

**Suspension Springs - Use of Packers/Spacers**MODEL 2000 MY-ON  
S-TYPE

VIN L00001-ON

**Issue:**

In production, suspension springs have one of two grades, depending on the tolerance of the overall length of the spring.

When short-tolerance springs are used in suspension assemblies, a 3 mm spacer (packing) ring is inserted under the spring, to maintain the correct ride height of the vehicle. **No** spacer ring is used with long-tolerance springs. Any one vehicle can be factory-equipped with any combination of long-tolerance and short-tolerance springs as original equipment.

**All** replacement springs supplied by Jaguar Parts are long tolerance springs that do **not** need spacer rings.

**Action:**

When installing a replacement spring on an S-TYPE vehicle, examine the existing condition.

In any location where a 3 mm spacer ring is found under the existing spring, discard the spacer ring before installing the **replacement** spring.
