposing force to sprocket and chain, tighten the sprocket bolt.
   - Make sure that a new bolt is installed.

Using the special tool apply force to the tool in an anti-clockwise direction to tension the primary timing chain on its drive side.
   - Tighten to 20 Nm + 90 deg.

16. CAUTIONS:
   - While applying the opposing force to sprocket and chain, tighten the sprocket bolt.
   - Make sure that a new bolt is installed.

Using the special tool apply force to the tool in an anti-clockwise direction.
   - Tighten to 20 Nm + 90 deg.
17. Using a suitable tool, retain the right-hand timing chain tensioner piston.

18. CAUTIONS:

⚠️ Do not tighten the camshaft sprocket retaining bolts.

⚠️ Make sure the secondary timing chain and camshaft sprockets are free to rotate.

- Install the camshaft sprockets.
  - Install the secondary timing chain tensioner and secondary timing chain to the camshaft sprockets.

19. Install the secondary timing chain tensioner retaining bolts.
  - Tighten to 12 Nm.

20. Install the timing chain tensioning tool 303-532 to the exhaust camshaft sprocket.
  - Reposition the camshaft sprockets for the most advantageous position for use of the tool.

21. Install the primary timing chain guide.
  - Tighten to 12 Nm.
22. **CAUTION:** Make sure the timing chain slack is on the tensioned side of the timing chain.

   Install the primary timing chain.
   - Install the primary chain over the crankshaft sprocket and the intake sprocket.

23. Install the primary timing chain tensioner guide.
   - Tighten to 12 Nm.

24. **CAUTION:** During timing chain tensioner compression, do not release the ratchet stem until the timing chain tensioner piston is fully bottomed in its bore or damage to the ratchet stem will result.

   Using a suitable tool, hold the right-hand timing chain tensioner ratchet lock mechanism away from the ratchet stem.

25. **NOTE:** The timing chain tensioner piston should retract with minimal force. If binding occurs, reposition the timing chain tensioner to eliminate side loading.

   Slowly compress the right-hand timing chain tensioner.

26. **NOTE:** The retaining tool must remain in the timing chain tensioner until the timing chain tensioner is installed to the engine with the piston bottomed in the bore.

   Using a suitable tool, retain the right-hand timing chain tensioner piston.
27. Install the primary timing chain tensioner assembly.
   - Tighten to 12 Nm.

28. Release the tension in the right-hand timing chain tensioner.
   - Remove the retaining tool.

29. CAUTIONS:
   - While applying the opposing force to sprocket and chain, tighten the sprocket bolt.
   - Make sure that a new bolt is installed.
   Using the special tool apply force to the tool in an anti-clockwise direction to tension the primary timing chain on its drive side.
   - Tighten to 20 Nm + 90 deg.

30. CAUTIONS:
   - While applying the opposing force to sprocket and chain, tighten the sprocket bolt.
   - Make sure that a new bolt is installed.
   Using the special tool apply force to the tool in an anti-clockwise direction.
   - Tighten to 20 Nm + 90 deg.

31. Remove the special tool from the right-hand cylinder head.
32. Remove the special tool from the left-hand cylinder head.

33. Install the left-hand variable camshaft timing oil control unit housing.
   - Install new O-ring seals.
   - Tighten to 22 Nm.

34. Install the right-hand variable camshaft timing oil control unit housing.
   - Install new O-ring seals.
   - Tighten to 22 Nm.

35. Raise the vehicle.

36. Remove the special tool.

37. Install the CKP sensor.
   - Tighten to 10 Nm.
38. Connect the CKP sensor electrical connector.

39. Lower the vehicle.

40. Install the spark plugs.

41. Install the engine front cover.
For additional information, refer to: Engine Front Cover - VIN Range: N52048->N99999 (303-01B Engine - V8 4.2L Petrol/V8 S/C 4.2L Petrol, In-vehicle Repair).
Removal

All vehicles

1. Remove the air cleaner. For additional information, refer to Section 303-12A Intake Air Distribution and Filtering / 303-12B Intake Air Distribution and Filtering / 303-12C Intake Air Distribution and Filtering.

2. Remove the ignition coil-on-plug cover.

3. Remove the oil level indicator and tube.
   - Remove and discard the O-ring seal.

Vehicles without supercharger

4. Remove the left-hand engine cover bracket.

5. Detach the engine wiring harness.
   1. Disconnect the variable camshaft timing (VCT) oil control solenoid electrical connector.
   2. Detach the engine wiring harness.
6. Detach the left-hand engine wiring harness.

7. Detach the fuel line retaining clip.

8. Detach the fuel line. For additional information, refer to Section 310-00 Fuel System - General Information.

9. Disconnect the ignition coil-on-plug electrical connectors.

10. Remove the ignition coil on-plugs.

11. Remove the valve cover assembly.
   - Remove and discard valve cover gaskets.
12. NOTE: On removal of the valve cover retaining bolts note their positions in the valve cover.

Remove the valve cover retaining bolts.

- Remove and discard the valve cover retaining bolt O-ring seals.

Installation

All vehicles

1. NOTE: Install the valve cover retaining bolts to their positions previously noted.

Install the valve cover retaining bolts.

- Install new valve cover retaining bolt O-ring seals.

2. Apply bead of silicone gasket sealant or equivalent meeting Jaguar specification on the two places where the cylinder head and front cover join.

- The application of sealant must be 3mm diameter by 12mm long. Install the valve cover immediately after applying the sealant.
- The cover should be fitted directly to the head without smearing the sealant or the seals.
3. Install the valve cover.
   - Install new valve cover gaskets.
   - Complete the tightening sequence.
   - Tighten to 12 Nm.

4. Install the ignition coil-on-plugs.
   - Tighten to 5 Nm.

5. Connect the ignition coil-on-plug electrical connectors.

6. Attach the left-hand engine wiring harness.

7. Connect the fuel line.
   - Attach the fuel line retaining clip.
   - Install new O-ring seals.
Vehicles without supercharger

8. Attach the engine wiring harness.
   1. Connect the variable camshaft timing (VCT) oil control solenoid electrical connector.
   2. Attach the engine wiring harness.

9. Install the left-hand engine cover bracket.
   - Tighten to 6 Nm.

All vehicles

10. Install the oil level indicator and tube.
    - Install a new O-ring seal.
    - Tighten to 6 Nm.

11. Install the ignition coil-on-plug cover.

12. Install the air cleaner. For additional information, refer to Section 303-12A Intake Air Distribution and Filtering / 303-12B Intake Air Distribution and Filtering / 303-12C Intake Air Distribution and Filtering.
1. Remove the air cleaner.
For additional information, refer to: Air Cleaner (303-12B Intake Air Distribution and Filtering - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Removal and Installation).

2. **CAUTION:** If power steering fluid comes into contact with the paintwork, the affected area must be immediately washed down with cold water.
Detach the power steering fluid reservoir.

3. Remove the oil level indicator and tube.
   - Remove and discard the O-ring seal.

4. Remove the ignition coil-on-plug cover.

5. **NOTE:** Vehicles with supercharger shown, vehicles without supercharger similar.
Detach the engine cover bracket.
6. Detach the engine wiring harness.
   1. Disconnect the variable camshaft timing (VCT) oil control solenoid electrical connector.
   2. Detach the engine wiring harness.

7. NOTE: Right-hand shown, left-hand similar.
   Detach the engine wiring harness.

8. Disconnect the fuel line.
   For additional information, refer to: Spring Lock Couplings (310-00 Fuel System - General Information, General Procedures).

9. Disconnect the ignition coil-on-plug electrical connectors.

10. Remove the ignition coil on-plugs.
11. Remove the valve cover assembly.
   - Remove and discard valve cover gaskets.

12. NOTE: On removal of the valve cover retaining bolts note their positions in the valve cover.

   Remove the valve cover retaining bolts.
   - Remove and discard the valve cover retaining bolt O-ring seals.

**Installation**

1. NOTE: Install the valve cover retaining bolts to their positions previously noted.

   Install the valve cover retaining bolts.
   - Install new valve cover retaining bolt O-ring seals.

2. Apply bead of silicone gasket sealant or equivalent meeting Jaguar specification on the two places where the cylinder head and front cover join.
   - The application of sealant must be 3mm diameter by 12mm long.
     - Install the valve cover immediately after applying the sealant.
   - The cover should be fitted directly to the head without smearing the sealant or the seals.
3. Install the valve cover.
   - Install new valve cover gaskets.
   - Complete the tightening sequence.
   - Tighten to 10 Nm.

4. Install the ignition coil-on-plugs.
   - Tighten to 5 Nm.

5. Connect the ignition coil-on-plug electrical connectors.

6. Connect the fuel line.
   - Attach the fuel line retaining clip.
   - Install new O-ring seals.

7. NOTE: Right-hand shown, left-hand similar.
   Attach the engine wiring harness.
8. Attach the engine wiring harness.
   1. Connect the VCT oil control solenoid electrical connector.
   2. Attach the engine wiring harness.

9. **NOTE:** Vehicles with supercharger shown, vehicles without supercharger similar.
   Attach the engine cover bracket.
   - Tighten to 6 Nm.

10. Install the ignition coil-on-plug cover.

11. Install the oil level indicator and tube.
    - Install a new O-ring seal.
    - Tighten to 6 Nm.

12. **CAUTION:** If power steering fluid comes into contact with the paintwork, the affected area must be immediately washed down with cold water.
    Attach the power steering fluid reservoir.

13. Install the air cleaner.
    For additional information, refer to: [Air Cleaner](303-12B Intake Air Distribution and Filtering - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Removal and Installation).
Removal

All vehicles

1. NOTE: Left-hand shown right-hand similar.
Remove the ignition coil-on-plug cover.

Vehicles without supercharger

2. Remove the right-hand engine cover bracket.

3. Detach the engine wiring harness.
   1. Detach the ground harness
   2. Disconnect the variable camshaft timing (VCT) oil control solenoid electrical connector.
   3. Detach the engine wiring harness.

All vehicles

4. Disconnect the positive crank ventilation (PCV) pipe.
5. Detach the right-hand engine wiring harness.

6. Remove the ignition coil-on-plugs.
   - Remove the retaining bolts.

7. Remove the ignition coil-on-plugs.
   - Remove the retaining bolts.

8. Remove the valve cover assembly.
   - Remove and discard valve cover gaskets.
Installation

All vehicles

1. **NOTE:** Install the valve cover retaining bolts to their positions previously noted.

   Install the valve cover retaining bolts.
   - Install new valve cover retaining bolt O-ring seals.

2. Install the valve cover.
   - Install new valve cover gaskets.
   - Complete the tightening sequence.
   - Tighten to 12 Nm.

3. Install the ignition coil-on-plugs.
   - Tighten to 5 Nm.
4. Attach the right-hand engine wiring harness.

5. Connect the positive crank ventilation (PCV) pipe.

Vehicles without supercharger

6. Attach the engine wiring harness.
   1. Attach the ground harness
   2. Connect the VCT oil control solenoid electrical connector.
   3. Attach the engine wiring harness.

7. Install the right-hand engine cover bracket.

All vehicles
8. NOTE: Left-hand shown right-hand similar.
Install the ignition coil-on-plug cover.
Removal

All vehicles

1. NOTE: Left-hand shown, right-hand similar.
   Remove the ignition coil-on-plug cover.

Vehicles without supercharger

2. Remove the engine cover right-hand bracket.

All vehicles

3. Detach the engine wiring harness.
   1. Detach the ground harness.
   2. Disconnect the variable camshaft timing (VCT) oil control solenoid electrical connector.
   3. Detach the engine wiring harness.

4. Detach the engine wiring harness.
5. Disconnect the positive crank ventilation (PCV) pipe.

6. Disconnect the ignition coil on-plug electrical connectors.

7. NOTE: Left-hand shown, right-hand similar.
   Remove the ignition coil-on-plugs.

8. Remove the valve cover assembly.
   • Remove and discard valve cover gaskets.
9. **NOTE:** On removal of the valve cover retaining bolts note their positions in the valve cover.

Remove the valve cover retaining bolts.
- Remove and discard the valve cover retaining bolt O-ring seals.

---

**Installation**

All vehicles

1. **NOTE:** Install the valve cover retaining bolts to their positions previously noted.

Install the valve cover retaining bolts.
- Install new valve cover retaining bolt O-ring seals.

2. Apply bead of silicone gasket sealant or equivalent meeting Jaguar specification on the two places where the cylinder head and front cover join.

- The application of sealant must be 3mm diameter by 12mm long.
  
  Install the valve cover immediately after applying the sealant.

- The cover should be fitted directly to the head without smearing the sealant or the seals.

3. Install the valve cover.

- Install new valve cover gaskets.
- Complete the tightening sequence.
- Tighten to 10 Nm.
4. **NOTE:** Left-hand shown, right-hand similar.
   Install the ignition coil-on-plugs.
   - Tighten to 5 Nm.

5. Connect the ignition coil on-plug electrical connectors.

6. Connect the PCV pipe.

7. Attach the engine wiring harness.

8. Attach the engine wiring harness.
   1. Attach the ground harness.
   2. Connect the VCT oil control solenoid electrical connector.
   3. Attach the engine wiring harness.
Vehicles without supercharger

9. Install the engine cover bracket.
   • Tighten to 6 Nm.

All vehicles

10. NOTE: Left-hand shown, right-hand similar.
    Install the ignition coil-on-plug cover.
Engine - V8 4.2L Petrol/V8 S/C 4.2L Petrol - Crankshaft Main Bearing Carrier

**Removal**

All vehicles

1. Remove the engine from the vehicle.
2. Mount the engine to an engine stand.
Vehicles without supercharger

3. Disconnect the oil cooler hoses.

Vehicles with supercharger

4. Detach the supercharger belt.
   - Use a ½ inch square drive bar to rotate the supercharger belt tensioner.
   - Detach the supercharger belt.

5. Remove the supercharger belt tensioner.
   - Remove the supercharger belt.

6. Remove the supercharger belt idler pulley.
   - Remove the retaining bolt.
7. Remove the mounting bracket.
   - Remove the retaining bolts.

All vehicles

8. Detach the accessory drive belt.
   - Rotate the accessory drive belt tensioner counter-clockwise.
   - Detach the accessory drive belt.

9. Remove the accessory drive belt tensioner.
   - Remove the accessory drive belt.

10. Remove the accessory drive belt idler pulley.
11. Detach the battery positive cable.

12. Detach the generator battery positive cable protective cover.

13. Remove the battery positive cable.
   - Remove the retaining nut.

14. Disconnect the generator electrical connector.

15. Remove the generator.
16. Detach the engine wiring harness.

17. Remove the generator mounting bracket.

18. Detach the right-hand heated oxygen sensor (HO2S) retaining bracket.
   - Remove the retaining bolt.

19. Detach the HO2S wiring harness, from the engine.

20. Remove the starter motor.
21. **NOTE:** Right-hand shown, left-hand similar.
   Remove both engine mounts.
   - Remove the retaining nuts.

22. Disconnect the air conditioning compressor electrical connector.

23. Detach the A/C compressor wiring harness.
   - Remove the retaining nut.

24. Remove the A/C compressor.

25. Remove the air conditioning compressor mounting bracket.
26. Remove the power steering pump.

27. Remove the power steering pump mounting bracket.

28. Remove the oil level indicator and tube.
   • Remove and discard the O-ring seal.

29. Disconnect the crankshaft position (CKP) sensor electrical connector.

30. Remove the CKP sensor.
31. Detach the left-hand heated oxygen sensor (HO2S) wiring harness.
   • Remove the retaining bolt.

32. Detach the engine wiring harness from the cylinder block.

33. Detach the engine wiring harness.

34. Detach the engine wiring harness.
   • Disconnect the variable camshaft timing (VCT) solenoid electrical connector.
   • Detach the engine wiring harness.

Vehicles without supercharger
35. Disconnect the engine coolant temperature (ECT) sensor electrical connector.

36. Remove the thermostat housing.
   - Remove and discard the O-ring seals.

Vehicles with supercharger

37. Disconnect the thermostat housing hoses

38. Disconnect the ECT sensor electrical connector.
39. Reposition the thermostat housing hose retaining clip.

40. Disconnect the hose.

41. Disconnect the heater supply hose from the thermostat housing.

42. Disconnect the water pump outlet hose.

43. Remove the thermostat housing retaining bolts.
44. Remove the thermostat housing.
   - Remove and discard thermostat housing O-ring seals.

Vehicles without supercharger

45. Remove the engine cover left-hand retaining bracket.

46. Remove the engine cover right-hand retaining bracket.

All vehicles

47. NOTE: Left-hand shown, right-hand similar.

Remove both ignition coil covers.
48. Disconnect the left-hand ignition coil electrical connectors.

49. Detach the left-hand ignition coil wiring harness.

50. Detach the left-hand ignition coil wiring harness.

51. Detach the right-hand ignition coil wiring harness.

52. Disconnect the right-hand ignition coil electrical connectors.
53. Detach the right-hand ignition coil wiring harness.

54. Detach the engine wiring harness.
   - Detach the ground cable.
   - Disconnect the variable camshaft timing (VCT) solenoid electrical connector.
   - Detach the engine wiring harness.

55. NOTE: Left-hand shown, right-hand similar

Remove the ignition coils.
   - Remove the retaining bolts.

Vehicles without supercharger

56. Disconnect the positive crankcase ventilation (PCV) pipe.

All vehicles

57. Remove the right-hand valve cover.
   - Remove and discard the valve cover gaskets.
58. Remove the left-hand valve cover.
   - Remove and discard the valve cover gaskets.

59. Using the special tool, remove the water pump pulley.
   - Using the special tool, retain the water pump pulley.

60. NOTE: Place a suitable container underneath the oil filter housing to prevent oil spillage.
    Remove the oil filter.
61. Disconnect the oil pressure switch and oil temperature sensor electrical connectors.

62. Remove the oil filter housing.
   - Remove and discard the O-ring seal.

63. **CAUTION:** Under no circumstances should the crankshaft setting peg 303-645 be used in the following operations to lock the crankshaft.
   - **NOTE:** The crankshaft retaining bolt will be very tight.
     Using special tools, retain the crankshaft pulley.
     - Remove and discard the crankshaft pulley bolt.

64. Remove the special tools.

65. **NOTE:** The crankshaft pulley will be very tight.
   Using special tools, remove the crankshaft pulley.
   - Collect the locking ring.
   - Remove and discard the O-ring seal.
66. Using the special tool, remove the crankshaft front seal.

67. **CAUTIONS:**

- **⚠️** Make sure the spark plugs are removed to enable the engine to rotate freely.

- **⚠️** Do not rotate the crankshaft counterclockwise. The timing chains may bind causing engine damage.

- **⚠️** Rotate the crankshaft clockwise to position the engine to top dead center (TDC) No. 1 cylinder

  Install the special tool.

68. Remove the engine front cover.
69. Remove the left-hand VCT oil control unit housing.
   - Remove and discard the O-ring seals.

70. Install the special tool to the left-hand cylinder head.

71. Loosen the left-hand exhaust camshaft sprocket retaining bolt.

72. Loosen the left-hand inlet camshaft sprocket retaining bolt.

73. Remove the right-hand VCT oil control unit housing.
   - Remove and discard the O-ring seals.
74. Install the special tool to the right-hand cylinder head.

75. Loosen the right-hand exhaust camshaft sprocket retaining bolt.

76. Loosen the right-hand exhaust camshaft sprocket retaining bolt.

77. Remove the right-hand primary timing chain tensioner assembly.

78. Remove the right-hand primary timing chain tensioner guide.
79. Remove the right-hand primary timing chain.

80. Remove the right-hand primary timing chain guide.

81. Remove the left-hand primary timing chain tensioner assembly.

82. Remove the left-hand primary timing chain tensioner guide.

83. Remove the left-hand primary timing chain.
84. Remove the crankshaft sprocket.

85. Remove the left-hand primary timing chain tensioner guide.

86. Remove the special tool.

87. **CAUTION:** The bolts can only be used 3 times, mark the bolts with a center punch. If 2 punch marks are visible, discard the bolts.

   Remove the drive plate.
   - Remove the 8 bolts.

88. Remove the lower oil pan.
   - Remove and discard the gasket.
89. Remove the oil strainer.
   - Remove and discard the O-ring seal.

90. Remove the upper oil pan.

91. Remove the oil pump.
   - Remove and discard the gasket.

92. **CAUTION:** To make sure damage does not occur to the crankshaft and piston components, the engine must be inverted on the engine stand. Failure to follow this instruction may result in damage to the engine.

   - **NOTE:** If the crankshaft main bearing carrier retaining bolts have been marked with a center punch dot, they must be discarded and new bolts installed.

   Remove the crankshaft main bearing carrier.
   - Remove the crankshaft main bearing carrier retaining bolts in the indicated sequence.
93. Discard the crankshaft rear main oil seal.

**Installation**

**All vehicles**

1. **CAUTIONS:**

   - Use only a plastic scraper when removing the sealing material.

   - If any new bolts are to be installed to retain the crankshaft main bearing carrier, pre-stress the retaining bolts by installing the crankshaft main bearing carrier without any sealant and tightening the new retaining bolts to the specified torque. Remove the crankshaft main bearing carrier once the bolts have been pre-stressed. Failure to follow this instruction may result in damage to the vehicle.
Clean all the mating faces and reusable parts thoroughly and check for damage.

2. **NOTE:** Install the crankshaft main bearing carrier and tighten bolts to specification within twenty minutes of applying the sealant.

   Apply a 2 mm (0.08in) bead of sealant to the cylinder block in the area shown.
   - Use WSS-M4G323-A4-RTV sealant.

3. **NOTE:** Install the crankshaft main bearing carrier and tighten bolts to specification within twenty minutes of applying the sealant.

   Apply a 1 mm (0.039in) bead of sealant to the cylinder block in the area shown.
   - Use WSS-M4G323-A4-RTV sealant.

4. **CAUTION:** Make sure all dowels are fully seated into the crankshaft main bearing carrier prior to tightening the bolts.

   - **NOTE:** Do not lubricate the crankshaft main bearing carrier retaining bolts.
   - **NOTE:** Do not rotate the crankshaft until all the retaining bolts are tightened to specification.
   - **NOTE:** The retaining bolts must be tightened within twenty minutes of applying the sealant.
   - **NOTE:** Tighten the retaining bolts in the sequence shown.

   Install the crankshaft main bearing carrier to the cylinder block.
   - Stage 1: Bolts 21 to 32, tighten to 15 Nm.
   - Stage 2: Bolts 33 to 34, tighten to 15 Nm.
   - Stage 3: Bolts 1 to 10, tighten to 25 Nm.
   - Stage 4: Bolts 11 to 20, tighten to 15 Nm.
   - Stage 5: Bolts 1 to 10, tighten to 35 Nm + 135 degrees.
   - Stage 6: Bolts 11 to 20, tighten to 20 Nm + 150 degrees.
   - Stage 7: Bolts 21 to 32, tighten to 20 Nm + 90 degrees.
   - Stage 8: Bolts 33 to 34, tighten to 20 Nm + 150 degrees.
   - Stage 9: Center punch each of the bolt heads to indicate it has been reused.
5. Remove the special tool.

6. Remove the special tool from the left-hand cylinder head.
7. Remove the special tool from the right-hand cylinder head.

8. **CAUTION:** Make sure that number 1 cylinder intake camshaft lobes are vertical to the cylinder head face.
   Position the right-hand camshafts to the neutral position.

9. **CAUTION:** Make sure that number 2 cylinder exhaust camshaft lobes are vertical to the cylinder head face.
   Position the left-hand camshafts to the neutral position.

10. **CAUTIONS:**
    - Make sure no binding of the crankshaft occurs.
    - Make sure the spark plugs are removed to enable the engine to rotate freely.
      Carefully rotate the crankshaft two complete turns to check for correct operation.

11. **CAUTIONS:**
    - Make sure the spark plugs are removed to enable the engine to rotate freely.
    - Do not rotate the crankshaft counterclockwise.
    - Rotate the crankshaft clockwise to position the engine to top dead center (TDC) No. 1 cylinder
      Install the special tool.
12. Install the special tool to the left-hand cylinder head.

13. Install the special tool to the right-hand cylinder head.

14. Remove excess sealant which may squeeze out at the front cover sealing surfaces.

15. NOTE: Make sure the transit sleeve is correctly positioned.

   Align the rear crankshaft oil seal, to the crankshaft.

   • Carefully remove the transit sleeve, leaving the seal in place.

16. Install the special tool to the crankshaft.

17. Reposition the nuts to hold the special tool against the crankshaft rear seal. Check that the crankshaft rear seal and the special tool are parallel to the rear of the engine.
18. NOTE: Alternate nut tightening to correctly seat the crankshaft rear seal.
   Using the special tool, install the crankshaft rear seal.

19. Remove the special tool from the crankshaft.
   • Check that the seal is located correctly.

20. NOTE: Install a new gasket.
   Install the oil pump.
   • Tighten to 12 Nm.

21. NOTE: It is important that the oil pan extension is bolted to the crankshaft main bearing carrier within twenty minutes of applying the sealant.
   Apply a continuous 3mm bead of sealant around the crankshaft main bearing carrier flange OR around the oil pan body flange as shown.
   • Use WSS-M4G323-A4-RTV sealant.

22. NOTE: It is important that the oil pan extension is bolted to the crankshaft main bearing carrier within twenty minutes of applying the sealant.
   Apply a continuous 2mm bead of sealant, around the diverter valve flange as shown.
   • Use WSS-M4G323-A4-RTV sealant.
23. NOTE: Tighten the retaining bolts in the sequence shown.

Install the upper oil pan.

- Tighten to 21 Nm.
24. **NOTE:** Install a new O-ring seal.

Install the oil strainer.
- Tighten to 12 Nm.

25. Install the oil pan gasket to the oil pan body assembly.

26. Install the lower oil pan.
- Install, but do not fully tighten the retaining bolts.

27. Tighten the retaining bolts in the indicated sequence in two stages.
- Stage 1: bolts 1 to 7, tighten to 5 Nm.
- Stage 2: bolts 1 to 17, tighten to 12 Nm.
28. Install the drive plate.
   - Install the drive plate retaining bolts, and tighten in 2 stages.
   - Stage 1: Tighten to 15 Nm.
   - Stage 2: Tighten to 110 Nm.

29. Position the crankshaft.
   - Install the special tool.

30. Install the left-hand primary timing chain tensioner guide.
   - Tighten to 12 Nm.
31. Install the crankshaft sprocket.

32. **CAUTION:** Make sure the timing chain slack is on the tensioned side of the timing chain.

   Install the left-hand primary timing chain.
   - Install the primary chain over the crankshaft sprocket and the intake sprocket.

33. Install the left-hand primary timing chain tensioner guide.
   - Tighten to 12 Nm.

34. **CAUTION:** Use suitable protective covers on the vice jaws to protect the timing chain tensioner.

   Secure the left-hand timing chain tensioner in the vice jaws.

35. **CAUTION:** During timing chain tensioner compression, do not release the ratchet stem until the timing chain tensioner piston is fully bottomed in its bore or damage to the ratchet stem will result.

   Using a suitable tool, hold the left-hand timing chain tensioner ratchet lock mechanism away from the ratchet stem.

36. **NOTE:** The timing chain tensioner piston should retract with minimal force. If binding occurs, reposition the timing chain tensioner to eliminate
side loading.

Slowly compress the left-hand timing chain tensioner.

37. NOTE: The retaining tool must remain in the timing chain tensioner until the timing chain tensioner is installed to the engine with the piston bottomed in the bore.

Using a suitable tool, retain the left-hand timing chain tensioner piston.

38. Install the left-hand primary timing chain tensioner assembly.
   
   • Tighten to 12 Nm.

39. Release the tension in the left-hand timing chain tensioner.
   
   • Remove the retaining tool.

40. CAUTION: While applying the opposing force to sprocket and chain, tighten the sprocket bolt.

   Using the special tool apply force to the tool in an anti-clockwise direction to tension the primary timing chain on its drive side.
   
   • Tighten to 120 Nm.

41. CAUTION: While applying the opposing force to sprocket and chain, tighten the sprocket bolt.

   Using the special tool apply force to the tool in an anti-clockwise direction.
   
   • Tighten to 120 Nm.
42. Install the right-hand primary timing chain guide.
   - Tighten to 12 Nm.

43. **CAUTION:** Make sure the timing chain slack is on the tensioned side of the timing chain.

   Install the right-hand primary timing chain.
   - Install the primary chain over the crankshaft sprocket and the intake sprocket.

44. Install the right-hand primary timing chain tensioner guide.
   - Tighten to 12 Nm.

45. **CAUTION:** Use suitable protective covers on the vice jaws to protect the timing chain tensioner.

   Secure the right-hand timing chain tensioner in the vice jaws.

46. **CAUTION:** During timing chain tensioner compression, do not release the ratchet stem until the timing chain tensioner piston is fully bottomed in its bore or damage to the ratchet stem will result.

   Using a suitable tool, hold the right-hand timing chain tensioner ratchet lock mechanism away from the ratchet stem.

47. **NOTE:** The timing chain tensioner piston should retract with minimal force. If binding occurs, reposition the timing chain tensioner to eliminate
side loading.

Slowly compress the right-hand timing chain tensioner.

48. **NOTE:** The retaining tool must remain in the timing chain tensioner until the timing chain tensioner is installed to the engine with the piston bottomed in the bore.

Using a suitable tool, retain the right-hand timing chain tensioner piston.

49. Install the right-hand primary timing chain tensioner assembly.
   - Tighten to 12 Nm.

50. Release the tension in the right-hand timing chain tensioner.
    - Remove the retaining tool.

51. **CAUTION:** While applying the opposing force to sprocket and chain, tighten the sprocket bolt.

Using the special tool apply force to the tool in an anti-clockwise direction to tension the primary timing chain on its drive side.
   - Tighten to 120 Nm.

52. **CAUTION:** While applying the opposing force to sprocket and chain, tighten the sprocket bolt.

Using the special tool apply force to the tool in an anti-clockwise direction.
   - Tighten to 120 Nm.
53. Remove the special tool from the right-hand cylinder head.

54. **NOTE: Install new O-ring seals.**
   
   Install the right-hand VCT oil control unit housing.
   
   - Tighten to 22 Nm.

55. Remove the special tool from the left-hand cylinder head.

56. **NOTE: Install new O-ring seals.**
   
   Install the left-hand VCT oil control unit housing.
   
   - Tighten to 22 Nm.

57. Install new seals to the timing cover.
   
   - Install the new seal to the inner groove on the face of the timing cover.
   
   - Install the new seal to the outer groove on the face of the timing cover.
58. Apply sealant to the eight joints on the engine face.
   - Sealant beads to be 3mm diameter and 12mm long. Cut the nozzle of the sealant tube to produce a 3mm (0.12 in) bead. (Install and tighten the securing bolts within twenty minutes of sealant application).

59. Install the timing cover.
   - Tighten in the sequence shown.

60. CAUTIONS:
   - Make sure the crankshaft front seal mating faces are clean and dry.
   - Do not remove the crankshaft front seal protector.

Using the special tool, install a new crankshaft front seal.

61. Remove the crankshaft seal protector.
62. Remove the special tool.

63. Install the CKP sensor.
   - Tighten to 12 Nm.

64. Install a new O-ring seal to the crankshaft pulley.
   - Lubricate the new O-ring.

65. CAUTIONS:

   - The screw thread in the crankshaft must be cleaned out before a new crankshaft pulley bolt is installed.
   - A new crankshaft pulley bolt must be used.
   - Install, but do not tighten, a new crankshaft pulley retaining bolt.
     - Install the crankshaft pulley and locking ring to the crankshaft.

66. CAUTION: Under no circumstances should the crankshaft setting peg 303-645 be used in the following operations to lock the crankshaft.

   - Using special tools, retain the crankshaft pulley.
     - Tighten the crankshaft pulley retaining bolt to 375 Nm.

67. Remove the special tools.
68. NOTE: Install a new gasket.
   Install the oil filter housing.
   - Tighten to 21 Nm.

69. Connect the oil pressure switch and oil temperature sensor electrical connectors.

70. NOTE: Apply a suitable amount of clean engine oil to lubricate the oil filter O-ring seal.
   Install a new oil filter.
   - Tighten to 18 Nm.

71. Install the water pump pulley.
   - Using the special tool, retain the water pump pulley.
   - Tighten to 10 Nm + 45°.
72. NOTE: Install new valve cover gaskets.
• NOTE: Apply an 8mm diameter bead of silicone gasket sealant on the two places where the cylinder head and front cover join.

Install the left-hand valve cover.
  • Tighten in the sequence shown to 10 Nm.

73. NOTE: Install new valve cover gaskets.
• NOTE: Apply an 8mm diameter bead of silicone gasket sealant on the two places where the cylinder head and front cover join.

Install the left-hand valve cover.
  • Tighten in the sequence shown to 10 Nm.

Vehicles without supercharger

74. Connect the PCV pipe.

All vehicles

75. NOTE: Left-hand shown, right-hand similar

Install the ignition coils.
  • Tighten to 5 Nm.
76. Attach the engine harness.
   - Connect the VCT solenoid electrical connector.
   - Attach the engine harness.

77. Attach the right-hand ignition coil wiring harness.

78. Connect the right-hand ignition coil electrical connectors.

79. Attach the right-hand ignition coil wiring harness.

80. Attach the left-hand ignition coil wiring harness.
81. Attach the left-hand ignition coil wiring harness.

82. Connect the left-hand ignition coil electrical connectors.

83. NOTE: Left-hand shown, right-hand similar.
   Install both ignition coil covers.

Vehicles without supercharger

84. Install the right-hand engine cover retaining bracket.
85. Install the left-hand engine cover retaining bracket.

Vehicles with supercharger

86. NOTE: Install new O-ring seals to the thermostat housing.

Install thermostat housing.
- Tighten to 10 Nm.

87. Tighten to 10 Nm.

88. Connect the water pump outlet to thermostat housing hose.
89. Connect the heater supply hose to the thermostat housing.

90. Connect the thermostat outlet hose.

91. Reposition the thermostat housing hose retaining clip.

92. Connect the ECT sensor electrical connector.

93. Connect the thermostat housing hoses.
Vehicles without supercharger

94. NOTE: Install new O-ring seals.
   Install the thermostat housing.
   • Tighten to 10 Nm.

95. Connect the ECT sensor electrical connector.

All vehicles

96. Attach the engine wiring harness.
   • Connect the VCT solenoid electrical connector.
   • Attach the engine wiring harness.

97. Attach the engine wiring harness to the cylinder block.
98. Attach the engine wiring harness to the cylinder block.

99. Attach the left-hand HO2S wiring harness.
   - Install the retaining bolt.
   - Tighten to 10 Nm.

100. Connect the CKP sensor electrical connector.

101. NOTE: Install a new O-ring seal.
   Install the oil level indicator and tube.
   - Tighten to 6 Nm.

102. Install the power steering pump mounting bracket.
   - Tighten to 25 Nm.
103. Install the power steering pump.
   • Tighten to 25 Nm.

104. Install the A/C compressor mounting bracket.
   • Tighten to 25 Nm.

105. Install the A/C compressor.
   • Tighten to 25 Nm.

106. Attach the A/C compressor harness.
   • Install the retaining nut.
   • Tighten to 10 Nm.

107. Connect the A/C compressor electrical connector.
108. NOTE: Right-hand shown, left-hand similar.

Install both engine mounts.
- Tighten to 43 Nm.

109. Install the starter motor.
- Tighten to 45 Nm.

110. Attach the right-hand HO2S wiring harness to the cylinder block.

111. Attach the right-hand HO2S electrical connector retaining bracket.
- Install the retaining bolt.
- Tighten to 10 Nm.

112. Install the generator mounting bracket.
- Tighten to 45 Nm.
113. Attach the engine wiring harness.

114. Install the generator.
   - Tighten the generator upper retaining bolt to 21 Nm.
   - Tighten the generator lower retaining bolts to 40 Nm.

115. Connect the generator electrical connector.

116. Connect the battery positive cable.
   - Tighten to 12 Nm.

117. Attach the generator battery positive cable protective cover.
118. Attach the battery positive cable.

119. Install the accessory drive belt idler pulley.
   - Tighten to 25 Nm.

120. Install the accessory drive belt tensioner.
   - Install the accessory drive belt.
   - Tighten to 45 Nm.

121. Release the accessory drive belt tension.
   - Attach the accessory drive belt.

Vehicles with supercharger
122. Install the mounting bracket.
   - Tighten to 9 Nm.

123. Install the supercharger belt idler pulley.
   - Tighten to 40 Nm.

124. Install the supercharger belt tensioner.
   - Install the supercharger belt.
   - Tighten to 40 Nm.

125. Attach the supercharger belt.
   - Use a ½ inch square drive bar to rotate the supercharger belt tensioner.
   - Attach the supercharger belt.

Vehicles without supercharger
126. Connect the oil cooler hoses.

All vehicles

127. Remove the engine from the engine stand.
128. Install the engine into the vehicle.
Engine - V8 4.2L Petrol/V8 S/C 4.2L Petrol - Engine

Removal

All Vehicles

1. Reclaim the air conditioning refrigerant
   For additional information, refer to Section 412-00 Climate Control System - General Information.

2. Remove the automatic transmission
   For additional information, refer to Section 307-01 Automatic Transmission/Transaxle.

3. NOTE: Left hand shown, right hand similar.
   Remove the engine mount retaining nuts.

Vehicles with supercharger

4. Detach the oil cooler lines.
   - Remove and discard the oil cooler O rings
5. Remove the oil cooler inlet line.
   - Remove and discard the O rings.

6. Remove the oil cooler outlet line.
   - Remove and discard the O rings.

All vehicles

7. Disconnect the engine ground cable.

8. Attach the starter motor positive cable cover.
9. Detach the starter motor positive cable.

10. Detach the air conditioning compressor line.
    - Remove and discard the O-ring seals

11. **CAUTION:** Do not use heat to loosen a seized wheel nut. Excessive heat may cause damage to the wheel and wheel bearings. Loosen the wheel nuts.

12. Remove the right hand wheel and tire assembly.

13. Remove the right hand fender splash shield.
14. Detach the ground cable.

15. Lower the vehicle.

16. Remove the hood.  
   For additional information, refer to Section  _501-03 Body Closures_.

17. Remove the radiator assembly. For additional information, refer to  
   Section _303-03A Engine Cooling / 303-03B Supercharger Cooling/ 
   303-03C Engine Cooling_.

18. Remove the cabin air filter. 
   For additional information, refer to Section _412-01 Air Distribution and Filtering_.

19. Remove the engine compartment support.

20. Remove the cabin air filter housing retaining nut.

21. Remove the cabin air filter housing.
22. Remove the engine compartment panel.

23. **NOTE:** The engine control module (ECM) electrical connector retaining bolt remains captive in the electrical connector

   Disconnect the ECM electrical connector.

24. Disconnect the engine harness electrical connector.

25. Disconnect the engine harness electrical connector.

26. Detach the engine harness electrical connector.
27. Remove the air cleaner. For additional information, refer to Section 303-12A Intake Air Distribution and Filtering / 303-12B Intake Air Distribution and Filtering / 303-12C Intake Air Distribution and Filtering.

28. Remove the power steering fluid reservoir. For additional information, refer to Section 211-02 Power Steering.

Vehicles without supercharger

29. Remove the air cleaner. For additional information, refer to Section 303-12A Intake Air Distribution and Filtering / 303-12B Intake Air Distribution and Filtering / 303-12C Intake Air Distribution and Filtering.

Vehicles with supercharger

30. Remove the air cleaner. For additional information, refer to Section 303-12A Intake Air Distribution and Filtering / 303-12B Intake Air Distribution and Filtering / 303-12C Intake Air Distribution and Filtering.

31. Remove the air intake tube.

All Vehicles

32. Install the right hand rear engine lifting bracket.

33. Detach the bulkhead ground cable.
34. Install the left hand rear engine lifting bracket.

35. Install the front engine lifting eyes.

Vehicles with supercharger

36. Detach the brake booster vacuum pipe.

Vehicles without supercharger

37. Detach the brake booster vacuum pipe.

All vehicles
38. Detach the fuel line retaining clip.

39. Detach the fuel line. For additional information, refer to Section 310-00 Fuel System - General Information.

40. Detach fuel purge line.
   - Remove and discard retaining clip.

41. Remove the engine using a suitable hydraulic lift.
## Engine - V8 4.2L Petrol/V8 S/C 4.2L Petrol - Engine

### Disassembly

**Vehicles without supercharger**

1. Disconnect the oil cooler hoses.

**Vehicles with supercharger**
2. Detach the supercharger belt.
   - Use a 1/2 inch square drive bar to rotate the supercharger belt tensioner.
   - Detach the supercharger belt.

3. Release the accessory drive belt tension.
   - Detach the accessory drive belt.

4. Remove the accessory drive belt tensioner.
   - Remove the accessory drive belt.

5. Remove the accessory drive belt idler pulley.
6. Detach the wiring harness.

7. Remove the wiring harness.
   - Remove the retaining nut.

8. Disconnect the generator electrical connector.

9. Remove the generator.

10. Detach the engine wiring harness.
11. Remove the generator mounting bracket.

12. Detach the right hand oxygen sensor retaining bracket.

13. Detach the engine wiring harness.

14. Remove the starter motor.

15. Remove the oil level indicator and tube.
   • Remove and discard the O-ring seal.
16. Remove the heat shield.

17. Remove the heat shield retaining bolt.

18. Remove the left-hand exhaust manifold.
   - Remove and discard the gasket.

19. Remove the left-hand engine mount.

20. Remove the left-hand engine mounting bracket.
21. Disconnect the air conditioning compressor electrical connector.

22. Remove the A/C compressor.

23. Remove the air conditioning compressor mounting bracket.

24. Remove the power steering pump.

25. Remove the power steering pump mounting bracket.
26. Disconnect the crankshaft position sensor electrical connector.

27. Remove the crankshaft position sensor.

28. Detach the engine wiring harness.

29. Detach the engine wiring harness.

30. Detach the engine wiring harness.
31. Detach the engine wiring harness.
   1. Disconnect the variable valve timing (VCT) solenoid electrical connector.
   2. Detach the engine wiring harness.

Vehicles without supercharger
32. Disconnect the coolant temperature sensor electrical connector.

Vehicles with supercharger
33. Detach the hoses.
   - Reposition the hose retaining clip.

34. Detach the supercharger outlet pipe coolant hose.
   - Cap the coolant ports.
35. **CAUTION**: Make sure no foreign matter enters the supercharger.

Remove the supercharger outlet pipe

36. Remove and discard the supercharger outlet pipe gasket.
37. Remove and discard the supercharger outlet pipe retaining bolt seals.
38. Remove and discard the supercharger outlet pipe to charge air coolers ducts.

39. Disconnect the thermostat housing hoses

40. Disconnect the coolant temperature sensor electrical connector.
41. Reposition the thermostat housing hose retaining clip.

42. Disconnect the hose.

43. Disconnect the hose.

44. Disconnect the hose.

45. Disconnect the hose.
46. Remove the thermostat housing retaining bolts.

47. Remove the thermostat housing.
   - Remove and discard thermostat housing O-ring seals.

48. Disconnect the charge air cooler coolant pipes.

49. Disconnect the intake air temperature (IAT) sensor electrical connector.

50. Disconnect the electrical connectors.
51. Detach the coolant hose from the throttle body.

52. Remove the throttle body.
   - Remove and discard the gasket.

53. Disconnect the exhaust gas recirculation (EGR) valve electrical connector.

54. NOTE: Cap the exposed ports.
    Disconnect the coolant hoses.

55. Remove the EGR valve and the exhaust manifold to EGR valve tube.
   - Remove the retaining bolts.
   - Remove and discard the exhaust manifold to EGR valve tube gasket.
   - Remove and discard the EGR valve to air intake elbow gasket.
56. Disconnect the air intake elbow pipes.

57. NOTE: Make sure correct location of the ground strap is noted.
Remove the air intake elbow retaining bracket lower retaining bolts.

58. Detach the air intake elbow.
- Remove and discard the gasket.
- Remove and discard the retaining bolt seals.

59. Remove the air intake elbow.
- Disconnect the manifold absolute pressure (MAP) sensor

60. Remove the supercharger.
61. CAUTION: Make sure no foreign matter enters the cylinder head ports.

- NOTE: Right hand shown left hand similar

Remove the charge air coolers.
  - Remove and discard the charge air cooler gasket.

All vehicles

62. Disconnect the knock sensor electrical connectors.

63. NOTE: Left-hand shown, right-hand similar.

Remove the ignition coil cover.

Vehicles without supercharger

64. Remove the engine cover retaining bracket.
65. Remove the engine cover retaining bracket.

66. Detach the engine wiring harness.

67. Disconnect the fuel injector electrical connectors.

68. Disconnect the ignition coil electrical connectors.
69. Detach the engine wiring harness.

70. Detach the engine wiring harness.

71. Disconnect the camshaft position sensor electrical connector.

72. Detach the engine wiring harness.
   1. Detach the ground cable.
   2. Disconnect the variable valve timing (VCT) solenoid electrical connector.
   3. Detach the engine wiring harness.

Vehicles without supercharger
73. Disconnect the positive crankcase ventilation pipe.

74. Disconnect the fuel pressure regulator electrical connector.

75. Disconnect the exhaust gas recirculation valve electrical connector.

76. Disconnect the exhaust gas recirculation valve coolant hose.

All vehicles
77. Detach the engine wiring harness.

78. Disconnect the fuel injector electrical connectors.

79. Detach the engine wiring harness.

80. Disconnect the ignition coil electrical connectors.

81. Disconnect the fuel temperature sensor electrical connector.
82. Disconnect the camshaft position sensor electrical connector.

83. Detach the engine wiring harness.

Vehicles without supercharger

84. Detach the engine wiring harness.

85. Remove the intake manifold.

All vehicles
86. NOTE: Place a suitable container underneath filter to prevent oil spillage.

Remove the oil filter element.

Vehicles without supercharger

87. Remove the oil cooler.

All vehicles

88. Disconnect the oil pressure switch and oil temperature sensor electrical connectors.

89. Remove the oil filter housing.
   - Remove and discard the O-ring seal.
90. Detach the right-hand oxygen sensor.

91. Detach the engine wiring harness retaining clips.

92. Remove the engine wiring harness

93. Remove the noise and vibration insulating pad.

94. Remove the intake manifold heater coolant hose.
   1. Remove the knock sensors.
   2. Remove the intake manifold heater coolant hose.

95. Remove the engine block insulation grommet.
96. Remove the water pump pulley.
   - Using special tool, retain the water pump pulley.

97. Remove the water pump.
   - Remove and discard the gasket.
   - Remove and discard the O-ring seal.

Vehicles without supercharger

98. Remove the thermostat housing.
   - Remove and discard the O-ring seals.

All vehicles

99. NOTE: Left-hand shown, right-hand similar
   Remove the ignition coils.

100. Remove the spark plugs.
101. Remove the right-hand camshaft position (CMP) sensor.
   - Remove and discard the O-ring seal.

102. Remove the left-hand camshaft position (CMP) sensor.
   - Remove and discard the O-ring seal.

103. **CAUTION:** Under no circumstances should the crankshaft setting peg 303645 be used in the following operations to lock the crankshaft.
   - **NOTE:** The crankshaft retaining bolt will be very tight.
     
     Using special tools, retain the crankshaft pulley.
     - Remove and discard the crankshaft pulley bolt.

104. Remove the special tools.

105. **NOTE:** The crankshaft pulley will be very tight.
     
     Using special tools, remove the crankshaft pulley.
     - Collect the locking ring.
     - Remove and discard the O-ring seal.

106. Remove the crankshaft position (CKP) sensor.
107. CAUTIONS:

⚠️ Make sure the spark plugs are removed to enable the engine to rotate freely.

⚠️ Do not rotate the crankshaft counterclockwise. The timing chains may bind causing engine damage.

⚠️ Rotate the crankshaft clockwise to position the engine to top dead center (TDC) No. 1 cylinder

Install the special tool 303-645.

108. Remove the right-hand valve cover.
- Discard the valve cover gaskets.

109. Remove the left-hand valve cover.
- Discard the valve cover gaskets.

110. Remove the engine front cover.
Vehicles without supercharger

111. Remove the right-hand variable camshaft timing oil control unit housing.
   - Remove and discard the O-ring seals.

112. Remove the left-hand variable camshaft timing oil control unit housing.
   - Remove and discard the O-ring seals.

All vehicles
113. Install the special tool to the left-hand cylinder head.

114. Install the special tool to the Right-hand cylinder head.

115. Remove the primary timing chain tensioner assembly.

116. Remove the primary timing chain tensioner guide.

117. Remove the primary timing chain.
118. Remove the primary timing chain guide.

119. Remove the secondary timing chain tensioner retaining bolts.

120. Remove the camshaft sprockets.
- Remove the secondary timing chain tensioner and secondary timing chain from the camshaft sprockets.

121. Remove the primary timing chain tensioner assembly.

122. Remove the primary timing chain tensioner guide.
123. Remove the primary timing chain.

124. Remove the crankshaft sprocket.

125. Remove the primary timing chain tensioner guide.

126. Remove the secondary timing chain tensioner retaining bolts.

127. Remove the camshaft sprockets.
   - Remove the secondary timing chain tensioner and secondary timing chain from the camshaft sprockets.
128. Remove the camshaft setting tool.

129. Remove the camshaft setting tool.

130. Remove the camshaft bearing caps.
   - Remove the camshaft bearing cap retaining bolts evenly and in stages.
   - Remove the camshaft bearing caps. Note their orientation and markings, each is marked with its position (a number) and orientation (an arrow).

131. Remove the right-hand exhaust camshaft.

132. Remove the camshaft bearing caps.
   - Remove the camshaft bearing cap retaining bolts evenly and in stages.
   - Remove the camshaft bearing caps. Note their orientation and markings, each is marked with its position (a number) and orientation (an arrow).
133. Remove the right-hand intake camshaft.

134. Remove the camshaft bearing caps.
   - Remove the camshaft bearing cap retaining bolts evenly and in stages.
   - Remove the camshaft bearing caps. Note their orientation and markings, each is marked with its position (a number) and orientation (an arrow).

135. Remove the left-hand exhaust camshaft.

136. Remove the camshaft bearing caps.
   - Remove the camshaft bearing cap retaining bolts evenly and in stages.
   - Remove the camshaft bearing caps. Note their orientation and markings, each is marked with its position (a number) and orientation (an arrow).

137. Remove the left-hand inlet camshaft.
138. CAUTIONS:

⚠️ The bolts can only be used twice, mark the bolts with a center punch. If two punch marks are visible, discard the bolts.

⚠️ Vehicles fitted with Polydrive cylinder head bolts, the cylinder head bolts must be removed using a 10 mm Polydrive socket or a 10 mm Allen key. Failure to follow this instruction may result in damage to the component.

Remove the right-hand cylinder head.
- Remove the bolts in the indicated sequence.
- Remove and discard the gasket.

139. CAUTIONS:

⚠️ The bolts can only be used twice, mark the bolts with a center punch. If two punch marks are visible, discard the bolts.

⚠️ Vehicles fitted with Polydrive cylinder head bolts, the cylinder head bolts must be removed using a 10 mm Polydrive socket or a 10 mm Allen key. Failure to follow this instruction may result in damage to the component.

Remove the left-hand cylinder head.
- Remove the bolts in the indicated sequence.
- Remove and discard the gasket.

140. Remove the crankshaft setting peg 303645 from the crankshaft position sensor location.

141. Remove the drive plate.
   1. Remove the drive plate retaining bolts.
   2. Remove the drive plate.
142. Remove the lower oil pan.
   - Remove and discard the gasket.

143. Remove the oil strainer.
   - Remove and discard the O-ring seal.

144. Remove the upper oil pan.
   - Remove and discard the gasket.
145. Remove the oil pump.
   - Remove and discard the gasket.

146. Inspect the tops of the cylinder bores. As necessary remove ridge and carbon build up from each cylinder.

Vehicles with supercharger

147. Remove the piston cooling jets.

All vehicles

148. **CAUTION:** Pistons, connecting rods and connecting rod bearings should be numbered to make sure they are reassembled in the same position.
   - **NOTE:** Mark the position of the connecting rod caps to the connecting rods to make sure of correct installation.
   - **NOTE:** Discard the connecting rod bolts after removal.

Remove the connecting rod bolts, the connecting rod caps and the lower connecting rod bearings.

149. **CAUTION:** Use appropriate protection to prevent damage to the crankshaft bearing journals and cylinder bore surfaces.

Install special tools to the connecting rods.

150. **CAUTION:** Care should be taken not to damage the connecting rod and cap joint face surfaces or possible engine damage may occur. Avoid contaminating the fractured joint surfaces with dirt or grease.
   - **NOTE:** Attach the connecting rods and caps after removal to avoid mismatch.

Remove the pistons.
   - Rotate the crankshaft to locate pistons at the bottom of travel.
   - Push the piston, connecting rod and upper bearing through the top of the cylinder.

151. **NOTE:** Remove the lower cylinder block bolts in the indicated sequence.
   - **NOTE:** Mark the position of the upper and lower crankshaft main bearings for reassembly.

Remove the lower cylinder block.
   - Remove the lower cylinder block retaining bolts in the indicated sequence.
152. Discard the crankshaft rear main oil seal.

153. **CAUTION:** Avoid damage to any crankshaft bearing surfaces.

- **NOTE:** Never remove any pipe plugs or dowels unless they are to be newly installed or the cylinder block is to be washed.

Remove the crankshaft.
154. Remove the upper crankshaft main bearings.
   1. Remove the upper crankshaft thrust washers.
   2. Remove the upper crankshaft main bearings.

155. Clean the cylinder block with a soap and water solution. Dry the cylinder block completely with compressed air.
Disassembly

1. **CAUTIONS:**

⚠️ Do not use a magnet to remove shims. Failure to follow these instructions may result in damage to the vehicle.

⚠️ If the cylinder head valve components are to be reused, mark the position of the valve components to make sure they are reassembled in the same position.

Remove the bucket tappet and shim assemblies.

2. Remove the camshaft position (CMP) sensor.
   - Remove and discard the 'O' ring seal.

3. Using the special tool, compress the valve springs.
   - Remove the valve collets.

4. Remove the valve spring retainers and valve springs.
   1. Remove the valve spring retainers.
   2. Remove the valve springs.
   3. Remove the valve stem oil seals.

Special Tool(s)

![Disassembly Image]
5. Remove the valves from the cylinder head.
   1. Remove the intake valves.
   2. Remove the exhaust valves.

6. Inspect the cylinder heads and related components. For additional information, refer to Section 303-00 Engine System - General Information.

7. Remove the pipe plugs and alignment dowels as necessary to clean the cylinder heads.

Assembly

1. **WARNING:** Eye protection is required during use of compressed air. Failure to follow these instructions may result in personal injury.

   **CAUTION:** The cylinder head surface finish is measured in microns. For correct head gasket sealing, avoid any contact of finish with metallic objects.

   Clean gasket material, dirt, and foreign material from cylinder heads. Wash with a suitable soap and water solution and dry the cylinder head completely using compressed air if pipe plugs have been removed.

2. Install the pipe plugs and alignment dowels to cylinder heads.
   - Apply pipe sealant to plugs prior to installation.

3. **NOTE:** Lubricate the valve stems before assembly.

   Install the valves into the cylinder heads.
   1. Install the intake valves.
   2. Install the exhaust valves.

4. Install the valve spring retainers and valve springs.
   1. Install the valve stem oil seals.
   2. Install the valve springs.
   3. Install the valve spring retainers.
5. Using the special tool, compress the valve springs.
   - Install the valve collets.

6. Install the camshaft position (CMP) sensor.
   - Install a new 'O' ring seal.
   - Tighten to 7 Nm.

7. **CAUTION:** Do not use a magnet to install shims. Failure to follow these instructions may result in damage to the vehicle.
   Install the bucket tappet and shim assemblies.

#### Assembly

**All vehicles**

1. **CAUTION:** Use only a plastic scraper when removing old gasket material.

   Clean all the mating faces and reusable parts thoroughly and check for damage.
If gasket material remains on the cylinder head after cleaning, use a plastic tipped scraper to remove remaining material.

2. **NOTE:** Never remove pipe plugs or alignment dowels unless they are to be serviced.

Reseal oil passage blanking plugs, as necessary.

3. **NOTE:** The main bearings are precision selective fit.

- **NOTE:** Lubricate the upper crankshaft main bearings and thrust washers.

Install the upper crankshaft main bearings. For additional information, refer to: [Crankshaft Main Bearing Journal Clearance - V8 4.2L Petrol/V8 5/C 4.2L Petrol](303-00 Engine System - General Information, General Procedures).

1. Install the upper crankshaft thrust washers.
2. Install the upper crankshaft main bearings.

4. **CAUTION:** Avoid damage to any crankshaft bearing surfaces.

Install the crankshaft.

5. **NOTE:** The main bearings are precision selective fit.

- **NOTE:** Install lower cylinder block and tighten bolts to specification within twenty minutes of applying sealer.

Apply a bead of sealant to the cylinder block housing. For additional information, refer to: [Crankshaft Main Bearing Journal Clearance - V8 4.2L Petrol/V8 5/C 4.2L Petrol](303-00 Engine System - General Information, General Procedures).

- Use WSS-M4G320-A3-RTV sealant.

6. **CAUTION:** Make sure all dowels are fully seated into lower cylinder block prior to tightening the bolts.

- **NOTE:** Do not lubricate the lower cylinder block bolts.

- **NOTE:** Do not rotate crankshaft until all bolts are tightened to specification.

- **NOTE:** Bolts must be tightened within twenty minutes of applying sealer.

- **NOTE:** Tighten the bolts in the sequence shown.

Install the lower cylinder block to the upper cylinder block.

1. Tighten bolts 21 to 32 to 15 Nm
2. Tighten bolts 33 to 34 to 15 Nm
3. Tighten bolts 1 to 10 to 25 Nm
4. Tighten bolts 11 to 20 to 15 Nm
5. Tighten bolts 1 to 10 to 35 Nm +135°
6. Tighten bolts 11 to 20 to 20 Nm +150°
7. Tighten bolts 21 to 32 to 20 Nm +90°
7. Rotate the crankshaft to check correct operation.
8. Remove excess sealant which may squeeze out at the front cover sealing surfaces.

All vehicles

9. NOTE: Make sure all components are clean and dry.

Make sure the transit sleeve is correctly in place and install the new seal over the crankshaft. Do not use any lubricant on the seal, the transit sleeve or the crankshaft.
10. Carefully remove the transit sleeve, leaving the seal in place.
11. Install the special tool to the crankshaft.
12. Reposition the nuts to hold the special tool against the crankshaft rear seal. Check that the crankshaft rear seal and the special tool are parallel to the rear of the engine.

13. **CAUTION:** Alternate nut tightening to correctly seat the crankshaft rear seal.

Using the special tool, install the crankshaft rear seal.

14. Remove the special tool from the crankshaft.
   - Check that the seal is located correctly.

15. **CAUTION:** Use appropriate protection to prevent damage to the crankshaft bearing journals and cylinder bore surfaces.

Install special tools to the connecting rods.
   - Position the crankshaft journal at the bottom of the stroke.
   - Make sure the piston rings are positioned at different positions opposite the thrust side of the piston before installation.

16. **NOTE:** Install pistons with arrow to front of engine.

Using the special tool compress the rings and install the piston and connecting rod.
   - Lubricate all piston components.

17. **CAUTIONS:**

- When assembling the connecting rods and connecting rod caps it is imperative that bearing slots and tangs be located on the same side of the connecting rods.

- Connecting rod bolts are torqued to yield and must be replaced.

- Bolts must be tightened equally.

- **NOTE:** Remove the special tools from the connecting rods.

Position the connecting rod cap on the appropriate connecting rod.

1. Tighten to 10 Nm
2. Tighten to 30 Nm
3. Tighten to 90°

18. Rotate the crankshaft to check correct operation.

Vehicles with supercharger

19. Install the piston cooling jets.
   - Tighten to 9 Nm

All vehicles

20. Install the oil pump.
   - Install a new gasket.
   - Tighten to 12 Nm.

21. Install the upper oil pan.
   - Install a new gasket.
   - Tighten to 21 Nm.

22. Install the oil strainer.
   - Install a new O-ring seal.
   - Tighten to 12 Nm.
23. Install the lower oil pan.
   - Install a new gasket.

24. Install the drive plate.
   1. Install the drive plate.
   2. Install the drive plate retaining bolts.
      - Tighten to 15 Nm.
      - Tighten to 110 Nm.

25. Position the crankshaft.
    - Install the crankshaft setting peg 303645 to the crankshaft position sensor location.

26. Install a new left-hand cylinder head gasket.
    - Make sure the cylinder head dowels are correctly located.
27. CAUTIONS:

⚠️ The bolts can only be used twice, mark the bolts with a center punch. If two punch marks are visible, discard the bolts.

⚠️ Vehicles fitted with Polydrive cylinder head bolts, the cylinder head bolts must be installed using a 10 mm Polydrive socket or a 10 mm Allen key. Failure to follow this instruction may result in damage to the component.

• NOTE: Tighten the bolts 1 to 10 in the sequence shown.

Install the left-hand cylinder head.

1. Tighten bolts 1 to 10 to 20 Nm.
2. Tighten bolts 1 to 10 to 35 Nm.
3. Tighten bolts 1 to 10 to 90°.
4. Tighten bolts 1 to 10 to 90°.
5. Tighten bolts 11 to 12 to 25 Nm.

28. Install a new right-hand cylinder head gasket.

• Make sure the cylinder head dowels are correctly located.

29. CAUTIONS:

⚠️ The bolts can only be used twice, mark the bolts with a center punch. If two punch marks are visible, discard the bolts.

⚠️ Vehicles fitted with Polydrive cylinder head bolts, the cylinder head bolts must be installed using a 10 mm Polydrive socket or a 10 mm Allen key. Failure to follow this instruction may result in damage to the component.

• NOTE: Tighten the bolts 1 to 10 in the sequence shown.

Install the right-hand cylinder head.

1. Tighten bolts 1 to 10 to 20 Nm.
2. Tighten bolts 1 to 10 to 35 Nm.
3. Tighten bolts 1 to 10 to 90°.
4. Tighten bolts 1 to 10 to 90°.
5. Tighten bolts 11 to 12 to 25 Nm.

30. NOTE: Make sure all components are clean.

Apply oil (EP-90) to the camshaft and bearing surfaces, as follows:

• To the upper face of each bearing surface in the cylinder head.
• To the upper face of each bearing surface in each bearing cap.
• On the cam lobes ONLY, not on the base circle area.
31. Install the left-hand inlet camshaft.

32. **CAUTION:** Alternate bolt tightening to correctly seat the camshaft bearing caps.

   Install the camshaft bearing cap bolts evenly.
   - Tighten to 10 Nm.

33. **NOTE:** Make sure all components are clean.

   Apply oil (EP-90) to the camshaft and bearing surfaces, as follows:
   - To the upper face of each bearing surface in the cylinder head.
   - To the upper face of each bearing surface in each bearing cap.
   - On the cam lobes ONLY, not on the base circle area.

34. Install the left-hand exhaust camshaft.

35. **CAUTION:** Alternate bolt tightening to correctly seat the camshaft bearing caps.

   Install the camshaft bearing cap bolts evenly.
   - Tighten to 10 Nm.
36. NOTE: Make sure all components are clean.
   Apply oil (EP-90) to the camshaft and bearing surfaces, as follows:
   - To the upper face of each bearing surface in the cylinder head.
   - To the upper face of each bearing surface in each bearing cap.
   - On the cam lobes ONLY, not on the base circle area.

37. Install the right-hand inlet camshaft.

38. CAUTION: Alternate bolt tightening to correctly seat the camshaft bearing caps.
   Install the camshaft bearing cap bolts evenly.
   - Tighten to 10 Nm.

39. NOTE: Make sure all components are clean.
   Apply oil (EP-90) to the camshaft and bearing surfaces, as follows:
   - To the upper face of each bearing surface in the cylinder head.
   - To the upper face of each bearing surface in each bearing cap.
   - On the cam lobes ONLY, not on the base circle area.

40. Install the right-hand exhaust camshaft.
41. **CAUTION:** Alternate bolt tightening to correctly seat the camshaft bearing caps.

   Install the camshaft bearing cap bolts evenly.
   - Tighten to 10 Nm.

42. Install the camshaft setting tool.

43. Install the camshaft setting tool.

**All vehicles**

44. **CAUTIONS:**

   - Do not tighten the camshaft sprocket retaining bolts.
   - Make sure the secondary timing chain and camshaft sprockets are free to rotate.

   Install the camshaft sprockets.
   - Install the secondary timing chain tensioner and secondary timing chain to the camshaft sprockets.
45. Install the secondary timing chain tensioner retaining bolts.
   - Tighten to 12 Nm.

46. Install the timing chain tensioning tool 303-532 to the exhaust camshaft sprocket.
   - Reposition the camshaft sprockets for the most advantageous position for use of the tool.

47. Install the primary timing chain tensioner guide.
   - Tighten to 12 Nm.

48. Install the crankshaft sprocket.

49. **CAUTION**: Make sure the timing chain slack is on the tensioned side of the timing chain.
   
   Install the primary timing chain.
   - Install the primary chain over the crankshaft sprocket and the intake sprocket.
50. Install the primary timing chain tensioner guide.
   - Tighten to 12 Nm.

51. **CAUTION:** Use suitable protective covers on the vice jaws to protect the timing chain tensioner.

   Secure the left-hand timing chain tensioner in the vice jaws.

52. **CAUTION:** During timing chain tensioner compression, do not release the ratchet stem until the timing chain tensioner piston is fully bottomed in its bore or damage to the ratchet stem will result.

   Using a suitable tool, hold the left-hand timing chain tensioner ratchet lock mechanism away from the ratchet stem.

53. **NOTE:** The timing chain tensioner piston should retract with minimal force. If binding occurs, reposition the timing chain tensioner to eliminate side loading.

   Slowly compress the left-hand timing chain tensioner.

54. **NOTE:** The retaining tool must remain in the timing chain tensioner until the timing chain tensioner is installed to the engine with the piston bottomed in the bore.

   Using a suitable tool, retain the left-hand timing chain tensioner piston.
55. Install the primary timing chain tensioner assembly.
   - Tighten to 12 Nm.

56. Release the tension in the left-hand timing chain tensioner.
   - Remove the retaining tool.

57. **CAUTION:** While applying the opposing force to sprocket and chain, tighten the sprocket bolt.
   Using the special tool apply force to the tool in an anti-clockwise direction to tension the primary timing chain on its drive side.
   - Tighten to 20 Nm + 90 deg.

58. **CAUTION:** While applying the opposing force to sprocket and chain, tighten the sprocket bolt.
   Using the special tool apply force to the tool in an anti-clockwise direction.
   - Tighten to 20 Nm + 90 deg.

59. **CAUTIONS:**

   - **Do not tighten the camshaft sprocket retaining bolts.**
   - **Make sure the secondary timing chain and camshaft sprockets are free to rotate.**

   Install the camshaft sprockets.
   - Install the secondary timing chain tensioner and secondary timing chain to the camshaft sprockets.
60. Install the secondary timing chain tensioner retaining bolts.
   - Tighten to 12 Nm.

61. Install the timing chain tensioning tool 303-532 to the exhaust camshaft sprocket.
   - Reposition the camshaft sprockets for the most advantageous position for use of the tool.

62. Install the primary timing chain guide.
   - Tighten to 12 Nm.

63. **CAUTION:** Make sure the timing chain slack is on the tensioned side of the timing chain.

   Install the primary timing chain.
   - Install the primary chain over the crankshaft sprocket and the intake sprocket.

64. Install the primary timing chain tensioner guide.
   - Tighten to 12 Nm.
65. **CAUTION:** Use suitable protective covers on the vice jaws to protect the timing chain tensioner.

Secure the right-hand timing chain tensioner in the vice jaws.

66. **CAUTION:** During timing chain tensioner compression, do not release the ratchet stem until the timing chain tensioner piston is fully bottomed in its bore or damage to the ratchet stem will result.

Using a suitable tool, hold the right-hand timing chain tensioner ratchet lock mechanism away from the ratchet stem.

67. **NOTE:** The timing chain tensioner piston should retract with minimal force. If binding occurs, reposition the timing chain tensioner to eliminate side loading.

Slowly compress the right-hand timing chain tensioner.

68. **NOTE:** The retaining tool must remain in the timing chain tensioner until the timing chain tensioner is installed to the engine with the piston bottomed in the bore.

Using a suitable tool, retain the right-hand timing chain tensioner piston.

69. Install the primary timing chain tensioner assembly.

- Tighten to 12 Nm.

70. Release the tension in the right-hand timing chain tensioner.

- Remove the retaining tool.
71. **CAUTION:** While applying the opposing force to sprocket and chain, tighten the sprocket bolt.

Using the special tool apply force to the tool in an anti-clockwise direction to tension the primary timing chain on its drive side.

- Tighten to 20 Nm + 90 deg.

72. **CAUTION:** While applying the opposing force to sprocket and chain, tighten the sprocket bolt.

Using the special tool apply force to the tool in an anti-clockwise direction.

- Tighten to 20 Nm + 90 deg.

73. Remove the special tool to the Right-hand cylinder head.

74. Remove the special tool to the left-hand cylinder head.

Vehicles without supercharger
75. Install the left-hand variable camshaft timing oil control unit housing.
   - Install new O-ring seals.
   - Tighten to 22 Nm.

76. Install the right-hand variable camshaft timing oil control unit housing.
   - Install new O-ring seals.
   - Tighten to 22 Nm.

All vehicles

77. Remove the special tool.

78. Install the crankshaft position sensor.
79. Install new seals to the timing cover.
   1. Install the new seal to the inner groove on the face of the timing cover.
   2. Install the new seal to the outer groove on the face of the timing cover.

80. Apply sealant to the eight joints on the engine face.
   - Sealant beads to be 3mm diameter and 12mm long. Cut the nozzle of the sealant tube to produce a 3 mm (0.12 in) bead. (Install and tighten the securing bolts within twenty minutes of sealant application).

81. Install the timing cover.
   - Tighten in the sequence shown.

82. CAUTIONS:
   - Make sure the crankshaft front seal mating faces are clean and dry.
   - Do not remove the crankshaft front seal protector.
   Using the special tool, install a new crankshaft front seal.
83. Remove the crankshaft seal protector.

84. Install a new O-ring seal to the crankshaft pulley.
   - Lubricate the new O-ring.

85. CAUTIONS:

   - The screw thread in the crankshaft must be cleaned out before a new crankshaft pulley bolt is installed.

   - A new crankshaft pulley bolt must be used.
   - Install, but do not tighten, a new crankshaft pulley retaining bolt.
   - Install the crankshaft pulley and locking ring to the crankshaft.

86. CAUTION: Under no circumstances should the crankshaft setting peg 303-645 be used in the following operations to lock the crankshaft.

   Using special tools, retain the crankshaft pulley.
   - Tighten the crankshaft pulley retaining bolt to 375 Nm.

87. Remove the special tools.

88. Carry out a valve clearance check. For additional information, refer to: Valve Clearance Check (303-01B Engine - V8 4.2L Petrol/V8 S/C 4.2L Petrol, General Procedures).

89. NOTE: Apply an 8mm diameter bead of silicone gasket sealant on the two places where the cylinder head and front cover join.

   Install the left-hand valve cover.
   - Install new valve cover gaskets.
   - Tighten in the sequence shown.
   - Tighten to 10 Nm.
90. **NOTE**: Apply an 8mm diameter bead of silicone gasket sealant on the two places where the cylinder head and front cover join.

Install the right-hand valve cover.
- Install new valve cover gaskets.
- Tighten in the sequence shown.
- Tighten to 10 Nm.

91. Install the spark plugs.
- Tighten to 27 Nm.

92. Install the left-hand camshaft position (CMP) sensor.
- Install a new O-ring seal.

93. Install the right-hand camshaft position (CMP) sensor.
- Install a new O-ring seal.

94. **NOTE**: Left-hand shown, right-hand similar

Install the ignition coils.
- Tighten to 5 Nm.

Vehicles without supercharger
95. Install the thermostat housing.
   - Install new O-ring seals.
   - Tighten to 10 Nm.

All vehicles

96. Install the water pump.
   - Install new O-ring seals and gaskets.
   - Tighten to 12 Nm.

97. Install the water pump pulley.
   - Using special tool, retain the water pump pulley.
   - Tighten to 10 Nm + 45°.

98. Install the engine block insulation grommet.
99. Install the intake manifold heater coolant hose.
   1. Install the knock sensors.
      • Tighten to 20 Nm.
   2. Install the intake manifold heater coolant hose.

100. Install the noise and vibration insulating pad.

101. Install the engine wiring harness

102. Attach the engine wiring harness retaining clips.

103. Attach the right-hand oxygen sensor.
      • Tighten to 10 Nm.

104. Install the oil filter housing.
      • Install a new gasket.
      • Tighten to 21 Nm.
105. Connect the oil pressure switch and oil temperature sensor electrical connectors.

Vehicles without supercharger

106. Install the oil cooler.
   - Install a new O-ring seal.
   - Tighten to 55 Nm.

All vehicles

107. NOTE: Apply a suitable amount of clean engine oil to lubricate the oil filter O-ring seal.
   Install a new oil filter.
   - Tighten to 18 Nm.

Vehicles without supercharger

108. Install the intake manifold.
   - Tighten to 22 Nm.
109. Attach the engine wiring harness.
   ● Tighten to 10 Nm.

All vehicles

110. Attach the engine wiring harness

111. Connect the camshaft position sensor electrical connector.

112. Connect the fuel temperature sensor electrical connector.
113. Connect the ignition coil electrical connectors.

114. Attach the engine wiring harness.

115. Connect the fuel injector electrical connectors.

116. Attach the engine wiring harness.

Vehicles without supercharger
117. Connect the exhaust gas recirculation valve coolant hose.

118. Connect the exhaust gas recirculation valve electrical connector.

119. Connect the fuel pressure regulator electrical connector.

120. Connect the positive crankcase ventilation pipe.

All vehicles
121. Attach the engine harness.
   1. Connect the variable valve timing (VCT) solenoid electrical connector.
   2. Attach the engine harness.

122. Connect the camshaft position sensor electrical connector.

123. Attach the engine wiring harness.

124. Attach the engine wiring harness.

125. Connect the ignition coil electrical connectors.
126. Connect the fuel injector electrical connectors.

127. Attach the engine wiring harness.

Vehicles without supercharger

128. Install the engine cover retaining bracket.

129. Install the engine cover retaining bracket.

All vehicles
130. NOTE: Left-hand shown, right-hand similar.
Install the ignition coil cover.

131. Connect the knock sensor electrical connectors.

Vehicles with supercharger

132. Install the charge air cooler.
   • Install a new charge air cooler gasket.
   • Tighten to 13 Nm.

133. Install the supercharger.
   • Tighten to 24 Nm.
134. Connect the manifold absolute pressure (MAP) sensor.

135. Install the air intake elbow.
   - Install a new gasket.
   - Install new retaining bolt seals.
   - Tighten to 24 Nm.

136. NOTE: Make sure ground strap is correctly installed to the location noted.
   Install the air intake elbow retaining bracket lower retaining bolts.
   - Tighten to 20 Nm.

137. Connect the air intake elbow pipes.

138. CAUTION: Do not attempt to clean the throttle body. The bore and the throttle plate has a special coating applied during manufacture which should not be removed.
   Install the throttle body.
   - Install a new throttle body gasket.
   - Tighten to 10 Nm.
139. **NOTE:** Un-cap the coolant hose.
Attach the coolant hose to the throttle body.

140. Connect the electrical connectors.

141. Install the EGR valve and the exhaust manifold to EGR valve tube.
   - Install a new exhaust manifold to EGR valve tube gasket.
   - Install a new EGR valve to air intake elbow gasket.
   - Tighten to 10 Nm.

142. Tighten to 21 Nm.

143. **NOTE:** Un-cap the exposed ports.
Connect the coolant hoses.
144. Connect the exhaust gas recirculation (EGR) valve electrical connector.

145. Connect the IAT sensor electrical connector.

146. Connect the charge air cooler coolant pipes.

147. Install new O-ring seals to the thermostat housing.

148. Install thermostat housing.

149. Tighten to 10 Nm.
150. Tighten to 10 Nm.

151. Connect the hose.

152. Connect the hose.

153. Connect the hose.

154. Reposition the thermostat housing hose retaining clip.
155. Connect the coolant temperature sensor electrical connector.

156. Connect the thermostat housing hoses

157. Install new supercharger outlet pipe to charge air coolers ducts.
   - Tighten to 8 Nm.

158. Install a new supercharger outlet pipe gasket.
159. Install new seals to the supercharger outlet pipe retaining bolts

160. **CAUTION: Make sure no foreign matter enters the supercharger.**
    Install the supercharger outlet pipe
161. NOTE: Un-cap the coolant ports.

Attach the supercharger outlet pipe coolant hose.

162. Attach the hoses.
   - Reposition the hose retaining clip.

Vehicles without supercharger

163. Disconnect the coolant temperature sensor electrical connector.

All vehicles

164. Attach the engine wiring harness.
   1. Connect the variable valve timing (VCT) solenoid electrical connector.
   2. Attach the engine wiring harness.
165. Attach the engine wiring harness.

166. Attach the engine wiring harness.

167. Attach the engine wiring harness.

168. Connect the crankshaft position sensor electrical connector.

169. Install the power steering pump mounting bracket.
   - Tighten to 25 Nm.
170. Install the power steering pump.
   - Tighten to 25 Nm.

171. Install the air conditioning compressor mounting bracket.
   - Tighten to 25 Nm.

172. Install the A/C compressor.
   - Tighten to 25 Nm.

173. Connect the air conditioning compressor electrical connector.

174. Install the left-hand engine mounting bracket.
   - Tighten to 25 Nm.
175. Install the left-hand engine mount.
   - Tighten to 43 Nm.

176. CAUTIONS:

⚠️ Make sure the exhaust manifold and gasket are correctly aligned to the cylinder head.

⚠️ Make sure the exhaust manifold torque is checked after initial tighten.

Install the left-hand exhaust manifold.
   - Install a new gasket.
   - Tighten to 20 Nm.

177. Remove the heat shield retaining bolt.
   - Tighten to 50 Nm.

178. Install the heat shield.
   - Tighten to 3 Nm.

179. Remove the oil level indicator and tube.
   - Install a new O-ring seal.
   - Tighten to 6 Nm.
180. Install the starter motor.
   - Tighten to 45 Nm.

181. Attach the engine wiring harness.

182. Attach the right hand oxygen sensor retaining bracket.

183. Install the generator mounting bracket.
   - Tighten to 45 Nm.

184. Attach the engine wiring harness.
185. Install the generator.
   - Tighten the generator upper retaining bolt to 21 Nm.
   - Tighten the generator lower retaining bolt to 40 Nm.

186. Connect the generator electrical connector.

187. Install the wiring harness.
   - Tighten to 12 Nm.

188. Attach the wiring harness.

189. Install the accessory drive belt idler pulley.
   - Tighten to 25 Nm.
190. Install the accessory drive belt tensioner.
- Install the accessory drive belt.
- Tighten to 45 Nm.

191. Release the accessory drive belt tension.
- Attach the accessory drive belt.

Vehicles with supercharger

192. Install the supercharger belt.
- Use a 1/2 inch square drive bar to rotate the supercharger belt tensioner.

Vehicles without supercharger

193. Connect the oil cooler hoses.
**Engine - V8 4.2L Petrol/V8 S/C 4.2L Petrol - Engine**

**Installation**

*All Vehicles*

1. Install the engine using suitable hydraulic lift.

2. Attach fuel purge line.
   - Install a new retaining clip.

3. Connect the fuel line.
   - Attach the fuel line retaining clip.
   - Install new O-ring seals.
Vehicles without supercharger

4. Attach the brake booster vacuum pipe.

Vehicles with supercharger

5. Attach the brake booster vacuum pipe.

All Vehicles

6. Remove the left hand rear engine lifting bracket.

7. Attach the bulkhead ground cable.
8. Remove the right hand rear engine lifting bracket.

9. Install the air intake tube.

Vehicles with supercharger

10. Install the air cleaner. For additional information, refer to Section 303-12A Intake Air Distribution and Filtering / 303-12B Intake Air Distribution and Filtering / 303-12C Intake Air Distribution and Filtering.

All vehicles

11. Install the power steering fluid reservoir For additional information, refer to Section 211-02 Power Steering.

12. Install the air cleaner For additional information, refer to Section 303-12A Intake Air Distribution and Filtering / 303-12B Intake Air Distribution and Filtering / 303-12C Intake Air Distribution and Filtering.

13. Attach the engine harness electrical connector.

14. Connect the engine harness electrical connector.
15. Connect the engine harness electrical connector.

16. Connect the engine control module (ECM) electrical connector.
   - Tighten to 6 Nm.

17. Install the engine compartment panel.

18. Install the cabin air filter housing.

19. Install the cabin air filter housing retaining nut.
20. Install the engine compartment support.

21. Install the cabin air filter.
   For additional information, refer to Section 412-01 Air Distribution and Filtering.

22. Install the radiator assembly. For additional information, refer to Section 303-03A Engine Cooling / 303-03B Supercharger Cooling / 303-03C Engine Cooling.

23. Install the hood.
   For additional information, refer to Section 501-3.

24. Raise the vehicle.

25. Attach the ground cable.

26. Install the right hand fender splash shield.

27. Install the right hand wheel and tire assembly.

28. NOTE: Un-cap the exposed ports.
   Install new A/C compressor O-ring seals.
   • Lubricate the new O-rings with A/C refrigerant oil.
29. Connect the A/C compressor supply and return lines.
   - Tighten to 20 Nm.

30. Tighten to 10 Nm.

31. Tighten to 7 Nm.

32. Attach the starter motor positive cable cover.

33. Tighten to 45 Nm.
Vehicles with supercharger

34. Tighten to 12 Nm.
   - Install new O rings.

35. Tighten to 12 Nm.
   - Install new O rings.

36. Tighten to 12 Nm.
   - Install new O rings.

All vehicles

37. NOTE: Left hand shown, right hand similar.
   Tighten to 63 Nm.

38. Install the automatic transmission
   For additional information, refer to Section 307-01 Automatic Transmission/Transaxle.

39. Carry out the A/C system evacuation and charging procedure.
   For additional information, refer to Section 412-00 Climate Control System - General Information.

40. Carry out the A/C system fluorescent dye leak detection procedure.
   For additional information, refer to Section 412-00 Climate Control System - General Information.

Engine - 2.7L V6 - TdV6 - Engine
Description and Operation

The 2.7 litre engine consists of a six cylinder 60-degree 'Enclosed Vee' configuration liquid cooled Compacted Graphite Iron (CGI) with the cylinder bores machined directly into the block.

Viewed from the driving position, the right-hand cylinder bank is numbered 1 to 3, from the front of the vehicle and the left-hand cylinder bank are numbered 4 to 6, from the front of the vehicle.

Knock Sensors

The knock sensor registers increased vibrations which occur due to increased combustion noise. The ECM uses the signal as a correction factor for calculating the quantity of fuel to be injected during the injection phase.

Crankshaft
The crankshaft is forged steel and fillet rolled with induction hardened journals, which run in four bearings with clamped two layer bearing shells. The upper and lower shells of bearing number four are flanged, which limits the end float of the crankshaft. The main bearing caps are double bolted and cross bolted to increase the strength and rigidity of the engine block.

The rear main oil seal and retainer assembly is a one piece unit and is supplied with its own plastic fitting sleeve. The seal and retainer have two locating dowels and ten fixing bolts. In addition the retainer has a location for the crankshaft position sensor.

A torsional vibration crankshaft damper pulley is bolted to the front of the crankshaft.

The crankshaft trigger wheel is located on the rear of the crankshaft. It is pressed onto the crank using a special tool which also precisely aligns the trigger wheel for crankshaft position and timing. The trigger wheel consists of 60 magnets minus two for ECM crankshaft position reference and synchronisation. The magnets cannot be seen on the trigger wheel, which therefore can only be positioned using a special tool.
If the trigger is removed for any reason, then a new trigger wheel MUST be fitted.

Connecting Rods and Pistons

Connecting rods are fitted in sets of six. The connecting rods are offset fracture split. Each connecting rod is marked (etched) with the cylinder number on either side of the fracture split line.

The pistons are made from aluminium alloy and fitted with three rings. The piston crown incorporates a pronounced bowl. This forms the combustion chamber which promotes swirl and turbulence, necessary for good combustion and improved emission. In addition, the piston skirt, which comes into contact with the cylinder bore, has molybdenum-coated surfaces. These counteract scoring of the cylinder and piston, therefore helping to increase engine life.

The piston also incorporates a double wave gallery within the piston crown to enhance piston cooling. The piston is supplied with oil by spray jets which are located in the engine block oil gallery. This ensures optimum piston cooling due to the high temperatures that are generated by the combustion process.

The arrows on the piston crown point to the front of the engine.
The piston top ring is a taper type and is fitted with a taper to the top of the piston. All rings marked 'top' are assembled with top to uppermost. All rings must be spaced evenly around the piston before installing. The circumference gap of the double bevelled oil control ring must be opposite to the spiral control joint.

Piston bowl volume is 20.025cc and the compression ratio is 17.3:1.

### Cylinder Heads and Valve Gear

The cylinder head is of high quality aluminium and cannot be reworked. The cylinder head is secured to the engine block by eight bolts. The cylinder head incorporates four valves per cylinder, glow plugs and a knock sensor. A vertically centrally placed fuel injector guarantees maximum distribution of fuel into the combustion chamber.

The cylinder head gasket is a three layer laminated steel construction that has an excellent service life and sealing properties. The cylinder head gasket is available in five different thicknesses depending on the piston protrusion height. The cylinder head gaskets are identified by serrations cut into the front end of the gasket.

The valves are operated directly by steel roller rockers with hydraulic lash adjusters.
Inlet Manifold

The induction is designed to optimise torque across the engine speed/load range. The air charge enters the induction manifold from the EGR throttle valve and passes into the plenum for distribution to the cylinders.

The purpose of the plenum is to maximise the air charge into the cylinders.

The inlet manifolds are of plastic composite construction and are handed for the left and right hand bank. The manifolds incorporate a twin plenum intake system and integrated cam covers. The plenum systems are vacuum operated, these are located at the rear of the manifolds and are ECM controlled.

The inlet manifolds/cam covers are secured to the cylinder head by 13 shouldered bolts and sealed by means of rubber gasket.

Camshafts

The camshaft's construction is of hollow steel tube with pressed on syntered lobes. There are two camshafts per cylinder head. The camshafts have pressed on drive sprockets which are marked for timing purposes. The interconnecting drive chain is also marked for valve timing. The drive chain has a hydraulic tensioner. Both banks are of similar construction. They are not interchangeable.
The drive sprockets also form the thrust faces for the camshaft. In production camshaft endfloat is set to 0.065mm-0.185mm.

**Camshaft Bearings**

The camshafts are supported in five line bored bearings. The bearing caps, which are individually identified, must be fitted in the correct sequence.
The right hand exhaust camshaft drives the vacuum pump which is sealed by an O-ring seal and secured by three bolts. Both inlet camshafts are sealed at each end by the inlet manifold/cam cover.

The vacuum pump supplies vacuum for the inlet port deactuation system and brake servo assistance. The pump is located at the rear of the engine and driven by the right hand side exhaust camshaft.

High Pressure Pump
The left hand exhaust camshaft drives the high pressure pump by means of a belt drive sprocket, which is supported by a boss and a single bolt fixing.

The high pressure pump is not timed to the engine.
Timing Gear
The camshafts are driven from the crankshaft pulley via a timing belt to the front the of exhaust camshafts. The camshaft gears are bolted to a drive flange via three elongated adjustment holes and in turn bolted to the camshafts by a single bolt.
Each pair of camshafts are chain driven and must be timed before assembly.

Sump Pan
The sump pan is made from pressed steel and is secured to the bedplate by 21 M6 x 16 bolts.

Engine Lubrication System
Oil is drawn from the oil pan and pressurised by the oil pump. The output from the oil pump is then filtered and distributed through the internal passage ways. Oil is cooled before entering the filter.

All moving parts are lubricated by pressure or splash oil. Pressurised oil is also provided for operation of the hydraulic adjusters, turbochargers and timing gear chain tensioners.

The engine is lubricated by a forced-feed circulation system with full flow oil filter. The oil cooler forms a unit with the oil filter and fuel cooler which is mounted centrally in the cylinder block between the two banks of cylinders. The engine oil is cooled using the engine cooling system. This eliminates the need for an additional engine oil cooler remotely mounted.
The oil pump is a gear type pump and is bolted and dowelled to the front of the engine block. It is sealed by means of rubber gasket which is recessed into the oil pump casing. The pump is driven directly by two flats from the front of the crankshaft. The oil relief valve is an integral part of the pump.
Oil spray jets are bolted in place under the cylinder bores between the crank bearing journals. The oil jets help to keep the pistons cool under arduous conditions and also prevent the oil draining back when the engine is stopped.
**Engine Management**

The ECM's (Engine Control Module) high capacity processor employs advanced software strategies that continuously control the engine's operating parameters. It gathers information from an array of sensors and provides output to the actuators. The ECM also operates a port deactivation system, which closes or opens flaps in the inlet system to provide the optimum swirl and flow conditions throughout the operating range of the engine.

In addition, the ECM controls the actuation of the Exhaust Gas Recirculation system, the Variable Geometry Turbochargers and the throttle, giving faster and more accurate response. A full torque-based strategy supports multiple injection control and integration with transmission and braking controllers. Transient torque and boost control enables vehicle performance to be optimised without compromising engine durability.

**System Components**

All engine functions are controlled by the Siemens common rail ECM.

- **Crank position (CKP) sensor**
  
  The CKP signal is used to determine: the quantity of fuel to be injected, the start of fuel delivery and the quantity of exhaust gases to be recirculated.
  
  The crank position sensor is located at the rear of the crankshaft behind the flywheel.

- **Camshaft position (CMP) sensor**
  
  Location: on the cylinder head behind the left hand camshaft timing belt pulley.
  
  The CMP sensor is Hall effect type and is required to identify cylinder No. 1. (This is to synchronise engine to camshaft). The sensor scans a ring incorporated in the left hand camshaft timing belt pulley. The air gap between the magnetic ring and the CMP sensor is predetermined by the mounting of the sensor.

- **Engine coolant temperature (ECT) sensor**
  
  Location: in the top outlet hose.
  
  The ECT is a NTC type sensor and is fitted into the top water outlet hose. The sensor has a bayonet type fitting.

- **Mass Air Flow (MAF) sensor**
  
  The MAF sensor is used to calculate the air mass. The MAF sensor is capable of detecting the mass air flow extremely precisely.

  Location: there are two MAF sensors fitted. Each sensor is fitted to separate intake pipes.

  On engines with a variable turbocharger, the MAF sensor is used solely to control the exhaust gas recirculation (EGR) and not the fuel metering. The MAF sensor also incorporates the Intake Air Temperature (IAT) sensor.

  The IAT sensor measures the intake air or, the charge air temperature and supplies the ECM with an analog voltage signal.

- **Manifold Absolute Pressure (MAP) sensor**
  
  Location: fitted to the top of the throttle valve.
  
  The MAP sensor measures the charging pressure in the intake pipe and sends the ECM an analog voltage signal.

- **Air Charge Temperature (ACT) sensor**
  
  Location: fitted to the pressure side of the air intake throttle valve.
The ACT sensor measures the intake air or the charge air temperature and supplies the ECM with an analog signal.

Fuel Rail Pressure sensor
Location: fitted to the diverter rail which in turn is bolted to the high pressure pump at the rear of the engine.
The fuel pressure sensor measures the instantaneous fuel pressure in the fuel rail very precisely within a very short time and supplies a voltage signal according to the pressure.

Fuel Temperature sensor
Location: the fuel temperature sensor is located on the low pressure side of the high pressure pump in the case of the common rail system. The sensor measures the temperature of the fuel in the low pressure system. Air and excessive heat in the fuel system can have an adverse effect on the operation of the sensor.

Exhaust Gas Recirculation (EGR) valves
Location: there are two EGR valves fitted, one to each exhaust manifold. These are water cooled and electronically controlled by the ECM.
Engine - 2.7L V6 - TdV6 - Engine
Diagnosis and Testing

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

<table>
<thead>
<tr>
<th>Visual Inspection Chart</th>
<th>Mechanical</th>
</tr>
</thead>
<tbody>
<tr>
<td>Coolant level</td>
<td></td>
</tr>
<tr>
<td>Coolant leaks</td>
<td></td>
</tr>
<tr>

<td></td>
</tr>
<tr>
<td>Visibly damaged or worn parts</td>
<td></td>
</tr>
<tr>
<td>Loose or missing nuts or bolts</td>
<td></td>
</tr>
</tbody>
</table>

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the cause is not visually evident, verify the symptom and REFER to: Engine (303-00, Diagnosis and Testing).

Active engine mounts

Overview

The active engine mount system operates at idle speed to help damp out any vibration from the engine.

The system is triggered by a signal from the engine control module activating the mounts at engine speeds between 600 and 900 rpm, when the mounts will operate as a pair.

The system determines which side mount is which by sending a ground signal to the right hand mount (this pin is vacant on the left hand mount).

Inspection and Verification

1. Verify the customer concern.
   - If the customer concern is of a vibration at other than idle speed, then the fault is not with the active engine mounts.
2. Use the Jaguar approved diagnostic system or a scan tool to retrieve any fault codes, as other causes of vibration or misfire should be eliminated before condemning an active engine mount.
3. Visually inspect for obvious signs of mechanical or electrical damage.

<table>
<thead>
<tr>

<td></td>
</tr>
<tr>
<td>Routing of pipework etc to avoid vibrations</td>
<td></td>
</tr>
<tr>
<td>Contact anywhere between the driveline and chassis</td>
<td></td>
</tr>
</tbody>
</table>

4. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding.
5. If any DTCs were present in the steps above, make sure their causes are rectified before beginning any work on the active engine mounts.

Pinpoint test

PINPOINT TEST A : ACTIVE ENGINE MOUNTS

WARNING: The following test may involve working in close proximity to hot components. Make sure adequate protection is used. Failure to follow this instruction may result in personal injury.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>
1. Key off.
2. Disconnect the right hand active engine mount connector, PI065.
3. Using the Jaguar approved diagnostic system, activate the mounts.
4. Check for operation of the left hand mount.
   - Operation can be confirmed by feeling for vibration of the mount.
5. Key off.
6. Reconnect the right hand active engine mount connector, PI065.
7. Disconnect the left hand active engine mount connector, PI066.
8. Using the Jaguar approved diagnostic system, activate the mounts.
9. Check for operation of the right hand mount.
   - Operation can be confirmed by feeling for vibration of the mount.

Did both mounts operate when activated?
Yes  **GO to A2.**
No  **GO to A3.**

---

### A2: CHECK THE INTERNAL DIAGNOSTIC CIRCUIT FOR SHORT CIRCUIT

</tr>
<tr>
<td>Pin 04</td>
<td>Pin 01</td>
</tr>
</tbody>
</table>

Are both resistances greater than 10 Kohms?
Yes  An intermittent fault may be present in the wiring harness. **GO to A3.**
No  INSTALL a new active engine mount in place of the suspect unit. Clear any DTCs, test the system for normal operation.

---

### A3: CHECK FOR POWER SUPPLY TO THE ACTIVE ENGINE MOUNTS

<table>
<thead>
<tr>
<th>Circuit</th>
<th>Pin</th>
</tr>
</thead>
<tbody>
<tr>
<td>Right hand active engine mount</td>
<td></td>
</tr>
<tr>
<td>PI065, harness side</td>
<td>Battery</td>
</tr>
<tr>
<td>Pin 02</td>

<td>Left hand active engine mount</td>
<td></td>
</tr>
<tr>
<td>PI066, harness side</td>
<td>Battery</td>
</tr>
<tr>
<td>Pin 02</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

Is the voltage at both pins greater than 10 volts?
Yes  **GO to A4.**
No  REPAIR the power supply circuit. This circuit includes harness splice, PIS87. For additional information, refer to the wiring diagrams. Clear any DTCs, test the system for normal operation.
A4: CHECK THE SIGNAL FROM THE ECM

1. Using the Jaguar approved diagnostic system, activate the mounts.
2. Measure the signal voltage between:
   - **Right hand active engine mount**
     - PI065, harness side
     - Battery
     - Pin 03 Negative terminal
   - **Left hand active engine mount**
     - PI066, harness side
     - Battery
     - Pin 03 Negative terminal

Is the voltage between 1 and 2.5 volts with the mount active? (the circuit should register 4-5 volts with the mount inactive).
- **Yes**  
  GO to A5.
- **No**  
  GO to A6.

A5: CHECK FOR GROUND TO THE ACTIVE ENGINE MOUNTS

**NOTE:** This test includes a check of the additional ground circuit for the right hand mount.

1. Disconnect the battery negative terminal.  
2. Measure the resistance between:
   - **Right hand active engine mount**
     - PI065, harness side
     - Battery
     - Pin 01 Negative lead
     - Pin 04 Negative lead
   - **Left hand active engine mount**
     - PI066, harness side
     - Battery
     - Pin 01 Negative lead

Are the resistances less than 10 ohms?
- **Yes**  
  INSTALL a new active engine mount in place of the inoperative unit. Clear any DTCs, test the system for normal operation.
- **No**  
  REPAIR the ground circuit. This circuit includes harness splice, PIS88. For additional information, refer to the wiring diagrams. Clear any DTCs, test the system for normal operation.

A6: CHECK THE SIGNAL CIRCUIT FOR SHORT CIRCUIT TO GROUND

1. Disconnect the ECM connector, EC066.
2. Measure the resistance between:
   - **Right hand active engine mount**
     - PI065, harness side
     - Battery
     - Pin 03 Negative lead
   - **Left hand active engine mount**
     - PI066, harness side
     - Battery
     - Pin 03 Negative lead

Is the resistance greater than 10 Kohms?
- **Yes**  
  GO to A7.
- **No**  
  REPAIR the short circuit. For additional information, refer to the wiring diagrams. Clear any DTCs, test the system for normal operation. REFER to the warranty policy and procedures manual if an ECM is suspect.

A7: CHECK THE SIGNAL CIRCUIT FOR SHORT CIRCUIT TO POWER

1. Measure the resistance between:
   - **Right hand active engine mount**
     - PI065, harness side
     - Battery
     - Pin 03 Positive terminal
   - **Left hand active engine mount**
     - PI066, harness side
     - Battery
     - Pin 03 Positive terminal

Is the resistance greater than 10 Kohms?
- **Yes**  
  GO to A8.
- **No**  
  REPAIR the short circuit. For additional information, refer to the wiring diagrams. Clear any DTCs, test the system for normal operation. REFER to the warranty policy and procedures manual if an ECM is suspect.

A8: CHECK THE SIGNAL CIRCUIT FOR HIGH RESISTANCE

1. Measure the resistance between:
   - **Right hand active engine mount**
     - PI065, harness side
     - ECM, harness side
     - Pin 03 Pin H1
   - **Left hand active engine mount**
     - PI066, harness side
     - ECM, harness side
     - Pin 03 Pin H1

Is the resistance less than 10 ohms?
- **Yes**  
  An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness or connectors. REFER to the warranty policy and procedures manual if an ECM is suspect.
- **No**  
  REPAIR the high resistance circuit. This circuit includes harness splice, PIS86. For additional information, refer to the wiring diagrams.

**Removal**

1. Remove the timing belt.
   For additional information, refer to: Timing Belt (303-01C Engine - 2.7L V6 - TdV6, In-vehicle Repair).

2. Remove the special tool.
   1. Retain the camshaft sprocket.
   2. Remove the special tool.

3. Remove the camshaft sprocket.
   - Remove the camshaft sprocket retaining bolts.
4. Using special tool, remove the camshaft sprocket hub.
   - Remove the camshaft sprocket hub retaining bolt.

5. Install the special tool to the camshaft.

6. Using the special tool, remove the camshaft front seal.

**Installation**

1. **CAUTION:** Do not use any lubricant on the seal or the camshaft. Failure to follow this instruction may result in damage to the vehicle.

   • **NOTE:** Make sure all components are clean and dry.

   Using the special tool, install the camshaft front seal.
2. Using special tool, install the camshaft sprocket hub.
   - Tighten the bolts in the sequence shown in two stages.
   - Stage 1: Tighten to 80 Nm
   - Stage 2: Tighten to 80 degrees

3. Install the camshaft sprocket.
   - Tighten to 22 Nm.

4. Install the special tool.
   1. Retain the camshaft sprocket.
   2. Install the special tool.

5. Install the timing belt.
   For additional information, refer to: Timing Belt (303-01C Engine - 2.7L V6 - TdV6, In-vehicle Repair).
**Engine - 2.7L V6 - TdV6 - Camshaft Rear Seal**

### Removal

1. Remove the fuel injection pump belt.  
   For additional information, refer to: Fuel Injection Pump Belt (303-05 Accessory Drive, Removal and Installation).

2. Using the special tool, remove the camshaft rear pulley bolt.

3. Remove the camshaft rear pulley.
4. Install the special tool to the camshaft.

5. **CAUTION:** Make sure the special tool is seated correctly behind the camshaft rear seal. Failure to follow this instruction will result in damage to the vehicle.

   Install the special tool to the camshaft rear seal.

6. **CAUTION:** Make sure the special tool is seated correctly behind the camshaft rear seal. Failure to follow this instruction will result in damage to the vehicle.

   Using the special tool, remove the camshaft rear seal.
   - Install the reaction arm.

**Installation**

1. Using the special tool, install the camshaft rear seal.
2. Install the camshaft rear pulley.

3. **CAUTION:** The camshaft pulley bolt must be tightened in two stages.

   Using the special tool, install the camshaft rear pulley bolt.
   - Stage 1: Tighten to 80 Nm.
   - Stage 2: Tighten to 80 degrees.

4. Install the fuel injection pump belt.
   For additional information, refer to: Fuel Injection Pump Belt (303-05 Accessory Drive, Removal and Installation).
## Removal

### WARNINGS:

- **WARNING:** Wait at least 30 seconds after the engine stops before commencing any repair to the high pressure fuel injection system. Failure to follow this instruction may result in personal injury.

- **WARNING:** Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable mixtures are always present and may ignite. Failure to follow these instructions may result in personal injury.

- **WARNING:** This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow this instruction may result in personal injury.

- **WARNING:** Do not carry out any repairs to the fuel injection system with the engine running. The fuel pressure within the system can be as high as 1650 bar. Failure to follow this instruction may result in personal injury.

### CAUTIONS:

- **CAUTION:** Make sure the workshop area in which the vehicle is being worked on is as clean and as dust free as possible. Foreign matter from work on clutches, brakes or from machining or welding operations can contaminate the fuel system and may result in later malfunction.

- **CAUTION:** Always carry out the cleaning process before carrying out any repairs to the fuel injection system components. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

- **CAUTION:** Diesel fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines.
1. Remove the intake air shut off throttle.
   For additional information, refer to: Intake Air Shutoff Throttle (303-04C Fuel Charging and Controls - 2.7L V6 - TdV6, Removal and Installation).

2. Remove the fuel injectors.
   For additional information, refer to: Fuel Injector (303-04C Fuel Charging and Controls - 2.7L V6 - TdV6, Removal and Installation).

3. Detach the electrical connector from the left-hand valve cover.

4. Disconnect the electrical connector.

5. Disconnect the electrical connector.

6. Detach the engine harness.
7. Detach the engine harness.
8. Remove the engine harness retaining bolts.
9. Detach the engine breather pipe.
10. Disconnect the vacuum pipe.
11. Remove the fuel injection pump supply line retaining bolt.
12. Clean the fuel pump, high-pressure fuel supply line and surrounding areas. 
For additional information, refer to: Fuel Injection Component Cleaning 
(303-04c Fuel Charging and Controls - 2.7L V6 - TdV6, General 
Procedures).

13. CAUTIONS:

⚠️ Make sure the tool used to loosen the high-pressure fuel supply line union is used at the top of the union as this is where there is most material. Failure to follow this instruction may result in damage to the union.

⚠️ Make sure that the high pressure fuel supply line remains in contact with both the fuel pump and the fuel injection supply manifold until both unions have been detached and cleaned. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

⚠️ While maintaining the pressure on the high-pressure fuel supply line, clean and vacuum foreign material from the line and unions.

14. Remove the high-pressure fuel supply line.

15. Remove the fuel injection supply manifold securing bracket.

16. Remove the engine cover and wiring harness retainers.
17. Remove the left-hand valve cover.
   - Remove and discard the valve cover gasket.

18. Remove the timing belt.
   For additional information, refer to: Timing Belt (303-01C Engine - 2.7L V6 - TdV6, In-vehicle Repair).

19. Remove the special tool.
   1. Retain the camshaft sprocket.
   2. Remove the special tool.

20. Remove the camshaft sprocket.
   - Remove the camshaft sprocket retaining bolts.

21. Using special tool, remove the camshaft sprocket hub.
   - Remove the camshaft sprocket hub retaining bolt.

22. Remove the fuel injection pump belt.
   For additional information, refer to: Fuel Injection Pump Belt (303-05 Accessory Drive, Removal and Installation).
23. Remove the camshaft rear pulley retaining bolt.
   - Using the special tool, retain the camshaft rear pulley.
   - Remove the special tool.

24. Remove the camshaft rear pulley.

25. Detach the EGR coolant inlet tube.

26. Detach the EGR coolant inlet tube.

27. Raise the vehicle.

28. Remove the left-hand catalytic converter.
   For additional information, refer to: Catalytic Converter - 2.7L V6 - TdV6 (309-00 Exhaust System, Removal and Installation).
29. Detach the EGR coolant inlet tube.

30. Remove the turbocharger heat shield.

31. Lower the vehicle.
32. Remove the fuel injection pump belt rear cover.

33. Retain the secondary timing chain tensioner plunger.
   1. Reposition the secondary timing chain tensioner.
   2. Retain the secondary timing chain tensioner plunger.

34. Remove the camshaft bearing caps evenly.
35. Remove the secondary timing chain tensioner retaining bolts.

36. Remove the left-hand camshafts and secondary timing chain tensioner assembly.
   - Discard the left-hand exhaust camshaft seals.

37. Remove the secondary timing chain tensioner assembly.

38. Remove the camshafts.
   - Remove the secondary timing chain from the camshafts.

Installation
1. WARNINGS:

⚠️ Wait at least 30 seconds after the engine stops before commencing any repair to the high pressure fuel injection system. Failure to follow this instruction may result in personal injury.

⚠️ Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable mixtures are always present and may ignite. Failure to follow these instructions may result in personal injury.

⚠️ This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow this instruction may result in personal injury.

⚠️ Do not carry out any repairs to the fuel injection system with the engine running. The fuel pressure within the system can be as high as 1650 bar. Failure to follow this instruction may result in personal injury.

• CAUTIONS:

⚠️ Make sure the workshop area in which the vehicle is being worked on is as clean and as dust free as possible. Foreign matter from work on clutches, brakes or from machining or welding operations can contaminate the fuel system and may result in later malfunction.

⚠️ Always carry out the cleaning process before carrying out any repairs to the fuel injection system components. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

⚠️ Diesel fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines.

⚠️ Make sure that the colored links on the secondary timing chain align with the dots and scribed line on the sprocket shoulder. Failure to follow this instruction may result in damage to the engine.

Install the camshafts.

• Install the secondary timing chain onto the camshafts.

2. Install the secondary timing chain tensioner assembly.

3. ⚠️ CAUTION: Make sure that the dots on the camshafts are aligned at the 12 o'clock position. Failure to follow this instruction may result in damage to the engine.

• NOTE: Lubricate the camshafts and the camshaft bearing caps with oil meeting Jaguar specification prior to installation.

Install the camshafts.
4. Install the secondary timing chain tensioner retaining bolts.
   • Tighten to 10 Nm.

5. Apply Loctite 518 sealant to the exhaust camshaft seal bearing caps.
   • Apply Loctite 518 sealant, 2 mm wide, to the left-hand rear and right-hand front camshaft bearing caps.
   • Apply Loctite 518 sealant, 7 mm in diameter, to the left-hand front and right-hand rear camshaft bearing caps.
6. NOTE: Install the camshaft bearing cap retaining bolts evenly.

Install the camshaft bearing caps in their original position.
- Tighten the retaining bolts in the sequence shown.
- Stage 1: Bolts 1 to 14, 1 Nm.
- Stage 2: Bolts 1 to 14, 5 Nm.
- Stage 3: Bolts 1 to 14, 10 Nm.
- Stage 4: Bolts 15 to 18, 1 Nm.
- Stage 5: Bolts 15 to 18, 5 Nm.
- Stage 6: Bolts 15 to 18, 10 Nm.
7. Remove the secondary timing chain tensioner retaining pin.

8. Install the left-hand valve cover.
   - Install a new valve cover gasket.
   - Tighten to 10 Nm.

9. **CAUTION:** Do not use any lubricant on the seal or the camshaft. Failure to follow this instruction may result in damage to the vehicle.
   - **NOTE:** Make sure all components are clean and dry.
     Using the special tool, install the camshaft front seal.

10. Using special tool, install the camshaft sprocket hub.
    - Install the camshaft sprocket hub retaining bolt.
    - Stage 1: Tighten to 80 Nm
    - Stage 2: Tighten to 80 degrees

11. Install the camshaft sprocket.
    - Install the camshaft sprocket retaining bolts.
12. Install the special tool.
   1. Retain the camshaft sprocket.
   2. Install the special tool.

13. Install the timing belt.
    For additional information, refer to: Timing Belt (303-01C Engine - 2.7L V6 - TdV6, In-vehicle Repair).

14. Install the fuel injection pump belt rear cover.

15. Raise the vehicle.

16. Install the turbocharger heat shield.

17. Attach the EGR coolant inlet tube.

18. Install the left-hand catalytic converter.
    For additional information, refer to: Catalytic Converter - 2.7L V6 - TdV6 (309-00 Exhaust System, Removal and Installation).

19. Lower the vehicle.
20. Attach the EGR coolant inlet tube.
   - Tighten to 10 Nm.

21. Attach the EGR coolant inlet tube.

22. **CAUTIONS:**

   - A new camshaft seal is supplied with an transit sleeve that must not be removed until the camshaft front seal is fully installed. Failure to follow this instruction may result in damage to the vehicle.
   
   - Do not use any lubricant on the seal, the transit sleeve or the camshaft. Failure to follow this instruction may result in damage to the vehicle.

   - **NOTE:** Make sure all components are clean and dry.
   
   Using the special tool, install the camshaft rear seal.
   - Remove and discard the transit sleeve.

23. Install the camshaft rear pulley.

24. Install the camshaft rear pulley retaining bolt.
   - Using the special tool, retain the camshaft rear pulley.
   - Remove the special tool.
   - Stage 1: Tighten to 80 Nm
   - Stage 2: Tighten to 80 degrees
25. Install the fuel injection pump belt. For additional information, refer to: Fuel Injection Pump Belt (303-05 Accessory Drive, Removal and Installation).

26. Install the engine cover and wiring harness retainers.

27. Install the fuel injection supply manifold securing bracket.
   - Tighten to 24 Nm.

28. Install the fuel injection supply manifold.
   - Tighten to 24 Nm.

29. Install new high-pressure fuel supply lines.
   - Remove and discard the blanking caps.
   - Tighten the high-pressure fuel supply line in the sequence shown in four stages:
     1. Stage 1: Tighten the high-pressure fuel supply line union 1 to 15 Nm.
     2. Stage 2: Tighten the high-pressure fuel supply line union 2 to 15 Nm.
     3. Stage 3: Tighten the high-pressure fuel supply line union 1 to 30 Nm.
     4. Stage 4: Tighten the high-pressure fuel supply line union 2 to 30 Nm.
30. Install the fuel injection pump supply line retaining bolt.
   - Tighten to 10 Nm.

31. Connect the vacuum pipe.

32. Attach the engine breather pipe.

33. Install the engine harness retaining bolts.
   - Tighten to 4 Nm.

34. Attach the engine harness.
35. Attach the engine harness.

36. Connect the electrical connector.

37. Connect the electrical connector.

38. Attach the electrical connector onto the left-hand valve cover.

39. Install the fuel injectors.
   For additional information, refer to: Fuel Injector (303-04C Fuel Charging and Controls - 2.7L V6 - TdV6, Removal and Installation).

40. Install the intake air shut off throttle.
   For additional information, refer to: Intake Air Shutoff Throttle (303-04C Fuel Charging and Controls - 2.7L V6 - TdV6, Removal and Installation).

## Removal

**All vehicles**

1. Remove the timing belt.  
   For additional information, refer to: [Timing Belt](303-01C Engine - 2.7L V6 - TdV6, In-vehicle Repair).

2. Remove the starter motor.  
   For additional information, refer to: [Starter Motor - 2.7L V6 - TdV6](303-06 Starting System, Removal and Installation).

**Vehicles with automatic transmission**
3. Remove the special tool.

Vehicles with manual transmission

4. Remove the special tool.

All vehicles

5. Install the special tool.

6. Loosen the crankshaft pulley retaining bolt.
7. Using the special tool, release the crankshaft pulley.

8. **CAUTION: The crankshaft pulley retaining bolt must not be re-used.**

   Remove the crankshaft pulley retaining bolt.

9. Install the special tool to the crankshaft.

10. Using the special tool, remove the crankshaft front seal.

**Installation**

All vehicles
1. **CAUTION:** Do not use any lubricant on the crankshaft front seal, the special tool or the crankshaft. Failure to follow this instruction may result in damage to the vehicle.

- **NOTE:** Make sure all components are clean and dry.

Install a new crankshaft front seal to the special tool.

2. Reposition the crankshaft front seal along the special tool.

3. Using the special tool, install the crankshaft front seal to the crankshaft.

4. Remove the special tool from the crankshaft.

5. Install the special tool to the crankshaft.
6. Using the special tool, fully install the crankshaft front seal.
   - Install the crankshaft pulley retaining bolt.

7. **CAUTION:** The crankshaft pulley retaining bolt must not be re-used.
   - Remove the special tool.
   - Remove and discard the crankshaft pulley retaining bolt.

8. **CAUTIONS:**
   - **⚠️** The crankshaft pulley retaining bolt must not be re-used.
   - **⚠️** The crankshaft pulley retaining bolt must be tighten in two stages.
   - Install the crankshaft pulley retaining bolt.
     - Stage 1: Tighten to 100 Nm.
     - Stage 2: Tighten to 90 degrees.

9. Remove the special tool.

Vehicles with manual transmission
10. Install the special tool.

Vehicles with automatic transmission
11. Install the special tool.

All vehicles
12. Install the starter motor.
For additional information, refer to: Starter Motor - 2.7L V6 - TdV6 (303-06 Starting System, Removal and Installation).

13. Install the timing belt.
For additional information, refer to: Timing Belt (303-01C Engine - 2.7L V6 - TdV6, In-vehicle Repair).
Engine - 2.7L V6 - TdV6 - Crankshaft Rear Seal

In-vehicle Repair

Removal

1. Remove the crankshaft position (CKP) sensor ring. For additional information, refer to: Crankshaft Position (CKP) Sensor Ring (303-14C Electronic Engine Controls - 2.7L V6 - TdV6, Removal and Installation).

2. Remove the crankshaft rear seal retaining bolts.

3. Remove the crankshaft rear seal.
   - Remove the retaining bolts.

Installation

⚠️ CAUTION: Make sure the crankshaft rear seal is installed correctly.

1. NOTE: Make sure the crankshaft rear seal mating faces are clean and dry.

   Apply a 8 mm bead of sealant to the cylinder block in the areas shown. For additional information, refer to: Specifications (303-01C Engine - 2.7L V6 - TdV6, Specifications).
2. Tighten to 10 Nm (7 lb.ft).

3. Tighten to 10 Nm (7 lb.ft).

4. Install the CKP sensor ring. For additional information, refer to: Crankshaft Position (CKP) Sensor Ring (303-14C Electronic Engine Controls - 2.7L V6 - TdV6, Removal and Installation).
Engine - 2.7L V6 - TdV6 - Crankshaft Vibration Damper
In-vehicle Repair

Special Tool(s)

| Accessory belt detensioner | 303-703 |

Removal

1. Disconnect the battery ground cable.
   For additional information, refer to: Battery Disconnect (414-01, General Procedures).

2. Remove the air deflector.
   For additional information, refer to: Air Deflector (501-02, Removal and Installation).

3. Detach the accessory drive belt.
   1. Using the special tool, rotate the belt tensioner counter clockwise.
   2. Detach the accessory drive belt.

4. Remove the crankshaft vibration damper.

Installation

1. To install, reverse the removal procedure.
   - Tighten to 14 Nm.
**Engine - 2.7L V6 - TdV6 - Cylinder Head LH**

**In-vehicle Repair**

**Removal**

1. Remove the left-hand camshafts.  
   For additional information, refer to: [Camshafts LH](303-01C Engine - 2.7L V6 - TdV6, In-vehicle Repair).

2. Detach the expansion tank hose from cylinder head coolant outlet assembly.

3. Detach the engine coolant hose from the cylinder head coolant outlet assembly.

4. Detach the radiator top hose from the cylinder head coolant outlet assembly.

5. **NOTE:** Discard the O-ring seals.  
   Remove the cylinder head coolant outlet assembly.

6. Remove the left-hand cylinder head glow plugs.  
   For additional information, refer to: [Glow Plugs](303-07C Glow Plug System, Removal and Installation).
7. Remove the hydraulic adjuster and rocker assemblies.

8. **CAUTION:** Only use a plastic scraper to clean off the old gasket. Remove the left-hand cylinder head assembly.
   - Remove and discard the left-hand cylinder head retaining bolts.
   - Remove and discard the left-hand cylinder head gasket.

**Installation**

1. **CAUTION:** Use care when installing the cylinder head. Damage to the cylinder block, cylinder head or the cylinder head gasket may result.
   - **NOTE:** Install a new cylinder head gasket.
   - **NOTE:** The head gaskets must be installed over the cylinder head to block dowels.
   - **NOTE:** Make sure the cylinder head is installed in its original position.
   - **NOTE:** Tighten the retaining bolts in the indicated sequence in four stages.

   - Install the cylinder head and install new cylinder head retaining bolts.
     - Stage 1: Tighten to 20 Nm.
     - Stage 2: Tighten to 40 Nm.
     - Stage 3: Tighten to 80 Nm.
     - Stage 4: Tighten to 180 degrees.

2. Install the hydraulic adjuster and rocker assemblies.

3. Install the left-hand cylinder head glow plugs.
   For additional information, refer to: **Glow Plugs** (303-07C Glow Plug System, Removal and Installation).
4. **NOTE:** Install new O-ring seals.
   Install the cylinder head coolant outlet assembly.
   - Tighten to 10 Nm.

5. Attach the radiator top hose onto the cylinder head coolant outlet assembly.

6. Attach the engine coolant hose onto the cylinder head coolant outlet assembly.

7. Attach the expansion tank hose onto cylinder head coolant outlet assembly.

8. Install the left-hand camshafts.
   For additional information, refer to: [Camshafts LH](#) (303-01C Engine - 2.7L V6 - TdV6, In-vehicle Repair).
Engine - 2.7L V6 - TdV6 - Engine Mount LH

</tbody>
</table>

Removal

1. Remove the filler cap.

2. Remove the engine cover.

3. Install the special tool.
4. Install the special tool.
   - Rotate the special tool adjustment bolt a suitable amount of turns to support the engine.

5. Remove the air deflector.
   For additional information, refer to: Air Deflector (501-02 Front End Body Panels, Removal and Installation).

6. Remove the retaining bolt.

7. Detach the steering gear.

8. Secure the steering gear.

9. Remove the retaining nut.
10. Remove the radiator splash shield. For additional information, refer to: Radiator Splash Shield (501-02 Front End Body Panels, Removal and Installation).

11. **WARNING**: Do not remove the front subframe front retaining bolts. Failure to follow this instruction may result in personal injury. **CAUTION**: Do not remove the front subframe front retaining bolts. Failure to follow this instruction may result in damage to the vehicle.  
• **NOTE**: Left-hand shown, right-hand similar. 

   Loosen the front subframe front retaining bolts to enable the engine mount left-hand to be removed.

12. **WARNING**: Do not remove the front subframe rear retaining bolts. Failure to follow this instruction may result in personal injury. **CAUTION**: Do not remove the front subframe rear retaining bolts. Failure to follow this instruction may result in damage to the vehicle. 
• **NOTE**: Left-hand shown, right-hand similar. 

   Loosen the front subframe rear retaining bolts to enable the engine mount left-hand to be removed.

13. Detach the air cleaner lower outlet tube.

14. Lower the vehicle.

15. Remove the left-hand engine compartment cover.
16. Detach the fuel filter from the mounting bracket.
   1. Release the retaining tangs.
   2. Detach the fuel filter from the mounting bracket.

17. Remove the fuel filter mounting bracket.

18. Raise the engine.
   • Rotate the special tool adjustment bolt a suitable amount of turns to raise the engine to aid the removal of the engine mount left-hand.

19. Detach the engine mount left-hand.

20. Raise the vehicle.
21. Remove the left-hand engine mount.
Installation

1. Install the left-hand engine mount.

2. **WARNING:** Do not remove the front subframe rear retaining bolts. Failure to follow this instruction may result in personal injury.

   • **CAUTIONS:**

   - **WARNING:** Do not remove the front subframe rear retaining bolts. Failure to follow this instruction may result in damage to the vehicle.

   - Make sure the engine mount locates into the correct position when the front subframe is repositioned. Failure to follow this instruction may result in damage to the vehicle.

   • **NOTE:** Left-hand shown, right-hand similar.

   Loosely install the front subframe rear retaining bolt.

3. **NOTE:** Left-hand shown, right-hand similar.

   Remove the front subframe front retaining bolt.

4. **NOTE:** Left-hand shown, right-hand similar.

   Install the special tool.
5. NOTE: Left-hand shown, right-hand similar.
   Install the front subframe rear retaining bolts.
   - Tighten to 80 Nm + 300°.

6. Remove the special tool.

7. Install the front subframe front retaining bolt.
   - Tighten to 180 Nm + 300°.

8. Remove the special tool.

9. Install the front subframe front retaining bolt.
   - Tighten to 180 Nm + 300°.
10. Detach the steering gear.

11. Attach the steering gear.
   - Tighten to 100 Nm.

12. Attach the shock absorber.
   - Tighten to 175 Nm.

13. Lower the vehicle.

14. Attach the engine mount left-hand.
   - Tighten to 48 Nm.

15. Install the fuel filter mounting bracket.
   - Tighten to 25 Nm.
16. Attach the fuel filter to the mounting bracket.

17. Attach the left-hand engine compartment cover.

18. Remove the special tool.
   - Loosen the special tool adjustment bolt.

19. Remove the special tool.

20. Install the engine cover.
21. Install the filler cap.

22. Raise the vehicle.

23. Attach the air cleaner lower outlet tube.

24. Tighten to 63 Nm.

25. Install the air deflector.
For additional information, refer to: Air Deflector (501-02 Front End Body Panels, Removal and Installation).
Engine - 2.7L V6 - TdV6 - Engine Mount RH

Removal

1. Remove the intake air shutoff throttle.
   For additional information, refer to: Intake Air Shutoff Throttle (303-04C Fuel Charging and Controls - 2.7L V6 - TdV6, Removal and Installation).

2. Remove the generator.
   For additional information, refer to: Generator - 2.7L V6 - TdV6 (414-02 Generator and Regulator, Removal and Installation).

3. Remove the starter motor.
   For additional information, refer to: Starter Motor - 2.7L V6 - TdV6 (303-06 Starting System, Removal and Installation).

4. Detach the right-hand air cleaner outlet tube from the timing cover.

5. Remove the right-hand catalytic converter.
   For additional information, refer to: Catalytic Converter - 2.7L V6 - TdV6 (309-00 Exhaust System, Removal and Installation).

6. Detach the turbocharger outlet tube connecting hose.
7. Remove the turbocharger outlet tube.

8. Remove the air cleaner outlet tube.
   1. Detach the air cleaner outlet tube to turbocharger retaining clip.
   2. Detach the air cleaner outlet tube to breather tube retaining clip.
   - Remove the air cleaner outlet tube.

9. Lower the vehicle.
10. Fit the front engine lifting brackets

11. Fit the engine support beam.

12. Detach the right-hand engine mounting.
13. Raise the engine.
14. Raise the vehicle.
15. Remove the right-hand engine mounting retaining bolt.

16. Remove the right-hand engine mounting bracket.

17. Remove the right-hand engine mounting.

**Installation**

1. Install the right-hand engine mounting.
2. Install the right-hand engine mounting bracket.
   • Tighten to 90 Nm.

3. Tighten to 63 Nm.

4. Lower the vehicle.
5. Lower the engine.
6. Tighten to 48 Nm.

7. Remove the engine support beam.
8. Remove the front engine lifting eyes.

9. Raise the vehicle.

10. Install the air cleaner outlet tube.
    1. Attach the air cleaner outlet tube to turbocharger retaining clip.
    2. Attach the air cleaner outlet tube to breather tube retaining clip.

11. Install the right-hand turbocharger outlet tube.

12. Attach the right-hand turbocharger outlet tube connecting hose.

13. Install the right hand catalytic converter.
    For additional information, refer to: Catalytic Converter - 2.7L V6 - TdV6 (309-00 Exhaust System, Removal and Installation).
14. Attach the right-hand air cleaner outlet tube to the timing cover.

15. Install the starter motor.
   For additional information, refer to: Starter Motor - 2.7L V6 - TdV6 (303-06 Starting System, Removal and Installation).

16. Install the generator.
   For additional information, refer to: Generator - 2.7L V6 - TdV6 (414-02 Generator and Regulator, Removal and Installation).

17. Install the intake air shutoff throttle.
   For additional information, refer to: Intake Air Shutoff Throttle (303-04C Fuel Charging and Controls - 2.7L V6 - TdV6, Removal and Installation).
**Engine - 2.7L V6 - TdV6 - Exhaust Manifold LH**

**In-vehicle Repair**

**Removal**

1. Remove the left-hand EGR valve. For additional information, refer to: [Exhaust Gas Recirculation (EGR) Valve LH](303-08B Engine Emission Control - 2.7L V6 - TdV6, Removal and Installation).

2. Remove the Turbocharger LH. For additional information, refer to: [Turbocharger LH](303-04D Fuel Charging and Controls - Turbocharger - 2.7L V6 - TdV6, Removal and Installation).

3. Remove the exhaust manifold heatshield.

4. **NOTE:** New exhaust manifold retaining studs must be fitted if the old studs are removed.

   Remove the exhaust manifold.
   - Remove and discard the retaining nuts.

5. Remove and discard the exhaust manifold gasket.

**Installation**

1. Install a new exhaust manifold gasket.
2. **CAUTION:** Ensure the exhaust manifold and gasket are correctly aligned to the cylinder head and studs.

   Install the exhaust manifold.
   - Install new exhaust manifold retaining nuts.
   - Tighten to 23 Nm.

3. Install the exhaust manifold heat shield.
   - Tighten to 10 Nm.

4. Install the Turbocharger LH.
   For additional information, refer to: [Turbocharger LH](303-04D Fuel Charging and Controls - Turbocharger - 2.7L V6 - TdV6, Removal and Installation).

5. Install the EGR valve.
   For additional information, refer to: [Exhaust Gas Recirculation (EGR) Valve LH](303-08B Engine Emission Control - 2.7L V6 - TdV6, Removal and Installation).
1. Remove the exhaust gas recirculation (EGR) valve RH. For additional information, refer to: Exhaust Gas Recirculation (EGR) Valve RH (303-08B Engine Emission Control - 2.7L V6 - TdV6, Removal and Installation).

2. Remove the turbocharger RH. For additional information, refer to: Turbocharger RH (303-04D Fuel Charging and Controls - Turbocharger - 2.7L V6 - TdV6, Removal and Installation).

3. Remove the exhaust manifold front heat shield.

4. Remove the exhaust manifold rear heat shield.

5. NOTE: New exhaust manifold retaining studs must be fitted if the old studs are removed.
   - Remove the exhaust manifold.
     1. Remove and discard the retaining nuts.

6. Remove and discard the exhaust manifold gasket.
1. Install a new exhaust manifold gasket.

2. **CAUTION:** Ensure the exhaust manifold and gasket are correctly aligned to the cylinder head and studs.

   Install the exhaust manifold.
   - Install new exhaust manifold retaining nuts.
   - Tighten to 23 Nm.

3. Install the exhaust manifold rear heat shield.
   - Tighten to 10 Nm.

4. Install the exhaust manifold front heat shield.
   - Tighten to 10 Nm.

5. Install the turbocharger RH.
   For additional information, refer to: Turbocharger RH (303-04D Fuel Charging and Controls - Turbocharger - 2.7L V6 - TdV6, Removal and Installation).

6. Install the exhaust gas recirculation (EGR) valve RH.
   For additional information, refer to: Exhaust Gas Recirculation (EGR) Valve RH (303-08B Engine Emission Control - 2.7L V6 - TdV6, Removal and Installation).
**Removal**

1. Remove the transmission.
   For additional information, refer to: [Transmission - 2.7L V6 - TdV6 (307-01 Automatic Transmission/Transaxle, Installation)].

2. **NOTE:** Prevent the flexplate from rotating.

   Remove the flexplate.

**Installation**

1. **NOTE:** Make sure the crankshaft and flexplate mating faces are clean before installation.
   - **NOTE:** The flexplate will only locate in one position.
   - **NOTE:** Install, but do not tighten, the flexplate retaining bolts.

   Install the flexplate.
   - Prevent the flexplate from rotating.

2. **CAUTION:** Tighten the flexplate securing bolts in three stages.

   Tighten the flexplate securing bolts.
   - Stage 1: Tighten to 50 Nm.
   - Stage 2: Tighten to 45 degrees.
   - Stage 3: Tighten to 45 degrees.

3. Install the transmission.
   For additional information, refer to: [Transmission - 2.7L V6 - TdV6 (307-01 Automatic Transmission/Transaxle, Installation)].
### Removal

2. **NOTE:** Prevent the flywheel from rotating.

   Remove the flywheel.

### Installation

1. **NOTE:** Make sure the crankshaft and flywheel mating faces are clean before installation.

   • **NOTE:** The flywheel will only locate in one position.
   
   • **NOTE:** Install, but do not tighten, the flywheel retaining bolts.

   Install the flywheel.
   
   • Prevent the flywheel from rotating.

2. **CAUTION:** Tighten the flywheel securing bolts in three stages.

   Tighten the flywheel securing bolts.
   
   • Stage 1: Tighten to 50 Nm.
   
   • Stage 2: Tighten to 45 degrees.
   
   • Stage 3: Tighten to 45 degrees.

**Engine - 2.7L V6 - TdV6 - Oil Filter Element**

<tbody>
<tr>
<td>303-1128</td>
</tr>
</tbody>
</table>

**Removal**

1. Remove the oil filler cap.

2. Remove the engine cover.

3. **NOTE:** Remove and discard the O-ring seal.

   Remove the oil filter element housing.
   - Rotate the oil filter element housing five complete turns counterclockwise.
   - Allow the engine oil to drain from the oil filter element housing for two minutes.
   - Remove the oil filter element housing.

4. Using the special tool, remove the oil filter element.
1. Install the oil filter element.

2. **NOTE:** Install a new O-ring seal.
   Install the oil filter element housing.
   - Tighten to 25 Nm.

3. Install the engine cover.

4. Install the oil filler cap.

5. Check and top up the engine oil.
6. Run the engine.
7. Check and if necessary top up the engine oil.

Removal

1. Remove the oil filler cap.

2. Remove the engine cover.

3. Install the engine oil filler cap to prevent foreign material entering the valve cover.

4. Install the engine lifting bracket.
5. Install the engine support bracket.

6. Remove the air deflector.  
   For additional information, refer to: Air Deflector (501-02 Front End Body Panels, Removal and Installation).

7. Detach the lower steering column.  
   - Remove the steering gear shaft pinch bolt.

8. Detach the steering gear.  
   - Remove the steering gear retaining bolts.

9. Using a suitable piece of string secure the steering gear.
10. Remove the right-hand turbo charger outlet tube retaining bolt.

11. Remove the right-hand turbo charger outlet tube.

12. Remove the left-hand engine mount retaining nut.

13. Lower the vehicle.

14. Using special tool raise the left-hand side of the engine.

15. Raise the vehicle.

16. Drain the engine oil.

- Place suitable container under the vehicle.
- Remove the drain plug and drain the engine oil.
17. Remove the oil pan retaining bolts.

18. Remove the oil strainer retaining bolt.

19. Reposition the oil strainer.

20. Remove the oil pan.
   • Remove and discard the gasket.

21. Remove the oil strainer.
   • Remove and discard the O-ring seal.
Installation

1. Install the oil strainer.
   - Install a new O-ring seal.
   - Tighten to 10 Nm.

2. Loosely install the oil pan.
   - Install a new oil pan gasket.

3. Reposition the oil strainer.

4. Install the oil strainer retaining bolt.
   - Tighten to 10 Nm.

5. NOTE: A new oil pan is supplied with the drain plug installed. Check that the drain plug is tightened to 25 Nm.
   Install the oil pan.
   - Tighten to 10 Nm.
6. Install the right-hand turbo charger outlet tube.

7. Install the right-hand turbo charger outlet tube retaining bolt.
   - Tighten to 10 Nm.

8. Remove the piece of string securing the steering gear.

9. Install the steering gear.
   - Tighten to 100 Nm.

10. Install the steering gear shaft pinch bolt.
    - Tighten to 35 Nm.
11. Lower the vehicle.
12. Using special tool lower the left-hand side of the engine.

13. Raise the vehicle.
14. Install the left-hand engine mount retaining nut.
   - Tighten to 63 Nm.

15. Install the air deflector.
    For additional information, refer to: Air Deflector (501-02 Front End Body Panels, Removal and Installation).
16. Lower the vehicle.
17. Remove the engine support bracket.

18. Remove the engine lifting bracket.

19. Remove the engine oil filler cap.
20. Install the engine cover.

21. Check and top-up the engine oil.

22. Install the oil filler cap.
Removal

Vehicles with automatic transmission

1. Remove the automatic transmission.
   For additional information, refer to: Transmission - 2.7L V6 - TdV6 (307-01 Automatic Transmission/Transaxle, Removal).

Vehicles with manual transmission

2. Remove the manual transmission.

All vehicles

3. Remove the oil pan.
   For additional information, refer to: Oil Pan (303-01C Engine - 2.7L V6 - TdV6, In-vehicle Repair).

4. Remove the air conditioning (A/C) pipe retaining bolt.

5. Remove the left-hand turbocharger outlet pipe retaining bolt.

6. Disconnect the left-hand turbocharger outlet pipe.
7. Remove the left-hand turbocharger outlet pipe from the turbocharger.

8. Detach the engine ground cable.

9. Detach the starter motor positive cable.

10. Detach the starter motor solenoid harness.
11. Reposition the starter motor positive cable.

12. Remove the starter motor.

13. Detach the oil temperature sensor harness from the cylinder block.

14. Remove the A/C compressor lower retaining bolt.
15. Remove the accessory drive belt tensioner bracket retaining bolt.

16. Remove the charge air cooler pipe retaining bolt.

17. Remove the oil pan extension.
   - NOTE: Note the position of the retaining bolts before removal.
   - Remove and discard the gasket.

**Installation**

All vehicles
- NOTE: Make sure the oil pan extension mating faces are clean and dry.
- NOTE: Install a new oil pan extension gasket.
1. Apply a 8 mm bead of sealant to the cylinder block in the areas shown. For additional information, refer to: Specifications (303-01C Engine - 2.7L V6 - TdV6, Specifications).

2. Loosely install all oil pan extension retaining bolts.
3. **NOTE:** The retaining bolts must be tightened within twenty minutes of applying the sealant.

Tighten the oil pan extension retaining bolts in the sequence shown.

1. Tighten bolts A to 10 Nm (7 lb.ft). Tighten bolts B to 4 Nm (2 lb.ft).
2. Tighten bolts A to 24 Nm (18 lb.ft). Tighten bolts B to 10 Nm (7 lb.ft).

4. Install the charge air cooler pipe retaining bolt.
   - Tighten to 10 Nm (7 lb.ft).

5. Install the accessory drive belt tensioner bracket retaining bolt.
   - Tighten to 24 Nm (18 lb.ft).
6. Install the A/C compressor lower retaining bolt.
   - Tighten to 24 Nm (18 lb.ft).

7. Attach the oil temperature sensor harness to the cylinder block.

8. Install the starter motor.
   - Tighten to 24 Nm (18 lb.ft).

9. Reposition the starter motor positive cable.
10. Attach the starter motor solenoid harness.  
   - Tighten to 7 Nm (5 lb.ft).

11. Attach the starter motor positive cable.  
   - Tighten to 10 Nm (7 lb.ft).

12. Attach the engine ground cable.  
   - Tighten to 24 Nm (18 lb.ft).

13. Install the left-hand turbocharger outlet pipe to the turbocharger.  
   - Tighten to 5 Nm (4 lb.ft).
14. Connect the left-hand turbocharger outlet pipe.
   ● Tighten to 5 Nm (4 lb.ft).

15. Install the left-hand turbocharger outlet pipe retaining bolt.
   ● Tighten to 24 Nm (18 lb.ft).

16. Install the A/C pipe retaining bolt.
   ● Tighten to 24 Nm (18 lb.ft).

17. Install the oil pan.
    For additional information, refer to: Oil Pan (303-01C Engine - 2.7L V6 - TdV6, In-vehicle Repair).

Vehicles with manual transmission

18. Install the manual transmission.

Vehicles with automatic transmission

19. Install the automatic transmission.
    For additional information, refer to: Transmission - 2.7L V6 - TdV6 (307-01 Automatic Transmission/Transaxle, Installation).
Engine - 2.7L V6 - TdV6 - Oil Pump
In-vehicle Repair

Removal

1. Disconnect the battery ground cable. For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

2. Remove the crankshaft front oil seal. For additional information, refer to: Crankshaft Front Seal (303-01C Engine - 2.7L V6 - TdV6, In-vehicle Repair).

3. **WARNING**: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

   Raise and support the vehicle.

4. Remove the oil pan extension. For additional information, refer to: Oil Pan Extension (303-01C Engine - 2.7L V6 - TdV6, In-vehicle Repair).

5. Remove the accessory drive belt tensioner.
   - Remove the bolt.

6. Release the right hand turbocharger outlet pipe from the turbocharger.
   - Release the clip.

7. Remove the right hand turbocharger outlet pipe.
   - Remove the bolt.
   - Release the clip.
8. Disconnect the generator electrical connector.

9. Disconnect the battery positive cable from the generator.
   - Reposition the battery positive cable connector cover.
   - Remove the nut.

10. Remove the 2 generator lower bolts.

11. Release the generator.
    - Remove the generator upper bolt.
    - Reposition the generator.
    - Using a suitable tie strap, secure the generator to the front subframe.

12. NOTE: The generator mounting bracket upper rear bolt cannot be fully removed until the generator mounting bracket has been detached from the engine.
    - Remove the generator mounting bracket.
    - Remove the 4 bolts.
13. Remove the timing belt idler pulley.
   - Remove the bolt.

14. Remove the 2 timing belt cover sealing strips.

15. Remove the oil pump.
   - Remove the 10 bolts.
   - Remove and discard the gasket.

**Installation**

1. Prime the oil pump.
   1. Fill the orifice shown with 20 ml of engine oil. For additional information, refer to: Specifications (303-01C Engine - 2.7L V6 - TdV6, Specifications).
   2. Rotate the oil pump drive 2 complete turns.
2. **CAUTIONS:**

- Make sure that the mating faces are clean and free of foreign material.
- Make sure the gasket is installed correctly.
- Rotate the oil pump drive to align with the flats on the crankshaft before installation.

   Install the oil pump.
   - Clean the component mating faces.
   - Install a new gasket.
   - Lightly tighten the bolts in the positions shown.

3. **CAUTION:** Make sure the base of the oil pump is aligned within 0.2 mm of the base of the engine block. Failure to follow this instruction may result in damage to the vehicle.

   - **NOTE:** Vehicles fitted with oil pumps without dowels.

     Check the oil pump to engine block alignment.

4. **NOTE:** All vehicles.

   Secure the oil pump.
   - Tighten the 10 bolts to 10 Nm in the sequence shown.

5. Install the timing belt cover sealing strips.
6. Install the timing belt idler pulley.
   - Tighten the bolt to 45 Nm.
7. NOTE: The generator mounting bracket upper rear bolt must be installed to the generator mounting bracket before the generator bracket is installed to the engine.

Install the generator mounting bracket.
- Loosely install the 4 bolts.
- Tighten the 4 bolts in the sequence shown to 23 Nm.

8. Install the generator.
- Tighten the 3 bolts to 47 Nm.

9. Connect the generator electrical connections.
- Attach the battery positive cable and tighten the nut to 12 Nm.
- Reposition the battery positive cable connector cover.
- Connect the electrical connection.

10. Install the RH turbocharger outlet pipe.
- Secure the 2 clips.

11. Install the accessory drive belt tensioner.
- Tighten the bolt to 47 Nm.

12. Install the oil pan extension. For additional information, refer to: Oil Pan Extension (303-01C Engine - 2.7L V6 - TdV6, In-vehicle Repair).

13. Install the crankshaft front oil seal. For additional information, refer to: Crankshaft Front Seal (303-01C Engine - 2.7L V6 - TdV6, In-vehicle Repair).

14. Connect the battery ground cable. For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

</table>

## Removal

All vehicles

1. Disconnect the battery.
   For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

2. Remove the timing belt cover.
   For additional information, refer to: [Engine Front Cover - VIN Range: N52048 -> N99999](#) (303-01B Engine - V8 4.2L Petrol/V8 S/C 4.2L Petrol, In-vehicle Repair).

3. Remove the starter motor retaining bracket.
4. Detach the starter motor solenoid harness.

5. Detach the starter motor cable.

6. Detach the starter motor solenoid harness.

7. Detach the starter motor.

8. NOTE: Remove the locking pin access grommet.
   Align the timing pin hole.
   • Rotate the crankshaft clockwise.

Vehicles with automatic transmission
9. Using the special tool, lock the flexplate.

Vehicles with manual transmission

10. Using the special tool, lock the flywheel.

All vehicles

11. Lower the vehicle.

12. **CAUTION:** If the camshafts are not aligned to the correct position, remove the special tool and rotate the crankshaft 180 degrees.

Check that the left-hand camshaft alignment hole is at the 7 o'clock position and that the right-hand camshaft alignment hole is at the 5 o'clock position.

13. Remove the auxiliary drive belt pulley.

14. Remove the auxiliary drive belt pulley bracket.
15. Using the special tools, lock the camshaft pulleys.

16. **CAUTION**: The camshaft pulley hub must be counter held while undoing the camshaft pulley hub retaining bolts. Failure to follow this instruction may result in damage to the special tools and the engine.

   Undo but do not remove the camshaft pulley securing bolts.
   1. Counter hold the camshaft pulley hub.
   2. Undo but do not remove the camshaft pulley securing bolts.

17. Remove and discard the timing belt tensioner.
   - Release the timing belt tensioner.

18. Remove and discard the timing belt.

---

**Installation**

All vehicles
1. Rotate both camshaft pulleys fully clockwise.

2. Install a new timing belt tensioner.
   - Do not fully tighten the retaining bolt.

3. **CAUTION:** Make sure that the timing belt slack is at the timing belt tensioner. Failure to follow this instruction may result in damage to the engine.

   Install the timing belt in the sequence shown.
   1. Install the timing belt to the crankshaft pulley.
   2. Attach the timing belt to the idler pulley.
   3. Attach the timing belt to the left-hand camshaft pulley.
   4. Attach the timing belt to the idler pulley.
   5. Attach the timing belt to the right-hand camshaft pulley.
   6. Attach the timing belt to the timing belt tensioner.

4. **CAUTION:** Make sure the timing belt tensioner window is correctly aligned. Failure to follow this instruction may result in damage to the engine.

   Tension the timing belt.
   1. Rotate the tensioner.
   2. Make sure the tensioner window is aligned.
   3. Tighten to 24 Nm.

5. **CAUTION:** The camshaft pulley hub must be counter held while undoing the camshaft pulley hub retaining bolts. Failure to follow this instruction may result in damage to the special tools and the engine.

   Fully tighten the camshaft pulley retaining bolts.
   1. Counter hold the camshaft pulley hub.
   2. Tighten to 23 Nm.
6. Raise the vehicle.

Vehicles with automatic transmission
7. Remove the special tool.

8. Remove the special tool.

All vehicles
9. Lower the vehicle.
10. Remove the special tools.

11. CAUTION: Do not rotate the crankshaft counter clockwise.
    Rotate the crankshaft clockwise two complete turns.
12. Raise the vehicle.

Vehicles with automatic transmission
13. Using the special tool, lock the flexplate.
14. Using the special tool, lock the flywheel.

All vehicles

15. Lower the vehicle.

16. **CAUTION:** If the camshafts are misaligned repeat the timing belt installation procedure.

Using the special tools, make sure the camshafts are aligned.

17. Remove the special tools.

18. Install the auxiliary drive belt pulley bracket.
19. Install the auxiliary drive belt pulley.

20. Raise the vehicle.

Vehicles with automatic transmission

21. Remove the special tool.
   - Install the grommet.

Vehicles with manual transmission

22. Remove the special tool.
   - Install the grommet.

All vehicles

23. Attach the starter motor.
   - Tighten to 48 Nm.
   ● Tighten to 8 Nm.

25. Attach the starter motor cable.
   ● Tighten to 7 Nm.

26. Install the starter motor retaining bracket.
   ● Tighten to 23 Nm.

27. Install the timing belt cover.
   For additional information, refer to: Engine Front Cover - VIN Range: N52048->N99999 (303-01B Engine - V8 4.2L Petrol/V8 S/C 4.2L Petrol, In-vehicle Repair).

28. Connect the battery.
   For additional information, refer to: Battery Connect (414-01 Battery, Mounting and Cables, General Procedures).
**Engine - 2.7L V6 - TdV6 - Timing Belt Cover**

**Removal**

1. Remove the air cleaner. 
   For additional information, refer to: [Air Cleaner](303-12C Intake Air Distribution and Filtering - 2.7L V6 - TdV6, Removal and Installation).

2. Remove the oil filler cap.

3. Remove the engine cover.

4. Remove the air deflector. 
   For additional information, refer to: [Air Deflector](501-02 Front End Body Panels, Removal and Installation).

5. Detach the accessory drive belt.
   1. Using the special tool, rotate the accessory drive belt tensioner counter clockwise.
   2. Remove the accessory drive belt.

6. Lower the vehicle.
7. Detach the coolant hose.

8. Disconnect the coolant temperature sensor.

9. Detach the coolant temperature sensor wiring harness.

10. Detach the exhaust gas recirculation (EGR) valve tube.
    - Remove the retaining bolt.

11. Detach the oil level indicator tube.
    - Remove the retaining bolt.
12. Remove the left-hand timing cover.
   - Remove and discard the gaskets.

13. Detach the coolant hose.

14. Remove the retaining bolt.

15. Disconnect the electrical connector.

16. Remove the intake air shutoff throttle elbow.
   - Release the retaining clip.
17. Remove the charge air cooler hose.

18. Detach the coolant hose.

19. Detach the port deactivation valve retaining bracket.

20. Detach the air temperature sensor wiring harness.

21. Detach the EGR valve tube.
   - Remove the retaining bolt.
22. Remove the RH timing cover.
   - Remove and discard the gaskets.

23. Remove the crankshaft vibration damper.
    For additional information, refer to: Crankshaft Vibration Damper
    (303-01C Engine - 2.7L V6 - TdV6, In-vehicle Repair).

24. Detach the charge air cooler hose.
    1. Remove the hose clamp.
    2. Remove the retaining bolt.

25. Lower the vehicle.

26. Remove the charge air cooler hose.

27. Detach the turbocharger inlet hose.
    - Remove the retaining nut.

28. NOTE: Lock the water pump pulley with suitable 6 mm bar.
    Remove the water pump pulley.
    - Remove the retaining bolts.
29. Remove the lower timing cover.
   - Remove and discard the gaskets.

Installation

1. NOTE: Install a new gasket.
   Install the lower timing cover.
   - Tighten to 10 Nm.

2. Install the water pump pulley.
   - Tighten to 24 Nm.

3. Attach the turbo charger inlet hose.

4. Attach the charge air cooler hose.

5. Raise the vehicle.
6. Attach the charge air cooler hose.
   1. Tighten to 4 Nm.
   2. Tighten to 8 Nm.

7. Install the crankshaft vibration damper.
   For additional information, refer to: **Crankshaft Vibration Damper (303-01C Engine - 2.7L V6 - TdV6, In-vehicle Repair).**

8. **NOTE:** Install a new gasket.
   Install the RH timing cover.
   - Tighten to 10 Nm.

9. Attach the EGR valve tube.
   - Tighten to 4 Nm.

10. Attach the air temperature sensor wiring harness.
11. Attach the port deactivation valve retaining bracket.
   - Tighten to 8 Nm.

12. Attach the coolant hose.

13. Install the charge air cooler hose.
   - Tighten to 8 Nm.

14. Install the intake air shutoff throttle elbow.
   - Release the retaining clip.

15. Connect the electrical connector.
16. Install the retaining bolt.

17. Attach the coolant hose.

18. **NOTE:** Install a new gasket.

   Install the LH timing cover.
   - Tighten to 10 Nm.

19. Attach the oil level indicator tube.
   - Tighten to 3 Nm.

20. Attach the EGR valve tube.
   - Tighten to 3 Nm.
21. Attach the coolant temperature sensor wiring harness.

22. Connect the coolant temperature sensor.

23. Attach the coolant hose.

24. Install the engine cover.

25. Install the oil filler cap.
26. Install the air deflector.
   For additional information, refer to: Air Deflector (501-02 Front End Body Panels, Removal and Installation).

27. Attach the accessory drive belt.
   1. Using the special tool, rotate the accessory drive belt tensioner counter clockwise.
   2. Install the accessory drive belt.

28. Lower the vehicle.

29. Install the air cleaner.
    For additional information, refer to: Air Cleaner (303-12C Intake Air Distribution and Filtering - 2.7L V6 - TdV6, Removal and Installation).

Removal

Valve Cover LH and RH

1. **WARNINGS:**

⚠️ Wait at least 30 seconds after the engine stops before commencing any repair to the high pressure fuel injection system. Failure to follow this instruction may result in personal injury.

⚠️ Do not smoke or carry lit tobacco or open flame of any type when working on or near any fuel related components. Highly flammable mixtures are always present and may ignite. Failure to follow these instructions may result in personal injury.

⚠️ This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow this instruction may result in personal injury.

⚠️ Do not carry out any repairs to the fuel injection system with the engine running. The fuel pressure within the system can be as high as 1650 bar. Failure to follow this instruction may result in personal injury.

• **CAUTIONS:**

⚠️ Make sure the workshop area in which the vehicle is being worked on is as clean and as dust free as possible. Foreign matter from work on clutches, brakes or from machining or welding operations can contaminate the fuel system and may result in later malfunction.

⚠️ Always carry out the cleaning process before carrying out any repairs to the fuel injection system components. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

⚠️ Diesel fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines.

Remove the intake air shut off throttle.

For additional information, refer to:  **Intake Air Shutoff Throttle** (303-04C Fuel Charging and Controls - 2.7L V6 - TdV6, Removal and Installation).

2. **Remove the air cleaner.**

For additional information, refer to: **Air Cleaner** (303-12C Intake Air Distribution and Filtering - 2.7L V6 - TdV6, Removal and Installation).

3. **Remove the air deflector.**

For additional information, refer to: **Air Deflector** (501-02 Front End Body Panels, Removal and Installation).

Valve Cover LH
4. Detach the accessory drive belt.
   1. Using the special tool, rotate the accessory drive belt tensioner counter clockwise.
   2. Detach the accessory drive belt.

5. Lower the vehicle.
6. Detach the engine coolant hose.

7. Disconnect the electrical connector.

8. Detach the engine harness.

Valve Cover LH and RH
9. Remove the exhaust gas recirculation outlet tube retaining bolt.

Valve Cover LH

10. Remove the oil level indicator retaining bolt.

11. Remove the timing belt cover.

Valve Cover LH and RH

12. Remove the fuel injectors.
For additional information, refer to: Fuel Injector (303-04C Fuel Charging and Controls - 2.7L V6 - TdV6, Removal and Installation).

13. Remove the intake air shut off throttle.
For additional information, refer to: Intake Air Shutoff Throttle (303-04C Fuel Charging and Controls - 2.7L V6 - TdV6, Removal and Installation).

14. Detach the electrical connector from the valve cover.
15. Disconnect the electrical connector.

Valve Cover RH

16. Detach the timing cover retaining bolt.

Valve Cover LH

17. Disconnect the electrical connector.

Valve Cover LH and RH

18. Detach the engine harness.
19. Remove the engine harness retaining bolts.

20. Detach the engine breather pipe.

21. Disconnect the vacuum pipe.

22. Remove the fuel injection pump supply line retaining bolt.

23. Clean the fuel pump, high pressure fuel supply line and surrounding areas.
   For additional information, refer to: Fuel Injection Component Cleaning
   (303-04C Fuel Charging and Controls - 2.7L V6 - TdV6, General Procedures).
24. CAUTIONS:

⚠️ Make sure that the high pressure fuel supply line remains in contact with both the fuel pump and the fuel injection supply manifold until both unions have been detached and cleaned. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

⚠️ While maintaining the pressure on the high pressure fuel supply line, clean and vacuum foreign material from the line and unions.

Remove the high pressure fuel supply line.

25. Remove the fuel injection supply manifold.

26. Remove the fuel injection supply manifold securing bracket.

27. Remove the engine cover and wiring harness retainers.
28. Remove the engine cover retainer.

Valve Cover LH and RH

29. Remove the valve cover.
   - Remove and discard the valve cover gasket.

Installation
Valve Cover LH and RH

1. WARNINGS:

   - Wait at least 30 seconds after the engine stops before commencing any repair to the high pressure fuel injection system. Failure to follow this instruction may result in personal injury.

   - Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable mixtures are always present and may ignite. Failure to follow these instructions may result in personal injury.

   - This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow this instruction may result in personal injury.

   - Do not carry out any repairs to the fuel injection system with the engine running. The fuel pressure within the system can be as high as 1650 bar. Failure to follow this instruction may result in personal injury.

   • CAUTIONS:

   - Make sure the workshop area in which the vehicle is being worked on is as clean and as dust free as possible. Foreign matter from work on clutches, brakes or from machining or welding operations can contaminate the fuel system and may result in later malfunction.

   - Always carry out the cleaning process before carrying out any repairs to the fuel injection system components. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

   - Diesel fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines.

   To install, reverse the removal procedure.
   - Tighten to 10 Nm.
2. Tighten to 24 Nm.

3. Tighten to 24 Nm.

4. NOTE: Left-hand shown, right-hand similar.
   Install new high pressure fuel supply lines.
   - Remove and discard the blanking caps.
   - Tighten the high-pressure fuel supply line in the sequence shown in four stages:
     1. Stage 1: Tighten the high-pressure fuel supply line union 1 to 15 Nm.
     2. Stage 2: Tighten the high-pressure fuel supply line union 2 to 15 Nm.
     3. Stage 3: Tighten the high-pressure fuel supply line union 1 to 30 Nm.
     4. Stage 4: Tighten the high-pressure fuel supply line union 2 to 30 Nm.

5. Tighten to 10 Nm.

6. Tighten to 4 Nm.
Valve Cover RH
7. Tighten to 4 Nm.

8. Tighten to 10 Nm.

Valve Cover LH
9. Tighten to 3 Nm.

10. Tighten to 3 Nm.

Valve Cover LH and RH
11. Tighten to 3 Nm.

### Removal

#### All Vehicles

1. Drain the cooling system.  
   For additional information, refer to: **Cooling System Draining, Filling and Bleeding** (303-03C Engine Cooling - 2.7L V6 - TdV6, General Procedures).

2. Remove the cooling fan motor and shroud.  
   For additional information, refer to: **Cooling Fan Motor and Shroud** (303-03C Engine Cooling - 2.7L V6 - TdV6, Removal and Installation).

3. Remove the transmission assembly.  
   For additional information, refer to: **Transmission - 2.7L V6 - TdV6** (307-01 Automatic Transmission/Transaxle, Removal).

#### Vehicles with manual transmission

4. Remove the transmission assembly.  
   For additional information, refer to: **Transmission** (308-03B Manual Transmission/Transaxle - Vehicles With: S6-53 6-Speed Manual Transmission, Removal).

#### All vehicles

5. Recover the air conditioning refrigerant.  
   For additional information, refer to: **Air Conditioning (A/C) System Recovery, Evacuation and Charging** (412-00 Climate Control System - General Information, General Procedures).

6. Detach the radiator top hose.

#### Vehicles with automatic transmission
7. Detach the radiator hose.

8. Detach the brake booster vacuum pipe.

9. Disconnect the glow plug harness electrical connectors.

10. Remove the air intake hose.

11. Remove the cabin air filter.

For additional information, refer to: Cabin Air Filter (412-01 Air Distribution and Filtering, Removal and Installation).
12. Remove the cabin air filter housing retaining nut.

13. Remove the cabin air filter housing.

14. Remove the engine compartment panel.

15. Remove the left hand engine compartment trim panel.

16. Disconnect the engine wiring harness electrical connector.
17. Disconnect the engine control module (ECM) electrical connectors.

18. NOTE: Cap the exposed ports.
   Disconnect the fuel filter feed hose.

19. NOTE: Cap the exposed ports.
   Disconnect the fuel filter return hose.

20. NOTE: Cap the exposed ports.
   Disconnect the fuel filter return hose.

21. Remove the power steering fluid reservoir.
   For additional information, refer to: Power Steering Fluid Reservoir
   (211-02 Power Steering, Removal and Installation).
22. Disconnect the coolant hose.

23. Disconnect the charge air cooler hose.

24. Detach the thermostat housing.

25. NOTE: Right-hand shown, left-hand similar. Support the radiator.

26. Raise the vehicle.

27. Detach the starter motor wiring harness.
28. Detach the starter motor wiring harness.

29. Detach the power steering hose.

30. Detach the earth cable.

31. Make sure the alignment mark on the steering gear pinion seal protection cover is central to the steering gear pinion casting.
32. Loosen the lower steering column pinch bolt.

33. Disconnect the power steering control valve actuator electrical connector.

34. Detach the lower steering column.
   - Remove the steering gear shaft pinch bolt.

35. CAUTIONS:
   - Cap the power steering lines to prevent loss of fluid and dirt ingress.
   - If power steering fluid comes into contact with the paintwork, the affected area must be immediately washed down with cold water.
   - NOTE: Drain the fluid into a suitable container.
     - Disconnect the power steering supply and return lines.
       - Remove and discard the O-ring seals.

36. NOTE: Right-hand shown, left-hand similar.
    Remove the front fog lamp covers.
37. Detach the coolant hose.

38. Detach the speed control module retaining bracket.
   - Tie the speed control module retaining bracket aside.

39. Disconnect the air conditioning pressure switch electrical connector.

40. **CAUTION:** Cap the air conditioning line and the condenser to prevent dirt ingress.
    Detach the air conditioning line.
    - Remove and discard the O-ring seal.

41. **CAUTION:** Cap the air conditioning line and the condenser to prevent dirt ingress.
    Detach the air conditioning line.
    - Remove and discard the O-ring seal.
42. Remove the fender splash shield. For additional information, refer to: Fender Splash Shield (501-02 Front End Body Panels, Removal and Installation).

43. Detach the air conditioning line.

44. **CAUTION:** Cap the air conditioning line to prevent dirt ingress. Detach the air conditioning line.
   - Remove and discard the O-ring seal.

45. **NOTE:** Left-hand shown, right-hand similar. Detach the front wheel speed sensors.
   1. Remove the front wheel speed sensor retaining clip.
   2. Detach the front wheel speed sensors.

46. **CAUTION:** The brake caliper must be supported at all times. 
   - **NOTE:** Left-hand shown, right-hand similar. Detach the brake caliper and brake caliper anchor plate and secure to one side.
   - Remove and discard the brake caliper retaining bolts.
47. NOTE: Left-hand shown, right-hand similar.
Detach the shock absorber.

48. CAUTION: Make sure the wheel knuckle is supported. Failure to follow these instructions may result in damage to the vehicle.
• NOTE: Left-hand shown, right-hand similar.
Detach the upper arm.

49. Disconnect the headlamp leveling sensor electrical connector.

50. Lower the vehicle.
51. Detach the engine brace bar.

52. Raise the vehicle.
53. Install the special tool.

54. NOTE: Left-hand shown, right-hand similar.
Remove the front subframe front retaining bolts.

55. NOTE: Left-hand shown, right-hand similar.
Remove the front subframe rear retaining bolts.

56. Using the special tool, remove the engine and front subframe assembly.

Vehicles with automatic transmission
57. Detach the fluid cooler lines.
   - Remove and discard the fluid cooler O-ring seals.

58. Detach the fluid cooler.
   - Remove the retaining bolt.

59. Remove the fluid cooler.
   1. Detach the coolant hoses.
   2. Remove the fluid cooler.

60. Install the special tool.
61. Install the special tool.

62. Detach the port deactivation valve retaining bracket.

63. Disconnect the air intake sensor electrical connector.

64. Detach the intake air elbow.

65. Disconnect the throttle motor electrical connector.
66. **NOTE:** Right-hand shown, left-hand similar.
Remove and discard the exhaust gas recirculation (EGR) valve pipe retaining clip.

67. Disconnect the air intake sensor electrical connector.

68. Detach the electrical connector.

69. Reposition the intake air shutoff throttle.

70. Remove the intake air shutoff throttle.
- Remove and discard the O-ring seals.
71. Install the special tool.

72. NOTE: Left-hand shown, right-hand similar.
Remove the engine mount retaining nut.

73. Remove the engine using a suitable hydraulic lift.

### Installation

**All vehicles**

1. Install the engine using a suitable hydraulic lift.

2. **NOTE: Left-hand shown, right-hand similar.**
   
   Install the engine mount retaining nut.
   
   - Tighten to 63 Nm.
3. Remove the special tool.

4. Install the intake air shutoff throttle.
   - Install new O-ring seals.

5. Reposition the intake air shutoff throttle.

6. Attach the electrical connector.

7. Connect the air intake sensor electrical connector.
8. NOTE: Right-hand shown, left-hand similar.
Install new exhaust gas recirculation (EGR) valve pipe retaining clip.

9. Connect the throttle motor electrical connector.

10. Attach the intake air elbow.

11. Connect the air intake sensor electrical connector.

12. Attach the port deactivation valve retaining bracket.
   - Tighten to 8 Nm.
13. Remove the special tool.

14. Remove the special tool.

Vehicles with automatic transmission

15. Install the fluid cooler.
   1. Install the fluid cooler.
   2. Attach the coolant hoses.

16. Attach the fluid cooler.
   • Install the retaining bolt.
17. Attach the fluid cooler lines.
   - Install new fluid cooler O-ring seals.

All vehicles

18. Using the special tool, install the engine and front subframe assembly.

19. NOTE: Left-hand shown, right-hand similar.

   Install the special tool.

20. NOTE: Left-hand shown, right-hand similar.

   Install the front subframe rear retaining bolts.
   - Tighten to 80 Nm + 300°.
21. NOTE: Left-hand shown, right-hand similar.
Remove the special tool.

22. NOTE: Left-hand shown, right-hand similar.
Install the front subframe front retaining bolt.
- Tighten to 180 Nm + 300°.

23. Remove the special tool.

24. Lower the vehicle.
25. Attach the engine brace bar.

26. Raise the vehicle.
27. Connect the headlamp leveling sensor electrical connector.

28. **CAUTION:** Make sure the wheel knuckle is supported. Failure to follow these instructions may result in damage to the vehicle.

- **NOTE:** Left-hand shown, right-hand similar.
  
  Attach the upper arm.
  
  - Tighten to 90 Nm.

29. **NOTE:** Left-hand shown, right-hand similar.

  Attach the shock absorber.
  
  - Tighten to 175 Nm.

30. **CAUTION:** The brake caliper must be supported at all times.

- **NOTE:** Left-hand shown, right-hand similar.
  
  Attach the brake caliper and brake caliper anchor plate.
  
  - Install new brake caliper retaining bolts.
  
  - Tighten to 103 Nm.

31. **NOTE:** Left-hand shown, right-hand similar.

  Attach the front wheel speed sensors.
  
  1. Attach the front wheel speed sensors.
  
  2. Install the front wheel speed sensor retaining clip.
32. **CAUTION: Un-cap the ports.**
Attach the air conditioning line.
- Install a new O-ring seal.

33. Attach the air conditioning line.

34. Install the fender splash shield.
For additional information, refer to: Fender Splash Shield (501-02 Front End Body Panels, Removal and Installation).

35. **CAUTION: Un-cap the exposed ports.**
Attach the air conditioning line.
- Install the O-ring seal.

36. **CAUTION: Un-cap the exposed ports.**
Attach the air conditioning line.
- Install the O-ring seal.
37. Connect the air conditioning pressure switch electrical connector.

38. Attach the speed control module retaining bracket.

39. Attach the coolant hose.

40. NOTE: Right-hand shown, left-hand similar.

Install the front fog lamp covers.

41. CAUTIONS:

⚠️ Un-cap the exposed ports.

⚠️ If power steering fluid comes into contact with the paintwork, the affected area must be immediately washed down with cold water.

Connect the power steering supply and return lines.
- Install new O-ring seals.
- Tighten to 15 Nm.
42. Attach the lower steering column.
   - Install a new steering gear shaft pinch bolt.
   - Tighten to 35 Nm.

43. Connect the power steering control valve actuator electrical connector.

44. Tighten to 35 Nm.

45. Attach the earth cable.

46. Attach the power steering hose.
47. Attach the starter motor wiring harness.
   - Tighten to 10 Nm.

48. Detach the starter motor wiring harness.
   - Tighten to 6 Nm.

49. Lower the vehicle.
50. **NOTE: Right-hand shown, left-hand similar.**
    Remove the radiator support.

51. Attach the thermostat housing.

52. Connect the charge air cooler hose.
   - Tighten to 4 Nm.
53. Connect the coolant hose.

54. Install the power steering fluid reservoir.
   For additional information, refer to: Power Steering Fluid Reservoir
   (211-02 Power Steering, Removal and Installation).

55. NOTE: Un-cap the exposed ports.
   Connect the fuel filter return hose.

56. NOTE: Un-cap the exposed ports.
   Connect the fuel filter return hose.

57. NOTE: Un-cap the exposed ports.
   Connect the fuel filter feed hose.
58. Connect the engine control module (ECM) electrical connectors.

59. Connect the engine wiring harness electrical connector.

60. Install the left hand engine compartment trim panel.

61. Install the engine compartment panel.

62. Install the cabin air filter housing.
63. Remove the cabin air filter housing retaining nut.

64. Install the cabin air filter. For additional information, refer to: Cabin Air Filter (412-01 Air Distribution and Filtering, Removal and Installation).

65. Install the air intake hose.

66. Connect the glow plug harness electrical connectors.

67. Attach the brake booster vacuum pipe.

Vehicles with manual transmission
68. Attach the radiator hose.

All vehicles

69. Attach the radiator top hose.

70. Recharge the air conditioning system.
For additional information, refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging (412-00 Climate Control System - General Information, General Procedures).

Vehicles with manual transmission

71. Install the transmission.

Vehicles with automatic transmission

72. Install the transmission assembly.
For additional information, refer to: Transmission - 2.7L V6 - TdV6 (307-01 Automatic Transmission/Transaxle, Installation).

All Vehicles

73. Install the cooling fan motor and shroud.
For additional information, refer to: Cooling Fan Motor and Shroud (303-03C Engine Cooling - 2.7L V6 - TdV6, Removal and Installation).

74. Fill and bleed the cooling system.
For additional information, refer to: Cooling System Draining, Filling and Bleeding (303-03C Engine Cooling - 2.7L V6 - TdV6, General Procedures).

---

E30956
- **WARNINGS:**

⚠️ Never remove the coolant pressure cap under any circumstances while the engine is operating. Failure to follow this instruction may result in personal injury.

To avoid having scalding hot coolant or steam blow out of the cooling system, use extreme care when removing the coolant pressure cap from a hot cooling system. Wait until the engine has cooled, then wrap a thick cloth around the coolant pressure cap and turn it slowly until the pressure begins to release. Step back while the pressure is released from the system. When certain all the pressure has been released (still with a cloth) turn and remove the coolant pressure cap from the coolant expansion tank. Failure to follow these instructions may result in personal injury.

⚠️ To avoid the possibility of personal injury, do not operate the engine with the hood open until the fan blades have been examined for cracks and separation. Failure to follow this instruction may result in personal injury.

⚠️ Remove fuse 38 from the engine compartment fuse box prior to performing any under hood service in the area of the cooling fan when the engine is hot, since the cooling fan motor could operate if the engine has been switched OFF. Failure to follow this instruction may result in personal injury.

- **CAUTIONS:**

⚠️ The engine cooling system must be maintained with the correct concentration and type of anti-freeze solution to prevent corrosion and frost damage.
Never remove the coolant pressure cap under any circumstances while the engine is operating. Failure to follow this instruction may result in damage to the engine.

The cooling system consists of the following:

- Radiator
- Coolant pressure cap
- Thermostat
- Water pump
- Electric cooling fan
- Coolant expansion tank
- Engine oil cooler

**Water Pump**

The water pump is of a conventional design and is driven by the crankshaft pulley through the accessory drive belt. The water pump belt tension is maintained by an automatic drive belt tensioner.

For additional information, refer to Section 303-05 Accessory Drive.

**Thermostat**

The thermostat is located in the thermostat housing and allows rapid engine warm-up by restricting coolant flow through the radiator below 82°C (180°F). The thermostat also assists in keeping the engine operating temperature within predetermined limits. On the 4.2L supercharged engine the thermostat begins to open at 84°C (183°F) and is fully open at 98°C (208°F), on the 4.2L and 2.5 or 3.0L engine the thermostat begins to open at 88°C - 92°C (190°F - 198°F) and is fully open at 102°C (216°F).

When the engine is cold and the thermostat is closed, coolant flows from the water pump through the upper coolant hose.

When the engine is warm and the thermostat is open, coolant flows into the radiator through the upper coolant hose. It then returns to the water pump through the lower coolant hose and engine oil cooler.

The heater core is on a parallel circuit and is unaffected by the position of the thermostat.

**Radiator**

The radiator is of aluminium construction with plastic end tanks. Foam seals are fitted to the radiator to prevent the cooling air from by-passing the radiator core. A coolant drain plug is provided in the lower coolant end tank of the radiator for the draining of the coolant. The Cooling fan shroud is attached to the radiator.

**Cooling Fan**

A single, variable speed cooling fan motor is attached to a fan shroud located behind the radiator. The speed is determined by the Engine Coolant Temperature (ECT) and the air conditioning pressure and transmission oil temperature.

Under hot operating conditions, the fan may continue to operate for four minutes after the engine has been switched off.

**Engine Block Heater**

For vehicle markets subject to very cold climate conditions, an engine block heater for connection to an external mains power supply, is fitted in place of the engine block drain plug.

**Coolant Recovery System**

A pressurized coolant expansion tank system is used which continuously separates the air from the cooling system and replenishes the system through the coolant expansion tank outlet hose, attached to the heater return hose.

A continuous vent from the engine and radiator to the coolant expansion tank prevents air locks from forming in the cooling system.

Manual bleed points are provided on the coolant reservoir.

The coolant expansion tank serves as the location for:

- Service fill.
- Coolant expansion during warm-up.
- Air separation during operation.
- System pressurization by the coolant pressure cap.
- The coolant expansion tank is designed to have approximately 0.5 to 1 liter of air when cold to allow for coolant expansion.

**Engine Oil Cooler**

The engine oil cooler is a Modine oil to water type. The oil cooler on the 2.5 or 3.0L engine is located on the left-hand side of the engine and is fitted to the oil filter housing. The oil cooler on the 4.2L engine is located at the front of the engine and is fitted between the oil filter housing and the oil filter.

The coolant supply for the engine oil cooler is through the radiator bottom hose.

**Engine Coolant**

The long life engine coolant is formulated to last for five years or 240,000 km (150,000 miles). The coolant is silicate free and orange in color. The long life engine coolant must not be mixed with conventional engine coolant.

**Vehicles with 2.5L or 3.0L engine**

### PINPOINT TEST A : LOSS OF COOLANT

**TEST CONDITIONS**

1. Visually inspect for loss of coolant
2. Carry out a system pressure test. See component tests in this section.

**DETAILS/RESULTS/ACTIONS**

- **Yes**: Rectify the leak as indicated by the test result. REFER to Engine Cooling / Cooling System Draining, Filling and Bleeding in this section.
- **No**: TEST the system for normal operation.

**PINPOINT TEST B : THE ENGINE OVERHEATS**
B1: CHECK COOLANT

WARNING: The cooling system is pressurised! Make sure the reservoir cap is never released until the system has cooled. Failure to follow these instructions may result in personal injury.

Check the coolant level and condition.

Does the system contain sufficient coolant of the correct specification?

Yes

GO to B2.

No

Top-up the system.

REFER to Cooling System Draining, Filling and Bleeding in this section.

Check for coolant loss. GO to Pinpoint Test A.

B2: CHECK THERMOSTAT

Check the thermostat.

REFER to Thermostat-2.5L/3.0L / Thermostat-4.2L, Vehicles With: Supercharger / Thermostat-4.2L, Vehicles Without: Supercharger in this section.

See component tests in this section.

Is the thermostat OK?

Yes

REFER to Section 303-14A Electronic Engine Controls / 303-14B Electronic Engine Controls / 303-14C Electronic Engine Controls. Cooling fans, modules, circuits, sensors, etc are tested in this section.

No

INSTALL a new thermostat.

REFER to Thermostat-2.5L/3.0L / Thermostat-4.2L, Vehicles With: Supercharger / Thermostat-4.2L, Vehicles Without: Supercharger / Cooling System Draining, Filling and Bleeding in this section.

TEST the system for normal operation.

PINPOINT TEST C : THE ENGINE DOES NOT REACH NORMAL OPERATING TEMPERATURE

C1: CHECK THERMOSTAT

Check the thermostat.

REFER to Thermostat-2.5L/3.0L / Thermostat-4.2L, Vehicles With: Supercharger / Thermostat-4.2L, Vehicles Without: Supercharger in this section.

See component tests in this section.

Is the thermostat OK?

Yes

REFER to Section 303-14A Electronic Engine Controls / 303-14B Electronic Engine Controls / 303-14C Electronic Engine Controls. Cooling fans, modules, circuits, sensors, etc are tested in this section.

No

INSTALL a new thermostat.

REFER to Thermostat-2.5L/3.0L / Thermostat-4.2L, Vehicles With: Supercharger / Thermostat-4.2L, Vehicles Without: Supercharger / Cooling System Draining, Filling and Bleeding in this section.

TEST the system for normal operation.

Component Tests

Pressure Test

WARNING: Never remove the coolant expansion tank cap under any circumstances while the engine is operating. Failure to follow these instructions may result in damage to the cooling system or engine and/or personal injury. To avoid having scalding hot water or steam blow out of the cooling system, use extreme care when removing the coolant expansion tank cap from a hot cooling system. Wait until the engine has cooled, then wrap a thick cloth around the coolant expansion tank cap and turn it slowly until the pressure begins to release, step back while the pressure is released from the system. When certain all the pressure has been released (still with a cloth) turn and remove the coolant expansion tank cap. Failure to follow these instructions may result in personal injury.

1. Switch the engine off.
2. Open the hood and install protective fender covers.
3. Carefully remove the coolant expansion tank cap from the coolant expansion tank to relieve pressure in the cooling system. Add coolant to coolant expansion tank as necessary.
4. Install the adapter fitting from Pressure Tester tightly between overflow/air purge nipple and overflow/air purge hose at the coolant expansion tank. Reinstall the coolant expansion tank cap.
5. Attach the pressure pump and gauge to the adapter fitting and pressurize the cooling system to the coolant expansion tank cap lower limit. Refer to Specification.
6. Pressurize the cooling system. Observe the gauge reading for approximately two minutes. Pressure should not drop during this time.
   - If system holds pressure, proceed to step 8.
   - If the pressure drops, check for leaks at the engine to heater core hoses, engine to radiator hoses, bypass hose, water valve hose (if applicable), thermostat housing gasket, radiator and heater core, etc. Also refer to engine system checks if a leak cannot be located in the cooling system. Correct any leaks found and recheck the system.
7. Release the system pressure by loosening the coolant expansion tank cap. Check the coolant level. Replenish as necessary with the correct coolant solution.
8. Check the radiator overflow hose for any obstructions which may block the flow of coolant either to or from the coolant expansion tank.
9. Conduct the expansion tank cap Pressure Test in this section.

**Coolant Expansion Tank Pressure Cap Pressure Test**

**WARNING:** Never remove the coolant expansion tank cap under any circumstances while the engine is operating. Failure to follow these instructions may result in damage to the cooling system or engine and/or personal injury. To avoid having scalding hot water or steam blow out of the cooling system, use extreme care when removing the coolant expansion tank cap from a hot cooling system. Wait until the engine has cooled, then wrap a thick cloth around the coolant expansion tank cap and turn it slowly until the pressure begins to release, step back while the pressure is released from the system. When certain all the pressure has been released (still with a cloth) turn and remove the coolant expansion tank cap. Failure to follow these instructions may result in personal injury.

1. **1.** Remove the expansion tank cap from the radiator coolant expansion tank.
2. **2.** Use water to clean in area of rubber seal and vacuum relief valve. Immerse expansion tank cap in water and install expansion tank cap pressure test adapter from Pressure Tester on the expansion tank cap.
3. **• NOTE:** If the plunger of the pump is depressed too quickly, an erroneous pressure reading will result.
   3. Slowly depress the plunger of the pressure test pump until the pressure gauge reading stops increasing, and note highest pressure reading obtained.
4. **4.** Release pressure by turning the pressure relief screw counterclockwise. Then tighten the pressure relief screw and repeat Step 5 at least twice to make sure the pressure test reading is repeatable and within acceptable gauge reading limits of the expansion tank cap.
5. **5.** If the pressure test gauge readings are not within acceptable gauge reading limits, install a new expansion tank cap.

**Thermostat Test, Mechanical**

Remove and inspect the thermostat, note its opening temperature and immerse it in water. Heat the water until this temperature is reached. The thermostat should begin to open. If it does not begin to open, install a new thermostat. Continue to heat the water until the thermostat fully opens, 5.8 mm (0.2in) or more off the valve seat. If it does not fully open, install a new thermostat.

**Radiator Leak Test, Removed From the Vehicle**

**CAUTION:** Do not leak test an aluminium radiator in the same water that is used to leak test copper/brass radiators. Flux and caustic cleaners may be present in the test water which will corrode aluminium.

Clean the radiator before leak testing to prevent contamination of the test tank. Leak test the radiator in clean water with 138 kPa (20 psi) air pressure.

A separate clean test tank is recommended for aluminium radiators. If a separate tank is not available for aluminium radiator testing, rinse the test tank each time before testing an aluminium radiator.
Engine Cooling - V8 4.2L Petrol/V8 S/C 4.2L Petrol/2.5L NA V6 - AJV6/3.0L NA V6 - AJ27 - Cooling System Backflushing

General Procedures

• CAUTIONS:

The heater core must be backflushed separately from the engine cooling system to prevent the engine cooling system particles from clogging the heater core tubes and reducing (or eliminating) coolant flow through the heater core.

All engine cooling system flushing and backflushing procedures must include a separate backflushing of the heater core after the flushing or backflushing of the engine cooling system.

Heater core internal pressure must not exceed 100 kPa (14.5 psi). Failure to follow this instruction may cause damage to the heater core.

• NOTE: Cooling system backflushing should be carried out before the cooling system components are installed after the cooling system flushing procedure.

1. Disconnect the heater outlet coolant hose from the engine and connect the heater hose to a suitable hose pipe.
2. Disconnect the heater inlet coolant hose from the engine and allow the coolant to drain into a suitable container.
3. Turn the water supply valve to the hose ON and allow water pressure to flow through the heater core.
4. Allow water pressure to flow through the heater core for approximately five minutes.
5. Turn the water supply valve to the hose OFF and disconnect the hose pipe from the heater hose.
6. Connect the heater inlet coolant hose to the engine.
7. Connect the heater outlet coolant hose to the engine.
8. Fill the cooling system as described using a 50% mixture of Jaguar Premium Cooling System Fluid, or equivalent meeting Jaguar specification WSS M97B44-D and 50% distilled water.
9. Test the system for correct heater performance with the specified engine cooling system conditions.

Radiator Backflushing

1. Remove the radiator.
   For additional information, refer to Radiator in this section.
2. Invert the radiator.
3. Connect a suitable hose pipe to the lower coolant hose connection of the radiator.
4. Turn the water supply valve to the hose ON and allow water pressure to flow through the radiator.
5. Allow water pressure to flow through the radiator for approximately five minutes.
6. Turn the water supply valve to the hose OFF and disconnect the hose pipe from the radiator.
7. Allow the coolant to drain from the radiator.
8. Install the radiator.
   For additional information, refer to Radiator in this section.

Engine Backflushing

1. Remove the thermostat before backflushing the engine.
   For additional information, refer to Thermostat in this section.
2. Position the high-pressure water hose into the engine through the engine return and backflush the engine.
3. Connect a suitable hose pipe to the upper coolant hose connection of the engine.
4. Turn the water supply valve to the hose ON and allow water pressure to flow through the engine.
5. Allow water pressure to flow through the engine for approximately five minutes.
6. Turn the water supply valve to the hose OFF and disconnect the hose pipe from the upper coolant hose connection of the engine.
7. Connect the upper coolant hose to the engine.
8. Fill the cooling system as described using a 50% mixture of Jaguar Premium Cooling System Fluid or equivalent, meeting Jaguar specification WSS M97B44-D and 50% distilled water.
Engine Cooling - V8 4.2L Petrol/V8 S/C 4.2L Petrol/2.5L NA V6 - AJV6/3.0L NA V6 - AJ27 - Cooling System Draining, Filling and Bleeding

General Procedures

All Vehicles

1. WARNINGS:

⚠️ Never remove the coolant pressure cap under any circumstances while the engine is operating. Failure to follow this instruction may result in personal injury.

To avoid having scalding hot coolant or steam blow out of the cooling system, use extreme care when removing the coolant pressure cap from a hot cooling system. Wait until the engine has cooled, then wrap a thick cloth around the coolant pressure cap and turn it slowly until the pressure begins to release. Step back while the pressure is released from the system. When certain all the pressure has been released (still with a cloth) turn and remove the coolant pressure cap from the coolant expansion tank. Failure to follow these instructions may result in personal injury.

⚠️ To avoid the possibility of personal injury, do not operate the engine with the hood open until the fan blades have been examined for cracks and separation. Failure to follow this instruction may result in personal injury.

⚠️ Remove fuse 38 from the engine compartment fuse box prior to performing any under hood service in the area of the cooling fan when the engine is hot, since the cooling fan motor could operate if the engine has been switched OFF. Failure to follow this instruction may result in personal injury.

• CAUTIONS:

⚠️ The engine cooling system must be maintained with the correct concentration and type of anti-freeze solution to prevent corrosion and frost damage.

⚠️ Never remove the coolant pressure cap under any circumstances while the engine is operating. Failure to follow this instruction may result in damage to the engine.

Relieve the cooling system pressure.

- Unscrew the coolant expansion tank cap slowly.

2. Remove the coolant expansion tank cap.

3. Remove the radiator splash shield.

For additional information, refer to Section 501-02 Front End Body Panels.

4. Remove the radiator lower cowl.
5. Remove the coolant drain plug.
   - Drain the coolant into a suitable container.

6. **CAUTION:** Do not over tighten the drain plug. Failure to follow this instruction may cause damage to the vehicle.
   
   Install the drain plug when all coolant has drained.
   - Tighten to 1 Nm.
   - Remove the drain tray.

7. Install the radiator lower cowl.

8. Install the radiator splash shield.
   
   For additional information, refer to Section 501-02 Front End Body Panels.

Vehicles without supercharger

9. Remove the coolant expansion tank bleed screw.

10. Fill the cooling system up to the MAX mark on the coolant expansion tank using a fifty percent mixture of Jaguar Premium Cooling System Fluid or equivalent, meeting Jaguar specification WSS M97B44-D and fifty percent water.
11. **CAUTION:** Do not over tighten the coolant expansion tank bleed screw. Failure to follow this instruction may cause damage to the vehicle.

   Install the coolant expansion tank bleed screw.

   - Tighten to 1 Nm.

12. Install the coolant expansion tank pressure cap.

13. **CAUTION:** Do not RUN the engine with the coolant expansion tank pressure cap removed. Failure to follow this instruction may cause damage to the vehicle.

   START and RUN the engine.

14. SET the heating system to MAX heat, the blower motor to MAX speed and the air distribution to instrument panel registers.

15. **CAUTION:** Observe the engine temperature gauge. If the engine starts to over-heat switch off immediately and allow to cool. Failure to follow this instruction may cause damage to the vehicle.

   Allow the engine to RUN until hot air is emitted from the instrument panel registers, while observing the engine temperature gauge.

16. Switch off the engine.

17. Allow the engine to cool.

18. Release the cooling system pressure.

   - Remove the coolant expansion tank pressure cap.

19. Fill the cooling system up to the MAX mark on the coolant expansion tank using a fifty percent mixture of Jaguar Premium Cooling System Fluid or equivalent, meeting Jaguar specification WSS M97B44-D and fifty percent water.

20. Install the coolant expansion tank pressure cap.
1. **WARNING**: To avoid having scalding hot coolant or steam blowing out of the cooling system, use extreme care when removing the coolant pressure cap from a hot cooling system. Wait until the engine has cooled, then wrap a thick cloth around the coolant pressure cap and turn it slowly until the pressure begins to release. Step back while the pressure is released from the system. When certain all the pressure has been released (still with a cloth) turn and remove the coolant pressure cap from the coolant expansion tank. Failure to follow these instructions may result in personal injury.

   • **CAUTIONS:**

   - The engine cooling system must be maintained with the correct concentration and type of anti-freeze solution to prevent corrosion and frost damage. Failure to follow this instruction may result in damage to the vehicle.

   - Engine coolant will damage the paint finished surfaces. If spilt, immediately remove the coolant and clean the area with water.

     Set the heater controls to maximum HOT.

2. **WARNING**: Relieve the cooling system pressure by unscrewing the coolant pressure cap. Failure to follow this instruction may result in personal injury.

   Remove the coolant expansion tank pressure cap.

3. Remove the radiator splash shield.

   For additional information, refer to: [Radiator Splash Shield](#) (501-02 Front End Body Panels, Removal and Installation).

4. **NOTE**: Remove and discard the radiator drain plug O-ring seal.

   Remove the coolant drain plug.

   - Drain the coolant into a suitable container.
5. **CAUTION:** Do not over tighten the drain plug. Failure to follow this instruction may result in damage to the vehicle.

- **NOTE:** Install a new O-ring seal.

Install the coolant drain plug.

---

**Vehicles with supercharger**

6. Disconnect the supercharger radiator bottom hose.
   - Release the clip.
   - Allow the coolant to drain.

---

7. Connect the supercharger bottom hose.
   - Secure the clip.

---

**All vehicles**

8. Remove the suitable container.

9. Lower the vehicle.

10. Install the cooling system vacuum refill adaptor to the expansion tank.
11. Install the vacuum filler gauge to the cooling system vacuum refill adaptor.

12. Install the venturi tube assembly to the vacuum filler gauge.

13. NOTE: Make sure that both valves are in the closed position on the vacuum filler gauge assembly.
   • NOTE: The coolant vacuum fill tool needs an air pressure of 6 to 8 bar (87 to 116 psi) to operate correctly.
   • NOTE: Small diameter or long airlines may restrict airflow to the coolant vacuum fill tool.
   Connect a regulated compressed air supply to the venturi tube assembly.

14. NOTE: Make sure air cannot enter the hose.
   Position the coolant pick-up pipe into a container of clean coolant.
15. Position the evacuated air hose into a container.
16. Open the air supply valve.
17. NOTE: Make sure the coolant supply hose is positioned into a container of fifty percent mixture of Jaguar Premium Cooling System Fluid or equivalent, meeting Jaguar specification WSS M97B44-D and fifty percent water. Make sure no air can enter the coolant supply hose.

Open the coolant supply valve for 2 seconds to prime the coolant supply hose.

18. Apply air pressure progressively until the arrow on the vacuum filler gauge reaches the green segment.

19. Close the air supply valve.

20. Allow one minute to check the vacuum is held.
   - Disconnect the air supply.
21. NOTE: Close the coolant supply valve when the coolant expansion tank MAX mark is reached or coolant movement has ceased.
   Open the coolant supply valve and allow the coolant to be drawn into the system.

22. Remove the vacuum filler gauge and cooling system vacuum refill adaptor assembly.
23. Check and top up the cooling system if required.
24. Install the coolant expansion tank filler cap.

Vehicles with supercharger

25. Remove the engine cover.

26. Remove the supercharger coolant filler plug.
   - Remove and discard the sealing washer.

27. NOTE: Place a suitable cloth around supercharger fill port.
   Top up the coolant through the supercharger fill port.

28. CAUTION: Coolant may spill from supercharger fill port when ignition switched on.
   Switch ignition on.

29. CAUTION: Do not allow the supercharger water pump to run dry for more than one minute. Failure to follow this instruction may result in damage to the vehicle.
   Allow the supercharger pump to run and top up the coolant through supercharger fill port.
30. Switch the ignition off.
31. Install the supercharger coolant fill plug.
   - Install a new sealing washer.
   - Tighten to 45 Nm.
   - Clean off any spillages.

32. Install the engine cover.

All vehicles

33. **CAUTION:** Do not RUN the engine with the coolant expansion tank pressure cap removed. Failure to follow this instruction may cause damage to the vehicle.

   START and RUN the engine.

34. SET the heating system to MAX heat, the blower motor to MAX speed and the air distribution to instrument panel registers.

35. **CAUTION:** Observe the engine temperature gauge. If the engine starts to over-heat switch off immediately and allow to cool. Failure to follow this instruction may cause damage to the vehicle.

   Allow the engine to RUN until hot air is emitted from the instrument panel registers, while observing the engine temperature gauge.

36. Switch off the engine.

37. Allow the engine to cool.

38. Check and top up the cooling system if required.
Engine Cooling - V8 4.2L Petrol/V8 S/C 4.2L Petrol/2.5L NA V6 - AJV6/3.0L NA V6 - AJ27 - Cooling System Flushing

General Procedures

Vehicles with 2.5L or 3.0L engine

1. Remove the air cleaner. For additional information, refer to Section 303-12A Intake Air Distribution and Filtering / 303-12B Intake Air Distribution and Filtering / 303-12C Intake Air Distribution and Filtering.

Vehicles with 4.2L engine

2. Remove the air cleaner. For additional information, refer to Section 303-12A Intake Air Distribution and Filtering / 303-12B Intake Air Distribution and Filtering / 303-12C Intake Air Distribution and Filtering.

All vehicles

3. Remove the thermostat. For additional information, refer to Thermostat in this section.

4. Detach the lower coolant hose from the radiator and position to one side.

5. Detach the upper coolant hose from the radiator.

- NOTE: To remove rust, sludge and other foreign material from the cooling system, use Premium Cooling System flush, meeting Jaguar specification EGR-M14P7-A, which is safe for use with aluminium cooling systems. This cleaning restores cooling system efficiency and helps prevent overheating.

- NOTE: In severe cases where cleaning solvents will not properly clean the cooling system, it will be necessary to use the pressure flushing method using Cooling System Flusher, 164-R3670 to restore efficient operation.

- NOTE: A pulsating or reversed direction of flushing water will loosen sediment more quickly than a steady flow in the normal coolant flow direction.

- NOTE: Dispose of old coolant and flushing water contaminated with coolant and cleaning chemicals in accordance with local, state and federal laws.

6. Connect a hose pipe to the radiator upper coolant hose connection using a suitable connector.

7. CAUTION: Radiator internal pressure must not exceed 100 kPa (14.5 psi). Failure to follow this instruction may cause damage to the radiator.

Flush the radiator using the hose pipe until the coolant flowing from the radiator lower coolant hose connection is clear.

8. Remove the hose pipe from the radiator upper coolant hose connection.

9. Connect a hose pipe to the upper coolant hose using a suitable connector.

10. Flush the engine using the hose pipe until the coolant flowing from the radiator lower coolant hose is clear.

11. Remove the hose pipe from the upper coolant hose connection.

12. Connect the upper coolant hose to the radiator.
13. Connect the lower coolant hose to the radiator.
   For additional information, refer to Thermostat in this section.
15. Fill the cooling system.
   For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

Vehicles with 2.5L or 3.0L engine

16. Install the air cleaner. For additional information, refer to Section 303-12A Intake Air Distribution and Filtering / 303-12B Intake Air Distribution and Filtering / 303-12C Intake Air Distribution and Filtering.

Vehicles with 4.2L engine

17. Install the air cleaner. For additional information, refer to Section 303-12A Intake Air Distribution and Filtering / 303-12B Intake Air Distribution and Filtering / 303-12C Intake Air Distribution and Filtering.
Removal

Vehicles without supercharger

1. NOTE: Cap the vent hose to minimize coolant loss.
   Detach the coolant expansion tank.
   - Detach the vent hose.
   - Remove the coolant expansion tank retaining bolt.

Vehicles with supercharger

2. NOTE: Cap the vent hoses to minimize coolant loss.
   Detach the coolant expansion tank.
   - Detach the vent hoses.
   - Remove the coolant expansion tank retaining bolt.

All vehicles

3. Detach the coolant expansion tank.

4. Disconnect the coolant expansion tank low level sensor.
5. NOTE: Make sure the retaining clip is not removed.
• NOTE: Cap the coolant expansion tank lower hose to minimize coolant loss.

Detach the coolant expansion tank lower hose.
• Remove the coolant expansion tank.

Installation

1. To install, reverse the removal procedure.
   • Tighten to 3 Nm.

2. Check and top up the cooling system as required.
Engine Cooling - V8 4.2L Petrol/V8 S/C 4.2L Petrol/2.5L NA V6 - AJV6/3.0L NA V6 - AJ27 - Cooling Fan Motor and Shroud

Removal

All Vehicles

1. Remove fuse 38 from the engine compartment fuse box prior to performing any under hood service in the area of the cooling fan.

2. Drain the cooling system.
   For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

3. Lower the vehicle.

4. Remove the coolant expansion tank.
   For additional information, refer to Coolant Expansion Tank in this section.

Vehicles with 2.5L or 3.0L engine

5. Remove the air cleaner. For additional information, refer to Section 303-12A Intake Air Distribution and Filtering / 303-12B Intake Air Distribution and Filtering / 303-12C Intake Air Distribution and Filtering.

Vehicles with 4.2L engine

6. Remove the air cleaner. For additional information, refer to Section 303-12A Intake Air Distribution and Filtering / 303-12B Intake Air Distribution and Filtering / 303-12C Intake Air Distribution and Filtering.

All Vehicles

7. Remove the radiator mounting brackets.

8. Detach the upper coolant hose.

9. Disconnect the cooling module electrical connectors.
Vehicles with 4.2L engine

10. Detach the thermostat housing hose.

11. Disconnect the auxiliary water pump electrical connector.

12. Detach the auxiliary water pump.

All Vehicles

13. Disconnect the dual coolant flow valve electrical connector.
14. Detach the dual coolant flow valve.

Vehicles with supercharger

15. Disconnect the water pump electrical connector.

All vehicles

16. NOTE: Right-hand shown left-hand similar.
Remove the cooling fan motor and shroud retaining bolt.

17. CAUTION: Make sure that the retaining lugs of the radiator are not damaged when detaching the cooling fan motor and shroud.

• NOTE: Left-hand shown right-hand similar.

Detach the cooling fan motor and shroud from the retaining lugs of the radiator.
18. **CAUTION:** Make sure that the radiator is not damaged when removing the cooling fan motor and shroud.

Remove the cooling fan motor and shroud.

---

**Installation**

1. **CAUTIONS:**

   - **CAUTION:** Make sure that the radiator is not damaged when installing the cooling fan motor and shroud.
   - **CAUTION:** Make sure that the retaining lugs of the radiator are not damaged when installing the cooling fan motor and shroud.

   To install, reverse the removal procedure.

2. Tighten to 10 Nm.

3. Tighten to 10 Nm.

4. Tighten to 10 Nm.
5. Tighten to 6 Nm.

6. Fill the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.
Engine Cooling - V8 4.2L Petrol/V8 S/C 4.2L Petrol/2.5L NA V6 - AJV6/3.0L NA V6 - AJ27 - Cooling Module

Vehicles Without: Supercharger

Removal

All Vehicles

1. Remove fuse 38 from the engine compartment fuse box prior to performing any under hood service in the area of the cooling fan.

2. Drain the cooling system.
   For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

3. Reclaim the air conditioning refrigerant.
   For additional information, refer to Section 412-00 Climate Control System - General Information.

Vehicles with 2.5L or 3.0L engine

4. Remove the air cleaner. For additional information, refer to Section 303-12A Intake Air Distribution and Filtering / 303-12B Intake Air Distribution and Filtering / 303-12C Intake Air Distribution and Filtering.

Vehicles with 4.2L engine

5. Remove the air cleaner. For additional information, refer to Section 303-12A Intake Air Distribution and Filtering / 303-12B Intake Air Distribution and Filtering / 303-12C Intake Air Distribution and Filtering.

All Vehicles

6. Remove the radiator mounting brackets.

7. Detach the upper coolant hose.

8. Detach the expansion tank vent hose.
9. **NOTE:** Make sure the retaining clip is not removed.
   Detach the coolant expansion tank lower hose.

10. Disconnect the cooling module electrical connectors.

11. Disconnect the front crash sensor.

12. Detach the wiring harness.

**Vehicles with 4.2L engine**
13. Disconnect the auxiliary water pump electrical connector.

14. Detach the auxiliary water pump.

All vehicles

15. Disconnect the dual coolant flow valve electrical connector.

16. Detach the dual coolant flow valve.

Vehicles with 2.5L or 3.0L engine
17. Disconnect the throttle potentiometer (TP) electrical connector.

18. Detach the brake tube securing brackets.

Vehicles with automatic transmission

19. Detach the transmission oil cooler inlet and return pipes.
   - Remove and discard the O-ring seals.
   - Cap the oil cooler inlet and return pipes and the oil cooler.

20. Detach the lower coolant hose.

Vehicles with manual transmission
21. Detach the lower coolant hose.

22. Detach the radiator seal.
   - Left-hand shown, right-hand similar.
   - Remove the double-sided adhesive tape.

23. Raise the vehicle.
24. Remove the radiator lower cowl.

25. NOTE: Left-hand shown, right-hand similar.
    Detach the power steering oil cooler.
26. Disconnect the condenser core supply and return lines.
   - Remove and discard the O-ring seals.
   - Cap the exposed ports.

27. Lower the vehicle.

28. **CAUTION:** Make sure that the radiator and the air conditioning condenser are not damaged during the removal of the cooling module.

Remove the cooling module.

---

**Installation**

All vehicles

1. **CAUTION:** Make sure that the radiator and the air conditioning condenser are not damaged during the installation of the cooling module.

   - **NOTE:** Install new O-ring seals to the condenser core supply and return lines and lubricate them with A/C refrigerant oil.

   To install, reverse the removal procedure.

2. Tighten to 8 Nm.

3. Tighten to 7 Nm.

---

Vehicles with automatic transmission
4. **NOTE:** Install new O-ring seals.  
   Tighten to 20 Nm.

All vehicles

5. Tighten to 10 Nm.

Vehicles with 4.2L engine

6. Tighten to 10 Nm.

All vehicles

7. Tighten to 7 Nm.

8. Carry out the air conditioning (A/C) system evacuation and charging procedure.  
   For additional information, refer to Section [412-00 Climate Control System - General Information](#).

9. Fill the cooling system.  
   For additional information, refer to [Cooling System Draining, Filling and Bleeding](#) in this section.

Vehicles with automatic transaxle

10. Carry out transmission fluid level check.  
    For additional information, refer to Section [307-01 Automatic Transmission/Transaxle](#).
Removal

All vehicles

1. Remove the cooling fan motor and shroud. For additional information, refer to Cooling Fan Motor and Shroud in this section.

Vehicles with automatic transmission

2. Detach the transmission oil cooler inlet and return pipes.
   - Remove and discard the O-ring seals.
   - Cap the oil cooler inlet and return pipes and the oil cooler.

3. Detach the lower coolant hose.

Vehicles with manual transmission

4. Detach the lower coolant hose.

All Vehicles
5. Disconnect the front crash sensor.

6. Detach the wiring harness.

7. Detach the radiator seal.
   - Left-hand shown, right-hand similar.
   - Remove the double-sided adhesive tape.

8. Raise the vehicle.

9. Remove the radiator lower cowl.

Vehicles with supercharger
10. Remove the water pump. For additional information, refer to Section 303-03A Engine Cooling / 303-03B Supercharger Cooling / 303-03C Engine Cooling.
11. Remove the water pump retaining bracket.
   1. Remove the retaining bolt.
   2. Remove the water pump retaining bracket.

12. Remove the cooling module retaining bolt.

13. Remove the cooling module retaining bolt.
   - Secure the supercharger cooling radiator, condenser core and engine oil cooler using suitable retaining straps.

Vehicles without supercharger

14. NOTE: Left-hand shown, right-hand similar.
    Detach the power steering oil cooler.
15. NOTE: Left-hand shown, right-hand similar.
Remove the condenser core retaining stud.
- Secure the condenser core and PAS cooler using suitable retaining straps.

All vehicles

16. Lower the vehicle.

17. **CAUTION:** Make sure that the radiator is not damaged when removed.
Remove the radiator.

**Installation**

All vehicles

1. **CAUTION:** Make sure that the radiator is not damaged when installed.
To install, reverse the removal procedure.

Vehicles without supercharger

2. NOTE: Left-hand shown, right-hand similar.
Tighten to 7 Nm.
3. NOTE: Left-hand shown, right-hand similar.
   Tighten to 7 Nm.

Vehicles with supercharger

4. Tighten to 7 Nm.

5. Tighten to 7 Nm.

Vehicles with automatic transmission

6. Tighten to 7 Nm.
7. NOTE: Install new O-ring seals.
   Tighten to 20 Nm.

8. Carry out transmission fluid level check.
   For additional information, refer to Section 307-01 Automatic Transmission/Transaxle.
Removal

1. Remove fuse 38 from the engine compartment fuse box prior to performing any under hood service in the area of the cooling fan.
2. Drain the cooling system.
   For additional information, refer to: Cooling System Draining, Filling and Bleeding (303-03A Engine Cooling - V8 4.2L Petrol/V8 S/C 4.2L Petrol/2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, General Procedures).
3. Lower the vehicle.
4. Remove the air cleaner outlet pipe.
   For additional information, refer to: Air Cleaner Outlet Pipe - VIN Range: N52048->N99999 (303-12A Intake Air Distribution and Filtering - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation).
5. Remove the thermostat housing.
6. Remove the thermostat.

Installation

1. To install, reverse the removal procedure.
   - Install a new O-ring seal.
2. Tighten to 18 Nm.
3. Fill the cooling system.
   For additional information, refer to: Cooling System Draining, Filling and Bleeding (303-03A Engine Cooling - V8 4.2L Petrol/V8 S/C 4.2L Petrol/2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, General Procedures).
4. NOTE: For NAS vehicles only.
   If required, carry out a long drive cycle.
   For additional information, refer to: Powertrain Control Module (PCM) Long Drive Cycle Self-Test (303-14A Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, General Procedures).
Engine Cooling - V8 4.2L Petrol/V8 S/C 4.2L Petrol/2.5L NA V6 - AJV6/3.0L NA V6 - AJ27 - Thermostat4.2L, Vehicles With: Supercharger

Removal

- WARNINGS:
  - Never remove the coolant pressure cap under any circumstances while the engine is operating. Failure to follow this instruction may result in personal injury.

To avoid having scalding hot coolant or steam blow out of the cooling system, use extreme care when removing the coolant pressure cap from a hot cooling system. Wait until the engine has cooled, then wrap a thick cloth around the coolant pressure cap and turn it slowly until the pressure begins to release. Step back while the pressure is released from the system. When certain all the pressure has been released (still with a cloth) turn and remove the coolant pressure cap from the coolant expansion tank. Failure to follow these instructions may result in personal injury.

- CAUTIONS:
  - Remove fuse 38 from the engine compartment fuse box prior to performing any under hood service in the area of the cooling fan when the engine is hot, since the cooling fan motor could operate if the engine has been switched OFF. Failure to follow this instruction may result in personal injury.

- The engine cooling system must be maintained with the correct concentration and type of anti-freeze solution to prevent corrosion and frost damage.

- Never remove the coolant pressure cap under any circumstances while the engine is operating. Failure to follow this instruction may result in damage to the engine.

1. Remove the air cleaner outlet pipe.
   For additional information, refer to: Air Cleaner Outlet Pipe (303-12B Intake Air Distribution and Filtering - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Removal and Installation).

2. Detach the thermostat housing hose.
   - Clamp the bottom hose, to minimise coolant loss.
   - Position an absorbent cloth to collect fluid spillage.

3. Remove the thermostat.
   - Position an absorbent cloth to collect fluid spillage.

Installation
1. To install, reverse the removal procedure.
   - Tighten to 9 Nm.

2. Install the air cleaner outlet pipe.
   For additional information, refer to: Air Cleaner Outlet Pipe (303-12B Intake Air Distribution and Filtering - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Removal and Installation).

3. Remove the coolant expansion tank bleed screw.

4. Fill the cooling system up to the MAX mark on the coolant expansion tank using a fifty percent mixture of Jaguar Premium Cooling System Fluid or equivalent, meeting Jaguar specification WSS M97B44-D and fifty percent water.

5. **CAUTION:** Do not over tighten the coolant expansion tank bleed screw. Failure to follow this instruction may cause damage to the vehicle.
   - Install the coolant expansion tank bleed screw.
   - Tighten to 1 Nm.

6. Install the coolant expansion tank pressure cap.

7. **CAUTION:** Do not RUN the engine with the coolant expansion tank pressure cap removed. Failure to follow this instruction may cause damage to the vehicle.
   - START and RUN the engine.

8. SET the heating system to MAX heat, the blower motor to MAX speed and the air distribution to instrument panel registers.

9. **CAUTION:** Observe the engine temperature gauge. If the engine starts to over-heat switch off immediately and allow to cool. Failure to follow this instruction may cause damage to the vehicle.
   - Allow the engine to RUN until hot air is emitted from the instrument panel registers, while observing the engine temperature gauge.

10. Switch off the engine.
11. Allow the engine to cool.
12. Release the cooling system pressure.
    - Remove the coolant expansion tank pressure cap.
13. Top up the cooling system.
    - Fill the cooling system up to the MAX mark on the coolant.
14. Install the coolant expansion tank pressure cap.
Removal

• WARNINGS:

⚠️ Never remove the coolant pressure cap under any circumstances while the engine is operating. Failure to follow this instruction may result in personal injury.

To avoid having scalding hot coolant or steam blow out of the cooling system, use extreme care when removing the coolant pressure cap from a hot cooling system. Wait until the engine has cooled, then wrap a thick cloth around the coolant pressure cap and turn it slowly until the pressure begins to release. Step back while the pressure is released from the system. When certain all the pressure has been released (still with a cloth) turn and remove the coolant pressure cap from the coolant expansion tank. Failure to follow these instructions may result in personal injury.

⚠️ Remove fuse 38 from the engine compartment fuse box prior to performing any under hood service in the area of the cooling fan when the engine is hot, since the cooling fan motor could operate if the engine has been switched OFF. Failure to follow this instruction may result in personal injury.

• CAUTIONS:

⚠️ The engine cooling system must be maintained with the correct concentration and type of anti-freeze solution to prevent corrosion and frost damage.

⚠️ Never remove the coolant pressure cap under any circumstances while the engine is operating. Failure to follow this instruction may result in damage to the engine.

1. Remove the air cleaner outlet tube.
For additional information, refer to: Air Cleaner Outlet Pipe (303-12B Intake Air Distribution and Filtering - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Removal and Installation).

2. Detach the thermostat housing hose.
   - Position an absorbant cloth to collect fluid spillage.
   - Clamp the hose, to minimise coolant loss.

3. Detach the thermostat housing hose.
   - Clamp the bottom hose, to minimise coolant loss.
   - Position an absorbant cloth to collect fluid spillage.
4. Remove the thermostat.
   - Position an absorbant cloth to collect fluid spillage.

Installation

1. To install, reverse the removal procedure.
2. Tighten to 9 Nm.

3. Install the air cleaner outlet tube.
   For additional information, refer to: Air Cleaner Outlet Pipe (303-12B Intake Air Distribution and Filtering - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Removal and Installation).

4. Remove the coolant expansion tank bleed screw.

5. Fill the cooling system up to the MAX mark on the coolant expansion tank using a fifty percent mixture of Jaguar Premium Cooling System Fluid or equivalent, meeting Jaguar specification WSS M97B44-D and fifty percent water.

6. **CAUTION:** Do not over tighten the coolant expansion tank bleed screw. Failure to follow this instruction may cause damage to the vehicle.
   - Install the coolant expansion tank bleed screw.
   - Tighten to 1 Nm.

7. Install the coolant expansion tank pressure cap.

8. **CAUTION:** Do not RUN the engine with the coolant expansion tank pressure cap removed. Failure to follow this instruction may cause damage to the vehicle.
START and RUN the engine.

9. SET the heating system to MAX heat, the blower motor to MAX speed and the air distribution to instrument panel registers.

10. CAUTION: Observe the engine temperature gauge. If the engine starts to over-heat switch off immediately and allow to cool. Failure to follow this instruction may cause damage to the vehicle.

Allow the engine to RUN until hot air is emitted from the instrument panel registers, while observing the engine temperature gauge.

11. Switch off the engine.

12. Allow the engine to cool.

13. Release the cooling system pressure.

   • Remove the coolant expansion tank pressure cap.

14. Top up the cooling system.

   • Fill the cooling system up to the MAX mark on the coolant expansion tank using a fifty percent mixture of Jaguar Premium Cooling System Fluid or equivalent, meeting Jaguar specification WSS M97B44-D and fifty percent water.

15. Install the coolant expansion tank pressure cap.
Removal

1. Remove fuse 38 from the engine compartment fuse box prior to performing any under hood service in the area of the cooling fan.

2. Drain the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

3. Lower the vehicle.

4. Remove the air cleaner outlet tube. For additional information, refer to Section 303-12A Intake Air Distribution and Filtering / 303-12B Intake Air Distribution and Filtering / 303-12C Intake Air Distribution and Filtering.

5. Detach the supercharger belt.
   - Use a 1/2 inch square drive bar to rotate the supercharger belt tensioner.
     1. Detach the supercharger belt.

6. Loosen the water pump pulley retaining bolts.

7. Detach the accessory drive belt.
   1. Rotate the accessory drive belt tensioner counter-clockwise.
      1. Use a 3/8 inch square drive bar to rotate the accessory drive belt tensioner.

     2. Detach the accessory drive belt.
8. Remove the water pump pulley.
   - Discard the water pump pulley retaining bolts.

9. Remove the water pump.

**Installation**

1. To install, reverse the removal procedure.
   - Install a new water pump gasket and O-ring seal.

2. Tighten to 8 Nm + 90°.
3. Tighten to 10 Nm + 45°.
   - Install new retaining bolts.

4. Fill the cooling system.
   For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.
Removal

1. Remove fuse 38 from the engine compartment fuse box prior to performing any under hood service in the area of the cooling fan.

2. Drain the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

3. Lower the vehicle.

4. Remove the air cleaner outlet tube. For additional information, refer to Section 303-12A Intake Air Distribution and Filtering / 303-12B Intake Air Distribution and Filtering / 303-12C Intake Air Distribution and Filtering.

5. Loosen the water pump pulley retaining bolts.

6. Detach the accessory drive belt.
   
   1. Rotate the accessory drive belt tensioner counter-clockwise.
   1. Use a 3/8 inch square drive bar to rotate the accessory drive belt tensioner.
   2. Detach the accessory drive belt.

7. Remove the water pump pulley.
   
   - Discard the water pump pulley retaining bolts.
8. Remove the water pump.

Installation

1. To install, reverse the removal procedure.
   - Install a new water pump gasket and O-ring seal.

2. Tighten to 8 Nm + 90°.

3. Tighten to 10 Nm + 45°.
   - Install new retaining bolts.

4. Fill the cooling system.
   For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

Supercharger cooling coolant flow
The supercharger cooling system is integrated with the engine cooling system but uses a separate radiator and electrical water pump.

**Radiator**

The supercharger radiator is of aluminium construction. The radiator is mounted to the cooling module between the oil cooler and the air conditioning condenser. A coolant drain plug is located at the left-hand bottom of the radiator.

**Water pump**

The charge air cooler water pump is electrically driven, continuously while the ignition is on. The charge air cooler water pump provides an efficient coolant flow to the charge air coolers.
1. Verify the customer concern by operating the system.

2. Visually inspect for obvious signs of mechanical and electrical damage.

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. If the cause is not visually evident, verify the symptom and refer to the Jaguar Approved Diagnostic System.

Component tests

Pressure test. REFER to Section 303-03A Engine Cooling / 303-03B Supercharger Cooling / 303-03C Engine Cooling. Coolant pressure cap pressure test. REFER to Section 303-03A Engine Cooling / 303-03B Supercharger Cooling / 303-03C Engine Cooling. Thermostat test. REFER to Section 303-03A Engine Cooling / 303-03B Supercharger Cooling / 303-03C Engine Cooling. Radiator leak test. REFER to Section 303-03A Engine Cooling / 303-03B Supercharger Cooling / 303-03C Engine Cooling.
1. WARNINGS:

⚠️ Never remove the coolant expansion tank pressure cap under any circumstances while the engine is operating. Failure to follow this instruction may result in personal injury.

⚠️ To avoid hot coolant or steam blowing out of the cooling system, use extreme care when removing the coolant expansion tank pressure cap. Wait until the engine has cooled down, then insulate the coolant pressure cap with a suitable cloth and slowly loosen the coolant expansion tank pressure cap until the cooling system pressure is released. Do not remove the coolant expansion tank pressure cap. Step back while the pressure is released from the system. When all of the pressure has been released slowly remove the coolant expansion tank pressure cap (still with the suitable cloth in position) from the coolant expansion tank. Failure to follow this instruction may result in personal injury.

⚠️ Prior to performing any under hood servicing in the area of the cooling fans when the engine is hot, disconnect the electrical supply to the cooling fans as the cooling fans may operate if the ignition is switched off. Failure to follow this instruction may result in personal injury.

Release the cooling system pressure.

- Remove the coolant expansion tank pressure cap.

2. Remove the radiator splash shield.

For additional information, refer to Section 501-02 Front End Body Panels.

3. Remove the radiator lower cowl.

4. Remove the radiator drain plug.

- Drain the coolant into a suitable container.
5. **CAUTION:** Do not over tighten the radiator drain plug. Failure to follow this instruction may cause damage to the vehicle.

   Install the radiator drain plug when all coolant has drained.
   - Tighten to 1 Nm.
   - Remove the container.
   - Clean off any spillages.

6. Install the radiator lower cowl.

7. Install the radiator splash shield.
   For additional information, refer to Section 501-02 Front End Body Panels.

8. Remove the coolant expansion tank bleed screw.

9. **CAUTION:** The supercharger cooling system must be maintained with the correct concentration and type of coolant solution to prevent corrosion and frost damage.

   Fill the cooling system up to the MAX mark on the coolant expansion tank using a fifty percent mixture of Jaguar Premium Cooling System Fluid or equivalent, meeting Jaguar specification WSS M97B44-D and fifty percent water.

10. **CAUTION:** Do not over tighten the coolant expansion tank bleed screw. Failure to follow this instruction may cause damage to the vehicle.

    Install the coolant expansion tank bleed screw.
    - Tighten to 1 Nm.

11. Install the coolant expansion tank pressure cap.

12. Remove the engine cover.
13. Remove the supercharger coolant filler plug.
   • Remove and discard the sealing washer.

14. **NOTE:** Place a suitable cloth around supercharger fill port.
    Top up the coolant through the supercharger fill port.

15. **CAUTION:** Coolant may spill from supercharger fill port when ignition switched on.
    Switch ignition on.

16. **CAUTION:** Do not allow the supercharger water pump to run dry for more than one minute. Failure to follow this instruction may result in damage to the vehicle.
    Allow the supercharger pump to run and top up the coolant through supercharger fill port.
17. Switch the ignition off.
18. Install the supercharger coolant fill plug.
   • Install a new sealing washer.
   • Tighten to 45 Nm.
   • Clean off any spillages.

19. Install the engine cover.

20. **CAUTION:** Do not RUN the engine with the coolant expansion tank pressure cap removed. Failure to follow this instruction may cause damage to the vehicle.
    START and RUN the engine.

21. SET the heating system to MAX heat, the blower motor to MAX speed and the air distribution to instrument panel registers.

22. **CAUTION:** Observe the engine temperature gauge. If the engine starts to over-heat switch off immediately and allow to cool. Failure to follow this instruction may cause damage to the vehicle.
    Allow the engine to RUN until hot air is emitted from the instrument panel registers, while observing the engine temperature gauge.

23. Switch off the engine.
24. Allow the engine to cool.
25. Release the cooling system pressure.
   • Remove the coolant expansion tank pressure cap.

26. Fill the cooling system up to the MAX mark on the coolant expansion tank using a fifty percent mixture of Jaguar Premium Cooling System Fluid or equivalent, meeting Jaguar specification WSS M97B44-D and fifty percent water.

27. Install the coolant expansion tank pressure cap.
**Supercharger Cooling - Radiator**

**Removal**

1. Remove the water pump. For additional information, refer to Water Pump in this section.
2. Remove the oil cooler. For additional information, refer to Section 303-01A Engine / 303-01B Engine / 303-01C Engine.
3. Lower the vehicle.
4. Disconnect the radiator coolant vent hose.

5. Raise the vehicle.
6. Disconnect the left-hand radiator hose.

7. Disconnect the right-hand radiator hose.

8. Remove the water pump retaining bracket.
   1. Remove the retaining bolt.
   2. Remove the water pump retaining bracket.
9. Remove the cooling module retaining bolt.

10. Remove the cooling module retaining bolt.

11. Remove the radiator.

**Installation**

1. To install, reverse the removal procedure.
   - Tighten to 7 Nm.
2. Tighten to 7 Nm.

3. Tighten to 7 Nm.
Supercharger Cooling - Water Pump
Removal and Installation

Removal
1. Carry out the supercharging cooling system draining procedure. For additional information, refer to: Supercharger Cooling System Draining, Filling and Bleeding (303-03B Supercharger Cooling, General Procedures).
2. Disconnect the water pump coolant hoses.
   1. Disconnect the water pump electrical connector.
   2. Disconnect the water pump coolant hoses.
3. Remove the water pump.
   1. Remove the water pump retaining bolt.
   2. Remove the water pump.

Installation
1. To install, reverse the removal procedure.
2. Carry out the supercharging cooling system filling and bleeding procedure. For additional information, refer to: Supercharger Cooling System Draining, Filling and Bleeding (303-03B Supercharger Cooling, General Procedures).
3. NOTE: For NAS vehicles only.
   If required, carry out a long drive cycle. For additional information, refer to: Powertrain Control Module (PCM) Long Drive Cycle Self-Test (303-14A Electronic Engine Controls - 2.5L NA V6 – AJV6/3.0L NA V6 – AJ27, General Procedures).

### Water Pump

The water pump is of a conventional design and is driven by the crankshaft pulley through the accessory drive belt. The water pump belt tension is maintained by an automatic drive belt tensioner. For additional information, refer to: [Accessory Drive](303-05 Accessory Drive, Description and Operation).

### Thermostat

The thermostat is located in the thermostat housing and allows rapid engine warm-up by restricting coolant flow through the radiator below approximately 92°C (198°F). The thermostat also assists in keeping the engine operating temperature within predetermined limits.

When the engine is cold and the thermostat is closed, coolant flows from the water pump through the engine. It then returns to the water pump through the upper coolant hose.

When the engine is warm and the thermostat is open, coolant flows into the radiator through the upper coolant hose. It then returns to the water pump from the radiator through the lower coolant hose and engine oil cooler.

The heater core is on a parallel circuit and is unaffected by the position of the thermostat.

### Radiator

The radiator is of aluminium construction with plastic end tanks. Foam seals are fitted to the radiator to prevent the cooling air from by passing the radiator core. A coolant drain plug is provided in the lower coolant end tank of the radiator for the draining of the coolant. The cooling fan shroud is attached to the radiator.

### Cooling Fan

A single, variable speed cooling fan motor is attached to a fan shroud located behind the radiator. The speed is determined by the Engine Coolant Temperature (ECT) and the air conditioning pressure and transmission oil temperature.

Under hot operating conditions, the fan may continue to operate for four minutes after the engine has been switched off.
Coolant Recovery System

A pressurized coolant expansion tank system is used which continuously separates the air from the cooling system and replenishes the system through the coolant expansion tank outlet hose, attached to the heater return hose.

A continuous vent from the engine and radiator to the coolant expansion tank prevents air locks from forming in the cooling system.

A manual bleed point is provided on the coolant reservoir.

The coolant expansion tank serves as the location for:

- Service fill.
- Coolant expansion during warm-up.
- Air separation during operation.
- System pressurization by the coolant pressure cap.
- The coolant expansion tank is designed to have approximately 0.5 to 1 liter of air when cold to allow for coolant expansion.

Engine Coolant

The long life engine coolant is formulated to last for five years or 240,000 km (150,000 miles). The coolant is silicate free and orange in color. The long life engine coolant must not be mixed with conventional engine coolant.

</tr>
</tbody>
</table>

Does the thermostat fully close?

Yes

Check the cooling fans, modules, circuits, sensors, etc, REFER to:

Electronic Engine Controls - VIN Range: M45255->N52047 (303-14A Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Diagnosis and Testing),

Electronic Engine Controls - VIN Range: N80181->R99999 (303-14A Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Diagnosis and Testing),

Electronic Engine Controls - VIN Range: M45255->N52047 (303-14B Electronic Engine Controls - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Diagnosis and Testing),

Electronic Engine Controls - VIN Range: N80181->R99999 (303-14B Electronic Engine Controls - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Diagnosis and Testing),

Electronic Engine Controls (303-14C Electronic Engine Controls - 2.7L V6 - TdV6, Diagnosis and Testing).

No

INSTALL a new thermostat, REFER to:

Thermostat - 2.5L/3.0L (303-03A Engine Cooling - V8 4.2L Petrol/V8 S/C 4.2L Petrol/2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation),

Thermostat - 4.2L, Vehicles With: Supercharger (303-03A Engine Cooling - V8 4.2L Petrol/V8 S/C 4.2L Petrol/2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation),

Thermostat - 4.2L, Vehicles Without: Supercharger (303-03A Engine Cooling - V8 4.2L Petrol/V8 S/C 4.2L Petrol/2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation),

Thermostat (303-03C Engine Cooling - 2.7L V6 - TdV6, Removal and Installation).

REFER to: Cooling System Draining, Filling and Bleeding (303-03A Engine Cooling - V8 4.2L Petrol/V8 S/C 4.2L Petrol/2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, General Procedures).

TEST the system for normal operation.
1. **WARNINGS:**

- To avoid having scalding hot coolant or steam blow out of the cooling system, use extreme care when removing the coolant pressure cap from a hot cooling system. Wait until the engine has cooled, then wrap a thick cloth around the coolant pressure cap and turn it slowly until the pressure begins to release. Step back while the pressure is released from the system. When certain all the pressure has been released (still with a cloth) turn and remove the coolant pressure cap from the coolant expansion tank. Failure to follow these instructions may result in personal injury.

- Relieve the cooling system pressure by unscrewing the coolant pressure cap. Failure to follow these instructions may result in personal injury.

- **CAUTION:** The engine cooling system must be maintained with the correct concentration and type of anti-freeze solution to prevent corrosion and frost damage. Failure to follow this instruction may result in damage to the vehicle.

2. Remove the radiator splash shield.
For additional information, refer to: **Radiator Splash Shield** (501-02 Front End Body Panels, Removal and Installation).

3. **NOTE:** Remove and discard the radiator drain plug O-ring seal.

Remove the coolant drain plug,

- Drain the coolant into a suitable container.

4. Allow the coolant to drain.

5. **NOTE:** Install a new O-ring seal.

- **NOTE:** Do not over tighten the drain plug. Failure to follow this instruction may result in damage to the vehicle.

Install the coolant drain plug,

- Remove the drain tray.

6. Lower the vehicle.

7. Remove the coolant expansion tank bleed screw.
8. Fill the cooling system up to the MAX mark on the coolant expansion tank using a fifty percent mixture of Jaguar Premium Cooling System Fluid or equivalent, meeting Jaguar specification WSS M97B44-D and fifty percent water.

9. **CAUTION:** Do not over tighten the coolant expansion tank bleed screw. Failure to follow this instruction may result in damage to the vehicle.

   Install the coolant expansion tank bleed screw.
   - Tighten to 3 Nm.

10. Set the heating system to the COLD position.

11. Using an assistant, turn the ignition key to the ON position.

12. **NOTE:** Do not allow the expansion tank to empty when the electric coolant pump starts.

   Fill the cooling system up to the MAX mark on the coolant expansion tank using a fifty percent mixture of Jaguar Premium Cooling System Fluid or equivalent, meeting Jaguar specification WSS M97B44-D and fifty percent water.

13. After 3 minutes, set the heating system to the HOT position.

14. Maintain the coolant level in the coolant expansion tank at the MAX mark using a fifty percent mixture of Jaguar Premium Cooling System Fluid or equivalent, meeting Jaguar specification WSS M97B44-D and fifty percent water.

15. After four minutes, refit the coolant expansion tank pressure cap.

16. Start the engine and allow to idle for five minutes.

17. Raise the engine to 2500 RPM for 30 seconds.

18. Turn the ignition key to the OFF position.

19. Allow the engine to cool.

20. **WARNING:** To avoid having scalding hot coolant or steam blow out of the cooling system, use extreme care when removing the coolant pressure cap from a hot cooling system. Wait until the engine has cooled, then wrap a thick cloth around the coolant pressure cap and turn it slowly until the pressure begins to release. Step back while the pressure is released from the system. When certain all the pressure has been released (still with a cloth) turn and remove the coolant pressure cap from the coolant expansion tank. Failure to follow these instructions may result in personal injury.

   After two minutes, release the cooling system pressure.
   - Remove the coolant expansion tank pressure cap.

21. **NOTE:** Make sure the heating system is set to the HOT position.

   Turn the ignition key to the ON position.

22. Maintain the coolant level in the coolant expansion tank using a fifty percent mixture of Jaguar Premium Cooling System Fluid or equivalent, meeting Jaguar specification WSS M97B44-D and fifty percent water.

23. After three minutes, refit the coolant expansion tank pressure cap.

24. Drive the vehicle on the road at varying speeds until the engine reaches normal operating temperature.

25. Allow the engine to cool.

26. **WARNING:** To avoid having scalding hot coolant or steam blow out of the cooling system, use extreme care when removing the coolant pressure cap from a hot cooling system. Wait until the engine has cooled, then wrap a thick cloth around the coolant pressure cap and turn it slowly until the pressure begins to release. Step back while the pressure is released from the system. When certain all the pressure has been released (still with a cloth) turn and remove the coolant pressure cap from the coolant expansion tank. Failure to follow these instructions may result in personal injury.

   Release the cooling system pressure.
   - Remove the coolant expansion tank pressure cap.

27. Fill the cooling system up to the MAX mark on the coolant at the MAX mark expansion tank using a fifty percent mixture of Jaguar Premium...
Cooling System Fluid or equivalent, meeting Jaguar specification WSS M97B44-D and fifty percent water.

28. Raise the vehicle.
29. Check for water leaks.
30. Install the radiator splash shield.

For additional information, refer to: Radiator Splash Shield (501-02 Front End Body Panels, Removal and Installation).
Removal

Vehicles without supercharger

1. NOTE: Cap the vent hose to minimize coolant loss.

   Detach the coolant expansion tank.
   - Detach the vent hose.
   - Remove the coolant expansion tank retaining bolt.

Vehicles with supercharger

2. NOTE: Cap the vent hoses to minimize coolant loss.

   Detach the coolant expansion tank.
   - Detach the vent hoses.
   - Remove the coolant expansion tank retaining bolt.

All vehicles

3. Detach the coolant expansion tank.

4. Disconnect the coolant expansion tank low level sensor.
5. **NOTE:** Make sure the retaining clip is not removed.

- **NOTE:** Cap the coolant expansion tank lower hose to minimize coolant loss.

   Detach the coolant expansion tank lower hose.
   - Remove the coolant expansion tank.

---

### Installation

1. To install, reverse the removal procedure.
   - Tighten to 3 Nm.

2. Check and top up the cooling system as required.
Engine Cooling - 2.7L V6 - TdV6 - Cooling Fan Motor and Shroud
Removal and Installation

Removal

1. Remove fuse 38 from the front power distribution box prior to performing any under hood service in the area of the cooling fan.
2. Remove the radiator splash shield. For additional information, refer to: Radiator Splash Shield (501-02 Front End Body Panels, Removal and Installation).
3. Disconnect the cooling fan motor and shroud electrical connectors.

4. Detach the heater return pipe.

5. Detach the air conditioning return pipe.

6. Disconnect the auxiliary coolant flow pump electrical connector.

7. Lower the vehicle.
8. Remove the air cleaner. For additional information, refer to: Air Cleaner (303-12C Intake Air
9. Remove the coolant expansion tank.
   For additional information, refer to: Coolant Expansion Tank (303-03C Engine Cooling - 2.7L Diesel, Removal and Installation).

10. Detach the auxiliary coolant flow pump.

11. Remove the cooling fan motor and shroud retaining bracket.

12. Remove the cooling fan motor and shroud retaining bolt.

13. Remove the cooling fan motor and shroud.
   - Reposition the cooling fan motor and shroud wiring harness.

**Installation**

1. To install, reverse the removal procedure.
Engine Cooling - 2.7L V6 - TdV6 - Radiator
Removal and Installation

Removal

1. Drain the cooling system.
For additional information, refer to: Cooling System Draining, Filling and Bleeding (303-03C Engine Cooling - 2.7L Diesel, General Procedures).

2. Remove the air deflector.
For additional information, refer to: Air Deflector (501-02 Front End Body Panels, Removal and Installation).

3. Remove the cooling fan motor and shroud.
For additional information, refer to: Cooling Fan Motor and Shroud (303-03C Engine Cooling - 2.7L Diesel, Removal and Installation).

4. Disconnect the radiator top hose.

5. Remove the air intake elbow pipe.

6. Detach the power steering cooler hose.

7. Detach the charge air cooler intake elbow.
8. Detach the thermostat.
   - Release the retaining clip.

9. Using suitable tie straps, support the air conditioning (A/C) condensor.

10. Remove the radiator mounting brackets.

11. Raise the vehicle.
    For additional information, refer to: Lifting (100-02, Description and Operation).

12. Detach the coolant pipe.
13. Remove the radiator lower cowl.

14. **NOTE:** Support the speed control module using tie straps.
   Detach the speed control module.
   - Remove the retaining nuts.

15. Remove the right-hand power steering cooler retaining nut.

16. **NOTE:** Support the power steering cooler using tie straps.
   Detach the power steering cooler.
   - Remove the retaining nut.

17. Remove the right-hand A/C condenser retaining bolt.
18. Remove the left-hand A/C condensor retaining stud.

19. Lower the vehicle.

20. Reposition the radiator rearwards.

21. Reposition the radiator to the left.

22. Remove the radiator assembly.

23. Detach the foam insulation pads.
24. Remove the charge air cooler from the radiator.
   1. Remove the charge air cooler retaining bolts.
   2. Remove the charge air cooler from the radiator.

**Installation**

1. Install the radiator assembly.
   1. Install the charge air cooler to the radiator.
   2. Install the charge air cooler retaining bolts.
      - Tighten to 7 Nm.

2. Fit the foam insulation pads.

3. Install the radiator assembly.

4. Raise the vehicle.
   For additional information, refer to: Lifting (100-02, Description and Operation).
5. Install the left-hand A/C condensor retaining stud.
   - Tighten to 7 Nm.

6. Install the right-hand A/C condensor retaining bolt.
   - Tighten to 7 Nm.

7. Attach the power steering cooler.
   - Install the retaining nut.
   - Tighten to 7 Nm.

8. Install the power steering cooler retaining nut.
   - Tighten to 7 Nm.

9. Attach the speed control module.
   - Install the retaining nuts.
   - Tighten to 7 Nm.
10. Install the radiator lower cowl.

11. Attach the coolant pipe.

12. Lower the vehicle.
13. Install the radiator mounting brackets.
   - Tighten to 7 Nm.

14. Remove the tie straps supporting the A/C condensor.

15. NOTE: Make sure the retaining clip is fully installed.
   Attach the thermostat.
16. Attach the charge air cooler intake elbow.
   - Tighten to 7 Nm.

17. Attach the power steering cooler hose.

18. Install the air intake elbow pipe.

19. Connect the radiator top hose.

20. Install the cooling fan motor and shroud.
    For additional information, refer to: Cooling Fan Motor and Shroud
    (303-03C Engine Cooling - 2.7L Diesel, Removal and Installation).

21. Install the air deflector.
    For additional information, refer to: Air Deflector (501-02 Front End Body
    Panels, Removal and Installation).

22. Fill and bleed cooling system.
    For additional information, refer to: Cooling System Draining, Filling and
    Bleeding (303-03C Engine Cooling - 2.7L Diesel, General Procedures).
**Engine Cooling - 2.7L V6 - TdV6 - Thermostat**

**Removal**

1. Remove fuse 38 from the front power distribution box prior to performing any under hood service in the area of the cooling fan.
2. Remove the air cleaner.
   For additional information, refer to: Air Cleaner (303-12C Intake Air Distribution and Filtering - 2.7L V6 - TdV6, Removal and Installation).
3. Drain the cooling system.
   For additional information, refer to: Cooling System Draining, Filling and Bleeding (303-03C Engine Cooling - 2.7L V6 - TdV6, General Procedures).
4. Remove the air deflector.
   For additional information, refer to: Air Deflector (501-02 Front End Body Panels, Removal and Installation).
5. Detach the accessory drive belt.
   1. Using the special tool, rotate the belt tensioner counter clockwise.
   2. Detach the accessory drive belt.
6. Remove the water pump pulley.
   - Using a suitable 6mm bar, retain the water pump pulley.
   - Discard the water pump pulley retaining bolts.
7. **CAUTION:** Reposition the accessory drive belt to prevent contamination from the coolant.
   Reposition the accessory drive belt.
Installation

1. **NOTE:** Install a new O-ring seal.
   Install the water pump.
   - Tighten to 10Nm.

2. Align the accessory drive belt.

3. Install the water pump pulley.
   - Using a suitable 6mm bar, retain the water pump pulley.
   - Tighten to 24 Nm.
   - Align the accessory drive belt.

8. **NOTE:** Discard the water pump O-ring seal.
Remove the water pump.
4. Attach the accessory drive belt.
   1. Using the special tool, rotate the belt tensioner counter clockwise.
   2. Attach the accessory drive belt.

5. Fill the cooling system.
   For additional information, refer to: Cooling System Draining, Filling and Bleeding (303-03C Engine Cooling - 2.7L V6 - TdV6, General Procedures).

6. Install the air deflector.
   For additional information, refer to: Air Deflector (501-02 Front End Body Panels, Removal and Installation).

7. Install the air cleaner.
   For additional information, refer to: Air Cleaner (303-12C Intake Air Distribution and Filtering - 2.7L V6 - TdV6, Removal and Installation).

8. Install fuse 38 to the front power distribution box.

</tr>
</tbody>
</table>

The electronic returnless fuel system has the advantages of reduced fuel temperature and fuel tank vapor caused by constant fuel recirculation. The system delivers the correct amount of fuel to the engine under all conditions and at a constant pressure differential with respect to manifold absolute pressure.

Fuel is supplied at high pressure to the fuel injectors via a fuel injection supply manifold which incorporates fuel injectors, a fuel pressure regulator and a fuel temperature sensor. The engine control module (ECM) increases the fuel pressure to minimise fuel vapor formation to maintain fuel flow across the injectors.

The throttle body assembly is calibrated during assembly, no adjustments are required or permitted. The throttle motor is a 12 volt DC motor which via movement of the throttle blade controls the amount of air flowing into the engine.
Symptom Chart

- NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.
- With an up-to-date calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.

%Error: invalid HTML entity.Unable to parse the entity '3548-1358-00.'

3. Visually inspect for obvious signs of mechanical or electrical damage.

4. Verify the following systems are working correctly:

- Air intake system
- Cooling system
- Charging system
- Ignition system

5. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

6. Where the Jaguar approved diagnostic system is available, complete the S93 report before clearing any or all fault codes from the vehicle.

- NOTE: If a DTC cannot be cleared, then there is a permanent fault present that flags again as soon as it is cleared. (The exception to this is P1260, which will only clear following an ignition OFF/ON cycle after rectification.)

7. If the cause is not visually evident and the Jaguar approved diagnostic system is not available, use a fault code reader to retrieve the fault codes before proceeding to the Diagnostic Trouble Code (DTC) Index Chart, or the Symptom Chart if no DTCs are set.

8. Using the Jaguar approved diagnostic system where available, and a scan tool where not, check the freeze frame data for information on the conditions applicable when the fault was flagged. The format of this will vary, depending on the tool used, but can provide information useful to the technician in diagnosing the fault.

**CAUTION:** When probing connectors to take measurements in the course of the pinpoint tests, use the adaptor kit, part number 3548-1358-00.

- NOTE: When performing electrical voltage or resistance tests, always use a digital multimeter (DMM) accurate to 3 decimal places, and with an up-to-date calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.
- NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

Check DTCs for VCT range/performance fault. For VCT information, REFER to Section 303-01A Engine / 303-01B Engine / 303-01C Engine. For BARO sensor, contact dealer technical support for advice on possible ECM failure.
No throttle response | • APP sensor malfunction • Throttle sensors • Throttle motor | For APP sensor, throttle position sensor and throttle motor relay tests, REFER to Section 303-14A Electronic Engine Controls / 303-14B Electronic Engine Controls / 303-14C Electronic Engine Controls.
Poor throttle response | • APP sensor malfunction • Throttle sensors • Engine coolant temperature (ECT) sensor • MAF sensor • Transmission malfunction • Traction control event • Air leakage • Breather system disconnected/restricted | For APP sensor, throttle position sensor, ECT sensor and MAF sensor tests, REFER to Section 303-14A Electronic Engine Controls / 303-14B Electronic Engine Controls / 303-14C Electronic Engine Controls. For transmission information, REFER to Section 307-01 Automatic Transmission/Transaxle. For intake system, REFER to Section 303-12A Intake Air Distribution and Filtering / 303-12B Intake Air Distribution and Filtering / 303-12C Intake Air Distribution and Filtering. For breather system information, REFER to Section 303-08A Engine Emission Control / 303-08B Engine Emission Control.

Driver Information Chart

• NOTE: Use this table to identify DTCs associated with the message centre display, then refer to the DTC index for possible sources and actions. For a list of all DTCs flagged by the ECM, REFER to Section 303-14A Electronic Engine Controls / 303-14B Electronic Engine Controls / 303-14C Electronic Engine Controls.

• NOTE: For definitions of Default Modes, see the foot of this table.

</tbody>
</table>

**Default mode Definitions**

**LIMP-HOME MODE**
- Throttle motor off
- Throttle motor relay off
- Throttle motor circuit off
- Fuel intervention
- Cruise control inhibited

**LIMP-HOME UNAVAILABLE**
- Power limitation
- Vehicle speed limited to 120 kph
- Reverse throttle progression enabled
- Cruise control Inhibited

**REVERSE THROTTLE PROGRESSION**
- Throttle opening limited to maximum 30%

*NOTE: The throttle operation uses the same map as for reverse gear.*

**ENGINE SPEED LIMITED**
### Diagnostic Trouble Code (DTC) index

<table>
<thead>
<tr>
<th>DTC</th>

| P1234  | No fuel pump commands received by ECM                                      | • ECM to fuel pump module drive circuit; open circuit, short circuit, high resistance  
• Fuel pump module failure                      | For fuel pump module circuit tests, REFER to Section 310-01 Fuel Tank and Lines. |
| P1236  | Fuel pump not activated when requested by ECM                             | • ECM to fuel pump module drive circuit; open circuit, short circuit, high resistance  
• Fuel pump module failure                      | For fuel pump module circuit tests, REFER to Section 310-01 Fuel Tank and Lines. |
| P1250  | Throttle return spring failure malfunction                               | Throttle return spring failure (throttle body failure)                           | This DTC can only be accurately diagnosed using the Jaguar approved diagnostic system. If this is not available, INSTALL a new throttle body. REFER to Throttle Body - in this section. CLEAR the DTC, TEST the system for normal operation. |
| P1251  | Throttle motor relay OFF failure                                          | • Throttle motor relay coil power supply circuit; open circuit  
• Throttle motor relay failure  
• Throttle motor relay coil to ECM circuit; open circuit  
• ECM ground circuit fault (relay coil drive)        | For throttle motor relay tests, REFER to Section 303-14A Electronic Engine Controls / 303-14B Electronic Engine Controls / 303-14C Electronic Engine Controls. |
| P1254  | Throttle limp-home spring malfunction                                      | Throttle body                                                                     | This DTC can only be accurately diagnosed using the Jaguar approved diagnostic system. If this is not available, INSTALL a new throttle body. REFER to Throttle Body - in this section. CLEAR the DTC, TEST the system for normal operation. |
| P1313  | Right-hand cylinders misfire rate catalyst damage (this DTC will flag only when accompanied by an individual cylinder misfire DTC; P0300-P0306) | Refer to P0300 possible sources                                                  | Refer to P0300 Actions                                                 |
| P1314  | Left-hand cylinders misfire rate catalyst damage (this DTC will flag only when accompanied by an individual cylinder misfire DTC; P0300-P0306) | Refer to P0300 possible sources                                                  | Refer to P0300 Actions                                                 |
| P1316  | Misfire excess emission (Note: This DTC will flag only when accompanied by an individual cylinder misfire DTC; P0300 to P0306) | Refer to P0300 possible sources                                                  | Refer to P0300 Actions                                                 |
| P1338  | Fuel pump drive circuit low/high voltage                                   | • Fuel pump module to fuel pump drive circuit; open circuit, high resistance  
• Fuel pump module failure                        | For fuel pump module circuit tests, REFER to Section 310-01 Fuel Tank and Lines. |
| P1631  | Throttle motor power relay coil activation circuit failure                 | • Throttle motor relay coil to ECM circuit; open circuit  
• Throttle motor relay failure  
• Throttle motor relay coil to ECM drive circuit; open circuit to ground       | For throttle motor relay tests, REFER to Section 303-14A Electronic Engine Controls / 303-14B Electronic Engine Controls / 303-14C Electronic Engine Controls. |
| P1634  | Throttle watchdog circuit malfunction                                       | • ECM failure                                                                      | Contact dealer technical support for advice on possible ECM failure.   |
| P1656  | Throttle position (TP) sensor amplifier circuit malfunction               | • ECM failure                                                                      | Contact dealer technical support for advice on possible ECM failure.   |
| P1657  | Throttle motor relay coil drive circuit ON failure                         | • Throttle motor relay failure  
• Throttle motor relay coil to ECM drive circuit; short circuit to B+ voltage | For throttle motor relay tests, REFER to Section 303-14A Electronic Engine Controls / 303-14B Electronic Engine Controls / 303-14C Electronic Engine Controls. |
| P1658  | Throttle motor relay ON failure                                            | • Throttle motor relay failure  
• Throttle motor relay coil to ECM drive circuit; short circuit to B+ voltage | For throttle motor relay tests, REFER to Section 303-14A Electronic Engine Controls / 303-14B Electronic Engine Controls / 303-14C Electronic Engine Controls. |

**Pinpoint Tests**

**PINPOINT TEST A : DTC P0201, P0202, P0203, P0204, P0205, P0206; FUEL INJECTORS**

**NOTE:** The DTC set will indicate which cylinder injector or circuit is faulty. Only in the event of multiple cylinder misfires will it be necessary to check more than one injector or circuit, in which case, multiple DTCs will be set.

</tr>
<tr>
<td>4 Measure the resistance between the injector pins.</td>
<td></td>
</tr>
</tbody>
</table>

**Is the resistance between 12 and 16 ohms?**

**Yes**

**GO TO A2.**

**No**

INSTALL a new injector.
A2: CHECK THE INJECTOR COIL INSULATION

1. Measure the resistance between the injector pin 01 and the injector body.
2. Measure the resistance between the injector pin 02 and the injector body.

Is either resistance less than 10,000 ohms?

Yes

INSTALL a new injector.

No

CLEAR the DTC. TEST the system for normal operation.

A3: CHECK THE INJECTOR SUPPLY VOLTAGE

1. Reconnect the battery negative terminal.
2. Turn the ignition switch to the ON position.
3. Disconnect the relevant injector harness electrical connector (IL03 to IL08).
4. Measure the voltage between the relevant injector harness electrical connector (IL03 to IL08) pin 02 and GROUND.

Is the voltage less than 10 Volts?

Yes

REPAIR the circuit between the relevant injector harness electrical connector (IL03 to IL08) pin 02 and battery. This circuit includes the front power distribution box, fuse 13, and the EMS relay. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No

GO to A4.

A4: CHECK THE INJECTOR GROUND CIRCUIT

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Disconnect the relevant injector harness electrical connector (IL03 to IL08).
4. Measure the resistance between the relevant injector harness electrical connector (IL03 to IL08) pin 01 and PI01 pins as follows:
   - Injector Cyl 1 pin 01 (BG) and PI01, pin 115 (BG).
   - Injector Cyl 2 pin 01 (BR) and PI01, pin 120 (BR).
   - Injector Cyl 3 pin 01 (BK) and PI01, pin 114 (BK).
   - Injector Cyl 4 pin 01 (BO) and PI01, pin 119 (BO).
   - Injector Cyl 5 pin 01 (BG) and PI01, pin 113 (BG).
   - Injector Cyl 6 pin 01 (U) and PI01, pin 118 (U).

Is the resistance greater than 5 ohms?

Yes

REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No

GO to A5.

A5: CHECK THE INJECTOR GROUND CIRCUIT FOR SHORT CIRCUIT TO BATTERY

1. Reconnect the battery negative terminal.
2. Turn the ignition switch to the ON position.
3. Measure the voltage between the relevant injector harness electrical connector (IL03 to IL08) pin 01 and GROUND.

Is the voltage greater than 3 volts?

Yes

REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No

GO to A6.

A6: CHECK THE INJECTOR GROUND CIRCUIT FOR SHORT CIRCUIT TO GROUND

1. Measure the resistance between the relevant injector harness electrical connector (IL03 to IL08) pin 01 and GROUND.

Is the resistance less than 10,000 ohms?

Yes

REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No

Contact dealer technical support for advice on possible ECM failure.

PINPOINT TEST B: DTC P0190, P0192, P0193; FUEL RAIL PRESSURE (FRP) SENSOR

• NOTE: For sensor supply tests, REFER to Section 303-14A Electronic Engine Controls / 303-14B Electronic Engine Controls / 303-14C Electronic Engine Controls.

• NOTE: For sensor ground tests, REFER to Section 303-14A Electronic Engine Controls / 303-14B Electronic Engine Controls / 303-14C Electronic Engine Controls.

TEST CONDITIONS

B1: CHECK THE FRP SENSOR SIGNAL CIRCUIT FOR HIGH RESISTANCE

1. Turn the ignition switch to the OFF position.
2. Disconnect the battery negative terminal.
3. Disconnect the FRP sensor electrical connector, IL12.
4. Measure the resistance between IL12 pin 03 (U) and PI01 pin 73 (U).

Is the resistance greater than 5 ohms?

Yes

REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

No

GO to B2.

B2: CHECK THE FRP SENSOR SIGNAL CIRCUIT FOR SHORT TO HIGH VOLTAGE

1. Reconnect the battery negative terminal.
2. Turn the ignition switch to the ON position.
3. Measure the voltage between IL12 pin 03 (U) and GROUND.
<table>

Fuel Charging and Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27 - Fuel Charging and Controls
VIN Range: N52048->N99999
Diagnosis and Testing

Overview
There are changes to the engine management system (EMS) for 2006 my, the most obvious of which will be the change to 7-digit diagnostic trouble codes (DTCs) from the familiar 5-digit.

Refer to the DTC index in this section for guidance on how to use these codes with the Jaguar approved diagnostic system or a scan tool.

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

<table>
<thead>
<tr>
<th>Visual inspection</th>
<th>Mechanical</th>
<th>Electrical</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fuel leaks</td>
<td></td>
<td>Fuses</td>
</tr>
<tr>
<td>Damaged fuel lines</td>
<td></td>
<td>Inertia switch</td>
</tr>
<tr>
<td>Damaged push connect fittings</td>
<td></td>
<td>Loose or corroded electrical connectors</td>
</tr>
<tr>
<td>Fuel level</td>
<td></td>
<td>Harnesses</td>
</tr>
<tr>
<td>Fuel contamination/grade/quality</td>
<td></td>
<td>Sensor(s)</td>
</tr>
<tr>
<td>Throttle body</td>
<td></td>
<td>Engine control module (ECM)</td>
</tr>
<tr>
<td>Damaged fuel tank filler pipe cap</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Damaged fuel tank filler pipe</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. If the cause is not visually evident use the Jaguar approved diagnostic system or a scan tool to retrieve the fault codes before proceeding to the diagnostic trouble code (DTC) index.

DTC | Description | Possible Causes | Action  
--- | --- | --- | ---  
P131600 | Injector driver misfire - emissions damage | Injector driver module codes detected | Check for associated DTCs and refer to the DTC index.  
P210129 | Throttle range performance - sub-processor | Jammed throttle blade, gearing or motor | Check for a message in the instrument cluster. Replace the throttle body. REFER to: Throttle Body - VIN Range: N52048->N99999 (303-04A Fuel Charging and Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation).  
P210164 | Throttle range performance | Jammed throttle blade, gearing or motor | Check for a message in the instrument cluster. Replace the throttle body. REFER to: Throttle Body - VIN Range: N52048->N99999 (303-04A Fuel Charging and Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation).  
P210329 | Throttle actuator motor control circuit high | Control circuit: short circuit to power  
ECM fault | For throttle actuator motor circuit tests, GO to Pinpoint Test B. Refer to the warranty policy and procedures manual if an ECM is suspect.  
P210364 | Throttle actuator motor control circuit high - signal plausibility failure | Control circuit: short circuit to power  
ECM fault | For throttle actuator motor circuit tests, GO to Pinpoint Test B. Refer to the warranty policy and procedures manual if an ECM is suspect.  
P210500 | Throttle actuator control system - forced engine shutdown | Throttle MIL request due to fuel cut | Check for DTCs indicating the reason for the fuel cut. Follow the action indicated for those DTCs.  
P210629 | Throttle actuator control system - forced limited power | Signal invalid | Check for a message in the instrument cluster. Replace the throttle body. REFER to: Throttle Body - VIN Range: N52048->N99999 (303-04A Fuel Charging and Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation).  
P210664 | Throttle actuator control system - forced limited power | Signal plausibility failure | Check for a message in the instrument cluster. Replace the throttle body. REFER to: Throttle Body - VIN Range: N52048->N99999 (303-04A Fuel Charging and Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation).  
P211800 | Throttle actuator motor control current range/performance | Control circuit: short circuit to power, short circuit to ground, high resistance  
ECM fault | For throttle actuator motor circuit tests, GO to Pinpoint Test B. Refer to the warranty policy and procedures manual if an ECM is suspect.  

Pinpoint Tests

**CAUTION:** When probing connectors to take measurements in the course of the pinpoint tests, use the adaptor kit, part number 3548-1358-00.

**NOTE:** When performing electrical voltage or resistance tests, always use a digital multimeter (DMM) accurate to 3 decimal places, and with an up-to-date calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.

**NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

**PINPOINT TEST A : FUEL INJECTORS**

**NOTE:** The DTC set will indicate which cylinder injector or circuit is faulty. Only in the event of multiple cylinder misfires will it be necessary to check more than one injector or circuit, in which case, multiple DTCs will be set.

| 2. Measure the resistance between the injector pins. | Is the resistance between 12 and 16 ohms?  
Yes | GO to A2.  
No | INSTALL a new injector. REFER to: Fuel Injectors (303-04A Fuel Charging and Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation). CLEAR the DTC and test the system for normal operation. |  
| **A2: CHECK THE INJECTOR COIL INSULATION** | | |
| 1. Measure the resistance between: | Injector, component side | Injector body |
| | Pin 01 | Injector body  
Pin 02 | Injector body |
Is either resistance less than 10,000 ohms?
Yes
INSTALL a new injector.
CLEAR the DTC and test the system for normal operation.

No
GO to A3.

A3: CHECK THE INJECTOR SUPPLY VOLTAGE

1. Key on, engine off.
2. Make sure the EMS relay is energized.
3. Measure the voltage between:
   - Injector connector, harness side
   - Battery

   Pin 02 Negative terminal

Is the voltage less than 10 Volts?
Yes
REPAIR the circuit between the relevant injector harness electrical connector pin 02 and battery. This circuit includes fuse 17 of the front power distribution box and the EMS relay. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No
GO to A4.

A4: CHECK THE INJECTOR CONTROL CIRCUIT FOR SHORT CIRCUIT TO GROUND

1. Key off.
2. Measure the resistance between:
   - Injector connector, harness side
   - Battery

   Pin 01 Negative terminal

Is the resistance less than 10,000 ohms?
Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No
GO to A5.

A5: CHECK THE INJECTOR CONTROL CIRCUIT FOR SHORT CIRCUIT TO POWER

1. Measure the resistance between:
   - Injector connector, harness side
   - Battery

   Pin 01 Positive terminal

Is the resistance less than 10,000 ohms?
Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No
GO to A6.

A6: CHECK THE INJECTOR CONTROL CIRCUIT FOR HIGH RESISTANCE

• NOTE: The DTC set will indicate which cylinder injector or circuit is faulty. Only in the event of multiple cylinder misfires will it be necessary to check more than one injector or circuit, in which case, multiple DTCs will be set.

1. Disconnect the ECM electrical connector PI300.
2. Measure the resistance between:
   - Cylinder 1 injector connector, harness side
   - ECM connector PI300, harness side

   PIN 01 Pin 78
   PIN 02 Pin 79
   PIN 03 Pin 80
   PIN 04 Pin 81
   PIN 05 Pin 82
   PIN 06 Pin 83

Is the resistance greater than 5 ohms?
Yes
REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No
INSTALL a new injector.
CLEAR the DTC and test the system for normal operation.

PINPOINT TEST B : THROTTLE BODY

TEST CONDITIONS

<table>
<thead>
<tr>
<th>DETAIL/RESULT/ACTION</th>
</tr>
</thead>
</table>

B1: CHECK THE THROTTLE ACTUATOR CONTROL MOTOR SUPPLY CIRCUIT FOR SHORT CIRCUIT TO GROUND

1. Disconnect the throttle body electrical connector, PI26.
2. Measure the resistance between:
   - Throttle body connector PI26, harness side
   - Battery

   Pin 02 Negative terminal

Is the resistance less than 10,000 ohms?
Yes
REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No
GO to B2.

B2: CHECK THE THROTTLE ACTUATOR CONTROL MOTOR SUPPLY CIRCUIT FOR SHORT CIRCUIT TO POWER
Measure the resistance between:

<table>
<thead>
<tr>
<th>Throttle body connector PI26, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

1. Is the resistance less than 10,000 ohms?
   - Yes: REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
   - No: GO to B3.

**B3: CHECK THE THROTTLE ACTUATOR CONTROL MOTOR NEGATIVE CIRCUIT FOR SHORT CIRCUIT TO GROUND**

Measure the resistance between:

<table>
<thead>
<tr>
<th>Throttle body connector PI26, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 01</td>
<td>Negative terminal</td>
</tr>
</tbody>
</table>

1. Is the resistance less than 10,000 ohms?
   - Yes: REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
   - No: GO to B4.

**B4: CHECK THE THROTTLE ACTUATOR CONTROL MOTOR NEGATIVE CIRCUIT FOR SHORT CIRCUIT TO POWER**

Measure the resistance between:

<table>
<thead>
<tr>
<th>Throttle body connector PI26, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 01</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

1. Is the resistance less than 10,000 ohms?
   - Yes: REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
   - No: GO to B5.

**B5: CHECK THE THROTTLE ACTUATOR CONTROL MOTOR SUPPLY CIRCUIT FOR HIGH RESISTANCE**

1. Disconnect the ECM electrical connector, PI300.
2. Measure the resistance between:

<table>
<thead>
<tr>
<th>Throttle body connector PI26, harness side</th>
<th>ECM connector PI300, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 02</td>
<td>Pin 75</td>
</tr>
</tbody>
</table>

1. Is the resistance greater than 5 ohms?
   - Yes: REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
   - No: GO to B6.

**B6: CHECK THE THROTTLE ACTUATOR CONTROL MOTOR NEGATIVE CIRCUIT FOR HIGH RESISTANCE**

Measure the resistance between:

<table>
<thead>
<tr>
<th>Throttle body connector PI26, harness side</th>
<th>ECM connector PI300, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 01</td>
<td>Pin 74</td>
</tr>
</tbody>
</table>

1. Is the resistance greater than 5 ohms?
   - Yes: REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
   - No: INSTALL a new throttle body assembly.

   CLEAR the DTC and test the system for normal operation.
**Removal**

1. Remove the intake manifold. For additional information, refer to Section [303-01A Engine / 303-01B Engine / 303-01C Engine](#).
2. Disconnect the spring lock coupling. For additional information, refer to Section [310-00 Fuel System - General Information](#).
3. Disconnect the fuel temperature sensor electrical connector.
   - Detach the fuel charging wiring harness.
4. Disconnect the fuel pressure regulator connector.
5. Detach the fuel pressure regulator vacuum line.
6. Disconnect the fuel charging wiring harness.
7. NOTE: Fuel may still be present in the fuel injection supply manifold. Remove the fuel injection supply manifold, lower intake manifold and place to one side.
   - Remove and discard the lower intake manifold O-ring seals.

8. Remove the lower intake manifolds.
   - Remove and discard the fuel injector O-ring seals.

9. Disconnect the electrical connectors.

**Installation**

1. NOTE: Install new fuel injector O-ring seals.
   - NOTE: Install new lower intake manifold O-ring seals.
   To install, reverse the removal procedure.
   - Tighten to 10 Nm.

2. Tighten to 10 Nm.
Fuel Charging and Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27 - Fuel Injection
Supply Manifold
Removal and Installation

Removal

1. Remove the fuel injectors. For additional information, refer to Fuel Injectors in this section.
2. Remove the fuel pressure regulator.
   - Remove and discard the O-ring seals.

Installation

1. NOTE: Install new O-ring seals.
   To install, reverse the removal procedure.
   - Tighten to 10 Nm.
Fuel Charging and Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27 - Fuel Injectors

Removal

1. Remove the fuel charging wiring harness.
   For additional information, refer to Fuel Charging Wiring Harness in this section.
2. Remove the fuel injectors.
   - Remove the fuel injector locating clips.

3. Remove and discard the O-ring seals.

Installation

1. NOTE: Install new fuel injector O-ring seals.
   To install, reverse the removal procedure.
   - Lubricate the fuel injector O-ring seals with clean engine oil.
Removal

1. Depressurize the fuel system. For additional information, refer to Section 310-00 Fuel System - General Information.

2. Remove the fuel pressure regulator bracket retaining bolt.

3. Remove the fuel pressure regulator bracket.

4. Disconnect the fuel pressure regulator electrical connector and vacuum hose (intake manifold removed for clarity).

5. Remove the fuel pressure regulator (intake manifold removed for clarity).
   - Remove and discard the O-ring seals.

Installation
1. NOTE: Install new O-ring seals.
To install, reverse the removal procedure (intake manifold removed for clarity).
  • Tighten to 10 Nm.

2. Install the fuel pressure regulator bracket.
  • Tighten the lower retaining bolt to 10 Nm.
  • Tighten the upper retaining bolt to 6 Nm.

3. Tighten to 10 Nm.
Removal

1. **WARNING:** When relieving cooling system pressure, cover the expansion tank cap with a thick cloth to prevent the possibility of scalding. Failure to follow these instructions may result in personal injury.

   Remove the expansion tank cap to relieve the cooling system pressure.

2. **CAUTION:** Do not attempt to clean the throttle body. The bore and the throttle plate has a special coating applied during manufacture which should not be removed.

   Remove the air cleaner outlet tube. For additional information, refer to Section 303-12A Intake Air Distribution and Filtering / 303-12B Intake Air Distribution and Filtering / 303-12C Intake Air Distribution and Filtering.

3. Disconnect the throttle motor electrical connector.

4. Disconnect the throttle position (TP) sensor electrical connector.

5. **NOTE:** Cap the coolant hoses to minimize coolant loss.

   Detach the coolant hoses from the throttle body.
6. Remove the throttle body.

7. Remove and discard the O-ring seal.

**Installation**

1. **CAUTION:** Do not attempt to clean the throttle body. The bore and the throttle plate has a special coating applied during manufacture which should not be removed.

   To install, reverse the removal procedure.
   - Install a new O-ring seal.

2. Tighten to 10 Nm.

3. Check and top up the cooling system as required.
Removal

1. **WARNING:** When relieving cooling system pressure, cover the expansion tank cap with a thick cloth to prevent the possibility of scalding. Failure to follow these instructions may result in personal injury.

   Remove the expansion tank cap to relieve the cooling system pressure.

2. **CAUTION:** Do not attempt to clean the throttle body. The bore and the throttle plate has a special coating applied during manufacture which should not be removed.

   Remove the air cleaner outlet pipe.

   For additional information, refer to: Air Cleaner Outlet Pipe - VIN Range: N52048->N99999 (303-12A Intake Air Distribution and Filtering - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Removal and Installation).

3. Disconnect the throttle body electrical connector.

4. **NOTE:** Clamp the coolant hose to minimize coolant loss.

   Disconnect the coolant hose.

5. **NOTE:** Clamp the coolant hose to minimize coolant loss.

   Disconnect the coolant hose.
6. Remove the throttle body.

7. Remove and discard the O-ring seal.

Installation

1. **CAUTION:** Do not attempt to clean the throttle body. The bore and the throttle plate has a special coating applied during manufacture which should not be removed.

   To install, reverse the removal procedure.
   - Install a new O-ring seal.

2. Tighten to 10 Nm.

3. Check and top up the cooling system as required.

The electronic returnless fuel system has the advantages of reduced fuel temperature and fuel tank vapor caused by constant fuel recirculation. The system delivers the correct amount of fuel to the engine under all conditions and at a constant pressure differential with respect to manifold absolute pressure.

Fuel is supplied at high pressure to the fuel injectors via a fuel injection supply manifold which incorporates fuel injectors, a fuel pressure regulator and a fuel temperature sensor. The engine control module (ECM) increases the fuel pressure to minimise fuel vapor formation to maintain fuel flow across the injectors.

The throttle body assembly is calibrated during assembly, no adjustments are required or permitted. The throttle motor is a 12 volt DC motor which via movement of the throttle blade controls the amount of air flowing into the engine.
1. Verify the customer concern by operating the system.
2. Visually inspect for obvious signs of mechanical or electrical damage.
3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the concern is not visually evident, use a fault code reader to retrieve fault codes before proceeding to the Symptom Chart.

**PINPOINT TEST A : FUEL INJECTORS: P0201, P0202, P0203, P0204, P0205, P0206, P0207, P0208**

*NOTE: The DTC set will indicate which cylinder injector or circuit is faulty. Only in the event of multiple cylinder misfires will it be necessary to check more than one injector or circuit, in which case, multiple DTCs will be set.*

**TEST CONDITIONS**

**DETAILS/RESULTS/ACTIONS**

**A1: CHECK THE INJECTOR COIL RESISTANCE**

1. Turn the ignition switch to the OFF position.
2. Disconnect the relevant injector electrical connector. (PI032 to PI039).
3. Measure the resistance between the injector pins.

   *Yes*  
   - Go to A2.

   *No*  
   - Install a new injector.  
   - Refer to Fuel Injectors in this section.
   - Clear the DTC.  
   - Test the system for normal operation.

**A2: CHECK THE INJECTOR COIL INSULATION**

1. Measure the resistance between the injector pin 001 and the injector body.
2. Measure the resistance between the injector pin 002 and the injector body.
Are both resistances greater than 10,000 ohms?
Yes  GO to A3.
No  INSTALL a new injector.
    REFER to Fuel Injectors in this section.
    CLEAR the DTC. TEST the system for normal operation.

A3: CHECK THE INJECTOR SUPPLY VOLTAGE
1 Turn the ignition switch to the ON position.
2 Disconnect the relevant injector harness electrical connector, (PI032 to PI039).
3 Measure the voltage between the relevant injector harness electrical connector, (PI032 to PI039) pin 002 and GROUND.

Is the voltage greater than 12 Volts?
Yes  GO to A4.
No  REPAIR the circuit between the relevant injector harness electrical connector, (PI032 to PI039) pin 002 and battery. This circuit includes the power distribution fuse box, fuse 41, and the EMS control relay. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

A4: CHECK THE INJECTOR GROUND CIRCUIT
1 Turn the ignition switch to the OFF position.
2 Disconnect the ECM electrical connector, PI001.
3 Measure the resistance between the relevant injector harness electrical connector, (PI032 to PI039) pin 001 and PI001, pins as follows -
   - Injector Cyl 1 pin 001 (BG) and ECM pin 120.
   - Injector Cyl 2 pin 001 (BR) and ECM pin 115.
   - Injector Cyl 3 pin 001 (BK) and ECM pin 114.
   - Injector Cyl 4 pin 001 (BO) and ECM pin 115.
   - Injector Cyl 5 pin 001 (BG) and ECM pin 113.
   - Injector Cyl 6 pin 001 (U) and ECM pin 118.
   - Injector Cyl 7 pin 001 (BW) and ECM pin 117.
   - Injector Cyl 8 pin 001 (UY) and ECM pin 112.

Is the resistance less than 5 ohms?
Yes  GO to A5.
No  REPAIR the circuit between the relevant injector harness electrical connector pin 001 and the powertrain control module electrical connector. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

A5: CHECK THE INJECTOR GROUND CIRCUIT FOR SHORT CIRCUIT TO BATTERY
1 Measure the voltage between the relevant injector harness electrical connector, (PI032 to PI039) pin 001 and GROUND.

Is the voltage greater than 1 volt?
Yes  REPAIR the short circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
No  GO to A6.

A6: CHECK THE INJECTOR GROUND CIRCUIT FOR SHORT CIRCUIT TO GROUND
1 Measure the resistance between the relevant injector harness electrical connector, (PI032 to PI039) pin 001 and GROUND.

Is the resistance less than 10,000 ohms?
Yes  REPAIR the short circuit. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
No  INSTALL a new ECM. REFER to Section 303-14A Electronic Engine Controls / 303-14B Electronic Engine Controls / 303-14C Electronic Engine Controls. Before replacing a ECM, contact Dealer technical support.

PINPOINT TEST B : FUEL RAIL PRESSURE SENSOR: P0190, P0192, P0193

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>B1: CHECK THE FUEL RAIL PRESSURE SENSOR SUPPLY VOLTAGE</td>
<td></td>
</tr>
<tr>
<td>1 Turn the ignition switch to the OFF position.</td>
<td></td>
</tr>
<tr>
<td>2 Disconnect the fuel rail pressure sensor electrical connector, PI028.</td>
<td></td>
</tr>
<tr>
<td>3 Turn the ignition switch to the ON position.</td>
<td></td>
</tr>
<tr>
<td>4 Measure the supply voltage to the fuel rail pressure sensor electrical connector, PI028 pin 001, (OY) and GROUND.</td>
<td></td>
</tr>
</tbody>
</table>

Is the supply voltage between 4.5 and 5.5 volts?
Yes  GO to B2.
No  REPAIR the circuit between PI028, pin 001, (OY) and ECM electrical connector, PI001, pin 012. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
(The fault could be in any of the components or sensors in the 5 volt supply circuit, or the ECM)
If the DTC is repeated, INSTALL a new ECM. REFER to Section 303-14A Electronic Engine Controls / 303-14B Electronic Engine Controls / 303-14C Electronic Engine Controls. Before replacing a ECM, contact Dealer technical support

B2: CHECK THE FUEL RAIL PRESSURE SENSOR GROUND CIRCUIT FOR OPEN CIRCUIT |
| 1 Turn the ignition switch to the OFF position. |
| 2 Measure the resistance between the fuel rail pressure sensor electrical connector PI028, pin 002, (BG) and GROUND. |

Is the resistance greater than 10,000 ohms?
Yes  REPAIR the circuit between PI028, pin 002, (BG) and ECM electrical connector, PI001, pin 019. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
(The fault could be in any of the components or sensors in the 5 volt supply circuit, or the ECM)
If the DTC is repeated, INSTALL a new ECM. REFER to Section 303-14A Electronic Engine Controls / 303-14B Electronic Engine Controls / 303-14C Electronic Engine Controls. Before replacing a ECM, contact Dealer technical support
Electronic Engine Controls / 303-14C Electronic Engine Controls. Before replacing a ECM, contact Dealer technical support.

**B3: CHECK THE FUEL RAIL PRESSURE SENSOR SIGNAL CIRCUIT FOR OPEN CIRCUIT**

1. Disconnect the ECM electrical connector, PI001.
2. Measure the resistance between the fuel rail pressure sensor electrical connector PI028, pin 003, (U) and PI001, pin 073.

Is the resistance greater than 5 ohms?

**Yes** REPAIR the circuit between PI028, pin 003, (U) and PI001 pin, 073 (U). For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

**No** GO to B4.

**B4: CHECK THE FUEL RAIL PRESSURE SENSOR SIGNAL CIRCUIT FOR SHORT TO GROUND**

1. Measure the resistance between the fuel rail pressure sensor electrical connector PI028, pin 003 (U) and GROUND.

Is the resistance less than 10,000 ohms?

**Yes** REPAIR the circuit between PI028, pin 003 (U) and PI001 pin 073, (U). For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

**No** GO to B5.

**B5: CHECK THE FUEL RAIL PRESSURE SENSOR CIRCUIT RESISTANCE**

1. Disconnect the fuel rail pressure sensor electrical connector PI028.
2. Measure the resistance between the fuel rail pressure sensor pins 001 and 002.

Is the resistance between 10,000 and 12,000 ohms?

**Yes** GO to B6.

**No** Install a new fuel rail pressure sensor. REFER to Fuel Pressure Regulator in this section. CLEAR the DTC. TEST the system for normal operation.

**B6: CHECK THE FUEL RAIL PRESSURE SENSOR CIRCUIT RESISTANCE**

1. Measure the resistance between the fuel rail pressure sensor pins 002 and 003.

Is the resistance between 22,000 and 33,000 ohms?

**Yes** GO to B7.

**No** Install a new fuel rail pressure sensor. REFER to Fuel Pressure Regulator in this section. CLEAR the DTC. TEST the system for normal operation.

**B7: CHECK THE FUEL RAIL PRESSURE SENSOR CIRCUIT RESISTANCE**

1. Measure the resistance between the fuel rail pressure sensor pins 001 and 003.

Is the resistance between 22,000 and 33,000 ohms?

**Yes** INSTALL a new ECM. REFER to Section 303-14A Electronic Engine Controls / 303-14B Electronic Engine Controls / 303-14C Electronic Engine Controls. Before replacing a ECM, contact Dealer technical support. CLEAR the DTC. TEST the system for normal operation.

**No** Install a new fuel rail pressure sensor. REFER to Fuel Pressure Regulator in this section. CLEAR the DTC. TEST the system for normal operation.

**PINPOINT TEST C : FUEL LEVEL SENSORS: P0460**

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
</table>

**C1: CHECK THE FUEL LEVEL SENSOR (1) GROUND CIRCUIT**

1. Disconnect the fuel level sensor electrical connector, FP004.
2. Turn the ignition switch to the ON position.
3. Measure the resistance between electrical connector FP004, pin 003 (KO) and GROUND.

Is the resistance less than 5 ohms?

**Yes** GO to C2.

**No** REPAIR the circuit between electrical connector FP004, pin 003 (KO) and GROUND. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

**C2: CHECK THE FUEL LEVEL SENSOR (1) SIGNAL CIRCUIT**

1. Disconnect the REM electrical connector, CA101.
2. Measure the resistance between CA101, pin 015 (WR) and FP004, pin 001 (WR).

Is the resistance less than 5 ohms?

**Yes** GO to C3.

**No** REPAIR the circuit between CA101, pin 015 (WR) and FP004, pin 001 (WR). For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

**C3: CHECK THE FUEL LEVEL SENSOR (1) RHEOSTAT (EMPTY)**

1. Empty the fuel tank.
2. Measure the resistance between pins 001 and 003 of the fuel level sensor.

Is the resistance 20 ohms?

**Yes** GO to C4.

**No** INSTALL a new fuel level sensor. REFER to Section 310-01 Fuel Tank and Lines. CLEAR the DTC. TEST the system for normal operation.

**C4: CHECK THE FUEL LEVEL SENSOR (1) RHEOSTAT. (FULL)**

1. Fill the fuel tank.
2. Measure the resistance between pins 001 and 003 of the fuel level sensor.
Is the resistance 160 ohms?
Yes
  GO to C5.
No
  INSTALL a new fuel level sensor.
  REFER to Section 310-01 Fuel Tank and Lines.
  CLEAR the DTC. TEST the system for normal operation.

C5: CHECK THE FUEL LEVEL SENSOR (2) GROUND CIRCUIT
1. Disconnect the fuel level sensor electrical connector, FP003.
2. Turn the ignition switch to the ON position.
3. Measure the resistance between electrical connector FP003, pin 003 (KO) and GROUND.

Is the resistance less than 5 ohms?
Yes
  GO to C6.
No
  REPAIR the circuit between FP003, pin 003 (KO) and ground. For additional information, refer to wiring diagrams.
  CLEAR the DTC. TEST the system for normal operation.

C6: CHECK THE FUEL LEVEL SENSOR (2) SIGNAL CIRCUIT
1. Disconnect the REM electrical connector, CA101.
2. Measure the resistance between FP003, pin 001 (WU) and CA101, pin 016 (WU).

Is the resistance less than 5 ohms?
Yes
  GO to C7.
No
  REPAIR the circuit between FP003, pin 001 (WU) and CA101, pin 016 (WU) For additional information, refer to wiring diagrams.
  CLEAR the DTC. TEST the system for normal operation.

C7: CHECK THE FUEL LEVEL SENSOR (2) RHEOSTAT. (EMPTY)
1. Empty the fuel tank.
2. Measure the resistance between pins 001 and 003 of the fuel level sensor.

Is the resistance 20 ohms?
Yes
  GO to C8.
No
  INSTALL a new fuel level sensor.
  REFER to Section 310-01 Fuel Tank and Lines.
  CLEAR the DTC. TEST the system for normal operation.

C8: CHECK THE FUEL LEVEL SENSOR (2) RHEOSTAT. (FULL)
1. Fill the fuel tank.
2. Measure the resistance between pins 001 and 003 of the fuel level sensor.

Is the resistance 160 ohms?
Yes
  INSTALL a new REM.
  REFER to Section 419-10 Multifunction Electronic Modules.
  If the DTC is repeated, INSTALL a new instrument cluster.
  REFER to Section 413-01 Instrument Cluster.
  CLEAR the DTC. TEST the system for normal operation.
No
  INSTALL a new fuel level sensor.
  REFER to Section 310-01 Fuel Tank and Lines.
  CLEAR the DTC. TEST the system for normal operation.

PINPOINT TEST D : FUEL PUMP NOT ACTIVATED WHEN REQUESTED BY ECM: P1236

TEST CONDITIONS

D1: CHECK THE POWER SUPPLY TO THE REM
1. Disconnect the REM electrical connector, CA103.
2. Turn the ignition switch to the ON position.
3. Measure the voltage between CA103, pin 001 (GR) and GROUND.

Is the voltage greater than 10 volts?
Yes
  GO to D2.
No
  REPAIR the supply circuit to the REM. This circuit includes the rear power distribution box, fuse 47, the fuel pump relay, and fuse 23. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

D2: CHECK THE REM + OUTPUT TO THE FUEL PUMP
1. Reconnect CA103.
2. Disconnect the fuel pump electrical connector, FP004.
3. Turn the ignition switch to the CRANK position.
4. Measure the voltage between FP004, pin 002 (R) and GROUND.

Is the voltage greater than 10 volts?
Yes
  GO to D4.
No
  GO to D3.

D3: CHECK THE REM - OUTPUT TO THE FUEL PUMP
1. Turn the ignition switch to the CRANK position.
2. Measure the resistance between FP004, pin 004 (B) and GROUND.

Is the resistance less than 10 ohms?
Yes
  INSTALL a new fuel pump.
  REFER to Section 310-01 Fuel Tank and Lines.
  CLEAR the DTC. TEST the system for normal operation.
No
  GO to D4.

D4: CHECK THE ECM OUTPUT WIRE TO THE REM FOR CONTINUITY
Disconnect the battery negative terminal.
Disconnect the REM electrical connector, CA103.
Disconnect the ECM electrical connector, PI001.
Measure the resistance between PI001, pin 027 (WR) and CA103, pin 019 (WR).

Is the resistance less than 5 ohms?
Yes
INSTALL a new REM. REFER to Section 419-10 Multifunction Electronic Modules. CLEAR the DTC. TEST the system for normal operation. If the DTC is repeated, INSTALL a new ECM. REFER to Section 303-14A Electronic Engine Controls / 303-14B Electronic Engine Controls / 303-14C Electronic Engine Controls. Before replacing an ECM, contact Dealer technical support.

No
REPAIR the circuit between the ECM and the REM. For additional information, refer to the wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

PINPOINT TEST E : THROTTLE CONTROL POSITION ERROR: P1224

• NOTE: For further diagnosis on this DTC, REFER to Section 303-14A Electronic Engine Controls / 303-14B Electronic Engine Controls / 303-14C Electronic Engine Controls.

TEST CONDITIONS DETAILS/RESULTS/ACTIONS
E1: CHECK THROTTLE CONTROL - CIRCUIT FOR CONTINUITY
1 Disconnect the throttle motor electrical connector, PI018.
2 Disconnect the ECM electrical connector, PI001.
3 Measure the resistance between PI001, pin 106 (RW) and throttle motor electrical connector PI018, pin 002 (RW)

Is the resistance less than 5 ohms?
Yes
GO to E2.

No
REPAIR the circuit between ECM electrical connector PI001, pin 106 (RW) and throttle motor electrical connector PI018, pin 002 (RW) For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

E2: CHECK THROTTLE CONTROL + CIRCUIT FOR CONTINUITY
1 Measure the resistance between ECM electrical connector PI001, pin 080 (GW) and throttle motor electrical connector PI018, pin 001 (GW)

Is the resistance less than 5 ohms?
Yes
INSTALL a new ECM. REFER to Section 303-14A Electronic Engine Controls / 303-14B Electronic Engine Controls / 303-14C Electronic Engine Controls. CLEAR the DTC. TEST the system for normal operation.

No
REPAIR the circuit between ECM electrical connector PI001, pin 080 (GW) and throttle motor electrical connector PI018, pin 001 (GW) For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

PINPOINT TEST F : CHECK THROTTLE POSITION (TP) SENSOR: P0121, P0122, P0123, P0222, P0223

• NOTE: Check sensor supply and ground circuits before commencing this test. REFER to Section 303-14A Electronic Engine Controls / 303-14B Electronic Engine Controls / 303-14C Electronic Engine Controls.

TEST CONDITIONS DETAILS/RESULTS/ACTIONS
F1: CHECK THROTTLE POSITION SENSOR RESISTANCE. SENSOR 1
1 Disconnect the throttle position sensor electrical connector, PI026.
2 Measure the resistance between pins 001 and 003 of the TP sensor.

Is the resistance 500 to 900 ohms?
Yes
GO to F2.

No
INSTALL a new throttle body. REFER to Throttle Body in this section. CLEAR the DTC. TEST the system for normal operation.

F2: CHECK THROTTLE POSITION SENSOR RESISTANCE. SENSOR 2
1 Measure the resistance between pins 001 and 002 of the TP sensor.

Is the resistance 1200 to 1600 ohms?
Yes
GO to Pinpoint Test G.

No
INSTALL a new throttle body. REFER to Throttle Body in this section. CLEAR the DTC. TEST the system for normal operation.

PINPOINT TEST G : CHECK THROTTLE MOTOR RELAY: P1251, P1631, P1657, P1658

TEST CONDITIONS DETAILS/RESULTS/ACTIONS
G1: CHECK THROTTLE MOTOR RELAY CONSTANT SUPPLY
1 Remove the throttle motor relay.
2 Measure the voltage between the throttle motor relay base, pin 003 and GROUND.

Is the voltage greater than 10 volts?
Yes
GO to G2.

No
REPAIR the circuit between the throttle motor relay base, pin 003 and the battery. This circuit includes the power distribution fuse box, fuse 18. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

G2: CHECK THROTTLE MOTOR RELAY EMS SWITCHED SUPPLY
1 Turn the ignition switch to the ON position.
2 Measure the voltage between the throttle motor relay base, pin 001 and GROUND.
Is the voltage greater than 10 volts?
Yes  
   GO to G3.
No  
   REPAIR the circuit between the throttle motor relay base, pin 001 and the battery. This circuit includes the power distribution fuse box, fuses 36, 9, and 31, and the EMS control relay. CLEAR the DTC. TEST the system for normal operation.

G3: CHECK THROTTLE MOTOR RELAY TO ECM CIRCUIT FOR CONTINUITY
1  Remove the throttle motor relay.
2  Disconnect the ECM electrical connector, PI001.
3  Measure the resistance between PI001, pin 052 (GR) and throttle motor relay base, pin 002.

Is the resistance less than 5 ohms?
Yes  
   GO to G4.
No  
   REPAIR the circuit between PI001, pin 052 (GR) and throttle motor relay base, pin 002. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

G4: CHECK THROTTLE MOTOR RELAY OUTPUT TO ECM
1  INSTALL the throttle motor relay.
2  Turn the ignition switch to the ON position.
3  Measure the voltage between PI001, pin 134, (GU) and GROUND.

Is the voltage greater than 10 volts?
Yes  
   INSTALL a new ECM. REFER to Section 303-14A Electronic Engine Controls / 303-14B Electronic Engine Controls / 303-14C Electronic Engine Controls. Before replacing a ECM, contact Dealer technical support.
No  
   INSTALL a new throttle motor relay. For additional information, refer to the electrical guide. CLEAR the DTC. TEST the system for normal operation.

PINPOINT TEST H : CHECK SECONDARY FUEL PUMP DRIVER INPUT CIRCUITS (S/C ONLY): P1233

TEST CONDITIONS
Details/Results/Actions

H1: CHECK POWER SUPPLY TO THE SECONDARY FUEL PUMP MODULE
1  Disconnect the secondary fuel pump module electrical connector, CA283.
2  Turn the ignition switch to the ON position.
3  Measure the voltage between CA283, pin 029 (UY) and GROUND.

Is the voltage greater than 10 volts?
Yes  
   GO to H2.
No  
   REPAIR the circuit between the fuel pump and the battery. This circuit includes fuse 49, the fuel pump relay, and fuse 23. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

H2: CHECK POWER SUPPLY TO THE SECONDARY FUEL PUMP
1  Reconnect the secondary fuel pump module electrical connector, CA283.
2  Disconnect the secondary fuel pump electrical connector, FP003.
3  Turn the ignition switch to the ON position.
4  Measure the voltage between FP003, pin 002 (R) and GROUND.

Is the voltage greater than 10 volts?
Yes  
   GO to H4.
No  
   GO to H3.

H3: CHECK POWER SUPPLY CIRCUIT TO THE SECONDARY FUEL PUMP FOR OPEN CIRCUIT
1  Disconnect the secondary fuel pump module electrical connector, CA283.
2  Measure the resistance between CA283, pin 010 (R) and FP003, pin 002 (R).

Is the resistance greater than 5 ohms?
Yes  
   REPAIR the circuit between CA283, pin 010 (R) and FP003, pin 002 (R). For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
No  
   INSTALL a new secondary fuel pump module. CLEAR the DTC. TEST the system for normal operation.

H4: CHECK THE GROUND CIRCUIT TO THE SECONDARY FUEL PUMP MODULE
1  Measure the resistance between secondary fuel pump module electrical connector, CA283, pin 002 (B) and GROUND.

Is the resistance greater than 5 ohms?
Yes  
   REPAIR the circuit between secondary fuel pump module electrical connector, CA283, pin 002 (B) and GROUND. For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.
No  
   GO to H5.

H5: CHECK THE SECONDARY FUEL PUMP RESISTANCE
1  Measure the resistance between pins 002 and 004 of the secondary fuel pump.

Is the resistance less than 2 ohms?
Yes  
   GO to H6.
No  
   INSTALL a new secondary fuel pump. REFER to Section 310-01 Fuel Tank and Lines. CLEAR the DTC. TEST the system for normal operation.

H6: CHECK MONITOR CIRCUITS FOR OPEN CIRCUIT/HIGH RESISTANCE
1  Disconnect the secondary fuel pump module electrical connector, CA283
2  Disconnect the ECM electrical connector, PI001.
3  Measure the resistance between PI001, pin 011 (Y) and CA283, pin 007 (Y).

Is the resistance greater than 5 ohms?
Yes  
   REPAIR the circuit between PI001, pin 011 (Y) and CA283, pin 007 (Y). For additional information, refer to wiring diagrams. CLEAR the DTC. TEST the system for normal operation.

Fuel Charging and Controls - V8 4.2L Petrol/V8 S/C 4.2L Petrol - Fuel Injection Supply Manifold

Removal

1. **CAUTION:** Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions can result in personal injury.

   Remove the fuel injection supply manifold.
   For additional information, refer to Fuel Injectors in this section.

2. Detach the fuel pressure regulator.
   - Remove the securing bolts.
   - Remove and discard the O-rings.

Installation

1. **CAUTION:** Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions can result in personal injury.

   To install, reverse removal procedure.
   - Install new fuel pressure regulator O-rings. Lubricate the O-ring seals with clean engine oil to aid installation.
   - Tighten to 5 Nm.
Fuel Charging and Controls - V8 4.2L Petrol/V8 S/C 4.2L Petrol - Fuel Charging and Controls
VIN Range: N52048->N99999
Diagnosis and Testing

Overview
There are changes to the engine management system (EMS) for 2006 my, the most obvious of which will be the change to 7-digit diagnostic trouble codes (DTCs) from the familiar 5-digit.

Refer to the DTC index in this section for guidance on how to use these codes with the Jaguar approved diagnostic system or a scan tool.

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual inspection

<table>
<thead>
<tr>
<th>Mechanical</th>
<th>Electrical</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fuel leaks</td>
<td>Fuses</td>
</tr>
<tr>
<td>Damaged fuel lines</td>
<td>Inertia switch</td>

<td>Throttle body</td>
<td>Engine control module (ECM)</td>
</tr>
<tr>
<td>Damaged fuel tank filler pipe cap</td>
<td></td>
</tr>
<tr>
<td>Damaged fuel tank filler pipe</td>
<td></td>
</tr>
</tbody>
</table>

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the cause is not visually evident use the Jaguar approved diagnostic system or a scan tool to retrieve the fault codes before proceeding to the diagnostic trouble code (DTC) Index.

• ECM fault | For throttle actuator motor circuit tests on vehicles without supercharger, GO to Pinpoint Test C. For throttle actuator motor circuit tests on vehicles with supercharger, GO to Pinpoint Test D. Refer to the warranty policy and procedures manual if an ECM is suspect. |

Pinpoint Tests

**CAUTION:** When probing connectors to take measurements in the course of the pinpoint tests, use the adaptor kit, part number 3548-1358-00.

*NOTE: When performing electrical voltage or resistance tests, always use a digital multimeter (DMM) accurate to 3 decimal places, and with an up-to-date calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.
• NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

PINPOINT TEST A: FUEL INJECTOR CIRCUITS (VEHICLES WITHOUT SUPERCHARGER)

• NOTE: The DTC set will indicate which cylinder injector or circuit is faulty. Only in the event of multiple cylinder misfires will it be necessary to check more than one injector or circuit, in which case, multiple DTCs will be set.

Is the resistance greater than 5 ohms?

- Yes: REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
- No: INSTALL a new injector. REFER to: Fuel Injectors (303-04B Fuel Charging and Controls - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Removal and Installation). CLEAR the DTC and test the system for normal operation.

### PINPOINT TEST B : FUEL INJECTOR CIRCUITS (VEHICLES WITH SUPERCHARGER)

• NOTE: The DTC set will indicate which cylinder injector or circuit is faulty. Only in the event of multiple cylinder misfires will it be necessary to check more than one injector or circuit, in which case, multiple DTCs will be set.

#### TEST CONDITIONS | DETAILS/RESULTS/ACTIONS
---|---
**B1: CHECK THE INJECTOR COIL RESISTANCE**

1. Disconnect the relevant injector electrical connector:

   - Injector, component side
   - Injector body

2. Measure the resistance between the injector pins.

   - Is the resistance between 12 and 16 ohms?
     - No: INSTALL a new injector. REFER to: Fuel Injectors (303-04B Fuel Charging and Controls - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Removal and Installation). CLEAR the DTC and test the system for normal operation.

**B2: CHECK THE INJECTOR COIL INSULATION**

1. Measure the resistance between:

   - Injector, component side
   - Injector body

   - Is either resistance less than 10,000 ohms?
     - Yes: INSTALL a new injector. REFER to: Fuel Injectors (303-04B Fuel Charging and Controls - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Removal and Installation). CLEAR the DTC and test the system for normal operation.
     - No: GO to B3.

**B3: CHECK THE INJECTOR SUPPLY VOLTAGE**

1. Key on, engine off.
2. Make sure the EMS relay is energized.
3. Measure the voltage between:

   - Injector, component side
   - Battery

   - Is the voltage less than 10 Volts?
     - Yes: REPAIR the circuit between the relevant injector harness electrical connector pin 02 and battery. This circuit includes fuse 13 of the front power distribution box and the EMS relay. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
     - No: GO to B4.

**B4: CHECK THE INJECTOR CONTROL CIRCUIT FOR SHORT CIRCUIT TO GROUND**

1. Key off.
2. Measure the resistance between:

   - Injector, component side
   - Battery

   - Is the resistance less than 10,000 ohms?
     - Yes: REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
     - No: GO to B5.

**B5: CHECK THE INJECTOR CONTROL CIRCUIT FOR SHORT CIRCUIT TO POWER**

---
1. Measure the resistance between:

<table>
<thead>
<tr>
<th>Injector connector, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 01</td>
<td>Positive terminal</td>
</tr>
</tbody>
</table>

- **Yes**
  - REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.
- **No**
  - GO to B6.

**B6: CHECK THE INJECTOR CONTROL CIRCUIT FOR HIGH RESISTANCE**

- NOTE: The DTC set will indicate which cylinder injector or circuit is faulty. Only in the event of multiple cylinder misfires will it be necessary to check more than one injector or circuit, in which case, multiple DTCs will be set.

1. Disconnect the ECM electrical connector PI300.
2. Measure the resistance between:

<table>
<thead>
<tr>
<th>Cylinder 1 injector connector, harness side</th>
<th>ECM connector PI300, harness side</th>
</tr>
</thead>

**Removal**

Vehicles with supercharger

1. Remove the charge air coolers. For additional information, refer to Section 303-12A Intake Air Distribution and Filtering / 303-12B Intake Air Distribution and Filtering / 303-12C Intake Air Distribution and Filtering.

Vehicles without supercharger

2. Remove the air outlet tube. For additional information, refer to Section 303-12A Intake Air Distribution and Filtering / 303-12B Intake Air Distribution and Filtering / 303-12C Intake Air Distribution and Filtering.

3. Remove the engine cover bracket.
   - Right hand shown left hand similar.

All vehicles

4. Disconnect the fuel line. For additional information, refer to Section 310-00 Fuel System - General Information.

5. Disconnect the fuel pressure regulator.
   1. Disconnect the electrical connector.
   2. Detach the vacuum hose.

6. Detach the engine wiring harness.
   - Right hand shown left hand similar.
7. Disconnect the electrical connectors.
   - Right hand shown left hand similar.

8. Remove the fuel injection supply manifold.

Vehicles without supercharger

9. Remove the fuel injection supply manifold.
   - Left hand shown right hand similar.

Vehicles with supercharger

All vehicles

10. Remove the fuel injectors.
    - Release the retaining clip.
    - Remove the fuel injector.
11. Remove and discard the O-ring seals.

## Installation

**All vehicles**

1. **CAUTION:** Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

To install, reverse the removal procedure.

- Install new fuel injector O-ring seals. Lubricate the O-ring seals with clean engine oil to aid installation.

**Vehicles with supercharger**

2. Tighten to 7 Nm.

**Vehicles without supercharger**

3. Tighten to 22 Nm.
4. Tighten to 6 Nm.
## Fuel Charging and Controls - V8 4.2L Petrol/V8 S/C 4.2L Petrol - Fuel Pressure Regulator
### Removal

1. **CAUTION:** Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions can result in personal injury.

   Depressurize the fuel system.
   For additional information, refer to Section [310-00 Fuel System - General Information](#).

2. Disconnect the fuel pressure regulator.
   1. Disconnect the electrical connector.
   2. Detach the vacuum hose.

3. Remove the fuel pressure regulator.

4. **CAUTION:** Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions can result in personal injury.

   To install, reverse removal procedure.
   - Tighten to 5 Nm.

Fuel Injection Pump

The fuel injection pump is located at the rear of the engine between the cylinder heads and is driven by a toothed drive belt attached to a pulley on the left hand exhaust camshaft. The fuel injection pump is not timed to the engine. The fuel injection pump assembly contains two different types of pump, a transfer pump and a high pressure pump.

Fuel is supplied to the fuel injection pump by an electric fuel pump in the fuel tank via the fuel filter. Fuel then passes through the transfer pump to the high pressure pump. The amount of fuel supplied to the high pressure pump from the transfer pump is determined by the volume control valve (VCV) which is controlled using a pulse width modulated (PWM) signal from the engine control module (ECM). The VCV makes it possible to match the high pressure pump delivery to the requirements of the engine from the low pressure side. This keeps the amount of fuel flowing back to the main supply line to a minimum and reduces the load on the high pressure pump, improving engine efficiency.

The high pressure pump contains three radial pumping elements, capable of generating a fuel pressure of up to 1650 Bar (23,200 lb ft), connected together which leads via a pressure control valve (PCV) to the high pressure outlet of the pump.

The PCV is located between the high pressure and the fuel return line outlet of the pump. The PCV is controlled using a PWM signal from the ECM, and controls the fuel pressure in the fuel diverter rail and fuel injection supply manifolds. Opening of the PCV diverts fuel to the fuel return line and back to the fuel filter. At the same time as the PCV opens to reduce fuel pressure, the ECM closes the VCV to reduce the amount of fuel delivered to the high pressure pump. When the engine is stopped the VCV closes and the PCV opens, this relieves the pressure in the system and returns the fuel to the main fuel supply line.

The PCV and VCV must not be disassembled from fuel injection pump. If either of these components are found to be faulty, the fuel injection pump must be replaced.

**CAUTIONS:**

- If any of the high pressure fuel pipe retaining nuts are loosened, the high pressure fuel pipe it is installed to must be renewed.
- Failure to follow this instruction may allow metal fragments to enter the fuel system and result in damage to the fuel system components or engine.

- The high pressure fuel line olive end deforms and work hardens during installation. If any of the high pressure fuel pipe retaining nuts are loosened, the high pressure fuel pipe it is installed to must be renewed. Failure to follow this instruction may allow the high-pressure fuel line to leak.

Fuel Injection Supply Manifold
The fuel injection supply manifolds are reservoirs for the pressurized fuel that is produced by the fuel pump. The two fuel injection supply manifolds are connected by high pressure fuel pipes to a fuel injection diverter rail mounted on the fuel injection pump. The fuel injection diverter rail also incorporates a pressure sensor so that the ECM can monitor/adjust the pressure of the fuel to be injected into the each cylinder. The fuel injection diverter rail and the pressure sensor are serviced as an assembly and must not under any circumstances be disassembled.

Fuel Injector

• CAUTIONS:

⚠ If any of the high pressure fuel pipe retaining nuts are loosened, the high pressure fuel pipe it is installed to must be renewed. Failure to follow this instruction may allow metal fragments to enter the fuel system and result in damage to the fuel system components or engine.
The high pressure fuel line olive end deforms and work hardens during installation. If any of the high pressure fuel pipe retaining nuts are loosened, the high pressure fuel pipe it is installed to must be renewed. Failure to follow this instruction may allow the high-pressure fuel line to leak.

Fuel Injectors

The fuel injectors are operated electrically by the engine control module (ECM) and inject a precise amount of fuel into the combustion chamber at the required time.

The injectors have been designed to:

- allow pilot and main injections with short intervals between each injection.
- be fully electrically controlled.

Fuel Filter

The diesel fuel filter is located on the left-hand side of the engine compartment. Incorporated in to the fuel filter housing is a bimetallic valve which will start to close at 30°C (86°F) and will fully close at 50°C (122°F).

When the bimetallic valve is open, warm fuel is directed in to the fuel filter to prevent waxing. When the fuel temperature increases, the bimetallic valve closes, diverting fuel through the under-floor fuel cooler which then lowers the fuel temperature before returning the fuel back to the fuel filter. This allows fuel to be supplied to the fuel injection pump at the optimum inlet temperature of between -30°C to 80°C.
Fuel Charging and Controls - 2.7L V6 - TdV6 - Fuel Charging and Controls

Diagnosis and Testing

Principle of operation

Common rail diesel

The 2.7L fuel injection system is a common-rail design, running at the high pressures (up to 1,650 bar or 23,930 lb/in²) typical of such systems.

The fuel is drawn from the fuel tank by an electric lift pump and delivered to the transfer pump side of a high pressure fuel pump (HPFP) driven by the engine. For additional information on the HPFP, REFER to: Fuel Charging and Controls (303-04C Fuel Charging and Controls - 2.7L V6 - TdV6, Description and Operation).

The fuel volume control valve (FVCV) regulates the amount of fuel supplied to the high pressure side of the HPFP, while the fuel pressure control valve (FPCV) regulates the pressure.

The high pressure fuel is delivered to the fuel rail where it is stored, ready for use by the injectors.

The fuel injectors are Piezo type, and are controlled by the engine control module (ECM) from inputs from the engine management sensors.

The injectors operate in stages, giving a pilot injection before the main injection to reduce detonation noise and help improve the efficiency of the engine.

For additional information, REFER to: Fuel Charging and Controls (303-04C Fuel Charging and Controls - 2.7L V6 - TdV6, Description and Operation).

Inspection and Verification

• WARNINGS:

Do NOT carry out any work on the fuel system with the engine running. The fuel pressure within the system can be as high as 1650 bar (23,930 lb/in²). Failure to follow this instruction may result in personal injury.

Eye protection must be worn at all times when working on or near any fuel related components. Failure to follow this instruction may result in personal injury.

This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow this instruction may result in personal injury.

After carrying out repairs, the fuel system must be checked visually for leaks. This should be done after the engine has been run, but with the engine switched OFF. Failure to follow this instruction may result in personal injury.

If taken internally, DO NOT induce vomiting. Seek immediate medical attention. Failure to follow this instruction may result in personal injury.

If fuel contacts the eyes, flush the eyes with cold water or eyewash solution and seek medical attention. Failure to follow this instruction may result in personal injury.

Wash hands thoroughly after handling, as prolonged contact may cause irritation. Should irritation develop, seek medical attention. Failure to follow this instruction may result in personal injury.

• CAUTIONS:

Before disconnecting any part of the system, it is imperative that all dust, dirt and debris is removed from around components to prevent ingress of foreign matter into the fuel system. Failure to follow this instruction may result in damage to the vehicle.

The fuel pipes between the injectors and the rail must be discarded after each use, and new pipes installed. Failure to follow this instruction may result in damage to the vehicle.

It is essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in damage to the vehicle.

Make sure that the workshop area in which the vehicle is being worked on is as clean and dust-free as possible. Areas in which work on clutches, brakes or where welding or machining are carried out are not suitable in view of the risk of contamination to the fuel system. Failure to follow this instruction may result in damage to the vehicle.

Make sure that any protective clothing worn is clean and made from lint-free non-flocking material. Failure to follow this instruction may result in damage to the vehicle.

Make sure that any protective gloves worn are new and are of the non-powdered latex type. Failure to follow this instruction may result in damage to the vehicle.

Make sure that clean, non-plated tools are used. Clean tools using a new brush that will not lose its bristles and fresh cleaning fluid prior to starting work on the vehicle. Failure to follow this instruction may result in damage to the vehicle.

## Pinpoint test

### PINPOINT TEST A : CHECK FOR FUEL SYSTEM LEAKS

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>A1: CHECK FOR FUEL SYSTEM LEAKS</strong></td>
<td>![Image]</td>
</tr>
</tbody>
</table>

- **WARNINGS:**
  - Do not carry out any work on the fuel system with the engine running, as the fuel pressure within the system can be as high as 1,650 bar (23,930 lb/in²). Failure to follow this instruction may result in personal injury.
  - Wait at least 30 seconds after the engine stops before commencing any repair to the high pressure fuel injection system. Failure to follow this instruction may result in personal injury.
  - **NOTE:** Remember that the high pressure of the system may mean that leaks will send fuel some distance. Look for a trail to determine the source of the leak.

1. Start and run the engine for five minutes.
2. Turn the ignition switch to the **OFF** position.
3. Inspect the fuel lines, pump, etc, in the engine bay for cracks/damage.
4. Raise the vehicle on a suitable lift.
5. Inspect the fuel lines for cracks/damage.
6. Check the integrity of the joints in the supply and return lines between the fuel tank and the fuel pump.
7. Carefully check around the fuel pipes, injectors and pump for evidence of leakage.
8. If there is evidence of a significant leak, clean the engine and repeat the test.

Is there any evidence of leakage?
- **Yes**
  - RECTIFY the leak as necessary. Reassemble the removed parts and check the vehicle for normal operation.
- **No**
  - CHECK for other possible causes for the customer concern.

### Inspection and Verification

- **WARNINGS:**
  - Wait at least 30 seconds after the engine stops before commencing any repair to the high pressure fuel injection system. Failure to follow this instruction may result in personal injury.
  - This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow this instruction may result in personal injury.
  - **CAUTION:** It is essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in damage to the vehicle.

### Preliminary Checks

- Check the condition and fitment of the fuel filler cap
- Check the fuses to the fuel lift pump (fuses 47 and 23 of the rear power distribution box)
- Check the security of the pipe fittings in the low pressure circuit
- Check the pipework for cracks/damage
- Check the fuel filter for cracks/damage

### Pinpoint test

### PINPOINT TEST B : CHECK THE LIFT PUMP FUNCTION

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>B1: CHECK THE LIFT PUMP FUNCTION</strong></td>
<td>![Image]</td>
</tr>
</tbody>
</table>

1. After thoroughly cleaning around the connections, disconnect the inlet pipe from the fuel filter.
2. Position a suitable container beneath the fuel filter inlet pipe to collect fuel.
3. Turn the ignition switch to the **ON** position (the pump should run for a short period, depending on temperature, etc).
4. Check that fuel is pumped from the fuel filter inlet pipe.
Is fuel pumped from the fuel filter inlet pipe?

Yes
- CHECK the drive belt to the high pressure fuel pump, REFER to: Accessory Drive (303-05, Diagnosis and Testing).
- Check for DTCs.

No
- CHECK the lift pump and circuit, REFER to: Fuel Tank and Lines (310-01, Diagnosis and Testing).

Inspection and Verification

**WARNINGS:**

⚠️ Wait at least 30 seconds after the engine stops before commencing any repair to the high pressure fuel injection system. Failure to follow this instruction may result in personal injury.

⚠️ This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow this instruction may result in personal injury.

⚠️ CAUTION: It is essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in damage to the vehicle.

Preliminary Checks

- Check the condition and fitment of the fuel filler cap
- Check the security of the pipe fittings in the low pressure circuit
- Check the pipework for cracks/damage
- Check the fuel filter for cracks/damage

Pinpoint test

**PINPOINT TEST C : CHECK FOR CONTAMINATED FUEL**

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>C1: CHECK FOR UNUSUAL ODOURS FROM THE FUEL FILLER</td>
<td></td>
</tr>
<tr>
<td>1</td>
<td>Gather as much information as possible from the owner/driver regarding refuelling practices.</td>
</tr>
<tr>
<td>2</td>
<td>Remove the fuel filler cap and check for unusual odours.</td>
</tr>
<tr>
<td>Yes</td>
<td>DRAIN the fuel tank and refill with fresh fuel. Install a new fuel filter. REFER to: Fuel Filter - 2.7L V6 - TdV6 (310-01 Fuel Tank and Lines, Removal and Installation). Test the vehicle for normal operation.</td>
</tr>
<tr>
<td>No</td>
<td>GO to C2.</td>
</tr>
</tbody>
</table>

| C2: CHECK FOR WATER IN THE FUEL | |
| 1 | After thoroughly cleaning around the connections, disconnect the inlet pipe from the fuel filter. |
| 2 | Position a suitable clear container beneath the fuel filter inlet pipe to collect fuel. |
| 3 | Turn the ignition switch to the ON position (the pump should run for a short period, depending on temperature, etc. It may be necessary to turn the ignition on and off more than once to obtain the desired amount of fuel). |
| 4 | Collect approximately one liter of fuel. |
| 5 | Allow the fuel to stand for at least one minute. |
| 6 | Without disturbing the fuel, check for separation of the fuel into layers (a significant amount of water in the fuel will result in a clear separation between the two fluids, with the water being at the bottom). |
| Yes | DRAIN the fuel tank and refill with fresh fuel. Install a new fuel filter. REFER to: Fuel Filter - 2.7L V6 - TdV6 (310-01 Fuel Tank and Lines, Removal and Installation). Test the vehicle for normal operation. |
| No | CHECK for other contaminants in the fuel. |

Inspection and Verification

**WARNINGS:**

⚠️ Wait at least 30 seconds after the engine stops before commencing any repair to the high pressure fuel injection system. Failure to follow this instruction may result in personal injury.

⚠️ This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow this instruction may result in personal injury.

⚠️ CAUTION: It is essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in damage to the vehicle.

Preliminary Checks

Check the pipes and connections to and from the fuel filter for security and condition.

Pinpoint test

**PINPOINT TEST D : CHECK FOR BLOCKED FUEL FILTER**

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
</table>
D1: CHECK THE FLOW OF FUEL THROUGH THE FILTER

1. After thoroughly cleaning around the connections, disconnect the fuel filter outlet pipe to the high pressure fuel pump.

   **WARNING:** During this test, fuel will flow backwards through the fuel filter because of the fuel cooler circuit.

2. Position a suitable container beneath the fuel filter outlet to collect fuel.

3. Turn the ignition switch to the **ON** position (the pump should run for a short period, depending on temperature, etc).

   Is there an unrestricted flow of fuel through the filter?
   
   **Yes**
   - CHECK for DTCs, check for another cause of customer complaint.
   
   **No**
   - INSTALL a new fuel filter.
   - Test the vehicle for normal operation.

---

**Inspection and Verification**

Please ensure you adhere to the following instructions while diagnosing and repairing this fault:

**CAUTION:** The fuel volume control valve (FVCV) must not be separated from the diesel common rail pump. The FVCV, fuel pressure control valve (FPCV), and high pressure pump should be considered a single unit. Failure to follow this instruction may result in damage to the vehicle.

This pinpoint test is intended to diagnose the following:

- Short circuit to GROUND in the FVCV circuit
- Short circuit to POWER in the FVCV circuit
- Open circuit in the FVCV circuit
- FVCV fault
- ECM fault

**Fuel volume control valve (FVCV) connector**

![Diagram of Fuel Volume Control Valve Connector]

**Pinpoint Tests**

**PINPOINT TEST E : FUEL VOLUME CONTROL VALVE AND CIRCUIT**

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>E1: CHECK THE POWER TO FVCV</td>
<td></td>
</tr>
<tr>
<td>1. Key off.</td>
<td></td>
</tr>
<tr>
<td>2. FVCV solenoid connector disconnected.</td>
<td></td>
</tr>
<tr>
<td>3. Key on, engine off.</td>
<td></td>
</tr>
<tr>
<td>4. Measure the voltage between:</td>
<td>fuel volume control valve - power - Pin 01 Negative post</td>
</tr>
</tbody>
</table>

   Is the Voltage between 9 volts - 15 volts?
   
   **Yes**
   - GO to E7.
   
   **No**
**E2: CHECK THE FVCV CONTROL LINE FOR SHORT TO GROUND**

1. Measure the resistance between:
   Fuel volume control valve - control - Pin 02
   - Negative post

   **Is the resistance greater than 100 Kohms?**
   - Yes: Go to E3.
   - No: Go to E6.

**E3: CHECK THE FVCV CONTROL LINE FOR SHORT TO POWER**

1. Measure the resistance between:
   Fuel volume control valve - control - Pin 02
   - Positive post

   **Is the resistance greater than 100 Kohms?**
   - Yes: Go to E4.
   - No: Go to E7.

**E4: CHECK THE FVCV CONTROL LINE FOR CONTINUITY**

1. Key off.
2. ECM connector disconnected.
3. Measure the resistance between:
   Fuel volume control valve - control - Pin 02
   Fuel volume control valve - control - Pin B- J4

   **Is the resistance less than 10 ohms?**
   - Yes: Go to E5.
   - No: Repair the open circuit. For additional information, refer to the wiring diagrams.

**E5: CHECK THE COMPONENT RESISTANCE**

1. Measure the resistance between:
   Fuel volume control valve - control - Pin 02
   Fuel volume control valve - power - Pin 01

   **Is the resistance between 1.5 ohms - 15 ohms?**
   - Yes: An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s):
     - FVCV connector
     - FVCV
     - ECM connector
     - ECM
   - No: Install a new FVCV solenoid.

**E6: CHECK WHETHER THE SHORT TO GROUND IS IN THE FVCV HARNESS OR ECU**

1. Key off.
2. ECM connector disconnected.
3. Key on, engine off.
4. Measure the resistance between:
   Fuel volume control valve - control - Pin 02
   - Negative post

   **Is the resistance greater than 100 Kohms?**
   - Yes: Harness is OK. Suspect: ECM
   - No: Repair the short circuit. For additional information, refer to the wiring diagrams.

**E7: CHECK WHETHER THE SHORT TO POWER IS IN THE FVCV HARNESS OR ECU**

1. Key off.
2. ECM connector disconnected.
3. Key on, engine off.
4. Measure the resistance between:
   Fuel volume control valve - control - Pin 02
   - Positive post

   **Is the resistance greater than 100 Kohms?**
   - Yes: Harness is OK. Suspect: ECM
   - No: Repair the short circuit. For additional information, refer to the wiring diagrams.

**Inspection and Verification**

Please ensure you adhere to the following instructions while diagnosing and repairing this fault:

**CAUTION:** The FRP sensor must not be separated from the diesel fuel rail. The FRP sensor and central fuel rail should be considered a single unit. Failure to follow this instruction may result in damage to the vehicle.

This pinpoint test is intended to diagnose the following:

- Short circuit to GROUND in the FRP circuit
- Short circuit to POWER in the FRP circuit
- Open circuit in the FRP circuit
- FRP fault
- ECM fault

Is the resistance greater than 100 Kohms?
Yes
   GO to F6.
No
   GO to F10.

F6: CHECK THE FRP SIGNAL LINE FOR OPEN CIRCUIT
1 Key off.
2 ECM connector disconnected.
3 Measure the resistance between:
   Fuel rail pressure sensor - signal - Pin 01 | Fuel rail pressure sensor - signal - Pin B-D1
Is the resistance less than 10 ohms?
Yes
   An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s):- FRP connector- ECM connector- FRP- ECM
No
   REPAIR the open circuit. For additional information, refer to the wiring diagrams.

F7: CHECK THE FRP CIRCUIT(S) FOR SIGNAL AND RETURN LINES SHORTED TOGETHER
1 Key off.
2 ECM connector disconnected.
3 Key on, engine off.
4 Measure the resistance between:
   Fuel rail pressure sensor - signal - Pin 01 | Fuel rail pressure sensor - return - Pin 02
Is the resistance greater than 100 Kohms?
Yes
   GO to F8.
No
   REPAIR the short circuit. For additional information, refer to the wiring diagrams.

F8: CHECK WHETHER THE SHORT CIRCUIT TO GROUND IS IN THE FRP HARNESS OR ECU
1 Measure the resistance between:
   Fuel rail pressure sensor - signal - Pin 01 | Negative post
Is the resistance greater than 100 Kohms?
Yes
   Suspect: ECM
No
   REPAIR the short circuit. For additional information, refer to the wiring diagrams.

F9: CHECK WHETHER THE SHORT CIRCUIT TO POWER IS IN THE FRP HARNESS OR ECU
1 Key off.
2 ECM connector disconnected.
3 Key on, engine off.
4 Measure the resistance between:
   Fuel rail pressure sensor - signal - Pin 01 | Positive post
Is the resistance greater than 100 Kohms?
Yes
   Suspect: ECM
No
   REPAIR the short circuit. For additional information, refer to the wiring diagrams.

F10: CHECK WHETHER THE SHORT CIRCUIT IS IN THE FRP HARNESS OR ECU
1 Key off.
2 ECM connector disconnected.
3 Key on, engine off.
4 Measure the resistance between:
   Fuel rail pressure sensor - signal - Pin 01 | Fuel rail pressure sensor - power - Pin 03
Is the resistance greater than 100 Kohms?
Yes
   Suspect: ECM
No
   REPAIR the short circuit. For additional information, refer to the wiring diagrams.

F11: CHECK THE 5 VOLT SUPPLY LINE FOR SHORT CIRCUIT TO GROUND
1 Measure the resistance between:
   Fuel rail pressure sensor - power - Pin 03 | Negative post
Is the resistance greater than 100 Kohms?
Yes
   GO to F12.
No
   GO to F17.

F12: CHECK THE 5 VOLT SUPPLY LINE FOR SHORT TO POWER
1 Measure the resistance between:
   Fuel rail pressure sensor - power - Pin 03 | Positive post
Is the resistance greater than 100 Kohms?
Yes
   GO to F13.
No
   GO to F19.

F13: CHECK THE FRP 5 VOLT SUPPLY LINE FOR OPEN CIRCUIT
1 Key off.
2 ECM connector disconnected.
3 Key on, engine off.
4 Measure the resistance between:
   Fuel rail pressure sensor - power - Pin 03 | Fuel rail pressure sensor - power - Pin B-D2
Is the resistance less than 10 ohms?
Yes
   Suspect: ECM connector- ECM
No
F14: CHECK THE FRP SENSOR RETURN LINE FOR SHORT CIRCUIT TO POWER
1. Measure the resistance between:
   Fuel rail pressure sensor - return - Pin 02  Positive post

   Is the resistance greater than 100 Kohms?
   Yes  GO to F15.
   No  GO to F20.

F15: CHECK WHETHER THE 5 VOLT SUPPLY AND SIGNAL RETURN LINES ARE SHORTED TOGETHER
1. Key off.
2. ECM connector disconnected.
3. Key on, engine off.
4. Measure the resistance between:
   Fuel rail pressure sensor - power - Pin 03  Fuel rail pressure sensor - return - Pin 02

   Is the resistance greater than 100 Kohms?
   Yes  GO to F16.
   No  REPAIR the short circuit. For additional information, refer to the wiring diagrams.

F16: CHECK THE FRP SENSOR RETURN LINE FOR OPEN CIRCUIT
1. Measure the resistance between:
   Fuel rail pressure sensor - return - Pin 02  Fuel rail pressure sensor - return - Pin B-E2

   Is the resistance less than 10 ohms?
   Yes  Suspect: ECM connector - ECM
   No  REPAIR the open circuit. For additional information, refer to the wiring diagrams.

F17: CHECK WHETHER THE 5 VOLT SUPPLY AND SIGNAL RETURN LINES ARE SHORTED TOGETHER
1. Key off.
2. ECM connector disconnected.
3. Key on, engine off.
4. Measure the resistance between:
   Fuel rail pressure sensor - power - Pin 03  Fuel rail pressure sensor - return - Pin 02

   Is the resistance greater than 100 Kohms?
   Yes  GO to F18.
   No  REPAIR the short circuit. For additional information, refer to the wiring diagrams.

F18: CHECK WHETHER THE SHORT CIRCUIT TO GROUND IS IN THE FRP HARNESS OR ECU
1. Measure the resistance between:
   Fuel rail pressure sensor - power - Pin 03  Negative post

   Is the resistance greater than 100 Kohms?
   Yes  Suspect: ECM
   No  REPAIR the short circuit. For additional information, refer to the wiring diagrams.

F19: CHECK WHETHER THE SHORT CIRCUIT TO POWER IS IN THE FRP HARNESS OR ECU
1. Key off.
2. ECM connector disconnected.
3. Key on, engine off.
4. Measure the resistance between:
   Fuel rail pressure sensor - power - Pin 03  Positive post

   Is the resistance greater than 100 Kohms?
   Yes  Suspect: ECM
   No  REPAIR the short circuit. For additional information, refer to the wiring diagrams.

F20: CHECK WHETHER THE SHORT CIRCUIT TO POWER IS IN THE FRP HARNESS OR ECU
1. Key off.
2. ECM connector disconnected.
3. Key on, engine off.
4. Measure the resistance between:
   Fuel rail pressure sensor - return - Pin 02  Positive post

   Is the resistance greater than 100 Kohms?
   Yes  Suspect: ECM
   No  REPAIR the short circuit. For additional information, refer to the wiring diagrams.

Inspection and Verification

Please ensure you adhere to the following instructions while diagnosing and repairing this fault:

⚠️ CAUTION: The fuel pressure control valve (FPCV) must not be separated from the diesel high pressure pump. The FVCV, FPCV, and high pressure pump should be considered a single unit. Failure to follow this instruction may result in damage to the vehicle.

This pinpoint test is intended to diagnose the following:

- Short circuit to GROUND in the FPCV circuit
- Short circuit to POWER in the FPCV circuit
- Open circuit in the FPCV circuit
- FPCV fault
- ECM fault
Pinpoint test

PINPOINT TEST G : FUEL PRESSURE CONTROL VALVE (FPCV) AND CIRCUIT

TEST CONDITIONS DETAILS/RESULTS/ACTIONS

G1: CHECK THE POWER TO FPCV

1. Key off.
2. FPCV solenoid connector disconnected.
3. Key on, engine off.
4. Measure the voltage between:
   Fuel pressure control valve - power - Pin 01 Negative post
   Is the Voltage between 9 volts - 15 volts?
   Yes
   Go to G2.
   No
   No supply to the FPCV circuit. Check and repair the circuit as necessary.

G2: CHECK THE FPCV CONTROL LINE FOR SHORT CIRCUIT TO GROUND

1. Measure the resistance between:
   Fuel pressure control valve - control - Pin 02 Negative post
   Is the resistance greater than 100 Kohms?
   Yes
   Go to G3.
   No
   Go to G6.

G3: CHECK THE FPCV CONTROL LINE FOR SHORT CIRCUIT TO POWER

1. Measure the resistance between:
   Fuel pressure control valve - control - Pin 02 Positive post
   Is the resistance greater than 100 Kohms?
   Yes
   Go to G4.
   No
   Go to G7.

G4: CHECK THE FPCV CONTROL LINE FOR CONTINUITY

1. Key off.
2. ECM connector disconnected.
3. Measure the resistance between:
   Fuel pressure control valve - control - Pin 02 Fuel pressure control valve - control - Pin B-K3
   Is the resistance less than 10 ohms?
   Yes
   Go to G5.
   No
   REPAIR the open circuit. For additional information, refer to the wiring diagrams.

G5: CHECK THE COMPONENT RESISTANCE

1. Measure the resistance between:
   Fuel pressure control valve - power - Pin 01 Fuel pressure control valve - control - Pin 02
Is the resistance between 0Ω - 5.5 ohms?

**Yes**
An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s):
- FPCV connector
- FPCV
- ECM connector
- ECM

**No**
INSTALL a new FPCV solenoid.

### G6: CHECK WHETHER THE SHORT CIRCUIT TO GROUND IS IN THE FPCV HARNESS OR ECU

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Key off.</td>
</tr>
<tr>
<td>2</td>
<td>ECM connector disconnected.</td>
</tr>
<tr>
<td>3</td>
<td>Key on, engine off.</td>
</tr>
<tr>
<td>4</td>
<td>Measure the resistance between: Fuel pressure control valve - control - Pin 02 Negative post</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

**Yes**
Harness is OK. Suspect: ECM

**No**
REPAIR the short circuit. For additional information, refer to the wiring diagrams.

### G7: CHECK WHETHER THE SHORT CIRCUIT TO POWER IS IN THE FPCV HARNESS OR ECU

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Key off.</td>
</tr>
<tr>
<td>2</td>
<td>ECM connector disconnected.</td>

<tr>
<td>3</td>
<td>Key on, engine off.</td>
</tr>
<tr>
<td>4</td>
<td>Measure the resistance between: Fuel pressure control valve - control - Pin 02 Positive post</td>
</tr>
</tbody>
</table>

Is the resistance greater than 100 Kohms?

**Yes**
Harness is OK. Suspect: ECM

**No**
REPAIR the short circuit. For additional information, refer to the wiring diagrams.

---

**Inspection and Verification**

*Please ensure you adhere to the following instructions while diagnosing and repairing this fault:*

- **CAUTIONS:**
  - When the engine is running, the electrical connectors from the injectors to the engine control unit must not be disconnected. Failure to follow this instruction may result in damage to the vehicle.
  - The injectors themselves must not be dismantled or loosened in any way. Failure to follow this instruction may result in damage to the vehicle.
  - The hexagonal nut between the injector fuel intake pipe and electrical connector should not be loosened, or used to apply rotational pressure when removing the injector from the engine. Failure to follow this instruction may result in damage to the vehicle.

**Note**

This pinpoint test is intended to diagnose the following:
- Short circuit to GROUND in the INJ0 circuit
- Short circuit to POWER in the INJ0 circuit
- Open circuit in the INJ0 circuit
- INJ0 fault
- ECM fault

To aid in the identification of the injector related to this strategy, a diagram has been provided below:

</tr>
</tbody>
</table>

Are the resistances less than 10 ohms?

| Yes | GO to H4. |
| No | GO to H5. |
Key on, engine off.
Measure the resistance between:
- Fuel injector, cylinder 1 - control - Pin C-M3
- Fuel injector, cylinder 1 - ground - Pin C-L3
Are the resistances greater than 100 Kohms?
Yes
   GO to H7.
No
   GO to H6.

H6: CHECK WHETHER THE SHORT CIRCUIT TO GROUND IS IN THE HARNESS OR INJ0

Key off.
INJ0 Solenoid connector disconnected.
Key on, engine off.
Measure the resistance between:
- Fuel injector, cylinder 1 - control - Pin C-M3
- Fuel injector, cylinder 1 - ground - Pin C-L3
Are the resistances greater than 100 Kohms?
Yes
   Harness is OK. Suspect: - INJ0
No
   REPAIR the short circuit. For additional information, refer to the wiring diagrams.

H7: CHECK THE INJ0 CIRCUIT FOR SHORT CIRCUIT TO POWER

Key off.
INJ0 Solenoid connector disconnected.
Key on, engine off.
Measure the resistance between:
- Fuel injector, cylinder 1 - control - Pin C-M3
- Fuel injector, cylinder 1 - ground - Pin C-L3
Are the resistances greater than 100 Kohms?
Yes
   An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s): - INJ0 connector - INJ0 - ECM connector - ECM
No
   GO to H8.

H8: CHECK WHETHER THE SHORT CIRCUIT TO POWER IS IN THE HARNESS OR INJ0

Key off.
INJ0 Solenoid connector disconnected.
Key on, engine off.
Measure the resistance between:
- Fuel injector, cylinder 1 - control - Pin C-M3
- Fuel injector, cylinder 1 - ground - Pin C-L3
Are the resistances greater than 100 Kohms?
Yes
   Harness is OK. Suspect: - INJ0
No
   REPAIR the short circuit. For additional information, refer to the wiring diagrams.

H9: CHECK WHETHER THE SHORT CIRCUIT IS IN THE HARNESS OR THE INJ0 COMPONENT

Key off.
INJ0 Solenoid connector disconnected.
Key on, engine off.
Measure the resistance between:
- Fuel injector, cylinder 1 - control - Pin C-M3
- Fuel injector, cylinder 1 - ground - Pin C-L3
Is the resistance greater than 100 Kohms?
Yes
   Harness is OK. Suspect: INJ0
No
   REPAIR the short circuit. For additional information, refer to the wiring diagrams.

Inspection and Verification

Please ensure you adhere to the following instructions while diagnosing and repairing this fault:

- **CAUTIONS:**
  - When the engine is running, the electrical connectors from the injectors to the engine control unit must not be disconnected. Failure to follow this instruction may result in damage to the vehicle.
  - The injectors themselves must not be dismantled or loosened in any way. Failure to follow this instruction may result in damage to the vehicle.
  - The hexagonal nut between the injector fuel intake pipe and electrical connector should not be loosened, or used to apply rotational pressure when removing the injector from the engine. Failure to follow this instruction may result in damage to the vehicle.

This pinpoint test is intended to diagnose the following:
- Short circuit to GROUND in the INJ0 circuit
- Short circuit to POWER in the INJ0 circuit
- Open circuit in the INJ0 circuit
- INJ0 fault
- ECM fault

</tbody>
</table>
Is the resistance greater than 100 Kohms?

Yes  GO to I4.

No  GO to I9.

**I4: CHECK INJ2 CIRCUIT FOR AN OPEN CIRCUIT IN THE HARNESS**

1. INJ2 solenoid connector disconnected.
2. Measure the resistance between:
   - Fuel injector, cylinder 2 - control - Pin 02  Fuel injector, cylinder 2 - control - Pin C-M2
   - Fuel injector, cylinder 2 - ground - Pin 01  Fuel injector, cylinder 2 - ground - Pin C-L2

Are the resistances less than 10 ohms?

Yes  An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s): - INJ2 connector - ECM connector - INJ2

No  REPAIR the open circuit. For additional information, refer to the wiring diagrams.

**I5: CHECK THE INJ2 CIRCUIT FOR SHORT CIRCUIT TO GROUND**

1. Key on, engine off.
2. Measure the resistance between:
   - Fuel injector, cylinder 2 - control - Pin C-M2  Negative post
   - Fuel injector, cylinder 2 - ground - Pin C-L2  Negative post

Are the resistances less than 100 Kohms?

Yes  An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s): - INJ2 connector - ECM connector - ECM

No  REPAIR the short circuit. For additional information, refer to the wiring diagrams.

**I6: CHECK WHETHER THE SHORT CIRCUIT TO GROUND IS IN THE HARNESS OR INJ2**

1. Key off.
2. INJ2 solenoid connector disconnected.
3. Key on, engine off.
4. Measure the resistance between:
   - Fuel injector, cylinder 2 - control - Pin C-M2  Negative post
   - Fuel injector, cylinder 2 - ground - Pin C-L2  Negative post

Are the resistances greater than 100 Kohms?

Yes  Harness is OK. Suspect:- INJ2

No  REPAIR the short circuit. For additional information, refer to the wiring diagrams.

**I7: CHECK INJ2 CIRCUIT FOR SHORT CIRCUIT TO POWER**

1. Measure the resistance between:
   - Fuel injector, cylinder 2 - control - Pin C-M2  Positive post
   - Fuel injector, cylinder 2 - ground - Pin C-L2  Positive post

Are the resistances greater than 100 Kohms?

Yes  An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s): - INJ2 connector - INJ2 - ECM

No  GO to I8.

**I8: CHECK WHETHER THE SHORT CIRCUIT TO POWER IS IN THE HARNESS OR INJ2**

1. Key off.
2. INJ2 solenoid connector disconnected.
3. Key on, engine off.
4. Measure the resistance between:
   - Fuel injector, cylinder 2 - control - Pin C-M2  Positive post
   - Fuel injector, cylinder 2 - ground - Pin C-L2  Positive post

Are the resistances greater than 100 Kohms?

Yes  Harness is OK. Suspect:- INJ2

No  REPAIR the short circuit. For additional information, refer to the wiring diagrams.

**I9: CHECK WHETHER THE SHORT CIRCUIT IS IN THE HARNESS OR THE INJ2 COMPONENT**

1. Key off.
2. INJ2 solenoid connector disconnected.
3. Key on, engine off.
4. Measure the resistance between:
   - Fuel injector, cylinder 2 - control - Pin C-M2  Fuel injector, cylinder 2 - ground - Pin C-L2

Is the resistance greater than 100 Kohms?

Yes  Harness is OK. Suspect:- INJ2

No  REPAIR the short circuit. For additional information, refer to the wiring diagrams.

**Inspection and Verification**

Please ensure you adhere to the following instructions while diagnosing and repairing this fault:

- **CAUTIONS:**

  1. When the engine is running, the electrical connectors from the injectors to the engine control unit must not be disconnected. Failure to follow this instruction may result in damage to the vehicle.

  2. The injectors themselves must not be dismantled or loosened in any way. Failure to follow this instruction may result in damage to the vehicle.
The hexagonal nut between the injector fuel intake pipe and electrical connector should not be loosened, or used to apply rotational pressure when removing the injector from the engine. Failure to follow this instruction may result in damage to the vehicle.

This pinpoint test is intended to diagnose the following:
- Short circuit to GROUND in the INJ4 circuit
- Short circuit to POWER in the INJ4 circuit
- Open circuit in the INJ4 circuit
- INJ4 fault
- ECM fault

To aid in the identification of the injector related to this strategy, a diagram has been provided below:

<td>No</td>
<td>INSTALL a new INJ4 solenoid. REFER to: [Fuel Injector](303-04C Fuel Charging and Controls - 2.7L V6 - TdV6, Removal and Installation).</td>
</tr>
</tbody>
</table>
J2: CHECK THE COMBINED INJ4 SOLENOID AND HARNESS RESISTANCE
1. Key off.
2. INJ4 solenoid connector connected.
3. ECM connector disconnected.
4. Measure the resistance between:
   Fuel injector, cylinder 3 - control - Pin C-M4
   Fuel injector, cylinder 3 - ground - Pin C-L4

   Is the resistance between 180 Kohms - 220 Kohms?
   Yes → GO to J5.
   No → GO to J3.

J3: CHECK FOR A SHORT CIRCUIT BETWEEN THE SIGNAL AND RETURN LINES
1. Measure the resistance between:
   Fuel injector, cylinder 3 - control - Pin C-M4
   Fuel injector, cylinder 3 - ground - Pin C-L4

   Is the resistance greater than 100 Kohms?
   Yes → GO to J4.
   No → GO to J9.

J4: CHECK INJ4 CIRCUIT FOR AN OPEN CIRCUIT IN THE HARNESS
1. INJ4 solenoid connector disconnected.
2. Measure the resistance between:
   Fuel injector, cylinder 3 - control - Pin 02
   Fuel injector, cylinder 3 - control - Pin C-M4
   Fuel injector, cylinder 3 - ground - Pin 01
   Fuel injector, cylinder 3 - ground - Pin C-L4

   Are the resistances less than 10 ohms?
   Yes → An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s):
   - INJ4 connector
   - ECM
   No → REPAIR the open circuit. For additional information, refer to the wiring diagrams.

J5: CHECK THE INJ4 CIRCUIT FOR SHORT CIRCUIT TO GROUND
1. Key on, engine off.
2. Measure the resistance between:
   Fuel injector, cylinder 3 - control - Pin C-M4
   Fuel injector, cylinder 3 - ground - Pin C-L4

   Are the resistances greater than 100 Kohms?
   Yes → GO to J7.
   No → GO to J6.

J6: CHECK WHETHER THE SHORT CIRCUIT TO GROUND IS IN THE HARNESS OR INJ4
1. Key off.
2. INJ4 solenoid connector disconnected.
3. Key on, engine off.
4. Measure the resistance between:
   Fuel injector, cylinder 3 - control - Pin C-M4
   Fuel injector, cylinder 3 - ground - Pin C-L4

   Are the resistances greater than 100 Kohms?
   Yes → Harness is OK. Suspect:
   - INJ4
   No → REPAIR the short circuit. For additional information, refer to the wiring diagrams.

J7: CHECK INJ4 CIRCUIT FOR SHORT CIRCUIT TO POWER
1. Measure the resistance between:
   Fuel injector, cylinder 3 - control - Pin C-M4
   Fuel injector, cylinder 3 - ground - Pin C-L4

   Are the resistances greater than 100 Kohms?
   Yes → An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s):
   - INJ4 connector
   - ECM
   No → GO to J8.

J8: CHECK WHETHER THE SHORT CIRCUIT TO POWER IS IN THE HARNESS OR INJ4
1. Key off.
2. INJ4 solenoid connector disconnected.
3. Key on, engine off.
4. Measure the resistance between:
   Fuel injector, cylinder 3 - control - Pin C-M4
   Fuel injector, cylinder 3 - ground - Pin C-L4

   Are the resistances greater than 100 Kohms?
   Yes → Harness is OK. Suspect:
   - INJ4
   No → REPAIR the short circuit. For additional information, refer to the wiring diagrams.

J9: CHECK WHETHER THE SHORT CIRCUIT IS IN THE HARNESS OR THE INJ4 COMPONENT
1. Key off.
2. INJ4 solenoid connector disconnected.
3. Key on, engine off.
4. Measure the resistance between:
   Fuel injector, cylinder 3 - control - Pin C-M4
   Fuel injector, cylinder 3 - ground - Pin C-L4
Is the resistance greater than 100 Kohms?
Yes
Harness is OK. Suspect INJ4
No
REPAIR the short circuit. For additional information, refer to the wiring diagrams.

**Inspection and Verification**

Please ensure you adhere to the following instructions while diagnosing and repairing this fault:

- **CAUTIONS:**

  - When the engine is running, the electrical connectors from the injectors to the engine control unit must not be disconnected. Failure to follow this instruction may result in damage to the vehicle.
  
  - The injectors themselves must not be dismantled or loosened in any way. Failure to follow this instruction may result in damage to the vehicle.
  
  - The hexagonal nut between the injector fuel intake pipe and electrical connector should not be loosened, or used to apply rotational pressure when removing the injector from the engine. Failure to follow this instruction may result in damage to the vehicle.

**This pinpoint test is intended to diagnose the following:**

- Short circuit to GROUND in the INJ1 circuit
- Short circuit to POWER in the INJ1 circuit
- Open circuit in the INJ1 circuit
- INJ fault
- ECM fault

To aid in the identification of the injector related to this strategy, a diagram has been provided below:

**Injector 1 (INJ1) solenoid connector**

Measure the resistance between:
Fuel injector, cylinder 4 - control - Pin B-L1
Fuel injector, cylinder 4 - ground - Pin B-L2
Positive post

Are the resistances greater than 100 Kohms?
Yes
Harness is OK. Suspect: INJ1
No
REPAIR the short circuit. For additional information, refer to the wiring diagrams.

K9: CHECK WHETHER THE SHORT CIRCUIT IS IN THE HARNESS OR THE INJ1 COMPONENT
1. Key off.
2. INJ1 solenoid connector disconnected.
3. Key on, engine off.
4. Measure the resistance between:
   Fuel injector, cylinder 4 - control - Pin B-L1
   Fuel injector, cylinder 4 - ground - Pin B-L2

Is the resistance greater than 100 Kohms?
Yes
Harness is OK. Suspect: INJ1
No
REPAIR the short circuit. For additional information, refer to the wiring diagrams.

Inspection and Verification

Please ensure you adhere to the following instructions while diagnosing and repairing this fault:

• CAUTIONS:

⚠️ When the engine is running, the electrical connectors from the injectors to the engine control unit must not be disconnected. Failure to follow this instruction may result in damage to the vehicle.

⚠️ The injectors themselves must not be dismantled or loosened in any way. Failure to follow this instruction may result in damage to the vehicle.

⚠️ The hexagonal nut between the injector fuel intake pipe and electrical connector should not be loosened, or used to apply rotational pressure when removing the injector from the engine. Failure to follow this instruction may result in damage to the vehicle.

This pinpoint test is intended to diagnose the following:

- Short circuit to GROUND in the INJ3 circuit
- Short circuit to POWER in the INJ3 circuit
- Open circuit in the INJ3 circuit
- INJ3 fault
- ECM fault

To aid in the identification of the injector related to this strategy, a diagram has been provided below:
Fuel injector, cylinder 5 - ground  B-L3
Fuel injector, cylinder 5 - control  B-M1

</tbody>
</table>
Are the resistances greater than 100 Kohms?

Yes
Harness is OK. Suspect: INJ3

No
REPAIR the short circuit. For additional information, refer to the wiring diagrams.

### L7: CHECK THE INJ3 CIRCUIT FOR SHORT CIRCUIT TO POWER

1. Measure the resistance between:
   - Fuel injector, cylinder 5 - control - Pin B-M1
   - Fuel injector, cylinder 5 - ground - Pin B-L3

Are the resistances greater than 100 Kohms?

Yes
An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s):
- INJ3 connector
- ECM connector
- ECM

No
GO to L8.

### L8: CHECK WHETHER THE SHORT CIRCUIT TO POWER IS IN THE HARNESS OR INJ3

1. Key off.
2. INJ3 solenoid connector disconnected.
3. Key on, engine off.
4. Measure the resistance between:
   - Fuel injector, cylinder 5 - control - Pin B-M1
   - Fuel injector, cylinder 5 - ground - Pin B-L3

Are the resistances greater than 100 Kohms?

Yes
Harness is OK. Suspect: INJ3

No
REPAIR the short circuit. For additional information, refer to the wiring diagrams.

### L9: CHECK WHETHER THE SHORT CIRCUIT IS IN THE HARNESS OR THE INJ3 COMPONENT

1. Key off.
2. INJ3 solenoid connector disconnected.
3. Key on, engine off.
4. Measure the resistance between:
   - Fuel injector, cylinder 5 - control - Pin B-M1
   - Fuel injector, cylinder 5 - ground - Pin B-L3

Is the resistance greater than 100 Kohms?

Yes
Harness is OK. Suspect: INJ3

No
REPAIR the short circuit. For additional information, refer to the wiring diagrams.

---

### Inspection and Verification

Please ensure you adhere to the following instructions while diagnosing and repairing this fault:

- **CAUTIONS:**
  - When the engine is running, the electrical connectors from the injectors to the engine control unit must not be disconnected. Failure to follow this instruction may result in damage to the vehicle.
  - The injectors themselves must not be dismantled or loosened in any way. Failure to follow this instruction may result in damage to the vehicle.
  - The hexagonal nut between the injector fuel intake pipe and electrical connector should not be loosened, or used to apply rotational pressure when removing the injector from the engine. Failure to follow this instruction may result in damage to the vehicle.

This pinpoint test is intended to diagnose the following:
- Short circuit to GROUND in the INJ5 circuit
- Short circuit to POWER in the INJ5 circuit
- Open circuit in the INJ5 circuit
- INJ5 fault
- ECM fault

To aid in the identification of the injector related to this strategy, a diagram has been provided below:

</tr>
</tbody>
</table>

- **Measure the resistance between:**
  - Fuel injector, cylinder 6 - control - Pin 02
  - Fuel injector, cylinder 6 - ground - Pin 01

- **Is the resistance between 180 Kohms - 220 Kohms?**
  - **Yes**
    - **GO to M2.**
  - **No**
    - INSTALL a new INJ5 solenoid.
    - REFER to: Fuel Injector (303-04C Fuel Charging and Controls - 2.7L V6 - TdV6, Removal and Installation).

#### DETAILS/RESULTS/ACTIONS

- **M2: CHECK THE COMBINED INJ5 SOLENOID AND HARNESS RESISTANCE**

  - **Key off.**
  - **INJ5 solenoid connector connected.**
  - **ECM connector disconnected.**
  - **Measure the resistance between:**
    - Fuel injector, cylinder 6 - control - Pin B-M2
    - Fuel injector, cylinder 6 - ground - Pin B-M3

  - **Is the resistance between 180 Kohms - 220 Kohms?**
    - **Yes**
      - **GO to M5.**
    - **No**
      - **GO to M3.**

#### M3: CHECK FOR A SHORT CIRCUIT BETWEEN THE SIGNAL AND RETURN LINES

- **Measure the resistance between:**
  - Fuel injector, cylinder 6 - control - Pin B-M2
  - Fuel injector, cylinder 6 - ground - Pin B-M3

- **Is the resistance greater than 100 Kohms?**
  - **Yes**
    - **GO to M4.**
  - **No**
    - **GO to M9.**

#### M4: CHECK INJ5 CIRCUIT FOR AN OPEN CIRCUIT IN THE HARNESS

- **INJ5 solenoid connector disconnected.**
- **Measure the resistance between:**
  - Fuel injector, cylinder 6 - control - Pin 02
  - Fuel injector, cylinder 6 - control - Pin B-M2
  - Fuel injector, cylinder 6 - ground - Pin 01
  - Fuel injector, cylinder 6 - ground - Pin B-M3

- **Are the resistances less than 10 ohms?**
  - **Yes**
    - An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s): - INJ5 connector - ECM connector - INJ5
  - **No**
    - **REPAIR the open circuit. For additional information, refer to the wiring diagrams.**

#### M5: CHECK THE INJ5 CIRCUIT FOR A SHORT CIRCUIT TO GROUND
Key on, engine off.
Measure the resistance between:
Fuel injector, cylinder 6 - control - Pin B-M2 Negative post
Fuel injector, cylinder 6 - ground - Pin B-M3 Negative post
Are the resistances greater than 100 Kohms?
Yes
GO to M7.
No
GO to M6.

M6: CHECK WHETHER THE SHORT CIRCUIT TO GROUND IS IN THE HARNESS OR INJ5
1 Key off.
2 INJ5 solenoid connector disconnected.
3 Key on, engine off.
4 Measure the resistance between:
Fuel injector, cylinder 6 - control - Pin B-M2 Negative post
Fuel injector, cylinder 6 - ground - Pin B-M3 Negative post
Are the resistances greater than 100 Kohms?
Yes
Harness is OK. Suspect: - INJ5
No
REPAIR the short circuit. For additional information, refer to the wiring diagrams.

M7: CHECK THE INJ5 CIRCUIT FOR A SHORT CIRCUIT TO POWER
1 Measure the resistance between:
Fuel injector, cylinder 6 - control - Pin B-M2 Positive post
Fuel injector, cylinder 6 - ground - Pin B-M3 Positive post
Are the resistances greater than 100 Kohms?
Yes
An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s): - INJ5 connector - INJ5 - ECM connector - ECM
No
GO to M8.

M8: CHECK WHETHER THE SHORT CIRCUIT TO POWER IS IN THE HARNESS OR INJ5
1 Key off.
2 INJ5 solenoid connector disconnected.
3 Key on, engine off.
4 Measure the resistance between:
Fuel injector, cylinder 6 - control - Pin B-M2 Positive post
Fuel injector, cylinder 6 - ground - Pin B-M3 Positive post
Are the resistances greater than 100 Kohms?
Yes
Harness is OK. Suspect: - INJ5
No
REPAIR the short circuit. For additional information, refer to the wiring diagrams.

M9: CHECK WHETHER THE SHORT CIRCUIT IS IN THE HARNESS OR THE INJ5 COMPONENT
1 Key off.
2 INJ5 solenoid connector disconnected.
3 Key on, engine off.
4 Measure the resistance between:
Fuel injector, cylinder 6 - control - Pin B-M2 Fuel injector, cylinder 6 - ground - Pin B-M3
Is the resistance greater than 100 Kohms?
Yes
Harness is OK. Suspect - INJ5
No
REPAIR the short circuit. For additional information, refer to the wiring diagrams.
Fuel Charging and Controls - 2.7L V6 - TdV6 - Fuel Injection Component Cleaning

General Procedures

• WARNINGS:

⚠️ Do not carry out any repairs to the fuel system with the engine running. The fuel pressure within the system can be as high as 2000 bar. Failure to follow this instruction may result in personal injury.

⚠️ Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

⚠️ If fuel contacts the eyes, flush the eyes with cold water or eyewash solution and seek immediate medical attention.

⚠️ Place the vehicle in a well ventilated, quarantined area and arrange 'No Smoking/Petrol Fumes' signs about the vehicle.

⚠️ Wait at least 30 seconds after the engine stops before commencing any repair to the high-pressure fuel injection system. Failure to follow this instruction may result in personal injury.

⚠️ Wash hands thoroughly after fuel handling, as prolonged contact may cause irritation. Should irritation develop, seek medical attention.

⚠️ Do not carry or operate cellular phones when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

• CAUTIONS:

⚠️ Before using the cleaning fluid, protect all electrical components and connectors with lint-free non-flocking material.

⚠️ Make sure that all parts removed from the vehicle are placed on the lint-free non-flocking material.

⚠️ Make sure that any protective clothing worn is clean and made from lint-free non-flocking material.

⚠️ Make sure that clean non-plated tools are used. Clean tools using a new brush that will not lose its bristles and fresh cleaning fluid, prior to starting work on the vehicle.

⚠️ Use a steel topped workbench and cover it with clean, lint-free non-flocking material.

⚠️ Make sure the workshop area in which the vehicle is being worked on is as clean and as dust free as possible. Foreign matter from work on clutches, brakes or from machining or welding operations can contaminate the fuel system and may result in later malfunction.

• NOTE: Pneumatic vacuum gun

1. Using a new brush that will not lose its bristles, brush cleaning fluid onto the components being removed and onto the surrounding area.

2. Using a pneumatic vacuum gun, remove all traces of cleaning fluid and foreign material.

3. Dispose of any used cleaning fluid and the brush after completing the repair.
Fuel Charging and Controls - 2.7L V6 - TdV6 - Fuel Injection Pump

**Removal**

- **WARNINGS:**
  - Wait at least 30 seconds after the engine stops before commencing any repair to the high pressure fuel injection system. Failure to follow this instruction may result in personal injury.
  - Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable mixtures are always present and may ignite. Failure to follow these instructions may result in personal injury.
  - This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.
  - Do not carry out any repairs to the fuel system with the engine running. The fuel pressure within the high-pressure system can be as high as 1650 bar. Failure to follow this instruction may result in personal injury.

- **CAUTIONS:**
  - Make sure the workshop area in which the vehicle is being worked on is as clean and as dust free as possible. Foreign matter from work on clutches, brakes or from machining or welding operations can contaminate the fuel system and may result in later malfunction.
  - Always carry out the cleaning process before carrying out any repairs to the fuel injection system components. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.
  - Diesel fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines.
  - Do not disassemble or clean inside the fuel pump, even with an ultrasonic cleaner. Always install a new fuel pump when required.

- **NOTE:** If the fuel pump has suffered a major mechanical failure, new fuel injectors should also be installed.

All vehicles

1. Disconnect the battery.
   For additional information, refer to: Battery Disconnect and Connect
   (414-01 Battery, Mounting and Cables, General Procedures).
2. Remove the oil filler cap.

3. Remove the engine cover.

Right-hand drive vehicles

4. Remove the cabin air filter. For additional information, refer to: Cabin Air Filter (412-01 Air Distribution and Filtering, Removal and Installation).

5. Remove the engine compartment support.

6. Remove the cabin air filter housing retaining nut.
7. Remove the cabin air filter housing.

8. Remove the engine compartment panel.

Left-hand drive vehicles

9. Remove the wiper mounting arm and pivot shaft.
   For additional information, refer to: Wiper Mounting Arm and Pivot Shaft (501-16 Wipers and Washers, Removal and Installation).

All vehicles

10. Remove the engine compartment access panel.
11. Remove the engine compartment access panel retaining strip.

12. Remove the engine harness retaining bolts.

13. Remove the fuel injection pump belt cover.

14. **NOTE:** The fuel injection pump belt is not timed to the engine.
Remove and discard the fuel injection pump belt tensioner.
15. NOTE: The fuel injection pump rotates in an anti-clockwise direction when view from the rear of the engine.

Note the direction of rotation of the fuel injection pump belt.

16. Remove and discard the fuel injection pump belt.

17. Remove the camshaft rear pulley retaining bolt.
   - Using the special tool, retain the camshaft rear pulley.
   - Remove and discard the retaining bolt.
   - Remove the special tool.

18. Remove the camshaft rear pulley.

19. Remove the injection pump pulley retaining nut.
   - Using the special tool, retain the fuel injection pump pulley.
   - Remove the special tool.
20. Using the special tool, remove the fuel injection pump pulley.
   • Remove the special tool.

21. Detach the exhaust gas recirculation (EGR) coolant outlet tube.

22. Detach the EGR coolant outlet tube.

23. Remove the left-hand catalytic converter.
    For additional information, refer to: Catalytic Converter - 2.7L V6 - TdV6
    (309-00 Exhaust System, Removal and Installation).
24. Detach the EGR coolant outlet tube.
    • Remove the retaining nut.
    • Reposition the EGR coolant outlet tube.
25. Remove the turbocharger heat shield.

26. Remove the fuel injection pump belt rear cover.

27. Lower the vehicle.

28. Clean around the low pressure fuel inlet and return lines, high-pressure fuel supply lines and surrounding areas. For additional information, refer to: Fuel Injection Component Cleaning (303-04C Fuel Charging and Controls - 2.7L V6 - TdV6, General Procedures).

29. Disconnect the low pressure fuel inlet and return lines. For additional information, refer to: Quick Release Coupling - Push Connect (310-00 Fuel System - General Information, General Procedures).
   - Install suitable blanking caps to the fuel lines and unions.

30. NOTE: Left-hand shown, right-hand similar.

   Detach the high pressure fuel supply line clamps.
31. **CAUTION:** Make sure that the high-pressure fuel supply line remains in contact with the fuel injection supply manifold and fuel injection diverter rail until both unions have been detached and cleaned. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

- **NOTE:** Left-hand shown, right-hand similar.

Loosen the high pressure fuel supply lines.

32. **CAUTION:** Make sure that the high-pressure fuel supply line remains in contact with the fuel injection supply manifold and fuel injection diverter rail until both unions have been detached and cleaned. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

- **NOTE:** Left-hand shown, right-hand similar.

Using the pneumatic vacuum gun, vacuum foreign material from the high-pressure fuel supply lines, the fuel injection diverter rail and the fuel injection supply manifolds.

33. **CAUTION:** Make sure that the high-pressure fuel supply line remains in contact with the fuel injection supply manifold and fuel injection diverter rail until both unions have been detached and cleaned. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

- **NOTE:** Left-hand shown, right-hand similar.

Remove and discard the high pressure fuel supply lines.

- Install suitable blanking caps to the open threaded ports on the fuel injection diverter rail and fuel injection supply manifold.

34. **CAUTIONS:**

- **CAUTION:** Make sure that the high-pressure fuel supply line remains in contact with the fuel injection pump and fuel injection diverter rail until both unions have been detached and cleaned. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

- **CAUTION:** Make sure that the fuel injection pump adaptor union does not move when loosening the high-pressure fuel supply line at the high pressure pump. Failure to follow this instruction may result in damage to the fuel injection pump or the fuel injection pump adaptor union.

Loosen the high pressure fuel supply line.

35. **CAUTION:** Make sure that the high-pressure fuel supply line remains in contact with the fuel injection pump and fuel injection diverter rail until both unions have been detached and cleaned. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

Using the pneumatic vacuum gun, vacuum foreign material from the high-pressure fuel supply lines, the fuel injection diverter rail and the fuel injection pump.
36. **CAUTION:** Make sure that the high-pressure fuel supply line remains in contact with the fuel injection pump and fuel injection diverter rail until both unions have been detached and cleaned. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

Remove and discard the high pressure fuel supply line.
- Install suitable blanking caps to the open threaded ports on the fuel injection diverter rail and fuel injection pump.

37. Detach the low pressure fuel line retaining nut.

38. Disconnect the electrical connector.

39. Disconnect the fuel line.
- Install suitable blanking caps to the fuel line and union.

40. Detach the fuel line.
- Install suitable blanking caps to the fuel line and union.
41. NOTE: Do not remove the fuel rail pressure sensor from the fuel injection diverter rail.

Remove the fuel injection diverter rail.

42. Disconnect the left-hand camshaft cover breather hose.

43. Disconnect the right-hand camshaft cover breather hose.

44. Disconnect the left-hand inlet port deactivation vacuum pipe.

45. Remove the oil separator housing.
   - Remove and discard the oil separator housing and engine block seals.
46. Disconnect the fuel injection pump electrical connectors.

47. Detach the glow plug electrical connectors.

48. Remove the fuel injection pump.

Installation

• WARNINGS:

⚠️ Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable mixtures are always present and may ignite. Failure to follow these instructions may result in personal injury.

⚠️ This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

• CAUTIONS:

⚠️ Make sure the workshop area in which the vehicle is being worked on is as clean and as dust free as possible. Foreign matter from work on clutches, brakes or from machining or welding operations can contaminate the fuel system and may result in later malfunction.

⚠️ Always carry out the cleaning process before carrying out any repairs to the fuel injection system components. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

⚠️ Diesel fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines.

⚠️ Do not disassemble or clean inside the fuel pump, even with an ultrasonic cleaner. Always install a new fuel pump when required.

⚠️ Install new high pressure fuel supply lines. Failure to follow this instruction may result in damage to the vehicle.

All vehicles
1. Install the fuel injection pump.
   - Tighten to 23 Nm.

2. Attach the glow plug electrical connectors.

3. Connect the fuel pump electrical connectors.

4. Install the oil separator housing.
   - Install new oil separator housing and engine block seals.

5. Connect the left-hand inlet port deactivation vacuum pipe.
6. Connect the left-hand camshaft cover breather hose.

7. Connect the right-hand camshaft cover breather hose.

8. Install the fuel injection diverter rail.
   - Do not fully tighten the fuel injection diverter rail retaining bolts at this stage.

9. Attach the fuel line.
   - Remove and discard the blanking caps.

10. Connect the fuel line.
11. Connect the electrical connector.

12. Attach the fuel line retaining nut.
   - Tighten to 7 Nm.

13. Install a new high pressure fuel supply line.
   - Remove and discard the blanking caps.
   - Install but do not tighten the new high pressure fuel supply line.
   - Tighten the fuel injection diverter rail retaining bolts to 23 Nm.
   - Tighten the high-pressure fuel supply line in the sequence shown in four stages:
     1. Stage 1: Tighten the high-pressure fuel supply line union 1 to 15 Nm.
     2. Stage 2: Tighten the high-pressure fuel supply line union 2 to 15 Nm.
     3. Stage 3: Tighten the high-pressure fuel supply line union 1 to 30 Nm.
     4. Stage 4: Tighten the high-pressure fuel supply line union 2 to 30 Nm.

14. Connect the low pressure fuel inlet and return lines.
    For additional information, refer to: Quick Release Coupling - Push Connect (310-00 Fuel System - General Information, General Procedures).
    - Remove and discard the blanking caps.

www.JagDocs.com
15. Install a new right-hand high pressure fuel supply line.
   - Remove and discard the blanking caps.
   - Tighten the high-pressure fuel supply line union to 15 Nm.

16. Tighten the high-pressure fuel supply line union to 15 Nm.

17. Tighten the high-pressure fuel supply line union to 30 Nm.

18. Tighten the high-pressure fuel supply line union to 30 Nm.

19. Tighten the clamp to 10 Nm.
20. NOTE: The left-hand high-pressure fuel supply line is tightened after the high pressure fuel system has been bled.

Install the left-hand high-pressure fuel supply line but do not tighten the unions at this stage.

- Remove and discard the blanking caps.

21. Install the fuel injection pump belt rear cover.

- Tighten to 7 Nm.

22. Raise the vehicle.

23. Install the turbocharger heat shield.

- Tighten to 10 Nm.

24. Tighten to 6 Nm.

25. Attach the EGR coolant outlet tube.

- Tighten to 10 Nm.
26. Install the left-hand catalytic converter. For additional information, refer to: Catalytic Converter - 2.7L V6 - TdV6 (309-00 Exhaust System, Removal and Installation).

27. Attach the EGR coolant outlet tube.
   - Tighten to 10 Nm.

28. Attach the EGR coolant outlet tube.

29. Install the fuel injection pump pulley.

30. Install the retaining nut.
   - Using the special tool, retain the fuel injection pump pulley.
   - Tighten to 50 Nm.
31. Install the camshaft rear pulley.

32. Install the camshaft rear pulley retaining bolt.
   - Using the special tool, retain the camshaft rear pulley.
   - Tighten the camshaft rear pulley retaining bolt in two stages:
     1. Tighten to 80 Nm.
     2. Tighten a further 90°
   - Remove the special tool.

33. **NOTE:** The fuel injection pump rotates in an anti-clockwise direction when view from the rear of the engine.
    
    Note the direction of rotation of the fuel injection pump belt.

34. **CAUTION:** Do not install the new fuel injection pump belt to the pulleys with the fuel injection pump belt tensioner installed. Failure to follow this instruction may result in damage to the fuel injection pump drive belt.
   - **NOTE:** Make sure the new fuel injection pump belt is correctly seated on to the fuel injection pump drive pulleys.
    
    Install a new fuel injection pump belt.

35. **CAUTION:** Make sure the fuel injection pump belt tensioner tang is correctly located to the fuel injection pump cover backplate. Failure to follow this instruction may result in damage to the components.
    
    Install the new fuel injection pump belt tensioner.
    - Locate the tang on the new fuel injection pump belt tensioner into the fuel injection pump cover backplate.
36. **NOTE:** Do not remove the fuel injection pump belt tensioner locking pin before installing the new tensioner.

   Install the new fuel injection pump belt tensioner retaining bolt.
   - Tighten to 25 Nm.

37. Remove and discard the fuel injection pump belt tensioner locking pin.

38. Install the fuel injection pump belt cover.

39. Install the engine compartment access panel retaining strip.
40. Install the engine harness retaining bolts.

41. Install the engine compartment access panel.

Left-hand drive vehicles

42. Install the wiper mounting arm and pivot shaft.
   For additional information, refer to: Wiper Mounting Arm and Pivot Shaft (501-16 Wipers and Washers, Removal and Installation).

Right-hand drive vehicles

43. Install the engine compartment panel.

44. Install the cabin air filter housing.
45. Install the cabin air filter housing retaining nut.

46. Install the engine compartment support.
   • Tighten to 25 Nm.

47. Install the cabin air filter.
   For additional information, refer to: Cabin Air Filter (412-01 Air Distribution and Filtering, Removal and Installation).

All vehicles

48. Connect the battery.
   For additional information, refer to: Battery Connect (414-01 Battery, Mounting and Cables, General Procedures).

49. Bleed the high-pressure fuel system.
   For additional information, refer to: High-Pressure Fuel System Bleeding (310-00 Fuel System - General Information, General Procedures).

50. Install the engine cover.

51. Install the oil filler cap.
Fuel Charging and Controls - 2.7L V6 - TdV6 - Fuel Injector
Removal and Installation

Special Tool(s)
- Fuel Injector Remover
  303-1127

General Equipment
- Pneumatic vacuum gun

Removal

1. **WARNINGS:**

   - Wait at least 30 seconds after the engine stops before commencing any repair to the high-pressure fuel injection system. Failure to follow this instruction may result in personal injury.
   
   - Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable mixtures are always present and may ignite. Failure to follow these instructions may result in personal injury.
   
   - This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.
   
   - Do not carry out any repairs to the fuel system with the engine running. The fuel pressure within the high-pressure fuel system can be as high as 1650 bar. Failure to follow this instruction may result in personal injury.

2. **CAUTIONS:**

   - Do not disconnect the fuel injector electrical connectors with the engine running. Failure to follow this instruction may result in serious damage to the engine.
   
   - Make sure the workshop area in which the vehicle is being worked on is as clean and as dust free as possible. Foreign matter from work on clutches, brakes or from machining or welding operations can contaminate the fuel system and may result in later malfunction.
   
   - Always carry out the cleaning process before carrying out any repairs to the fuel injection system components. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.
   
   - Diesel fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines.
   
   - Do not disassemble the fuel injectors or clean the nozzles, even with an ultrasonic cleaner. Always install new fuel injectors when required.

   Disconnect the battery ground cable.

   For additional information, refer to: [Battery Disconnect and Connect](414-01 Battery, Mounting and Cables, General Procedures).

2. Remove the exhaust gas recirculation (EGR) valve outlet tube.

   For additional information, refer to: [Exhaust Gas Recirculation (EGR) Valve Outlet Tube](303-08B Engine Emission Control - 2.7L V6 - TdV6, Removal and Installation).

3. Remove the injector sound proofing.

4. **CAUTION:** Protect the fuel injector electrical connectors with lint-free material to prevent contamination from the cleaning fluid.

   Clean the fuel injector, high-pressure fuel supply line and surrounding areas.

   For additional information, refer to: [Fuel Injection Component Cleaning](303-04C Fuel Charging and Controls - 2.7L V6 - TdV6, General Procedures).
5. NOTE: Right-hand shown, left-hand similar.
Disconnect the fuel injector electrical connectors.

6. NOTE: Right-hand shown, left-hand similar.
Detach the fuel injection wiring harness.

7. NOTE: Right-hand shown, left-hand similar.
Detach the fuel injection wiring harness.

8. Clean around the fuel injector, high-pressure fuel supply line and surrounding areas.
   For additional information, refer to: Fuel Injection Component Cleaning
   (303-04C Fuel Charging and Controls - 2.7L V6 - TdV6, General Procedures).

9. CAUTIONS:

   Make sure that the high-pressure fuel supply line remains in contact with both the fuel injector and the fuel injection supply manifold until both unions have been detached and cleaned. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

   Make sure that the fuel injector adaptor union does not move when loosening the high-pressure fuel supply lines. Failure to follow this instruction may result in damage to the fuel injector or the fuel injector adaptor union.

   • NOTE: Right-hand shown, left-hand similar.
   Loosen the high-pressure fuel supply line from the fuel injector and fuel injection supply manifold.

10. CAUTION: Make sure that the high-pressure fuel supply line remains in contact with both the fuel injector and the fuel injection supply manifold until both unions have been detached and cleaned. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

    Using the pneumatic vacuum gun, vacuum foreign material from the high-pressure fuel supply line, the fuel injector and the fuel injection supply manifold.
    For additional information, refer to: Fuel Injection Component Cleaning
    (303-04C Fuel Charging and Controls - 2.7L V6 - TdV6, General Procedures).
11. **NOTE:** Right-hand shown, left-hand similar.
   Remove and discard the high-pressure fuel supply line.
   - Install suitable blanking caps to the open threaded ports on the fuel injector and the fuel injection supply manifold.

12. Using the pneumatic vacuum gun, vacuum foreign material from the fuel injector and the fuel injection supply manifold.
    For additional information, refer to: [Fuel Injection Component Cleaning (303-04C Fuel Charging and Controls - 2.7L V6 - TdV6, General Procedures)].

13. **NOTE:** Right-hand shown, left-hand similar.
    Disconnect the fuel return line from the fuel injector.
    - Remove and discard the fuel return line retaining clip from the fuel injector.
    - Disconnect the fuel return line from the fuel injector.

14. **NOTE:** Right-hand shown, left-hand similar.
    Remove the fuel injector retaining bolts.

15. **NOTE:** Right-hand shown, left-hand similar.
    Remove the fuel injector retaining clamp spacer.
16. **NOTE:** Right-hand shown, left-hand similar.
Install the special tool studs.

17. **CAUTION:** Make sure the fuel injector remover legs are correctly engaged to the fuel injector. Failure to follow this instruction may result in damage to the component.

- **NOTE:** Right-hand shown, left-hand similar.
Install the special tool puller legs to the studs.

18. **NOTE:** Right-hand shown, left-hand similar.
Install the special tool locking plate to the puller legs.

19. **CAUTION:** Make sure the special tool puller bolts are rotated evenly. Failure to follow this instruction may result in damage to the special tool or fuel injector.

- **NOTE:** Right-hand shown, left-hand similar.
Using the special tool, remove the fuel injector.

1. Rotate the bolts evenly, in a clockwise direction.
2. Remove the fuel injector.

- Remove the special tool.
- Remove and discard the fuel injector retaining clamp.
- Remove and discard the fuel injector sealing washer.

---

**Installation**

- **WARNINGS:**

  - Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable mixtures are always present and may ignite. Failure to follow these instructions may result in personal injury.

  - This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

- **CAUTIONS:**

  - Make sure the workshop area in which the vehicle is being worked on is as clean and as dust free as possible. Foreign matter from work on clutches, brakes or from machining or welding operations can contaminate the fuel system and may result in later malfunction.
Always carry out the cleaning process before carrying out any repairs to the fuel injection system components. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

Diesel fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines.

Do not disassemble the fuel injectors or clean the nozzles, even with an ultrasonic cleaner. Always install new fuel injectors when required.

1. **CAUTION:** Do not use tools to install the new fuel return line retaining clip. Failure to follow this instruction will result in damage to the retaining clip.
   - NOTE: Install a new fuel return line retaining clip.
   - NOTE: Install a new high-pressure fuel supply line.
   - NOTE: Install a new fuel injector sealing washer.
   - NOTE: Note the orientation of the fuel injector retaining clamp.
     Install a new fuel injector retaining clamp.

2. **NOTE:** Right-hand shown, left-hand similar.
   Install the fuel injector.

3. **NOTE:** Right-hand shown, left-hand similar.
   Install the fuel injector retaining clamp spacer.

4. **NOTE:** Tighten the retaining bolts evenly to prevent the fuel injector retaining clamp tilting.
   - NOTE: Right-hand shown, left-hand similar.
   Tighten to 10 Nm.
5. **CAUTION:** Make sure the fuel return line retaining clip is correctly installed to the fuel injector before installing the fuel return line.

- **NOTE:** Right-hand shown, left-hand similar.

  Connect the fuel return line to the fuel injector.
  
  - Visually inspect the fuel return line O-ring for damage.
  - Apply a light coating of petroleum jelly to the fuel line return line O-ring.
  - Connect the fuel return line to the fuel injector.

6. **CAUTION:** Do not allow the unions to hit the olive ends of the high-pressure fuel supply line as this may damage the ends of the line and allow foreign matter enter the fuel injection system.

   Position the high-pressure fuel supply line as near to the final installation position as possible and then remove and discard the blanking plugs from the high-pressure fuel supply line.

7. **CAUTION:** Maintain pressure on the high-pressure fuel supply line to keep the olives in contact with the fuel injectors and the fuel injection supply manifold cones while installing the unions.

   - **NOTE:** Install the high-pressure fuel supply lines to the fuel injection supply manifold end first followed by the fuel injector end.
   - **NOTE:** Right-hand shown, left-hand similar.

   Install the new high-pressure fuel supply line.

   - Tighten the high-pressure fuel supply line in the sequence shown in four stages:
     1. Stage 1: Tighten the high-pressure fuel supply line union 1 to 15 Nm.
     2. Stage 2: Tighten the high-pressure fuel supply line union 2 to 15 Nm.
     3. Stage 3: Tighten the high-pressure fuel supply line union 1 to 30 Nm.
     4. Stage 4: Tighten the high-pressure fuel supply line union 2 to 30 Nm.

8. **NOTE:** Right-hand shown, left-hand similar.

   Attach the fuel injection wiring harness.

9. **NOTE:** Right-hand shown, left-hand similar.

   Attach the fuel injection wiring harness.
10. NOTE: Right-hand shown, left-hand similar.
   Connect the fuel injector electrical connectors.

11. Install the injector sound proofing.

12. Install the exhaust gas recirculation (EGR) valve outlet tube.
   For additional information, refer to: Exhaust Gas Recirculation (EGR) Valve Outlet Tube (303-08B Engine Emission Control - 2.7L V6 - TdV6, Removal and Installation).

13. Connect the battery ground cable.
   For additional information, refer to: Battery Connect (414-01 Battery, Mounting and Cables, General Procedures).

14. **WARNING:** Do not carry out any repairs to the fuel system with the engine running. The fuel pressure within the high-pressure system can be as high as 1650 bar. Failure to follow this instruction may result in personal injury.
   
   • NOTE: The fuel return line must be renewed if any leaks are found from the fuel return line O-rings.

   Start the engine and check visually for fuel leaks.
**Fuel Charging and Controls - 2.7L V6 - TdV6 - Intake Air Shutoff Throttle**

**Removal**

1. Remove the filler cap.

2. Remove the engine cover.

3. Detach the coolant hose.

4. Remove the retaining bolt.
5. Disconnect the electrical connector.

6. Detach the intake air shutoff throttle elbow.
   - Release the retaining clip.

7. Disconnect the electrical connector.

8. Remove both exhaust gas recirculation (EGR) valve outlet tubes. For additional information, refer to: Exhaust Gas Recirculation (EGR) Valve Outlet Tube (303-08B Engine Emission Control - 2.7L V6 - TdV6, Removal and Installation).

9. Detach the vacuum hose.
10. Remove the retaining bolt.

11. Disconnect the electrical connector.

12. Detach the fuel return line valve from the intake air shutoff throttle.

13. **CAUTION:** Make sure the fuel return line valve retaining clip is not damaged. Failure to follow this instruction may result in damage to the vehicle.

   Reposition the intake air shutoff throttle.

14. **CAUTION:** Make sure the fuel return line valve retaining clip is not damaged. Failure to follow this instruction may result in damage to the vehicle.

   Remove the intake air shutoff throttle.
15. Remove and discard the intake air shutoff throttle seals.

**Installation**

1. To install, reverse the removal procedure.
   - Tighten to 10 Nm.

2. Tighten to 10 Nm.
**Removal**

- **NOTE:** Removal steps in this procedure may contain installation details.

1. Remove the oil filler cap.

2. Remove the engine cover.

3. Remove the cowl vent screen.  
   For additional information, refer to: [Cowl Panel Grille](#) (501-02 Front End Body Panels, Removal and Installation).

4. Remove the engine compartment support.  
   - Remove the 4 bolts.  
   - Release the 3 scrivets.

5. Remove the engine compartment access panel.  
   - Remove the 2 scrivets.

6. Remove the wiring harness cover.  
   - Release the 7 clips.
7. Remove the wiring harness carrier.
   - Remove the 4 bolts.

8. Remove the RH injector sound proofing.
   - Release the 2 clips.

9. Check the port deactivation hoses are a secure fit onto the stub pipe and for signs of being trapped or chaffing.
   - If the valve does not hold vacuum continue with the replacement of the diaphragm.
   - If the valve holds vacuum check the valve on the other side of the engine.
   - If one side is found not to hold vacuum then both diaphragms are to be changed.

10. Disconnect the port deactivation valve vacuum hoses.
11. NOTE: Check the vacuum gauge and any hoses to be used for leaks prior to using on the vehicle.

• NOTE: Make sure the vacuum gauge hose is a secure fit to the port deactivation diaphragm caps.

Using a vacuum gauge, check the port deactivation valve diaphragms.

12. NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

Remove the engine bay brace.

13. Release the port deactivation valve connecting rod.
14. NOTE: Cut the retaining clips off the old port deactivation diaphragm caps to aid removal.

• NOTE: Make sure the valve cover is not damaged during removal of the port deactivation diaphragm cap.

   Remove the port deactivation valve cap.
   • Release the 6 clips.
   • Check the diaphragm for splits or damage.

15. Remove the port deactivation valve spring.

16. Remove the port deactivation valve connecting rod and diaphragm.

Installation
1. **NOTE:** Apply a small amount water to the diaphragm to aid installation.

   • **NOTE:** Make sure the diaphragm is fully seated on the connecting rod.

   Install the new port deactivation diaphragm to the new connecting rod.

2. **CAUTIONS:**

   - Make sure that the mating faces are clean and free of foreign material.

   - Make sure the port deactivation rod is correctly aligned to the port deactivation valve arm.

   • **NOTE:** Make sure the new port deactivation diaphragm and rod are installed in the correct orientation to the port deactivation linkage.

   Install the port deactivation valve connecting rod and diaphragm.

3. Install the port deactivation valve spring.
4. CAUTIONS:

⚠️ Using a mirror check all clips are fully latched.

⚠️ Make sure the port deactivation rod is not rotated once the cap has been installed, if rotation occurs the diaphragm will be damaged.

• NOTE: An audible click is heard when the clips are fully latched.

Install the port deactivation valve cap.

  • Make sure the cap is correctly aligned within the timing marks.
  • Secure the clips in the sequence shown.

5. Attach the port deactivation valve connecting rod.

6. Repeat the above procedure on the opposite side.
7. NOTE: Check the vacuum gauge and any hoses to be used for leaks prior to using on the vehicle.

Check the port deactivation valve diaphragms using a vacuum gauge.

8. NOTE: When the LH hose is re-connected to the valve the right angle bend must be turned downwards, make sure the hose lies correctly in the gap between the engine cover support and the valve cover.

Connect the port deactivation valve vacuum hoses.

9. Position the port deactivation hose as shown in illustration.
10. Install the RH injector sound proofing.
   - Secure with the clips.

11. Install the wiring harness cover.
   - Secure in the clips.

12. Install the wiring harness carrier.
   - Install the bolts. TORQUE: 10 Nm

13. Install the engine compartment access panel.
   - Secure with the scrivets.

14. Install the engine compartment support.
   - Install the scrivets.
   - Tighten the bolts to 25 Nm.

15. Install the cowl vent screen.
    For additional information, refer to: Cowl Panel Grille (501-02 Front End Body Panels, Removal and Installation).

16. **CAUTION:** Correct installation of the oil filler cap can be obtained by tightening the cap until an audible click is heard.
    Install the engine cover.

Variable Vane Turbocharger

The engine is fitted with twin variable vane Turbochargers, electronically controlled, one to each bank. The turbochargers are fixed to the exhaust manifold by a three hole flange. The turbocharger consists of two elements, a turbine and a compressor both installed on a single shaft.

The turbocharger bearings are supplied with oil from the engine.

The turbine uses the flow of the exhaust gas to drive the compressor. The compressor draws air through the air cleaner and forces it into the intake manifold.

Principles of Operation - Variable vane turbocharger

The turbocharger is designed to improve engine induction and engine performance. The list below details the concerns relating to
Turbocharger performance.

- High engine speed produces excessive turbine speed and therefore creates excessive turbocharger boost pressure.
- Low engine speed does not produce sufficient turbine speed and therefore not enough turbocharger boost pressure is achieved.

The turbocharger does not have a wastegate control valve. Instead, it has variable turbocharger vanes which are located in the turbocharger turbine housing and these direct the air flow into the turbocharger turbine. The turbocharger vanes act as the control for the turbocharger boost pressure.

The turbocharger produces its full turbocharger boost pressure over the entire engine speed range, not just at high engine speed. This is achieved through the adjustment of the vanes and the resulting change in the flow of the exhaust gas.

The speed of the exhaust gas flow within the turbocharger is increased independent of engine speed by varying the intake cross section in front of the turbocharger turbine. This is achieved by adjusting the angle of the vanes controlling the air flow into the turbocharger turbine and this then drives the turbocharger turbine faster. The higher turbocharger speed produces a high turbocharger boost pressure at all engine speeds.

The engine control module (ECM) controls the turbocharger vanes by means of an electronic vane adjustment solenoid attached to the turbocharger.

Regulation at Low Engine Speed

At low engine speeds the ECM operates the vane adjustment solenoid. The vane adjustment solenoid moves the adjusting ring so that the vanes are set at a shallow angle. The shallow intake cross section this creates for the stream of exhaust gas allows the turbocharger boost pressure to build up rapidly and easily at low engine speeds.

Regulation at Moderate Engine Speed

As the engine speed increases and the quantity of exhaust gas increases, the vane adjustment solenoid moves the adjusting ring so that the vanes are set at a steeper angle. The steeper angle opens the intake cross section effectively reducing the gas flow, and turbine speed, while maintaining constant turbocharger boost pressure.

Regulation at Maximum Engine Speed

As the engine speed increases the intake cross section in front of the turbocharger turbine is continuously enlarged. The turbine speed and hence the quantity of the air supplied to the engine, is adjusted to suit the engine speed. This means that the turbocharger boost pressure remains optimized over all engine speeds.

The maximum position of the turbocharger vanes (maximum opening cross section) is also an emergency position, in the event of an electrical concern. This lowers the chance of engine damage due to excessive boost in the event of a turbocharger control concern.

Fuel Charging and Controls - Turbocharger - 2.7L V6 - TdV6 - Turbocharger
Diagnosis and Testing

Principle of operation

The turbochargers used on the 2.7L diesel engine are variable geometry units, which means that the amount of boost generated can be varied according to the engine load, not just the engine speed.

The vane angles are varied by solenoids mounted on the turbochargers.

The solenoid operation is governed by the engine control module in response to engine load and conditions, ensuring the correct boost pressure for the prevailing conditions.

Inspection and Verification

- **WARNINGS:**
  - The following tests may involve working in close proximity to hot components. Make sure adequate protection is used. Failure to follow this instruction may result in personal injury.
  - The turbochargers can continue to rotate after the engine has stopped. Do not attempt to check the turbochargers until one minute has elapsed since the engine was switched off. Failure to follow this instruction may result in personal injury.
  - CAUTION: When probing connectors to take measurements in the course of the pinpoint tests, use the adaptor kit, part number 3548-1358-00. Failure to follow this instruction may result in damage to the vehicle.
  - NOTE: When performing voltage or resistance tests, always use a digital multimeter (DMM) accurate to 3 decimal places, and with an up-to-date calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.
  - NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.
  - NOTE: If diagnostic trouble codes (DTCs) are recorded and the symptom is not present when performing the pinpoint tests, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.
  - NOTE: This section contains references to Parameter Identifiers (PIDs). Where the Jaguar approved diagnostic system is not available, a scantool may be used to access these PIDs, all of which give information, and some of which can be used to both read information and to activate components. The format of the information may vary, depending on the tool used.

1. 1. Verify the customer concern.
2. 2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual inspection

- Restrictions/Leakage in the air intake. REFER to: Intake Air Distribution and Filtering (303-12C Intake Air Distribution and Filtering - 2.7L V6 - TdV6, Diagnosis and Testing).
- Loose hoses and/or clips
- Electrical connections and harnesses to the solenoids
- Solenoid(s) failure
- General engine condition.

REFER to: Engine - 2.7L V6 - TdV6 (303-00 Engine System - General Information, Diagnosis and Testing).

### Pinpoint Tests

**PINPOINT TEST A: CHECK THE TURBOCHARGER MECHANICAL CONDITION**

* CAUTIONS:

- Do not insert any tools into the turbocharger body. Failure to follow this instruction may result in damage to the vehicle.
- When probing connectors to take measurements in the course of the pinpoint tests, use the adaptor kit, part number 3548-1358-00. Failure to follow this instruction may result in damage to the vehicle.
- NOTE: A small amount of oil inside the turbocharger body, visible when the hoses are disconnected, is normal.
- NOTE: A small amount of play in the turbine shaft is normal. If in any doubt, compare with a known good unit.
- NOTE: When performing electrical voltage or resistance tests, always use a digital multimeter (DMM) accurate to 3 decimal places, and with an up-to-date calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.
- NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

**TEST CONDITIONS**

**A1: CHECK FOR EXCESSIVE PLAY IN THE TURBOCHARGER SHAFT**

1. Disconnect the intake and outlet hoses from the turbocharger. REFER to: Turbocharger LH (303-04D Fuel Charging and Controls - Turbocharger - 2.7L V6 - TdV6, Removal and Installation) / Turbocharger RH (303-04D Fuel Charging and Controls - Turbocharger - 2.7L V6 - TdV6, Removal and Installation).

2. Check that the turbocharger rotates freely, and without noise.

3. Grip the ends of the turbine shaft at either side of the turbocharger and assess the play.

<table>
<thead>
<tr>
<th>Is the play in the shaft excessive? (Compare the play to a known good unit in the event of uncertainty).</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes INSTALL a new turbocharger. REFER to: Turbocharger LH (303-04D Fuel Charging and Controls - Turbocharger - 2.7L V6 - TdV6, Removal and Installation) / Turbocharger RH (303-04D Fuel Charging and Controls - Turbocharger - 2.7L V6 - TdV6, Removal and Installation). CLEAR any DTCs, test the vehicle for normal operation.</td>
</tr>
<tr>
<td>No CHECK for other sources of noise. RECHECK the turbocharger system for the cause of the lack of boost.</td>
</tr>
</tbody>
</table>

### Inspection and Verification

This pinpoint test is intended to diagnose the following:

- Short circuit to GROUND in the variable geometry turbo actuator A (VGTA1) circuit.
- Short circuit to POWER in the VGTA1 circuit.
- Open circuit in the VGTA1 circuit.
- VGTA1 fault
- ECM fault

#### VGTA1 connector

![Diagram of VGTA1 connector](image)

| **C2: CHECK THE POWER SUPPLY TO THE VGTA2** | |
| 1  Measure the voltage between: Variable geometry turbo actuator 2 - power - Pin 01 | Negative post |
| Is the voltage between 9 volts - 15 volts? | |
| Yes | **GO to C3.** |
| No | No supply to VGTA2 circuit. Check and repair the circuit as necessary. |

| **C3: CHECK THE VGTA2 SIGNAL CIRCUIT FOR SHORT CIRCUIT TO GROUND** | |
| 1  Measure the resistance between: Variable geometry turbo actuator 2 - signal - Pin 04 | Negative post |
Is the resistance greater than 100 Kohms?
Yes
GO to C4.

No
GO to C6.

### C4: CHECK THE VGTA2 SIGNAL CIRCUIT FOR SHORT CIRCUIT TO POWER
1. Measure the resistance between:
   - Variable geometry turbo actuator 2 - signal - Pin 04
   - Positive post

Is the resistance greater than 100 Kohms?
Yes
GO to C5.

No
GO to C7.

### C5: CHECK THE VGTA2 SIGNAL CIRCUIT FOR OPEN CIRCUIT
1. Key off.
2. ECM connector disconnected.
3. Measure the resistance between:
   - Variable geometry turbo actuator 2 - signal - Pin 04
   - Variable geometry turbo actuator 2 - signal - Pin B-H4

Is the resistance less than 10 ohms?
Yes
An intermittent fault may be present in the wiring harness. Visually check for chaffed wires or other physical damage to the harness. If no fault is found in the circuit, suspect the following component(s):
- VGTA2 connector
- ECM

No
REPAIR the open circuit. For additional information, refer to the wiring diagrams.

### C6: CHECK WHETHER THE SHORT CIRCUIT TO GROUND IS IN THE VGTA2 HARNESS OR ECU
1. Key off.
2. ECM connector disconnected.
3. Key on, engine off.
4. Measure the resistance between:
   - Variable geometry turbo actuator 2 - signal - Pin 04
   - Negative post

Is the resistance greater than 100 Kohms?
Yes
Harness is OK. Suspect:
- ECM

No
REPAIR the short circuit. For additional information, refer to the wiring diagrams.

### C7: CHECK WHETHER THE SHORT CIRCUIT TO POWER IS IN THE VGTA2 HARNESS OR ECU
1. Key off.
2. ECM connector disconnected.
3. Key on, engine off.
4. Measure the resistance between:
   - Variable geometry turbo actuator 2 - signal - Pin 04
   - Positive post

Is the resistance greater than 100 Kohms?
Yes
Harness is OK. Suspect:
- ECM

No
REPAIR the short circuit. For additional information, refer to the wiring diagrams.
Fuel Charging and Controls - Turbocharger - 2.7L V6 - TdV6 - Turbocharger LH
Removal and Installation

Removal

1. Remove the oil filler cap.

2. Remove the engine cover.

3. Remove the fuel injector soundproofing.
4. Remove the cowl panel grille.
   For additional information, refer to: Cowl Panel Grille (501-02 Front End Body Panels, Removal and Installation).
5. Remove the air cleaner.
   For additional information, refer to: Air Cleaner (303-12C Intake Air Distribution and Filtering - 2.7L V6 - TdV6, Removal and Installation).
6. Remove the power steering reservoir.
   For additional information, refer to: Power Steering Fluid Reservoir (211-02 Power Steering, Removal and Installation).
7. Remove the air deflector.
   For additional information, refer to: Air Deflector (501-02 Front End Body Panels, Removal and Installation).
8. Drain the cooling system.
   For additional information, refer to: Cooling System Draining, Filling and Bleeding (303-03C Engine Cooling - 2.7L V6 - TdV6, General Procedures).
9. Remove the left-hand engine compartment cover.
10. Detach the fuel filter from the mounting bracket.
   1. Press the retaining tang.
   2. Detach the fuel filter from the mounting bracket.

11. Remove the fuel filter mounting bracket.

12. Disconnect the exhaust gas recirculation (EGR) coolant inlet hose.

13. Detach the EGR cooler inlet tube.
   - Disconnect the inlet hose.
   - Detach the EGR cooler inlet tube retaining clip.

14. Detach the EGR cooler inlet tube from the EGR mounting bracket.
15. Remove the left-hand catalytic converter. For additional information, refer to: Catalytic Converter - 2.7L V6 - TdV6 (309-00 Exhaust System, Removal and Installation).

16. Remove the EGR coolant inlet tube.
   1. Remove the retaining nut.
   2. Disconnect the coolant hose.
   • Remove the EGR coolant inlet tube.

17. Remove the turbocharger heatshield.

18. Remove the turbocharger support bracket.

19. Disconnect the turbocharger outlet hose from the turbocharger.
20. Disconnect the oil return tube from the turbocharger.
   - Remove and discard the gasket.

21. Remove the oil return tube.
   1. Remove and discard the O-ring seal.

22. Detach the air cleaner lower outlet tube.

23. Disconnect the turbocharger solenoid electrical connector.

24. Lower the vehicle.
25. Disconnect the turbocharger oil supply tube.
   - Remove and discard the sealing washers.
26. Raise the vehicle.
27. Remove the turbocharger.
   - Discard the turbocharger retaining nuts.
   - Remove and discard the turbocharger to exhaust manifold retaining studs.

**Installation**

1. Install the turbocharger.
   - Install new turbocharger to exhaust manifold retaining studs.
   - Install new turbocharger retaining nuts.
   - Tighten to 23 Nm.

2. Lower the vehicle.
3. Connect the turbocharger oil supply tube.
   - Install new sealing washers.
   - Tighten to 30 Nm.

4. Raise the vehicle.
5. Connect the turbocharger solenoid electrical connector.
6. Attach the air cleaner lower outlet tube.

7. Install the oil return tube.
   - Install a new O-ring seal.
   - Tighten to 10 Nm.

8. Connect the oil return tube to the turbocharger.
   - Install a new gasket.
   - Tighten to 10 Nm.

9. Connect the turbocharger outlet hose to the turbocharger.

10. Install the turbocharger support bracket.
    - Tighten to 23 Nm.
11. Install the turbocharger heatshield.
   - Tighten to 6 Nm.

12. Tighten to 10 Nm.

13. Install the EGR coolant inlet tube.
   1. Connect the coolant hose.
   2. Install the retaining nut.
      - Tighten to 10 Nm.

14. Install the left-hand catalytic converter.
    For additional information, refer to: Catalytic Converter - 2.7L V6 - TdV6 (309-00 Exhaust System, Removal and Installation).

15. Install the air deflector.
    For additional information, refer to: Air Deflector (501-02 Front End Body Panels, Removal and Installation).

16. Attach the EGR cooler inlet tube to the EGR mounting bracket.
    - Tighten to 10 Nm.
17. Attach the EGR cooler inlet tube to the power steering tube.

18. Connect the EGR cooler inlet hose.

19. Install the fuel filter mounting bracket.
   - Tighten to 25 Nm.

20. Attach the fuel filter to the mounting bracket.

21. Install the left-hand engine compartment cover.
22. Install the power steering reservoir.
   For additional information, refer to: Power Steering Fluid Reservoir
   (211-02 Power Steering, Removal and Installation).

23. Install the air cleaner.
   For additional information, refer to: Air Cleaner (303-12C Intake Air
   Distribution and Filtering - 2.7L V6 - TdV6, Removal and Installation).

24. Install the cowl panel grille.
   For additional information, refer to: Cowl Panel Grille (501-02 Front End
   Body Panels, Removal and Installation).

25. Fill and bleed the cooling system.
   For additional information, refer to: Cooling System Draining, Filling and
   Bleeding (303-03C Engine Cooling - 2.7L V6 - TdV6, General
   Procedures).

26. Install the fuel injector soundproofing.

27. Install the engine cover.

28. Install the oil filler cap.

Removal

1. Remove the intake air shutoff throttle.
   For additional information, refer to: Intake Air Shutoff Throttle (303-04C Fuel Charging and Controls - 2.7L V6 - TdV6, Removal and Installation).

2. Remove the fuel injector soundproofing.

3. Remove the generator.
   For additional information, refer to: Generator - 2.7L V6 - TdV6 (414-02 Generator and Regulator, Removal and Installation).

4. Remove the starter motor.
   For additional information, refer to: Starter Motor - 2.7L V6 - TdV6 (303-06 Starting System, Removal and Installation).

5. Remove the cowl panel grille.
   For additional information, refer to: Cowl Panel Grille (501-02 Front End Body Panels, Removal and Installation).

6. Detach the right-hand air cleaner outlet tube from the timing cover.

7. Remove the right-hand catalytic converter.
   For additional information, refer to: Catalytic Converter - 2.7L V6 - TdV6 (309-00 Exhaust System, Removal and Installation).

8. Detach the turbocharger outlet tube connecting hose.
9. Remove the turbocharger outlet tube.

10. Remove the air cleaner outlet tube.
    1. Detach the air cleaner outlet tube to turbocharger retaining clip.
    2. Detach the air cleaner outlet tube to breather hose retaining clip.
    - Remove the air cleaner outlet tube.

11. Remove and discard the catalytic converter retaining stud.

12. Remove the turbocharger heatshield.

13. Remove the turbocharger support bracket.
14. Disconnect the oil return tube from the turbocharger.
   - Remove and discard the gasket.

15. Remove the oil return tube retaining plate.

16. Remove the oil return tube.
   - Remove and discard the O-ring seal.

17. Lower the vehicle.
18. Fit the front engine lifting brackets

19. Fit the engine support beam.
20. Detach the right-hand engine mounting.

21. Raise the engine.
22. Remove the right-hand engine mounting retaining nut.

23. Remove the right-hand engine mounting bracket.

24. Remove the right-hand engine mounting.
25. Disconnect the turbocharger solenoid electrical connector.

26. Lower the vehicle.

27. Disconnect the turbocharger oil supply tube.
   - Remove and discard the sealing washers.

28. Raise the vehicle.

29. Remove the turbocharger.
   - Discard the turbocharger retaining nuts.
   - Remove and discard the turbocharger to exhaust manifold retaining studs.

**Installation**

1. Install the turbocharger.
   - Install new turbocharger to exhaust manifold retaining studs.
   - Install new turbocharger retaining nuts.
   - Tighten to 23 Nm.

2. Lower the vehicle.
3. Connect the turbocharger oil supply tube.
   - Install new sealing washers.
   - Tighten to 30 Nm.

4. Raise the vehicle.
5. Connect the turbocharger solenoid electrical connector.

6. Install the right-hand engine mounting.

7. Install the right-hand engine mounting bracket.
   - Tighten to 90 Nm.

8. Tighten to 63 Nm.
9. Lower the vehicle.
10. Lower the engine.
11. Tighten to 63 Nm.

12. Remove the engine support beam.

13. Remove the front engine lifting eyes.

14. Raise the vehicle.
15. Install the oil return tube.
   - Install a new O-ring seal.
16. Install the oil return tube retaining plate.  
   - Tighten to 10 Nm.

17. Connect the oil return tube to the turbocharger.  
   - Install a new gasket.

18. Install the turbocharger support bracket.  
   - Tighten to 23 Nm.

19. Install the turbocharger heatshield.  
   - Tighten to 10 Nm.

20. Install a new catalytic converter retaining stud.
21. Install the air cleaner outlet tube.
   1. Attach the air cleaner outlet tube to turbocharger retaining clip.
   2. Attach the air cleaner outlet tube to breather hose retaining clip.

22. Install the right-hand turbocharger outlet tube.

23. Attach the right-hand turbocharger outlet tube connecting hose.

24. Install the right hand catalytic converter.
    For additional information, refer to: Catalytic Converter - 2.7L V6 - TdV6 (309-00 Exhaust System, Removal and Installation).

25. Attach the right-hand air cleaner outlet tube to the timing cover.

26. Install the starter motor.
    For additional information, refer to: Starter Motor - 2.7L V6 - TdV6 (303-06 Starting System, Removal and Installation).

27. Install the generator.
    For additional information, refer to: Generator - 2.7L V6 - TdV6 (414-02 Generator and Regulator, Removal and Installation).

28. Install the cowl panel grille.
    For additional information, refer to: Cowl Panel Grille (501-02 Front End Body Panels, Removal and Installation).

29. Install the fuel injector soundproofing.

30. Install the intake air shutoff throttle.
    For additional information, refer to: Intake Air Shutoff Throttle (303-04C Fuel Charging and Controls - 2.7L V6 - TdV6, Removal and Installation).

Vehicles with supercharger

1 - Supercharger pulley
2 - Supercharger belt idler pulley
3 - Crankshaft pulley
Crankshaft Pulley
The combined crankshaft pulley and torsional vibration damper drives a single, six ribbed vee belt. The belt drives all of the engine-mounted accessories such as the generator, the power assisted steering pump, the air-conditioning compressor and the coolant water pump.

Air Conditioning Compressor Drive
This is positioned at the lowest point of the front-end accessory drive on the left hand side accessory mounting.

Power Assisted Steering Pump Drive
The power assisted steering pump pulley is located on the left-hand side, above the air conditioning compressor.

Generator Drive
The generator is fitted on the right hand accessory mounting.

Supercharger Drive
The supercharger is located between the left-hand and right-hand cylinders and retained at three mounting points.

Accessory drive belt tensioner and supercharger belt tensioner
The accessory drive belt tensioner and supercharger belt tensioner is calibrated to provide the correct amount of tension to the belt for a given drive system. Unless a spring within the tensioner assembly breaks, or some other mechanical part of the tensioner fails, there is no need to check the tensioner for correct tension.

Accessory drive belt and supercharger belt

<table>

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Acceptable drive belt cracking</td>
</tr>
<tr>
<td>2</td>
<td>Unacceptable drive belt damage</td>
</tr>
</tbody>
</table>

The accessory drive belt and the supercharger belt should be inspected at every routine service for excessive wear and damage. A drive belt which displays symptoms of cracking may be perfectly fit for further service.

Should cracking be detected, serviceability may be assessed using the following guidelines:

- Fifteen cracks per rib over a 100 mm length of drive belt is acceptable.
- Section(s) of belt missing from any rib is not acceptable and the drive belt must be renewed.

Accessory drive belt tensioner
The accessory drive belt tensioner consists of an idler pulley which is free to rotate on a bearing, located at the end of a spring-loaded pivot arm.

The pivot arm can be turned counter-clockwise (viewed from the front of the engine) for accessory drive belt removal and installation.

The accessory drive belt wear indicators are incorporated on the bottom of the accessory drive belt tensioner. When the indicators are aligned the accessory drive belt requires replacing.

Diagnosis and Testing

**Inspection and Verification**

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious signs of mechanical damage.

<table>

</tr>
</tbody>
</table>

**Component Tests**

**Accessory drive belt tensioner or supercharger belt tensioner-mechanical**

The only mechanical check that needs to be made is a check for the accessory drive belt tensioner or supercharger belt tensioner "stick, grab or bind".

1. **1.** Remove the drive belt in the area of the drive belt tensioner.
2. **2.** Using the correct tool, rotate the drive belt tensioner from its relaxed position through its full stroke and back to the relaxed position to make sure there is no "stick, grab or bind", and to make sure that there is tension on the drive belt tensioner spring.
3. **3.** If the drive belt tensioner meets the above criteria, proceed to test the drive belt tensioner dynamically. If the drive belt tensioner does not meet the above criteria install a new drive belt tensioner.

**Accessory drive belt tensioner or supercharger belt tensioner-dynamic**

The accessory drive belt tensioner or supercharger belt can be checked dynamically as follows:

1. **1.** With the engine running, observe drive belt tensioner movement, the accessory drive belt tensioner should move (respond) when the air conditioning clutch cycles (if equipped), both the accessory drive belt tensioner and supercharger belt tensioner should move (respond) when the engine is accelerated rapidly. If the drive belt tensioner movement is erratic without air conditioning clutch cycling or engine acceleration, a pulley or shaft is probably bent, or a pulley is distorted. Excessive drive belt rideout (uneven depth of grooves in the drive belt) can cause excessive drive belt tensioner movement. Check condition by installing a new accessory drive belt.

**Accessory Drive Belt-2.5L/3.0L** /
**Accessory Drive Belt-4.2L** /
**Supercharger belt** in this section.

2. **2.** With the engine off, check routing of the accessory drive belt.

**Description and Operation** in this section.

3. **3.** Inspect the drive belt tensioner wear indicator to confirm the accessory drive belt is within operating range. Install a new accessory drive belt or supercharger belt if necessary.

**Accessory Drive Belt-2.5L/3.0L** /
**Accessory Drive Belt-4.2L** /
4. Rotate the accessory drive belt tensioner and check for a binding or seized condition. Install a new accessory drive belt tensioner or supercharger belt tensioner if necessary. REFER to Accessory Drive belt tensioner 2.5L/3.0L / Accessory Drive belt tensioner 4.2L / Supercharger belt tensioner in this section.
Accessory Drive - Accessory Drive 2.7L V6 - TdV6
Diagnosis and Testing

**Principles of Operation**

The 2.7L diesel engine uses two accessory drive systems, the front end accessory drive (FEAD), and the fuel injection pump drive.

**FEAD**

The FEAD drives: the coolant pump, the generator, the power assisted steering pump, and the air conditioning compressor, driven from the crankshaft pulley via a single six-ribbed belt.

Fuel injection pump drive

The high-pressure fuel pump (HPFP) is driven from the exhaust camshaft of the left-hand cylinder bank, by a single, toothed belt.

The HPFP is **NOT** timed to the engine.

**Inspection and Verification**

1. Verify the customer concern.

<table>

**Noise definitions**

<table>
<thead>
<tr>
<th>Description of noise</th>
<th>Definition/Possible cause</th>
</tr>
</thead>
<tbody>
<tr>
<td>Squeal</td>
<td>Continuous shriek, most noticeable when the engine is accelerated (usually associated with lack of belt tension, contamination or wet slip)</td>
</tr>
<tr>
<td>Chirp</td>
<td>Twittering noise that usually stops at engine speeds above idle. Usually associated with misaligned pulleys</td>
</tr>
<tr>
<td>Whine</td>
<td>Continuous noise, changing frequency with engine speed, generally associated with rotating components (generator, idler, etc)</td>
</tr>
<tr>
<td>Rattle</td>
<td>Metallic knocking, often a loose component or tensioner fault</td>
</tr>
<tr>
<td>Rumble</td>
<td>Bearing noise</td>
</tr>
</tbody>
</table>

**Symptoms (FEAD)**

<table>
<thead>
<tr>
<th>Symptom</th>
<th>Possible cause</th>
<th>Action</th>
</tr>
</thead>
</table>
| Noise (see definitions above) | • Belt condition  
• Belt tension  
• Pulleys misaligned  
• Driven components | Check the belt condition (see visual inspection). Check the tensioner function. Go to Pinpoint Test A. Check the pulley alignment. Check the driven components for excessive resistance to rotation. Rectify as necessary. |
| Drive belt does not hold tension | • Belt condition  
• Tensioner fault | Check the belt condition (see visual inspection). Check the tensioner function. Rectify as necessary. |

**Symptoms (Fuel injection pump belt)**

<table>
<thead>
<tr>
<th>Symptom</th>
<th>Possible cause</th>
<th>Action</th>
</tr>
</thead>
</table>
| Noise (see definitions above) | • Belt condition  
• Belt fouling cover  
• Tensioner bearing failure  
• HPFP failure | Check the belt condition (see visual inspection). Check the belt cover for indications of fouling (this may indicate a pump misalignment, REFER to: Fuel Injection Pump (303-04C Fuel Charging and Controls - 2.7L V6 - TdV6, Removal and Installation).). The belt tensioner must be renewed if the belt is removed, making a check of the bearing impractical. Remove the belt, check the HPFP pulley for security. Check the HPFP for excessive resistance to rotation (excessive resistance in the pump will cause the pulley securing nut to loosen as a design feature). Check for DTCs indicating a pump malfunction, REFER to: Fuel Charging and Controls (303-04C Fuel Charging and Controls - 2.7L V6 - TdV6, Diagnosis and Testing). |
| Loss of drive (with no drive to the HPFP, the engine will not run) | • Belt broken/striped teeth  
• Drive pulleys loose | Investigate the cause of the belt breakage/damage (a belt broken at a 45 degree angle normally indicates a shear, a break straight across the belt normally indicates that the belt has been crimped). Check the HPFP for excessive resistance to rotation (excessive resistance in the pump will cause the pulley securing nut to loosen as a design feature). Check for DTCs indicating a pump malfunction, REFER to: Fuel Charging and Controls (303-04C Fuel Charging and Controls - 2.7L V6 - TdV6, Diagnosis and Testing). |

**Pinpoint tests**

**PINPOINT TEST A : ELIMINATE THE FEAD AS THE SOURCE OF NOISE**

**CAUTION:** The engine should not be run for long periods of time with the FEAD belt removed. Failure to follow this instruction may result in damage to the vehicle.

<table>
<thead>
<tr>

<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>A1: CHECK FOR THE PRESENCE OF NOISE WITH THE FEAD BELT DISCONNECTED</td>
<td>Remove the ignition key.</td>
</tr>
</tbody>
</table>
Disconnect the FEAD belt, 
REFER to: Accessory Drive Belt - 2.7L V6 - TdV6 (303-05 Accessory Drive, Removal and Installation).

Start the engine and allow to idle.

Check for the presence of the noise.

Is the noise still apparent?

Yes  
The FEAD is not the cause of the noise. Confirm the symptoms, check for alternative causes.

No  
Inspect the FEAD belt and driven components. Check the driven components for excessive resistance to rotation.

11. Remove the engine compartment access panel retaining strip.

12. Remove the engine harness retaining bolts.

13. Remove the fuel injection pump belt cover.
14. Cut off and discard the fuel injection pump belt.

15. Remove and discard the fuel injection pump belt tensioner.

Installation
All vehicles

1. CAUTIONS:

⚠️ Make sure the fuel injection pump belt tensioner is correctly located in to the fuel injection pump cover backplate. Failure to follow this instruction may result in damage to the components.

⚠️ Make sure that the fuel injection pump belt tensioner tang is correctly located to the fuel injection pump belt rear cover. Failure to follow this instruction may result in damage to the engine.

• NOTE: Do not remove the fuel injection pump belt tensioner locking pin before installing the tensioner.

Install the fuel injection pump belt tensioner retaining bolt.

- Locate the tang on the new fuel injection pump belt tensioner in to the fuel injection pump cover backplate.
- Tighten to 25 Nm.

2. NOTE: Make sure the fuel injection pump belt is correctly seated on to the fuel injection pump drive pulleys.

Install a new fuel injection pump belt.
3. Remove and discard the fuel injection pump belt tensioner locking pin.

4. Install the fuel injection pump belt cover.

5. Install the engine harness retaining bolts.

6. Install the engine compartment access panel retaining strip.

   - Detach the supercharger belt.

4. Remove the air deflector. For additional information, refer to: [Air Deflector](#) (501-02 Front End Body Panels, Removal and Installation).

5. **NOTE:** Remove and discard the oil cooler pipe O-ring seal.

Detach the oil cooler pipe from the oil filter adaptor.

   1. Remove the the oil cooler pipe retaining bolt.
   2. Detach the oil cooler pipe from the oil filter adaptor.

6. Remove the supercharger belt tensioner.

**Installation**
1. NOTE: Install a new O-ring seal to oil cooler pipe.
   To install, reverse the removal procedure.
   • Tighten to 40 Nm.

Starting System - Starting System

Description and Operation

The function of the starting system is to crank the engine fast enough to allow the engine to start. Heavy cables, connectors and switches are used in the system because of the large currents required.

The starting system consists of a pre-engaged type starter motor, battery, remote control switch (ignition switch) and relay. When the starter is operated from the ignition switch, the engagement lever moves the pinion into mesh with the engine ring gear teeth, the electrical contacts within the solenoid complete the high power circuit and the starter motor operates to turn the engine.

Vehicles equipped with automatic transmission have a transmission range sensor attached to the circuit which prevents operation of the starter motor unless NEUTRAL or PARK are selected.

The sequence of operation is as follows:

- Ignition switch in the start position III.
- Starter relay activated.
- Voltage provided to the starter motor solenoid.
- Starter solenoid engages the drive pinion to the flywheel or flexplate.
- Starter solenoid switches the battery current to the starter motor.
- System remains engaged until the ignition switch is returned to the run position.
1. Verify the customer concern by operating the system.
2. Visually inspect for obvious signs of mechanical and electrical damage.

### Visual Inspection Chart

</tbody>
</table>
Is the voltage greater than 10 volts?
Yes
REPAIR starter switch live circuit from the starter relay to the starter. TEST the system for normal operation.
No
CHECK fuse 27 (30A) in the front PDB. If fuse OK REPAIR starter relay permanent live supply circuit. TEST the system for normal operation.

A7: CHECK FOR IGNITION VOLTAGE TO STARTER RELAY
1. Remove the starter relay. Measure the voltage between connector 86 and ground.
   Is the voltage greater than 10 volts?
   Yes
   GO to A8.
   No
   GO to A10.

A8: CHECK GROUND SUPPLY TO STARTER RELAY
1. Measure the resistance between starter relay connector 85 and ground.
   Is the resistance less than 5 ohms?
   Yes
   INSTALL a new starter relay.
   No
   GO to A9.

A9: CHECK GROUND SUPPLY CIRCUIT
1. Measure the resistance between starter relay connector 85 and ECM electrical connector PI1 pin 41 (GO).
   Is the resistance less than 5 ohms?
   Yes
   DIAGNOSE the anti-theft system. For additional information, refer to Section 419-01A Anti-Theft - Active
   Section 419-01B Anti-Theft - Passive
   No
   REPAIR the ground circuit between starter relay and ECM.

A10: CHECK FUSE 1 IN THE PRIMARY JUNCTION BOX
1. Check the fuse.
   Is the fuse OK?
   Yes
   For vehicles with manual transmission REPAIR the circuit between primary junction box and starter relay. For vehicles with automatic transmission GO to A12.
   No
   GO to A11.

A11: CHECK FOR SHORT TO GROUND
1. Measure the resistance between starter relay connector 86 and ground.
   Is the resistance greater than 10,000 ohms?
   Yes
   INSTALL a new fuse.
   No
   REPAIR short to ground between primary junction box and starter relay. TEST system for normal operation.

A12: CHECK FOR CONTINUITY BETWEEN PRIMARY JUNCTION FUSE BOX AND ECM
1. Disconnect primary junction fuse box electrical connector FH53 and power train control module electrical connector PI1.
2. Check the resistance between FH53 pin 3 (Y) and PI1 pin 6 (Y).
   Is the resistance less than 5 ohms?
   Yes
   GO to A13.
   No
   REPAIR the circuit between the primary junction fuse box and the power train control module. TEST system for normal operation.

A13: CHECK FUSE 15 IN THE PRIMARY JUNCTION Fuse BOX
1. Check the fuse.
   Is the fuse OK?
   Yes
   GO to A15.
   No
   GO to A14.

A14: CHECK FOR SHORT TO GROUND

CAUTION: Many components on the vehicle are sensitive to electrostatic discharge. Use of an anti-static strap and mat is recommended.
1. Disconnect the primary junction fuse box electrical connector CA2 and transmission control module (TCM) GB2.
2. Measure the resistance primary junction fuse box electrical connector CA2 pin 1 (GO) and ground.
   Is the resistance greater than 10,000 ohms?
   Yes
   INSTALL a new fuse.
   No
   REPAIR short to ground between primary junction fuse box and TCM. INSTALL a new fuse. TEST system for normal operation.

A15: CHECK FOR IGNITION VOLTAGE AT TCM
1. Connect the primary junction fuse box electrical connector CA2.
2. Turn the ignition switch to the RUN position.
3. Measure the voltage between TCM electrical connector GB2 pin 9 (GO) and ground.
   Is the voltage greater than 10 volts?
   Yes
   GO to A16.
   No
   REPAIR the circuit between TCM and primary junction fuse box. TEST system for normal operation.

A16: CHECK FOR CONTINUITY BETWEEN TCM ELECTRICAL CONNECTOR GB2 AND ECM ELECTRICAL CONNECTOR PI1
1. Check the resistance between GB2 pin 1O (GR) and PI1 pin 31 (GR).
   Is the resistance less than 5 ohms?
   Yes
   INSTALL a new ECM. For additional information refer to Dealer Technical Support. TEST the system for normal operation. If fault is repeated INSTALL a new TCM.
REPAIR the circuit between TCM and primary junction fuse box. TEST system for normal operation.

All vehicles

1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 Battery, Mounting and Cables.

2. Remove the air deflector. For additional information, refer to Section 501-02 Front End Body Panels.

3. Disconnect the engine ground cable.

Vehicles fitted with 4.2L engine

4. Remove the starter motor positive cable cover.

5. Detach the starter motor positive cable.

6. Remove the starter motor.
   1. Remove the starter motor retaining bolts.
   2. Remove the starter motor.
Vehicles fitted with 2.5L or 3.0L engine

7. Remove the starter motor positive cable cover.

8. Detach the starter motor positive cables.

9. Remove the starter motor.

**Installation**

Vehicles with 2.5L or 3.0L engine

1. To install, reverse the removal procedure.
   - Tighten to 25Nm
2. Tighten to 7 Nm.

3. Tighten to 13 Nm.

Vehicles with 4.2L engine

4. Tighten to 45 Nm.

5. Tighten to 10 Nm.
6. Tighten to 7 Nm.
Removal

1. Disconnect the battery. For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

2. Remove the air deflector. For additional information, refer to: Air Deflector (501-02 Front End Body Panels, Removal and Installation).

3. Make sure the alignment mark on the steering pinion seal protection cover is central to the steering gear pinion casting.

4. Remove the steering gear shaft pinch bolt.

5. Detach the steering gear.
6. Secure the steering gear.

7. Disconnect the power steering control valve actuator electrical connector.

8. Remove the starter motor retaining bracket.

9. Detach the starter motor solenoid harness.

10. Detach the starter motor cable.
11. Detach the starter motor solenoid harness.

12. Remove the starter motor.

**Installation**

1. To install, reverse the removal procedure.
   - Tighten to 48 Nm.

2. Tighten to 10 Nm.
3. Tighten to 7 Nm.

4. Tighten to 10 Nm.

5. Tighten to 23 Nm.

6. Tighten to 100 Nm.

7. Tighten to 35 Nm.
8. Make sure the alignment mark on the steering pinion seal protection cover is central to the steering gear pinion casting.

The right-hand cylinders are numbered 5,3,1 and the left-hand cylinders are numbered 6,4,2 when viewed from the rear of the engine.

The ignition system consists of an ignition coil located on each individual cylinder and each individual spark plug. The ignition timing can now be adjusted more rapidly and independently.

The crankshaft position sensor signal is the basis for ignition timing calculations. The alternating voltage signal from the crankshaft position sensor is converted by the engine control module (ECM). This digital signal is then used to position the closing time of the primary circuit of the ignition coil. The effective range for ignition timing control is increased to the fact that there are no rotating parts.

On the basis of engine speed and load inputs, the powertrain control module determines the ignition timing. This function also takes other inputs into consideration such as engine temperature, throttle position, knock control, cam position, traction control and electronic transmission control inputs.

This ignition system enables the customer to drive the vehicle home if a coil or coil wiring failure occurs. In the event of a wiring failure between the powertrain control module and the coil, the coil will fail instead of the coil fuse blowing, which will allow the remaining coils to continue to function and the engine to limp home.
1. Verify the customer concern by operating the system.
2. Visually inspect for obvious signs of mechanical or electrical damage.
3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the concern is not visually evident, refer to the Symptom Chart.

**PINPOINT TEST A : IGNITION COILS — P0351, P0352, P0353, P0354, P0355, P0356, P1367, P1368**

• **NOTE:** Unless multiple cylinder misfires are apparent, only one circuit will normally need to be tested. The DTC set will indicate which cylinder is misfiring.

**TEST CONDITIONS**

**DETAILS/RESULTS/ACTIONS**

**A1: CHECK COIL FUNCTION BY SUBSTITUTION**

1. Replace the suspected faulty coil with a good one.
2. CLEAR the DTC. TEST the system for normal operation.

Does the same DTC reoccur? The DTC will indicate if the same cylinder is misfiring.

Yes

GO to A2.

No

CLEAR the DTC. TEST the system for normal operation.

**A2: CHECK THE IGNITION COIL SUPPLY VOLTAGE CIRCUIT**

1. Disconnect the relevant right-hand bank ignition coil electrical connector(s).
2. Turn the ignition switch to the ON position.
3. Measure the voltage between:
   - Cyl 1A. PI002 pin 1, (RW) and GROUND.
   - Cyl 2A. PI003 pin 1, (RW) and GROUND.
   - Cyl 3A. PI004 pin 1, (RW) and GROUND.
4. Disconnect the relevant left-hand bank ignition coil electrical connector(s).
5. Measure the voltage between:
   - Cyl 1B. PI006 pin 1, (RW) and GROUND.
   - Cyl 2B. PI007 pin 1, (RW) and GROUND.
   - Cyl 3B. PI008 pin 1, (RW) and GROUND.

Is the voltage greater than 10.5 Volts?

Yes

GO to A3.

No

REPAIR the relevant ignition coil supply voltage circuit. For additional information, refer to wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.

**A3: CHECK THE IGNITION COIL GROUND CIRCUIT**

1. Switch the ignition to the OFF position.
2. Disconnect the relevant right-hand bank ignition coil electrical connector(s).
3. Measure the resistance between:
   - Cyl 1A. PI002 pin 3, (B) and GROUND.
   - Cyl 2A. PI003 pin 3, (B) and GROUND.
   - Cyl 3A. PI004 pin 3, (B) and GROUND.
4. Disconnect the relevant left-hand bank ignition coil electrical connector(s).
5. Measure the resistance between:
   - Cyl 1B. PI006 pin 3, (B) and GROUND.
   - Cyl 2B. PI007 pin 3, (B) and GROUND.
   - Cyl 3B. PI008 pin 3, (B) and GROUND.

Is the resistance less than 5 ohms?

Yes

GO to A4.

No

REPAIR the relevant ignition coil ground circuit. For additional information, refer to wiring diagrams. CLEAR the DTCs. TEST the system for normal operation.

**A4: CHECK THE CONTINUITY OF THE IGNITION COIL TRIGGER SUPPLY CIRCUIT**

1. Disconnect the ECM electrical connector PI001.
2. Check the continuity of the ignition coil trigger supply circuit between the relevant ignition coil electrical connector(s) and the ECM electrical connector:
   - Cyl 1A. PI002 pin 4, (GU) and PI001 pin 87, (GU)
   - Cyl 2A. PI003 pin 4, (Y) and PI001 pin 88, (Y)
   - Cyl 3A. PI004 pin 4, (YR) and PI001 pin 89, (YR)
   - Cyl 1B. PI006 pin 4, (GW) and PI001 pin 61, (GW)
Cyl 2B. PI007 pin 4, (GW) and PI001 pin 62, (GW)
Cyl 3B. PI008 pin 4, (GR) and PI001 pin 63, (GR)

Is the resistance less than 5 ohms?
Yes  **GO to A5.**
No  REPAIR the ignition coil trigger supply circuit between the relevant ignition coil electrical connector(s) and the ECM electrical connector. CLEAR the DTCs. TEST the system for normal operation.

---

**A5: CHECK THE CONTINUITY BETWEEN THE IGNITION COIL AND THE ECM**

Check the continuity of the ignition coil diagnostic signal circuit, between the ignition coil electrical connector(s) and the ECM electrical connector:

- Cyl 1A. PI002 pin 2, (GB) and PI001 pin 131, (GB)
- Cyl 2A. PI003 pin 2, (GB) and PI001 pin 131, (GB)
- Cyl 3A. PI004 pin 2, (GB) and PI001 pin 131, (GB)
- Cyl 1B. PI006 pin 2, (YB) and PI001 pin 132, (YB)
- Cyl 2B. PI007 pin 2, (YB) and PI001 pin 132, (YB)
- Cyl 3B. PI008 pin 2, (YB) and PI001 pin 132, (YB)

Is the resistance less than 5 Ohms?
Yes  INSTALL a new ECM. For additional information refer to REFER to Section 303-14B Electronic Engine Controls / 303-14C Electronic Engine Controls. Before replacing a ECM, contact Dealer technical support. CLEAR the DTCs. TEST the system for normal operation.
No  REPAIR the circuit between the ignition coil electrical connector(s) and the ECM electrical connector. CLEAR the DTCs. TEST the system for normal operation.
Engine Ignition - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27 - Engine Ignition
VIN Range: N52048->N99999
Diagnosis and Testing

Overview

There are changes to the engine management system (EMS) for 2006 my, the most obvious of which will be the change to 7-digit diagnostic trouble codes (DTCs) from the familiar 5-digit.

Refer to the DTC index in this section for guidance on how to use these codes with the Jaguar approved diagnostic system or a scan tool.

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual inspection

<table>
<thead>
<tr>
<th>Mechanical</th>
<th>Electrical</th>
</tr>
</thead>
<tbody>
<tr>
<td>Engine oil level</td>
<td>Fuses</td>
</tr>
<tr>
<td>Cooling system coolant level</td>
<td>Wiring harness</td>
</tr>
<tr>
<td>Fuel level</td>
<td>Loose or corroded electrical connectors</td>
</tr>
<tr>
<td>Fuel contamination/grade/quality</td>
<td>Ignition coils</td>

<tr>
<td>Crankshaft position (CKP) sensor</td>
<td>Sensor(s)</td>
</tr>
<tr>
<td>Engine control module (ECM)</td>
<td>Engine control module (ECM)</td>
</tr>
<tr>
<td>Transmission control module (TCM)</td>
<td></td>
</tr>
</tbody>
</table>

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the cause is not visually evident use the Jaguar approved diagnostic system or a scan tool to retrieve the fault codes before proceeding to the DTC Index.

### Engine backfires
- **Symptom**: Fuel pump, Fuel lines, Air leakage, MAF sensor, HO2 sensors, Ignition system, Sticking variable camshaft timing (VCT) hub, APP sensor
- **Possible source**: Check the fuel pressure, check the fuel lines, REFERENCE: Fuel Tank and Lines - V8 4.2L Petrol/V8 S/C 4.2L Petrol/2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Diagnosis and Testing.

### Engine surges
- **Symptom**: Fuel pump, Fuel lines, MAF sensor, Harness, TP sensors, Throttle sensor, Ignition system
- **Possible source**: Check the fuel pressure, check the fuel lines, REFERENCE: Fuel Tank and Lines - V8 4.2L Petrol/V8 S/C 4.2L Petrol/2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Diagnosis and Testing.

### Engine detonates/knocks
- **Symptom**: Knock sensor (KS) circuit malfunction, MAF sensor, Engine surges, Fuel lines, Frp sensor, BARO sensor malfunction
- **Possible source**: Check the fuel pressure, check the fuel lines, REFERENCE: Fuel Tank and Lines - V8 4.2L Petrol/V8 S/C 4.2L Petrol/2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Diagnosis and Testing.

### No throttle response
- **Symptom**: APP sensor malfunction, TP sensors, Throttle motor
- **Possible source**: For APP, TP sensor and throttle motor tests, REFER to: Electronic Engine Controls - VIN Range: N80181->R99999 (303-14A Electronic Engine Controls - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Diagnosis and Testing).

### Poor throttle response
- **Symptom**: APP sensor malfunction, TP sensors, MAF sensor, Transmission malfunction, Traction control event, Air leakage, Breather system disconnected/restricted

### DTC Index
- **NOTE**: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the DTC listed. For more information, refer to Diagnostic Strategy - VIN Range: N52048->N99999 (307-01 Automatic Transmission/Transaxle, Diagnosis and Testing).

### Pinpoint Tests

**CAUTION:** When probing connectors to take measurements in the course of the pinpoint tests, use the adaptor kit, part number 3548-1358-00.

• NOTE: When performing electrical voltage or resistance tests, always use a digital multimeter (DMM) accurate to 3 decimal places, and with an up-to-date calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.

• NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

**PINPOINT TEST A : IGNITION COIL CIRCUITS**

• NOTE: Unless multiple cylinder misfires are apparent, only one circuit will normally need to be tested. The DTC set will indicate which cylinder is misfiring.

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
</table>

For ignition coil tests, GO to Pinpoint Test A.
A1: CHECK THE IGNITION COIL SUPPLY VOLTAGE CIRCUIT

1. Disconnect the relevant ignition coil electrical connector:
   - Ignition coil connector

2. Key on, engine off.
3. Make sure the ignition relay is energized.
4. Measure the voltage between:
   - Ignition coil connector, harness side
   - Battery
   - Pin 01

   Is the voltage less than 10.5 Volts?
   - Yes
     REPAIR the relevant ignition coil supply circuit. This circuit includes fuse 15 of the front power distribution box and the ignition relay. For additional information, refer to the wiring diagrams. CLEAR the DTCs and test the system for normal operation.
   - No
     GO to A2.

A2: CHECK THE IGNITION COIL SWITCHING CIRCUITS FOR SHORT CIRCUIT TO GROUND

1. Key off.
2. Measure the resistance between:
   - Ignition coil connector, harness side
   - Battery
   - Pin 04

   Is the resistance less than 10,000 ohms?
   - Yes
     REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs and test the system for normal operation.
   - No
     GO to A3.

A3: CHECK THE IGNITION COIL SWITCHING CIRCUITS FOR SHORT CIRCUIT TO POWER

1. Measure the resistance between:
   - Ignition coil connector, harness side
   - Battery
   - Pin 04

   Is the resistance less than 10,000 ohms?
   - Yes
     REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs and test the system for normal operation.
   - No
     GO to A4.

A4: CHECK THE IGNITION COIL MONITOR CIRCUITS FOR SHORT CIRCUIT TO GROUND

1. Measure the resistance between:
   - Ignition coil connector, harness side
   - Battery
   - Pin 02

   Is the resistance less than 10,000 ohms?
   - Yes
     REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs and test the system for normal operation.
   - No
     GO to A5.

A5: CHECK THE IGNITION COIL MONITOR CIRCUITS FOR SHORT CIRCUIT TO POWER

1. Measure the resistance between:
   - Ignition coil connector, harness side
   - Battery
   - Pin 02

   Is the resistance less than 10,000 ohms?
   - Yes
     REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs and test the system for normal operation.
   - No
     GO to A6.

A6: CHECK THE IGNITION COIL GROUND CIRCUIT FOR HIGH RESISTANCE

• NOTE: Unless multiple cylinder misfires are apparent, only one circuit will normally need to be tested. The DTC set will indicate which cylinder is misfiring.

1. Measure the resistance between:
   - Cylinder 1 ignition coil connector, harness side
   - Battery
   - PI02, pin 03

   - Cylinder 2 ignition coil connector, harness side
   - Battery
   - PI06, pin 03

   - Cylinder 3 ignition coil connector, harness side
   - Battery
   - PI03, pin 03

   - Cylinder 4 ignition coil connector, harness side
   - Battery
   - PI07, pin 03

   - Cylinder 5 ignition coil connector, harness side
   - Battery
   - PI04, pin 03

   - Cylinder 6 ignition coil connector, harness side
   - Battery
   - PI08, pin 03

   Is the resistance greater than 5 ohms?
   - Yes
     REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs and test the system for normal operation.
   - No
     GO to A7.

A7: CHECK THE IGNITION COIL SWITCHING CIRCUITS FOR HIGH RESISTANCE
1. Disconnect the ECM electrical connector, PI300.
2. Measure the resistance between:
   - Cylinder 1 ignition coil connector, harness side ECM connector PI300, harness side
     PIN 04 PIN 61
   - Cylinder 2 ignition coil connector, harness side ECM connector PI300, harness side
     PIN 04 PIN 60
   - Cylinder 3 ignition coil connector, harness side ECM connector PI300, harness side
     PIN 04 PIN 59
   - Cylinder 4 ignition coil connector, harness side ECM connector PI300, harness side
     PIN 04 PIN 58
   - Cylinder 5 ignition coil connector, harness side ECM connector PI300, harness side
     PIN 04 PIN 57
   - Cylinder 6 ignition coil connector, harness side ECM connector PI300, harness side
     PIN 04 PIN 56

   Is the resistance greater than 5 ohms?
   
   Yes
   - REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs and test the system for normal operation.
   
   No
   - GO to A8.

A8: CHECK THE IGNITION COIL MONITOR CIRCUITS FOR HIGH RESISTANCE

1. Measure the resistance between:
   - Cylinder 1 ignition coil connector, harness side ECM connector PI300, harness side
     PIN 02 PIN 64
   - Cylinder 2 ignition coil connector, harness side ECM connector PI300, harness side
     PIN 02 PIN 64
   - Cylinder 3 ignition coil connector, harness side ECM connector PI300, harness side
     PIN 02 PIN 64
   - Cylinder 4 ignition coil connector, harness side ECM connector PI300, harness side
     PIN 02 PIN 64
   - Cylinder 5 ignition coil connector, harness side ECM connector PI300, harness side
     PIN 02 PIN 64
   - Cylinder 6 ignition coil connector, harness side ECM connector PI300, harness side
     PIN 02 PIN 64

   Is the resistance greater than 5 ohms?
   
   Yes
   - REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs and test the system for normal operation.
   
   No
   - INSTALL a new ignition coil to the relevant cylinder.
     CLEAR the DTC and test the system for normal operation. Refer to the warranty policy and procedures manual if an ECM is suspect.

PINPOINT TEST B : CHECK SPARK PLUG

<table>
<thead>
<tr>
<th>TEST CONDITIONS</th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>B1: CHECK SPARK PLUG</td>
<td></td>
</tr>
</tbody>
</table>

• NOTE: Some spark plug types cannot be regapped and must be replaced.

1. Remove the suspect spark plug(s).

2. Visually inspect the spark plug for cracks, damage, carbon buildup or wet fouling, check the condition of the ground electrode, the center electrode tip and the spark plug HT contact and confirm that the spark plug gap is correctly set using a wire gauge taking care not to damage the center or ground electrode tips.
   REFER to: Specifications (303-07A Engine Ignition - 2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Specifications).

Is the spark plug condition good, and the spark plug gap is correct?

Yes
   Check ignition coil and circuits. See possible sources list for misfire.

No
   Install a new spark plug(s) as required.
   CLEAR the DTC. TEST the system for normal operation.
Removal

1. Remove the ignition coil-on-plug cover.

2. Disconnect the ignition coil-on-plug electrical connector.

3. Remove the ignition coil-on-plug.

Installation

1. To install, reverse the removal procedure.
   • Tighten to 6 Nm.
**Removal**

1. Remove the intake manifold. For additional information, refer to Section 303-01A Engine / 303-01B Engine / 303-01C Engine.
2. Disconnect the ignition coil-on-plug electrical connector.
3. Remove the ignition coil-on-plug.

**Installation**

1. To install, reverse the removal procedure.
   - Tighten to 6 Nm.

The right-hand cylinders are numbered 7, 5, 3, 1 and the left-hand cylinders are numbered 8, 6, 4, 2 when viewed from the rear of the engine.

An ignition coil is located on each individual spark plug allowing the ignition timing to be adjusted independently.

The crankshaft position (CKP) sensor signal is the basis for ignition timing calculations. The alternating voltage signal from the CKP sensor is converted to a digital signal by the engine control module (ECM). This digital signal is then used to position the closing time of the primary circuit of the ignition coil. The effective range for ignition timing control is increased to the fact that there are no rotating parts.

On the basis of engine speed and load inputs, the ECM determines the ignition timing. This function also takes other inputs into consideration such as engine temperature, throttle position, knock control, camshaft position, traction control and electronic transmission control inputs.

This ignition system enables the customer to drive the vehicle home if an ignition coil or ignition coil wiring failure occurs. In the event of a wiring failure between the ECM and the ignition coil, the ignition coil will fail instead of the ignition coil fuse blowing, which will allow the remaining ignition coils to continue to function and the engine to limp home.
Engine Ignition - V8 4.2L Petrol/V8 S/C 4.2L Petrol - Engine Ignition
VIN Range: M45255->N52047

Diagnosis and Testing

1. Verify the customer concern by operating the system.
2. Visually inspect for obvious signs of mechanical or electrical damage.
3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the concern is not visually evident, refer to the Symptom Chart.

  • Cyl 4B. PI009 pin 3, (B) and GROUND.  |
| Is the resistance less than 5 ohms? Yes GO to A4. No REPAIR the relevant ignition coil ground circuit. For additional information, refer to wiring diagrams. CLEAR the DTCs. TEST the system for normal operation. |
| A4: CHECK THE CONTINUITY OF THE IGNITION COIL TRIGGER SUPPLY CIRCUIT | Disconnect the ECM electrical connector PI001.
Check the continuity of the ignition coil trigger supply circuit between the relevant ignition coil electrical connector(s) and the ECM electrical connector:

- Cyl 1A. PI002 pin 4, (GU) and PI001 pin 87, (GU)
- Cyl 2A. PI003 pin 4, (Y) and PI001 pin 88, (Y)
- Cyl 3A. PI004 pin 4, (YR) and PI001 pin 89, (YR)
- Cyl 4A. PI005 pin 4, (GR) and PI001 pin 90, (GR)
- Cyl 1B. PI006 pin 4, (GW) and PI001 pin 61, (GW)
- Cyl 2B. PI007 pin 4, (GW) and PI001 pin 62, (GW)
- Cyl 3B. PI008 pin 4, (GR) and PI001 pin 63, (GR)
- Cyl 4B. PI009 pin 4, (YR) and PI001 pin 64, (YR)

Is the resistance less than 5 ohms?

Yes

GO to A5.

No

REPAIR the ignition coil trigger supply circuit between the relevant ignition coil electrical connector(s) and the ECM electrical connector. CLEAR the DTCs. TEST the system for normal operation.

A5: CHECK THE CONTINUITY BETWEEN THE IGNITION COIL AND THE ECM

Check the continuity of the ignition coil diagnostic signal circuit, between the ignition coil electrical connector(s) and the ECM electrical connector:

- Cyl 1A. PI002 pin 2, (GB) and PI001 pin 131, (GB)
- Cyl 2A. PI003 pin 2, (YB) and PI001 pin 132, (YB)
- Cyl 3A. PI004 pin 2, (YB) and PI001 pin 132, (YB)
- Cyl 4A. PI005 pin 2, (GB) and PI001 pin 131, (GB)
- Cyl 1B. PI006 pin 2, (YB) and PI001 pin 132, (YB)
- Cyl 2B. PI007 pin 2, (GB) and PI001 pin 131, (GB)
- Cyl 3B. PI008 pin 2, (GB) and PI001 pin 131, (GB)
- Cyl 4B. PI009 pin 2, (YB) and PI001 pin 132, (YB)

Is the resistance less than 5 Ohms?

Yes

INSTALL a new ECM. For additional information refer to REFER to Section 303-14A Electronic Engine Controls / 303-14B Electronic Engine Controls / 303-14C Electronic Engine Controls. Before replacing a ECM, contact Dealer technical support. CLEAR the DTCs. TEST the system for normal operation.

No

REPAIR the circuit between the ignition coil electrical connector(s) and the ECM electrical connector. CLEAR the DTCs. TEST the system for normal operation.
Engine Ignition - V8 4.2L Petrol/V8 S/C 4.2L Petrol - Engine Ignition
VIN Range: N52048->N99999

Diagnosis and Testing

Overview

There are changes to the engine management system (EMS) for 2006 my, the most obvious of which will be the change to 7-digit diagnostic trouble codes (DTCs) from the familiar 5-digit.

Refer to the DTC index in this section for guidance on how to use these codes with the Jaguar approved diagnostic system or a scan tool.

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual inspection

<table>
<thead>
<tr>
<th>Mechanical</th>
<th>Electrical</th>

</tr>
<tr>
<td></td>
<td>Transmission control module (TCM)</td>
</tr>
</tbody>
</table>

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the cause is not visually evident use the Jaguar approved diagnostic system or a scan tool to retrieve the fault codes before proceeding to the diagnostic trouble code (DTC) Index.

| P131500 | Persistent misfire | • Spark plug failure/fouled/incorrect gap  
• Ignition coil failure  
• ECM to ignition coil primary circuit fault (cylinder misfire detected DTC also flagged)  
• Fuel delivery pressure low  
• Fuel injector circuit fault(s) (injector DTCs also flagged)  
• Cylinder compression low | For spark plug tests, GO to Pinpoint Test B. For ignition coil circuits, GO to Pinpoint Test A. Check the fuel pressure, REFER to: Fuel Tank and Lines - V8 4.2L Petrol/V8 S/C 4.2L Petrol/2.5L NA V6 - AJV6/3.0L NA V6 - AJ27 VIN Range: N80181->R99999 (310-01 Fuel Tank and Lines, Diagnosis and Testing). For injector circuit tests, REFER to: Fuel Charging and Controls - VIN Range: N52048->N99999 (303-04B Fuel Charging and Controls - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Diagnosis and Testing). Check the cylinder compressions, REFER to: Engine (303-01B Engine - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Diagnosis and Testing). |
| P136700 | Ignition amplifier group A | • Ignition monitoring circuit to ECM: open circuit, short circuit to ground, short circuit to power  
• Ignition module/coils right hand bank ground circuit fault | For ignition coil tests, GO to Pinpoint Test A. |
| P136800 | Ignition amplifier group B | • Ignition monitoring circuit to ECM: open circuit, short circuit to ground, short circuit to power  
• Ignition module/coils left hand bank ground circuit fault | For ignition coil tests, GO to Pinpoint Test A. |
CAUTION: When probing connectors to take measurements in the course of the pinpoint tests, use the adaptor kit, part number 3548-1358-00.

• NOTE: When performing electrical voltage or resistance tests, always use a digital multimeter (DMM) accurate to 3 decimal places, and with an up-to-date calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.

• NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

### PINPOINT TEST A: IGNITION COIL CIRCUITS

• NOTE: Unless multiple cylinder misfires are apparent, only one circuit will normally need to be tested. The DTC set will indicate which cylinder is misfiring.

Is the resistance greater than 5 ohms?

Yes
REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs and test the system for normal operation.

No
GO to A7.

A7: CHECK THE IGNITION COIL SWITCHING CIRCUITS FOR HIGH RESISTANCE

• NOTE: Unless multiple cylinder misfires are apparent, only one circuit will normally need to be tested. The DTC set will indicate which cylinder is misfiring.

1. Disconnect the ECM electrical connector, PI300.

2. Measure the resistance between:

<table>
<thead>
<tr>
<th>Cylinder 1 ignition coil connector, harness side</th>
<th>ECM connector PI300, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cylinder 2 ignition coil connector, harness side</td>

</tbody>
</table>

Is the resistance greater than 5 ohms?

Yes
REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs and test the system for normal operation.

No
GO to A8.

A8: CHECK THE IGNITION COIL MONITOR CIRCUITS FOR HIGH RESISTANCE

• NOTE: Unless multiple cylinder misfires are apparent, only one circuit will normally need to be tested. The DTC set will indicate which cylinder is misfiring.

1. Measure the resistance between:

<table>
<thead>
<tr>
<th>Cylinder 1 ignition coil connector, harness side</th>
<th>ECM connector PI300, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cylinder 2 ignition coil connector, harness side</td>
<td>ECM connector PI300, harness side</td>
</tr>
<tr>
<td>Cylinder 3 ignition coil connector, harness side</td>
<td>ECM connector PI300, harness side</td>
</tr>
<tr>
<td>Cylinder 4 ignition coil connector, harness side</td>
<td>ECM connector PI300, harness side</td>
</tr>
<tr>
<td>Cylinder 5 ignition coil connector, harness side</td>
<td>ECM connector PI300, harness side</td>
</tr>
<tr>
<td>Cylinder 6 ignition coil connector, harness side</td>
<td>ECM connector PI300, harness side</td>
</tr>
<tr>
<td>Cylinder 7 ignition coil connector, harness side</td>
<td>ECM connector PI300, harness side</td>
</tr>
<tr>
<td>Cylinder 8 ignition coil connector, harness side</td>
<td>ECM connector PI300, harness side</td>
</tr>
</tbody>
</table>

Is the resistance greater than 5 ohms?

Yes
REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs and test the system for normal operation.

No
INSTALL a new ignition coil to the relevant cylinder.
REFER TO: Ignition Coil-On-Plug (303-07B Engine Ignition - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Removal and Installation).
Clear the DTC and test the system for normal operation. Refer to the warranty policy and procedures manual if an ECM is suspect.

PINPOINT TEST B: CHECK SPARK PLUG

• NOTE: Only resisted spark plugs must be used.
### B1: CHECK SPARK PLUG

**NOTE:** Some spark plug types cannot be regapped and must be replaced.

<table>
<thead>
<tr>
<th></th>
<th>DETAILS/RESULTS/ACTIONS</th>
</tr>
</thead>
</table>
| 1 | Remove the suspect spark plug(s).  
    REFER to: Ignition Coil-On-Plug (303-07B Engine Ignition - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Removal and Installation). |
| 2 | Visually inspect the spark plug for cracks, damage, carbon buildup or wet fouling, check the condition of the ground electrode, the center electrode tip and the spark plug HT contact and confirm that the spark plug gap is correctly set using a wire gauge taking care not to cause damage to the center or ground electrode tips.  
    REFER to: Specifications (303-07B Engine Ignition - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Specifications). |

<table>
<thead>
<tr>
<th></th>
<th>TEST CONDITIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Is the spark plug condition good, and the spark plug gap correct?</td>
<td></td>
</tr>
</tbody>
</table>
| Yes | Check ignition coil and circuits. See possible sources list for misfire.  
    CLEAR the DTC. TEST the system for normal operation. |
| No | Install a new spark plug(s) as required.  
    CLEAR the DTC. TEST the system for normal operation. |
Engine Ignition - V8 4.2L Petrol/V8 S/C 4.2L Petrol - Ignition Coil-On-Plug

Removal

1. Remove the oil level indicator.

2. NOTE: Left-hand shown, right-hand similar.
   Remove the ignition coil-on-plug cover.

3. Disconnect the ignition coil-on-plug electrical connector.

4. Disconnect the brake servo pressure sensor electrical connector.
5. Remove the ignition coil-on-plug.
   - Remove the retaining bolt.

**Installation**

1. To install, reverse the removal procedure.
2. Tighten to 5 Nm.
## Glow Plug System

<table>
<thead>
<tr>
<th>Description</th>
<th>Nm</th>
<th>lb-ft</th>
<th>lb-in</th>
</tr>
</thead>
<tbody>
<tr>
<td>Glow plug</td>
<td>10</td>
<td>-</td>
<td>89</td>
</tr>
</tbody>
</table>
The fundamental purpose of the glow plugs is to improve the cold start capability, cold start emissions and customer perception of the vehicle, such as short glow plug times and minimum cranking times, as well as low combustion noise at low ambient temperatures.

The maximum current when switched on will be approximately 18 Amps per plug at 40° C (104° F) with a 12 Volt supply.

The Glow Plug Control Module (GPCM) is located in the engine bay on the right hand side. It acts as a switch for the current to the glow plugs and is controlled via the engine control module (ECM). Above a given coolant temperature, glow plugs will not be switched on before, during or after starting. Within a certain coolant temperature range, the glow plugs will be active before cranking to increase combustion chamber temperature, during cranking to assist engine starting, and after the engine has started in order to reduce the emissions of white and possibility black smoke from the tail pipe immediately following a cold start.

The ECM is connected to the GPCM via a reference control line and a diagnostic line. The former will be pulled down by the ECM causing the GPCM to switch on and to remain switched on while the reference voltage is low. The ECM will store the error information generated by the GPCM in the case of glow plug failure.
Glow Plug System - Glow Plug System
Diagnosis and Testing

Principle of operation
For information on the system operation. REFER to: Glow Plug System (303-07C Glow Plug System, Description and Operation).

Inspection and Verification
1. Verify the customer concern.
2. Visually inspect for obvious signs of electrical damage.

Visual inspection table

<table>
<thead>
<tr>
<th>Electrical</th>

Pinpoint Tests

CAUTION: When probing connectors to take measurements in the course of the pinpoint tests, use the adaptor kit, part number 3548-1358-00. Failure to follow this instruction may result in damage to the vehicle.

• NOTE: When performing voltage or resistance tests, always use a digital multimeter (DMM) accurate to 3 decimal places, and with an up-to-date calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.

• NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

• NOTE: If DTCs are recorded and a fault is not present when performing the pinpoint tests, an intermittant concern may be the cause. Always check for loose connections and corroded terminals.

Positive Crankcase Ventilation System

Vehicles fitted with 4.2L engine

On vehicles fitted with a 4.2L engine the positive crankcase ventilation (PCV) system consists of a PCV valve, and two PCV hoses. The PCV valve is mounted on the right-hand valve cover and a hose is connected between PCV valve and the throttle body elbow. The PCV valve regulates the amount of ventilation air and crankcase gas supplied to the intake manifold and also prevents backfiring into the crankcase. The left-hand valve cover PCV hose is connected to the air cleaner outlet pipe.

Vehicles fitted with 2.5L and 3.0L engine

On vehicles fitted with 2.5L and 3.0L engine the PCV system consists of two hoses, connected between the right-hand valve cover and the intake manifold and the left-hand valve cover and the air cleaner outlet pipe.

The PCV system recycles crankcase gases back through the engine where they mix with incoming air/fuel charge.

The positive crankcase ventilation system helps to reduce hydrocarbon emissions from the engine.

Exhaust Gas Recirculation System

Exhaust Manifold to Exhaust Gas Recirculation (EGR) Valve Tube

The exhaust gas recirculation (EGR) system is fitted on all vehicles fitted with a 4.2L engine. It comprises of an EGR valve and exhaust manifold to EGR valve tube. The EGR system allows a measured quantity of exhaust gas to be directed back to the intake manifold. The exhaust gas is introduced to the incoming charge in the intake manifold, where it mixes with the air/fuel mixture and lowers the peak gas temperature, reducing nitrogen oxide (NOx) exhaust emissions. The gas is drawn through the exhaust manifold to EGR valve tube from the exhaust to the inlet manifold via the EGR valve. The EGR valve is electrically operated and is controlled via an input from the engine control module (ECM).

On vehicles without super charger the EGR valve is mounted on the intake manifold. On vehicles with supercharger the EGR valve is mounted on the throttle body elbow.

The ECM can monitor the operation of the EGR system by receiving inputs from the manifold absolute pressure (MAP) sensor. The MAP sensor monitors the EGR flow by the change in intake manifold pressure when the EGR valve is operated. If at any time the input signal to the ECM exceeds pre-defined thresholds due to low pressure reading for a calibrated period of time, a diagnostic trouble code (DTC) is recorded.

On vehicles without super charger the MAP sensor is mounted on the rear of intake manifold. On vehicles with supercharger the MAP sensor is mounted on the rear of the throttle body elbow. For additional information, refer to Section 303-14A Electronic Engine Controls / 303-14B Electronic Engine Controls / 303-14C Electronic Engine Controls.
Positive Crankcase Ventilation (PCV) System

The PCV system recycles crankcase gases back through the engine where they mix with incoming air/fuel charge and help to reduce hydrocarbon emissions.

Vehicles with 3.0L engine

The PCV system consists of two hoses, connected between the left-hand valve cover and the intake manifold and the right-hand valve cover and the air cleaner outlet pipe.

Vehicles with 4.2L engine

The PCV system consists of a valve, and two hoses. The PCV valve is mounted on the right-hand valve cover and a hose is connected between PCV valve and the throttle body elbow. The left-hand valve cover PCV hose is connected to the air cleaner outlet pipe.

The PCV valve regulates the amount of ventilation air and crankcase gas supplied to the intake manifold and also prevents backfiring into the crankcase.

Exhaust Gas Recirculation (EGR) System - Vehicles with 4.2L engine

EGR Valve

The EGR system comprises of an EGR valve and exhaust manifold to EGR valve tube. The EGR system allows a measured quantity of exhaust gas to be directed back to the intake manifold. The exhaust gas is introduced to the incoming charge air in the intake manifold, where it mixes with the air/fuel mixture and lowers the peak gas temperature, reducing nitrogen oxide (NOx) exhaust emissions. The gas is drawn through the exhaust manifold to EGR valve tube from the exhaust to the inlet manifold through the EGR valve. The EGR valve is electrically operated and is controlled through an input from the engine control module (ECM).

On vehicles without a supercharger the EGR valve is mounted on the intake manifold. On vehicles with a supercharger the EGR valve is mounted on the throttle body elbow.

The ECM monitors the operation of the EGR system from inputs from the manifold absolute pressure (MAP) sensor and can detect high or low flow through the valve as a result of changes to the pressure readings.

High or low flow outside the expected range results in the setting of a diagnostic trouble code (DTC).

On vehicles without a supercharger the MAP sensor is mounted on the rear of intake manifold. On vehicles with a supercharger the MAP sensor is mounted on the rear of the throttle body elbow.

For additional information, refer to: Electronic Engine Controls (303-14B Electronic Engine Controls - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Description and Operation).

Secondary Air Injection (AIR) System

To assist in the reduction of exhaust emissions to meet European Union (EU) Stage 4 and Federal Petrol Emission standards, AIR is fitted to the vehicle.

For additional information, refer to: Electronic Engine Controls (303-14B Electronic Engine Controls - V8 4.2L Petrol/V8 S/C 4.2L Petrol, Description and Operation).
The AIR pump is used to provide a supply of air into the exhaust manifolds during the cold start period of the engine. The AIR cycle lasts for up to 65 seconds. The hot unburnt fuel particles leaving the combustion chamber mix with the air injected into the exhaust manifolds and immediately combust.

This subsequent combustion of the unburnt and partially burnt carbon monoxide (CO) and hydrocarbon (HC) particles help to reduce the emission of these pollutants from the exhaust system. The additional heat generated in the exhaust manifold also provides rapid heating of the exhaust system catalytic converters. The additional oxygen which is delivered to the catalytic converters also generates an exothermic reaction which causes the catalytic converters to reach their optimum operating temperature and ‘light off’ quickly.

The catalytic converters only start to provide effective treatment of emission pollutants when they reach an operating temperature of approximately 250°C (482°F) and need to be between temperatures of 400°C (752°F) and 800°C (1472°F) for optimum efficiency. Consequently, the heat produced by the AIR ‘afterburning’ reduces the time delay before the catalysts reach an efficient operating temperature.

The AIR system comprises the following components:
- AIR pump
- AIR switching valve
- AIR control valve
- AIR vacuum reservoir
- AIR pump relay
- AIR pressure sensor (North American specification vehicles only)

<td>AIR control valve</td>
</tr>
</tbody>
</table>

**AIR Pump**
The AIR pump is located behind the left-hand side of the front bumper cover. The pump is fitted on rubber mountings to help prevent noise which is generated by AIR pump operation. The AIR pump is powered from the vehicle battery by a dedicated relay and supplies approximately 10 to 15 kg/hr (22 to 33 lb/hr) of air when the engine is at idle speed and the ambient temperature is below 20°C (68°F).

Air is drawn into the AIR pump through vents in its front cover and is then passed through a foam filter. The air is delivered to the exhaust manifold on each side of the engine through a combination of plastic pipes and stainless steel tubes.

One second after the AIR pump is energised, the ECM switches on the AIR switching valve, which opens to allow vacuum from the AIR vacuum reservoir to be applied to the vacuum operated AIR control valve. When the vacuum is applied to the AIR control valve, it opens to allow the air from the AIR pump through to the exhaust manifolds.

When the ECM switches off the AIR switching valve, the vacuum supply to the AIR control valve is cut-off and the valve closes to prevent further air being injected into the exhaust manifolds. With an approximate five second delay after as the AIR switching valve is closed, the ECM removes power from the AIR pump relay, and this in turn stops the AIR pump from operating.

**AIR Switching Valve**

The ECM switches on the AIR switching valve with a one second delay after initiating AIR pump operation. When the AIR switching valve is open, a steady vacuum supply is allowed through to open the vacuum operated AIR control valve. When the ECM switches off the AIR switching valve, the valve closes and immediately shuts off the vacuum supply to the AIR control valve. The pump continues to operate for a further five seconds for system diagnostic purposes.

When the AIR switching valve is switched off, the vacuum supply line opens to atmosphere, and this causes the AIR switching valve to close automatically to prevent any further injection of air.

**AIR Control Valve**
The injected air from the AIR pump is controlled by the AIR control valve. This allows the correct amount of air to be injected directly into the exhaust manifolds. The AIR control valve prevents exhaust gasses from blowing back into the AIR pump.

The AIR control valve is assisted in operation by a vacuum source from the AIR vacuum reservoir located in the right-hand side of the engine bay. This assistance allows the actuation of the AIR control valve independently from the intake manifold vacuum levels available.

When the pressure in the exhaust system is higher than in the AIR system, the AIR control valve closes the circuit, and this protects the AIR system from exhaust gasses blowing back into the AIR system.

Vacuum to the AIR switching valve is provided from the intake manifold vacuum by the AIR vacuum reservoir. A small bore vacuum hose provides the vacuum route between the AIR vacuum reservoir and AIR switching valve. A further small bore vacuum hose is used to connect the AIR switching valve to the AIR control valve.

**AIR Vacuum Reservoir**

The AIR vacuum reservoir is located on the right-hand side of the engine bay.

The AIR vacuum reservoir is included in the vacuum supply line between the intake manifold and the AIR switching valve.

The AIR vacuum reservoir contains a one-way valve to stop vacuum leaking back towards the intake manifold side. The AIR vacuum reservoir holds a constant vacuum so that the AIR control valve opens as soon as the AIR switching valve is switched on.

**AIR Pump Relay**

The AIR pump relay is located in the engine compartment fusebox. The ECM is used to control the operation of the AIR pump by the AIR pump relay.

The AIR system receives its voltage supply through the AIR pump relay. The ECM monitors the state of the relay for correct operation as part of its system diagnostic.

**AIR Pressure Sensor - North American specification vehicles only**

The AIR system is monitored by measuring the system pressure by using the AIR pressure sensor at several instances during its cycle of operation.

The AIR system pressure is measured before operation of the AIR pump. The AIR pump is then switched on and with a one second delay, the AIR switching valve is opened. After a stabilizing period, the system pressure is measured again, this time by taking the average of a
one second duration of readings, and normalising for variations in battery voltage and atmospheric pressure. If the system pressure measured at this time has not risen enough with respect to the initial AIR pressure reading then a failure will be flagged.

A second pressure measurement is made after the requirement for AIR into the exhaust system has expired, but continuing on from the same period of AIR pump operation, i.e. the pump is left running, against a closed AIR switching valve. Again this pressure measurement is the average of a one second duration of readings normalised for variations in battery voltage and atmospheric pressure. If the system pressure measured at this time has not risen enough or has risen too much with respect to the system pressure during normal operation of AIR then a failure will be flagged.

A final pressure reading is taken after the AIR system has been switched off to ensure the system shuts down.
Diagnostic and Testing

1. Verify the customer concern by operating the system.
2. Visually inspect for obvious signs of mechanical or electrical damage.
3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the concern is not visually evident, refer to the Symptom Chart.

</table>
CHECK the resistance between PI 15 pin 2 (GU) and ground.

Yes
REPAIR the circuit between the EGR valve and FPDB. INSTALL a new fuse. CLEAR DTC. To validate fix drive vehicle between 30 mph (48 kph) and 40 mph (64 kph). Allow vehicle to idle for 2 minutes.

No
INSTALL a new fuse. CLEAR DTC. To validate fix drive vehicle between 30 mph (48 kph) and 40 mph (64 kph). Allow vehicle to idle for 2 minutes.

A7: CHECK FOR BATTERY VOLTAGE AT FPDB

CHECK for voltage at FPDB electrical connector FH 32 pin 43 (GU).

Is the voltage less than 10 volts?
Yes
REPAIR the circuit between FPDB electrical connector FH 32 pin 43 (GU) and FPDB relay 5.

No
REPAIR the circuit between FPDB electrical connector FH 32 pin 43 (GU) and EGR valve electrical connector PI 15 pin 2 (GU). CLEAR DTC. To validate fix drive vehicle between 30 mph (48 kph) and 40 mph (64 kph). Allow vehicle to idle for 2 minutes.

A8: CHECK FOR POWER SUPPLY TO EGR VALVE

MEASURE the voltage at PI 15 pin 5 (GU)

Is the voltage less than 10 volts?
Yes
REPAIR the circuit between PI 15 pin 5 (GU) and splice PIS 15. CLEAR DTC. TEST the system for normal operation.

No
INSTALL a new EGR valve. CLEAR DTC. To validate fix drive vehicle between 30 mph (48 kph) and 40 mph (64 kph). Allow vehicle to idle for 2 minutes.

PINPOINT TEST C : DIAGNOSTIC TROUBLE CODE (DTC) P0406 INDICATES EXHAUST GAS RECIRCULATION (EGR) VALVE MALFUNCTION, SHORT TO GROUND/OPEN CIRCUIT.

TEST CONDITIONS
DETAILS/RESULTS/ACTIONS

C1: CHECK FOR A SHORT TO GROUND
1. Disconnect the EGR valve electrical connector PI 15.
2. Disconnect the engine control module (ECM) electrical connector PI 1.
3. Measure the resistance between the EGR valve electrical connector PI 15 pin 4 (YU) and GROUND.
   Is the resistance less than 10,000 ohms?
   Yes
      Repair the circuit between EGR valve electrical connector PI 15 pin 4 (YU) and ECM electrical connector PI 1 pin 57 (YU). CLEAR DTC. To validate fix drive vehicle between 30 mph (48 kph) and 40 mph (64 kph). Allow vehicle to idle for 2 minutes.
   No
      Go to C2.

C2: CHECK FOR AN OPEN CIRCUIT
1. Measure the resistance between the EGR valve electrical connector PI 15 pin 4 (YU) and ECM electrical connector PI 1 pin 57 (YU).
   Is the resistance more than 5.0 ohms?
   Yes
      Repair the circuit between EGR valve electrical connector PI 15 pin 4 (YU) and ECM electrical connector PI 1 pin 57 (YU). CLEAR DTC. To validate fix drive vehicle between 30 mph (48 kph) and 40 mph (64 kph). Allow vehicle to idle for 2 minutes.
   No
      Go to C3.

C3: CHECK FOR A SHORT TO GROUND
1. Measure the resistance between the EGR valve electrical connector PI 15 pin 1 (YG) and GROUND.
   Is the resistance less than 10,000 ohms?
   Yes
      Repair the circuit between EGR valve electrical connector PI 15 pin 1 (YG) and ECM electrical connector PI 1 pin 58 (YG). CLEAR DTC. To validate fix drive vehicle between 30 mph (48 kph) and 40 mph (64 kph). Allow vehicle to idle for 2 minutes.
   No
      Go to C4.

C4: CHECK FOR AN OPEN CIRCUIT
1. Measure the resistance between the EGR valve electrical connector PI 15 pin 1 (YG) and ECM electrical connector PI 1 pin 58 (YG).
   Is the resistance more than 5.0 Ohms?
   Yes
      Repair the circuit between EGR valve electrical connector PI 15 pin 1 (YG) and ECM electrical connector PI 1 pin 58 (YG). CLEAR DTC. To validate fix drive vehicle between 30 mph (48 kph) and 40 mph (64 kph). Allow vehicle to idle for 2 minutes.
   No
      Go to C5.

C5: CHECK FOR A SHORT TO GROUND
1. Measure the resistance between the EGR valve electrical connector PI 15 pin 6 (YR) and GROUND.
   Is the resistance less than 10,000 ohms?
   Yes
      Repair the circuit between EGR valve electrical connector PI 15 pin 6 (YR) and ECM electrical connector PI 1 pin 59 (YR). CLEAR DTC. TEST the system for normal operation.
   No
      Go to C6.

C6: CHECK FOR AN OPEN CIRCUIT
1. Measure the resistance between the EGR valve electrical connector PI 15 pin 6 (YR) and ECM electrical connector PI 1 pin 59 (YR).
   Is the resistance more than 5.0 Ohms?
   Yes
      Repair the circuit between EGR valve electrical connector PI 15 pin 6 (YR) and ECM electrical connector PI 1 pin 59 (YR). CLEAR DTC. TEST the system for normal operation.
   No
      Go to C7.

C7: CHECK FOR A SHORT TO GROUND
1. Measure the resistance between the EGR valve electrical connector PI 15 pin 3 (YU) and GROUND.
   Is the resistance less than 10,000 ohms?
   Yes
      Repair the circuit between EGR valve electrical connector PI 15 pin 3 (YU) and ECM electrical connector PI 1 pin 60 (YU). CLEAR DTC. TEST the system for normal operation.
**C8: CHECK FOR AN OPEN CIRCUIT**

1. Measure the resistance between the EGR valve electrical connector PI 15 pin 3 (Yu) and ECM electrical connector PI 1 pin 60 (Yu).

Overview

There are changes to the engine management system (EMS) for 2006 my, the most obvious of which will be the change to 7-digit diagnostic trouble codes (DTCs) from the familiar 5-digit, and the introduction of secondary air injection.

For additional information on the operation of the emission control systems, REFER to: Engine Emission Control - VIN Range: N52048->N80180 (303-08A Engine Emission Control - V8 4.2L Petrol/V8 S/C 4.2L Petrol/2.5L NA V6 - AJV6/3.0L NA V6 - AJ27, Description and Operation).

Inspection and verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. If the cause is not visually evident use the Jaguar approved diagnostic system or a scan tool to retrieve the fault codes before proceeding to the diagnostic trouble code (DTC) Index.

| P243300 | Secondary air injection system air flow/pressure sensor circuit high | • Secondary air injection MAP sensor circuit: short circuit to power | For Secondary air injection MAP sensor tests, GO to Pinpoint Test C. |
| P244400 | Secondary air injection pump stuck ON       | • Secondary air injection pump control circuit: short circuit to ground | For Secondary air injection pump circuit tests, GO to Pinpoint Test B. |
| P244500 | Secondary air injection pump stuck OFF      | • Secondary air injection pump control circuit: short circuit to power | For Secondary air injection pump circuit tests, GO to Pinpoint Test B. |

**Pinpoint tests**

**CAUTION:** When probing connectors to take measurements in the course of the pinpoint tests, use the adaptor kit, part number 3548-1358-00.

• NOTE: When performing electrical voltage or resistance tests, always use a digital multimeter (DMM) accurate to 3 decimal places, and with an up-to-date calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.

• NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

**PINPOINT TEST A : CHECK THE EGR STEPPER SUPPLY AND CONTROL CIRCUITS**

**NOTE:** Check for DTCs indicating an air filter solenoid, purge valve or mass air flow meter fault before carrying out EGR stepper supply voltage pinpoint tests.

**TEST CONDITIONS**

**DETAILS/RESULTS/ACTIONS**

**A1: CHECK THE EGR STEPPER SUPPLY VOLTAGE CIRCUITS**

<table>

  **EGR stepper connector PI15, harness side**  
  Battery  
  Pin 02  
  Pin 05 |
Is either voltage less than 10 volts?

Yes

REPAIR the relevant EGR stepper supply voltage circuit. This circuit includes the front power distribution box (fuse 37) and the EMS control relay. For additional information, refer to the wiring diagrams. CLEAR the DTCs and test the system for normal operation.

No

GO to A2.

A2: CHECK THE EGR STEPPER CONTROL CIRCUITS FOR SHORT CIRCUIT TO GROUND

1 Key off.
2 Measure the resistance between:

<table>
<thead>
<tr>
<th>EGR stepper connector PI15, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 04</td>
<td>Negative terminal</td>
</tr>
<tr>
<td>Pin 01</td>
<td>Pin 53</td>
</tr>
<tr>
<td>Pin 06</td>
<td>Pin 52</td>
</tr>
<tr>
<td>Pin 03</td>
<td>Pin 51</td>
</tr>
</tbody>
</table>

Are any of the resistances less than 10,000 ohms?

Yes

REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs and test the system for normal operation.

No

GO to A3.

A3: CHECK THE EGR STEPPER CONTROL CIRCUITS FOR SHORT CIRCUIT TO POWER

1 Measure the resistance between:

<table>
<thead>
<tr>
<th>EGR stepper connector PI15, harness side</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 04</td>
<td>Positive terminal</td>
</tr>
<tr>
<td>Pin 01</td>
<td>Pin 53</td>
</tr>
<tr>
<td>Pin 06</td>
<td>Pin 52</td>
</tr>
<tr>
<td>Pin 03</td>
<td>Pin 51</td>
</tr>
</tbody>
</table>

Are any of the resistances less than 10,000 ohms?

Yes

REPAIR the short circuit. For additional information, refer to the wiring diagrams. CLEAR the DTCs and test the system for normal operation.

No

GO to A4.

A4: CHECK THE EGR STEPPER CONTROL CIRCUITS FOR HIGH RESISTANCE

1 Key off.
2 Disconnect the ECM electrical connector, PI300.
3 Measure the resistance between:

<table>
<thead>
<tr>
<th>EGR stepper connector PI15, harness side</th>
<th>ECM connector PI300, harness side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 04</td>
<td>Pin 53</td>
</tr>
<tr>
<td>Pin 01</td>
<td>Pin 52</td>
</tr>
<tr>
<td>Pin 06</td>
<td>Pin 51</td>
</tr>
<tr>
<td>Pin 03</td>
<td>Pin 50</td>
</tr>
</tbody>
</table>

Are any of the resistances less than 10,000 ohms?

Yes

REPAIR the high resistance circuit. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No

CHECK for DTCs. Refer to the DTC index.

PINPOINT TEST B : CHECK THE SECONDARY AIR INJECTION PUMP CIRCUITS

TEST CONDITIONS

B1: CHECK THE SECONDARY AIR INJECTION PUMP RELAY SUPPLY VOLTAGES

1 Key off.
2 Remove the secondary air injection pump relay.
3 Measure the voltage between:

<table>
<thead>
<tr>
<th>Secondary air injection relay base</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 01</td>
<td>Negative terminal</td>
</tr>
<tr>
<td>Pin 05</td>
<td></td>
</tr>
</tbody>
</table>

Is either voltage less than 10 volts?

Yes

REPAIR the circuit between the secondary air injection relay base and battery. This circuit includes fuse 31 of the front power distribution box. For additional information, refer to the wiring diagrams. CLEAR the DTC and test the system for normal operation.

No

GO to B2.

B2: CHECK THE SECONDARY AIR INJECTION RELAY TO AIR PUMP SUPPLY CIRCUIT FOR SHORT CIRCUIT TO GROUND

1 Disconnect the secondary air injection pump electrical connector, FH310.
2 Measure the resistance between:

<table>
<thead>
<tr>
<th>Secondary air injection relay base</th>
<th>Battery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin 03</td>
